- Encouraging landscaping that requires no additional irrigation: utilizing native, drought tolerant plants can reduce water usage up to 60 percent compared to traditional lawns.
 - Encouraging combined heating and cooling (CHP), also known as cogeneration, in all buildings.
 - Encouraging neighborhood energy systems, which allow communities to generate their own electricity
 - Orienting streets and buildings for best solar access.
 - Encouraging buildings to obtain at least 20 percent of their electric load from renewable energy.
- **EN-12:** Developers and local governments should encourage that new buildings are able to incorporate solar panels in roofing and tap other renewable energy sources to offset new demand on conventional power sources.
- **EN-14:** Developers and local governments should explore programs to reduce single occupancy vehicle trips such as telecommuting, ridesharing, alternative work schedules, and parking cash-outs.
- **SW-14:** Developers and local governments should integrate green building measures into project design and zoning including, but not limited to, those identified in the U.S. Green Building Council’s Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. Construction reduction measures to be explored for new and remodeled buildings include:
 - Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities.
 - An ordinance that requires the inclusion of a waste management plan that promotes maximum C&D diversion.
 - Source reduction through (1) use of building materials that are more durable and easier to repair and maintain, (2) design to generate less scrap material through dimensional planning, (3) increased recycled content, (4) use of reclaimed building materials, and (5) use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.).
 - Reuse of existing building structure and shell in renovation projects.
 - Building lifetime waste reduction measures that should be explored for new and remodeled buildings include:
 - Development of indoor recycling program and space.
 - Design for deconstruction.
 - Design for flexibility through use of moveable walls, raised floors, modular furniture, moveable task lighting and other reusable components.

The 2008 RCP replaced the Regional Comprehensive Plan and Guide for use in SCAG’s Intergovernmental Review (IGR) process. SCAG’s Community, Economic, and Human Development Committee and the Regional Council took action to accept the 2008 RCP, which

now serves as an advisory document for local governments in the SCAG region for their information and voluntary use in developing local plans and addressing local issues of regional significance. However, as indicated by SCAG, because of its advisory nature, the 2008 RCP is not used in SCAG's IGR process. Rather, SCAG reviews new projects based on consistency with the RTP/SCS (discussed below) and the GVR.

SCAG's Regional Transportation Plan/Sustainable Communities Strategy

On April 7, 2016, SCAG's Regional Council adopted the 2016–2040 RTP/SCS. The 2016–2040 RTP/SCS presents the transportation vision for the region through the year 2040 and provides a long-term investment framework for addressing the region's transportation and related challenges. Also, the 2016–2040 RTP/SCS contains baseline socioeconomic projections that are used as the basis for SCAG's transportation planning, and the provision of services by other regional agencies. The 2016–2040 RTP/SCS includes nine goals that pertain to economic development, mobility, accessibility, travel safety, productivity of the transportation system, protection of the environment and health through improved air quality, energy efficiency, and land use and growth patterns that complement the state and region's transportation investments, and security of the regional transportation system. The applicable goals of the 2016–2040 RTP/SCS are listed below.

Goal 2: Maximize mobility and accessibility for all people and goods in the region. [See Section 3.14, Transportation and Circulation.]

Goal 3: Ensure travel safety and reliability for all people and goods in the region. [See Sections 3.8, Hazards and Hazardous Materials; 3.13, Public Services; and 3.14, Transportation and Circulation.]

Goal 4: Preserve and ensure a sustainable regional transportation system. [See Section 3.14, Transportation and Circulation.]

Goal 5: Maximize the productivity of our transportation system. [See Section 3.14, Transportation and Circulation.]

Goal 6: Protect the environment and health of our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking). [See Sections 3.2, Air Quality; 3.7, Greenhouse Gas Emissions; and 3.14, Transportation and Circulation.]

Goal 7: Actively encourage and create incentives for energy efficiency, where possible. [See Sections 3.2, Air Quality; 3.5, Energy Demand and Conservation; and 3.7, Greenhouse Gas Emissions.]

Goal 8: Encourage land use and growth patterns that facilitate transit and non-motorized transportation. [See discussion below.]

Goal 9: Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies. [See Section 3.14, Transportation and Circulation.]

The sections of the Draft EIR which evaluate the consistency of the Proposed Project with each applicable goal is listed after the goal in parenthesis. As it pertains to Goal 8, the Proposed Project would place a high-intensity use in the core area of Inglewood, in close proximity to other major entertainment and sports facilities such as The Forum and the new NFL Stadium. The Proposed Project would include shuttle connections to the nearby Metro light-rail Crenshaw and Green lines, as well as Metro bus lines that run on West Century Boulevard and South Prairie Avenue. As such, the Proposed Project would not be inconsistent with Goal 8 of the SCAG RTP/SCS.

Los Angeles County Airport Land Use Plan

The Project Site is located approximately 2 miles east of LAX and approximately 1.5 miles to the north of HHR. Pursuant to the California State Aeronautics Act (Public Utilities Code section 21001 et seq.), with certain exceptions, each county in California with a public-use airport is required to establish an ALUC. Each ALUC must develop a plan for promoting and ensuring compatibility between each public-use airport in the county and surrounding land uses. In Los Angeles County, the Los Angeles County Regional Planning Commission acts as the ALUC. The ALUC's purpose is to coordinate planning for areas around public-use airports to promote the development of aviation while protecting the public health, safety and welfare from exposure to excessive noise and safety hazards. This is achieved through the policies and guidance provided in the Los Angeles County ALUP, as well as review by the ALUC of proposed developments within the planning boundaries/AIAs for the County's airports for consistency with the ALUP.¹³

The Los Angeles County ALUC has developed the ALUP to ensure that development within the planning boundaries/AIAs for the County's airports is compatible with airport operations. The ALUP includes policies related to noise exposure and safety hazards. The planning boundaries/AIAs are based on a combination of areas located within the Community Noise Equivalent Level (CNEL) 65 dB and higher contours, as well as the approach surfaces and runway protection zones identified for each airport using criteria provided in 14 CFR Part 77. The methodology and procedures to be followed when preparing aircraft noise exposure maps and developing airport/airport environs land use compatibility programs is provided in 14 CFR Part 150 (Part 150), *Airport Noise Compatibility Planning*. Part 150 studies typically consist of two primary components: (1) the Noise Exposure Map report, which contains detailed information regarding existing and 5-year future airport/aircraft noise exposure patterns, and (2) the Noise Compatibility Program, which includes descriptions and an evaluation of noise abatement and noise mitigation options/programs applicable to an airport.¹⁴ Per the Part 150 Land Use Compatibility Guidelines, residential uses are identified as non-compatible land uses for parcels exposed to CNEL 65 dBA or higher.¹⁵ Commercial land uses are identified as non-compatible land uses for parcels exposed

¹³ Los Angeles County Airport Land Use Commission, *Los Angeles County Airport Land Use Plan*, prepared by the Department of Regional Planning, adopted December 19, 1991 (Amended 2004). Available: <http://planning.lacounty.gov/view/alup/>. Accessed May 2019.

¹⁴ City of Los Angeles, Los Angeles World Airports, Noise Management LAX, LAX Part 150 Noise Exposure Map Update, <https://lawa.org/en/lawa-environment/noise-management/lawa-noise-management-lax/lax-part-150-noise-exposure-map-update>. Accessed September 2018.

¹⁵ Federal Aviation Administration, Land Use Compatibility and Airports. Available: https://www.faa.gov/about/office_org/headquarters_offices/apl/noise_emissions/planning_toolkit/media/III.B.pdf. Accessed September 2018.

to CNEL 70 dBA or higher (or, conversely, are considered compatible for parcels exposed to 70 dBA or lower).

The Los Angeles County ALUP employs a land use compatibility table to identify the level of compatibility for particular land uses within the planning area boundaries/AIAs for the County's airports based on community noise exposure level. The ALUP Land Use Compatibility Chart is depicted in **Figure 3.10-3**.

As shown in Figure 2-4 in Chapter 2, Project Description, the Project Site is located within areas exposed to CNEL 65 dB to 75 dB in the LAX planning area boundary/AIA. Per ALUP policies, the Proposed Project must be submitted to the ALUC to be reviewed for consistency with the ALUP. The Project Site is not located within the designated planning area boundary/AIA for HHR; however, parts of the Proposed Project would penetrate the 14 CFR Part 77 imaginary airspace surfaces for HHR, and construction equipment may potentially penetrate the imaginary airspace surfaces for both LAX and HHR. ALUP policies require compliance with the height restrictions established in 14 CFR Part 77 and prohibit land uses, such as obstructions in the airspace surrounding the County's airports, that will negatively affect safe air navigation. Additional discussion of the Los Angeles County ALUP, including consistency with policies related to noise and safety, is contained in Section 3.8, Hazards and Hazardous Materials, and Section 3.11, Noise and Vibration. The following policies from the Los Angeles County ALUP are applicable to the Proposed Project:

General Policies:

- Policy G-1:** Require new uses to adhere to the Land Use Compatibility Chart.
- Policy G-2:** Encourage the recycling of incompatible land uses to uses which are compatible with the airport, pursuant to the Land Use Compatibility Table.
- Policy G-4:** Prohibit uses which will negatively affect safe air navigation.
- Policy N-3:** Utilize the Table Listing Land Use Compatibility for Airport Noise Environments in evaluating projects within the planning boundaries.
- Policy S-7:** Comply with the height restriction standards and procedures set forth in FAR Part 77.

Local

City of Inglewood General Plan

California law requires that every city and county prepare and adopt a long-range comprehensive General Plan to guide future development and to identify the community's environmental, social, and economic goals. As stated in California Government Code section 65302, "The general plan shall consist of a statement of development policies and shall include a diagram or diagrams and text setting forth objectives, principles, standards, and plan proposals." The City of Inglewood General Plan sets forth goals, objectives, and policies for the future development of the City and designates the location of desired future land uses within the City. The latest adoptions of the

Land Use Category	Community Noise Exposure

Inglewood Basketball and Entertainment Center

Figure 3.10-3
ALUP Land Use Compatibility Table

individual elements of the City of Inglewood General Plan are as follows: Land Use Element, adopted September 14, 2016; Housing Element 2013–2021, adopted January 28, 2014; Conservation Element, adopted October 21, 1997; Open Space Element, adopted December 1995; Safety Element, adopted July 1995; Circulation Element, adopted December 15, 1992; and Noise Element, adopted September 1, 1987. A summary of the General Plan Elements is provided below. The Proposed Project’s consistency with the City of Inglewood General Plan is discussed under Impact 3.10-2, below.

Land Use Element

The Land Use Element presents a long-range plan for the distribution and future use of land within the City. The Land Use Element analyzes population, existing and future land use requirements, and proposed implementation techniques. It provides a framework upon which the development of public and privately owned land can be based. The City of Inglewood General Plan Land Use Element was adopted in 1980 and amended in 1986, 2009, 2015, and 2016. The 1986 amendment was for residential development in the Limited Commercial category that lies within the In-Town Redevelopment Project Area. The 2009 amendment included adoption of the Major Mixed-Use goal and policies for the HPSP area. The 2015 amendment updated the Hollywood Park Mixed-Use land use category to “Major Mixed-Use,” and made corresponding text revisions. The amendment in 2016 included goals and objectives for the Downtown Transit Oriented District and the Fairview Heights Transit Oriented District. The goals and policies of the amendments in 1986, 2009, 2015, and 2016 are not applicable to the Proposed Project because they only apply to the HPSP area. The City of Inglewood General Plan Land Use Element contains the following goals:

A. General:

Goal: Provide for the orderly development and redevelopment of the City while preserving a measure of diversity among its parts. Allocate land in the City to satisfy the multiple needs of residents but recognize that land is a scarce resource to be conserved rather than wasted.

Goal: Help promote sound economic development and increase employment opportunities for the City’s residents by responding to changing economic conditions.

Goal: Maximize the use and conservation of existing housing stock and neighborhoods and also facilitate development of new housing to meet community needs.

Goal: Develop a land use element that facilitates the efficient use of land for conservation, development and redevelopment.

Goal: Promote Inglewood’s image and identify as an independent community within the Los Angeles Metropolitan area.

B. Residential:

Goal: Encourage neighborhood stability and conservation by reducing the amount of land designated for high density development.

Goal: Promote the maintenance, rehabilitation, and modernization of the City’s housing stock.

Goal: Encourage the preservation of Inglewood's fair share of housing for low and moderate income persons.

Goal: Safeguard the City's residential areas from the encroachment of incompatible uses.

Goal: Foster the revitalization or, if necessary, the recycling of residential areas which cannot provide a decent living environment because of jet noise impact.

Goal: Encourage suitable condominium development as a means of diversifying types of housing and increasing the number of residents who own property.

Goal: Promote residential developments which will attract middle and upper income families who can afford the higher cost of recycled development.

C. Commercial:

Goal: Create and maintain a healthy economic condition within the present business community and assist new business to located within the City.

Goal: Protect local businessmen and encourage the importance of maintaining a strong commercial district in the downtown.

Goal: Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood's major streets.

Goal: Encourage the continued development and promotion of existing commercial centers such as Crenshaw-Imperial and Morningside Park.

Goal: Continue to promote the development of high quality commercial/office space at appropriate locations within the City through the redevelopment process.

Goal: Promote the development of commercial/recreational uses which will complement those which already are located in Inglewood.

D. Industrial:

Goal: Provide a diversified industrial base for the City. Continue to improve the existing industrial districts by upgrading the necessary infrastructure and by eliminating incompatible and/or blighted uses through the redevelopment process.

Goal: Continue the redevelopment of Inglewood by promoting the expansion of existing industrial firms and actively seek the addition of new firms that are environmentally non-polluting.

Goal: Increase the industrial employment opportunities for the City's residents.

E. Circulation:

Goal: Insure that proposed new uses can be accommodated by adequate and safe streets.

Goal: Promote and support adequate public transportation within the City and the region.

Goal: Develop modified traffic systems that will discourage through traffic from utilizing neighborhood streets.

Goal: Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

F. Community Facilities:

Goal: Pursue the continued acquisition and development of parks and recreation facilities to the extent feasible within the City's budgetary capability.

Goal: Maintain the present high level of police and fire services to the extent it is fiscally prudent.

Goal: Encourage the retention of high quality library services.

Goal: Expand opportunities for cultural and social growth for the City's residents.

Circulation Element

The City of Inglewood General Plan Circulation Element, adopted on December 15, 1992, is designed to require that adequate street access and traffic capacity is considered for current and future land use needs. There are three broad themes running throughout the Circulation Element: (1) presenting and analyzing existing street measures and possible corrective measures, (2) discussing additional modes of transportation, and (3) evaluating Inglewood's street environment and its possible enhancement. The goals and policies of the Circulation Element are discussed in Section 3.14, Transportation and Circulation.

Safety Element

The City of Inglewood General Plan Safety Element, adopted July 1995, contains goals, objectives, and policies that are designed to ensure that the citizens of Inglewood can be protected from unreasonable risks caused by natural and manmade disasters. The goals and policies of the Safety Element are discussed in Sections 3.8, Hazards and Hazardous Materials, and 3.13, Public Services.

Conservation Element

The City of Inglewood General Plan Conservation Element, adopted on October 21, 1997, addresses the plan for conservation, development and utilization of natural resources found within the jurisdiction of the City. Chapters II through VI of the Conservation Element address resource conservation and management and contain several goals, objectives, and policies. The goals and policies of the Conservation Element are discussed in Sections 3.2, Air Quality; 3.3, Biological Resources; 3.9, Hydrology and Water Quality; and 3.15, Utilities and Service Systems.

Open Space Element

The City of Inglewood General Plan Open Space Element, adopted December 1995, is a plan to address the current and future recreation needs of the City for parkland and recreational facilities and for the conservation of open space. The primary goal of the Open Space Element is to provide recreational park facilities for all residents in the City. The second goal of the Open Space Element is to provide additional types of open space and to preserve existing open space resources. The goals and policies of the Open Space Element is discussed in Section 3.13, Public Services.

Housing Element

The City of Inglewood General Plan Housing Element 2013–2021, adopted on January 28, 2014, presents a framework upon which the City can implement a comprehensive housing program from 2013 to 2021 to facilitate decent and affordable housing for its residents. The program established policies to create or preserve quality residential neighborhoods. The Housing Element identifies current and future housing needs and established policies and programs to mitigate or correct housing deficiencies. The goals and policies of the Housing Element are discussed in Section 3.12, Population, Employment, and Housing.

Noise Element

The City of Inglewood General Plan Noise Element, adopted September 1, 1987, is designed to manage noise within the City and to protect sensitive uses from excessive noise-related impacts. Noise-sensitive uses generally include residential dwellings, medical care facilities, hotels, houses of worship, parks, and schools. The goals and policies of the Noise Element are discussed in Section 3.11, Noise and Vibration.

City of Inglewood Zoning Code

As shown in Figure 2-6, in Chapter 2, Project Description, the City of Inglewood Zoning Code designates the majority of the 17-acre Arena Site as M-1L, Limited Manufacturing, which permits manufacturing, freight terminals and parcel delivery terminals, storage and warehouse uses, shopping centers, hotels, and financial institutions with a maximum building height of 200 feet. A small portion of the Arena Site bordering the east side of South Prairie Avenue, is zoned C-2A, Airport Commercial, which is intended to provide for general commercial uses as well as commercial uses that are appropriate for and/or dependent upon close proximity to LAX, such as retail and restaurant uses, hotels, and automotive rental and leasing services. Building heights in the C-2A zone are limited to 75 feet.

North of West 101st Street, the West Parking Garage Site is zoned entirely as C-2A, Airport Commercial. South of West 101st Street, the West Parking Garage Site is zoned C-2A, Airport Commercial; P-1, Parking; R-2, Residential Limited Multifamily; and R-3, Residential Multiple Family. The P-1, Parking, zone permits housing and open air temporary parking facilities. The R-2, Residential Limited Multifamily, and R-3, Residential Multiple Family, zones permits single-family and multifamily housing with height limits of 35 feet and 45 feet, respectively.

The East Transportation and Hotel Site and the Well Relocation Site are both zoned entirely as M-1L, Limited Manufacturing.

The Proposed Project proposes zoning changes, as described in Chapter 2, Project Description.

Inglewood International Business Park Specific Plan

The IIBP Specific Plan, adopted in 1993, established development standards for land use, urban design, circulation, site access, public works, public services, noise, and air quality; infrastructure requirements; and the design character for the southern portion of the City. The IIBP Specific

Plan boundaries are 102nd Street on the north, Yukon Avenue on the east, 104th Street on the south, and South Prairie Avenue on the west. The area is bisected by South Doty Avenue.

The purpose of the land use development standards is to provide for the continued existence and new development of commercial, industrial, and research and development uses that facilitate large scale corporate users, generate employment and revenue base for the City, while being compatible with adjacent uses. When adopted, the IIBP Specific Plan was anticipated to fulfill the objectives of the City of Inglewood General Plan through the anticipated removal of the area's residential units that were impacted by noise attributable to LAX aircraft operations, and the relocation of the residents; the provision of appropriately sized industrial designated parcels; the provision of vehicular and pedestrian circulation facilities, sanitation, sewer facilities, water, storm drain facilities, utilities and other adequately sized infrastructure that support the projected industrial park use; and the provision of the uses in an aesthetically pleasing "campus like" setting.¹⁶

The stated goal of the IIBP Specific Plan is to enable private development to create an aesthetically pleasing business park which facilities large-scale corporate users while benefitting the City and the residents who live in the surrounding neighborhood. To achieve this overall goal, the City set more specific goals to:

- Create an economically viable business park that generates employment for residents and revenue to the City;
- Foster change from residential uses affected by aircraft noise to other noise compatible uses;
- Create a visually cohesive commercial-industrial center through unified streetscape, landscape, and urban design;
- Create a vehicular circulation system that provides efficient access while protecting nearby residents from associated impacts; and
- Implement land use policies of the General Plan, comply with FAA airport land use compatibility policies and with the State's airport noise standards.¹⁷

The IIBP identifies a range of permitted and prohibited uses largely focused on light industrial and employment generating uses, along with general commercial uses in the vicinity of South Prairie Avenue. It is noteworthy that among the permitted uses in the Limited Manufacturing zone that comprises most of the Specific Plan area are large scale retail uses, hotels of at least 100 rooms, professional and medical offices, and parking for employees and visitors. Among the permitted uses in the General Commercial zone near South Prairie Avenue are a range of entertainment uses, such as theaters, live performance venues, and food and drink establishments. The IIBP Specific Plan includes a circulation network that closes South Doty Avenue through the Specific Plan area, and includes a number of cul-de-sacs that extend south from West 102nd Street. Finally, the Specific Plan provides for setbacks along street frontages ranging from 25 feet along South Prairie Avenue to 15 feet along West 102nd Street.

¹⁶ City of Inglewood, 1993. *Inglewood International Business Park Specific Plan*, December 21, 1993, p. 2.

¹⁷ City of Inglewood, 1993. *Inglewood International Business Park Specific Plan*, December 21, 1993, p. 6.

City of Inglewood Redevelopment Project Areas

The City of Inglewood Redevelopment Agency was established in 1969. Between 1970 and 1973, six redevelopment project areas were adopted that include the In Town, La Cienega, Manchester–Prairie, North Inglewood Industrial Park, Century, and Imperial–Prairie Redevelopment Project Areas. As shown in **Figure 3.10-4**, the Consolidated Inglewood Merged Redevelopment Project Area, when adopted, included the Project Site as well as the Hollywood Park Racetrack and Casino located north of West Century Boulevard. In 1996, the Inglewood City Council merged the six redevelopment projects into one—the Merged and Amended Redevelopment Project Area (Merged Inglewood Redevelopment Project).^{18,19}

On December 29, 2011, the California Supreme Court upheld Assembly Bill XI 26, which provided for the termination of all California Redevelopment Agencies. On January 10, 2012, the City of Inglewood elected to become the Successor Agency of the former Inglewood Redevelopment Agency taking effect on February 1, 2012. The Successor Agency assumed the obligations of the former Inglewood Redevelopment Agency and elected to carry out activities necessary to wind down its affairs.

In 2015, the California Department of Finance approved a Long-Range Property Management Plan (LRPMP) for the disposition and uses of all the Successor Agency-owned properties, including the properties located within the Consolidated Inglewood Merged Redevelopment Project Area.^{20,21} The Successor Agency-owned parcels that are part of the Project Site are described on pages 1–9 of the LRPMP. The procedures for disposition of those properties are described on pages 29–36 of the LRPMP. The following goals from the LRPMP are applicable to the Proposed Project:

Consolidated Inglewood Merged Redevelopment Project Area:

Goal a: Increase employment opportunities for a diversified workforce.

Goal c: Promote new and continuing private sector investment within the Project Area to prevent the loss of and to facilitate the capture of commercial and industrial activities.

Consistent with Goal a. and Goal c., the Proposed Project would provide a multipurpose event center that promotes the City’s position as a center for sports and entertainment in the larger region. The Proposed Project would include approximately the same number of LA Clippers employees as under current conditions which is 254 permanent employees. It is anticipated that

SOURCE: TerraServer, 2018; ESA, 2019.

Inglewood Basketball and Entertainment Center

Figure 3.10-4
Consolidated Inglewood Merged Redevelopment Project Area

the Proposed Project would also require approximately 75 employees to provide operations and management services for the Arena. Future employment from the proposed restaurant, retail, sports medicine clinic, arena and plaza experience, community space, and hotel is estimated to be 439 permanent employees. For LA Clippers home games, the Proposed Project would require up to 1,320 temporary employees. Other major sold out events, such as a large concert, would require approximately 1,200 temporary employees. Events that would not sell out the Arena would require fewer employees. For medium-sized events, including weekend family shows and other events, temporary event-related employment is estimated to be between 480 and 530 jobs. For smaller events, including corporate or community events or events in the plaza, temporary event employment is estimated to be approximately 25 jobs. As such, the Proposed Project is not inconsistent with the Consolidated Inglewood Merged Redevelopment Project Area.

The New Downtown Inglewood & Inglewood TOD Plans

The New Downtown Inglewood & Inglewood TOD Plans Project began with the creation of urban plans for the revitalization of downtown Inglewood and the improvement of the Fairview Heights neighborhood, but now encompasses all the Metro stops within the City.²² The new Metro stops are the Westchester/Veterans Metro Station on the Crenshaw/LAX line (opening in 2019) and the existing Crenshaw Station on the Metro Green Line. The TOD plans are designed to modify zoning and parking regulations to encourage economically robust, pedestrian-friendly and community-centered development, improve networks for biking and walking, and recommended policies for implementation. Given the Project Site is not within the boundaries of the areas subject to the New Downtown Inglewood & Inglewood TOD Plans, these plans are not applicable to the Proposed Project and are not discussed further.

3.10.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to land use and planning. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Physically divide an established community; or
2. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Methodology and Assumptions

The criterion for determining significance with respect to a land use plan emphasizes conflicts with plans adopted for the purpose of avoiding or mitigating an environmental effect, recognizing that an inconsistency with an individual plan, policy, or regulation does not necessarily equate to a significant physical impact on the environment.

²² The New Downtown Inglewood & Inglewood TOD Plans website, <http://inglewood.arroyogroup.com/>, accessed September 2018.

As discussed above, the reader is referred to the various environmental resource evaluations presented in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, for a discussion of potential physical/environmental effects and potential incompatibilities that may be considered in the determination of physical environmental impacts. Such potential land use incompatibilities would be addressed in the applicable environmental resource sections in Chapter 3.

Impacts and Mitigation Measures

Impact 3.10-1: Construction and operation of the Proposed Project could physically divide an established community. (Less than Significant)

Under CEQA, physical division of an established community applies to projects, such as highway construction, that would create a barrier that would physically sever two or more connected parts of a community.²³ This CEQA criteria is not intended to apply to effects that may create a perceived barrier, such as increased traffic, or creating a challenge to cross a street, or other real or perceived inconveniences.

The majority of the 28-acre Project Site is vacant and underutilized within an existing surrounding urbanized area that contains a mix of uses including low to medium-density residential, commercial, entertainment, industrial, office and parking uses. The vacant parcels are secured with fencing and do not permit public access. Thus, under existing conditions, vacant parcels located within the Project Site do not allow for the connectivity of people in the existing community.

The design of the Proposed Project would not include physical barriers or obstacles to circulation that would restrict existing patterns of movement between the Project Site and the surrounding neighborhoods. In fact, the Proposed Project would include a number of features designed to encourage and promote public access and vehicular and pedestrian circulation, where limited access exists today. Specifically, the Proposed Project would include improved roadways and access points within the Arena Site and near parking areas near the Arena Site. The Proposed Project would facilitate pedestrian access onto the Project Site through shuttle services, public bus transit connectivity, pedestrian bridges and gathering areas, and long-term and short-term bicycle parking. The Proposed Project would provide shuttle service from the Metro Green Line's Hawthorne/Lennox Station and the Metro Crenshaw/LAX Line's La Brea/Florence Station to the Project Site during LA Clippers basketball games and other large events. To accommodate shuttles that would transport people from Metro light-rail stations to the Project Site, shuttle drop-offs would be provided along the east side of South Prairie Avenue near the entrance to the plaza. This shuttle stop would be primarily used for shuttles between Metro light-rail stations and the Arena. For events with shuttle service, shuttle vehicles providing service to the La Brea/Florence Station would use the internal access road to enter the Project Site from West 102nd Street and exit onto South Prairie Avenue before stopping at the shuttle pick-up and drop off location.

²³ "We believe, however, that this guideline was intended to apply to projects, such as highway construction, that would constitute physical barriers dividing a community." *Cathay Mortuary, Inc. v. San Francisco Planning Commission* (207 Cal. App. 3d 275), January 20, 1989.

Public bus transit would be relocated to improve connectivity for pedestrians and bicyclists going to the Project Site. The bus stop that serves Metro line 117 for eastbound traffic on West Century Boulevard would be temporarily relocated to the west side of the intersection during project construction, then permanently relocated back to the east side of the intersection directly in front of the proposed plaza. The bus stop that serves Metro lines 212/312 for northbound traffic on South Prairie Avenue would be permanently relocated to the northwest corner of the intersection.

Also, the Proposed Project would include development of an above-grade pedestrian bridge that would cross South Prairie Avenue, linking the plaza with the West Parking Garage Site located to the west, and facilitating increased pedestrian connectivity during periods of high traffic compared to existing conditions. The majority of pedestrian traffic flowing between the western parking garage and the plaza is expected to use the pedestrian bridge.

The plaza adjacent to the Arena Structure to the northwest will serve as the main pedestrian gathering/circulation entryway into the Arena Structure. The majority of attendees with general admission tickets would enter the Arena Structure from the plaza into entrances located on the northern facades of the Arena Structure. Secondary pedestrian entries would be located on the south side of the Arena Structure from the adjacent parking garage, as well as an employee access pavilion on the eastern side of the Arena Structure. These secondary entrances would be used by the team, media, talent, and employees, and a limited number of attendees with access to the premium parking structure located on the Arena Site.

Further, during events, particularly at the end of LA Clippers basketball games and large concerts, when the peak flow of patrons would exit the Project Site, the Proposed Project would implement an Event Transportation Management Plan (TMP), a management and operating plan designed to facilitate multimodal travel to and from events and to assist with flow of traffic by the Project Site to the larger community in a safe and efficient manner.

Street Vacations

Implementation of the Proposed Project also would include the vacation of an approximately 900-foot linear section of West 102nd Street between South Prairie Avenue to a line approximately 335 feet west of South Doty Avenue to be developed with the Arena Structure. People who currently use West 102nd Street to access South Prairie Avenue to the west or South Doty Avenue or South Yukon to the east would no longer have this access and would need to seek alternative connections. The closure of this stretch of West 102nd Street would require use of alternative routes to the north or south. Alternative routes include using West 104th Street or West Century Boulevard to access South Prairie Avenue to the west or South Doty Avenue and South Yukon to the east. Similar to the above, this street vacation would replace a 1,255-foot route along West 102nd Street, between South Doty Avenue and South Prairie Avenue, with a 2,600-foot route with a one-block detour to the north or south. While this increase of distance would somewhat increase the distance and time to travel between South Prairie Avenue and the community along West 102nd Street to the east, it would not physically divide the existing community because numerous alternative routes in the nearby vicinity are available.

Similarly, implementation of the Proposed Project also would include the vacation of an approximately 350-foot linear section of West 101st Street between South Prairie Avenue and South Freeman Avenue to be developed with the parking garage building. With the Proposed Project, people who currently use West 101st Street to access South Prairie Avenue from the west or South Freeman Avenue from the east would no longer have this access and would need to seek alternative connections. The closure of this stretch of West 101st Street would require use of alternative routes to the north or south. Alternative routes include using West 103rd Street or West Century Boulevard to access South Prairie Avenue to the east or South Freeman Avenue to the west. In addition, the Proposed Project would include the addition of a new access road, along the west boundary of the West Parking Garage Site, connecting West Century Boulevard to West 101st and West 102nd Streets. Using the new access road, this street vacation would replace a 1,255-foot route along West 101st Street, between South Freeman and South Prairie Avenues, with a 2,000-foot route with a one-block detour to the north or south. While this increase of distance would somewhat increase the time to travel between South Prairie Avenue and the community along West 101st Street to the west, it would not physically divide the existing community because numerous alternative routes in the nearby vicinity are available.

The West Parking Garage Site would provide entrance/exit on South Prairie Avenue, and would remove the existing crosswalk on the north side of the South Prairie Avenue and West 102nd Street intersection, the relocated crosswalk would be immediately south of the garage entrance/exit. The existing south crosswalk at South Prairie Avenue and West 102nd Street would be eliminated. The removal of this crosswalk would not create a physical barrier or obstacle to circulation that would restrict existing patterns of movement between the Project Site and the surrounding neighborhoods. Pedestrians could use the relocated crosswalk to cross South Prairie Avenue, walk two blocks south to the crosswalks at the South Prairie Avenue and West 104th Street intersection, or walk one block north to use the crosswalk located at the South Prairie Avenue and West Century Boulevard intersection. Thus would not physically divide an established community.

Overall, based on the above considerations, while the Proposed Project would result in the vacation of parts of two east–west City streets and remove one crosswalk across South Prairie Avenue, because of the availability of nearby alternative routes, including the addition of a pedestrian bridge across South Prairie Avenue, implementation of the Proposed Project would not physically divide an established community. This impact would be considered to be **less than significant**.

Mitigation Measures

None required.

Impact 3.10-2: Construction and operation of the Proposed Project could conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

The criterion for determining significance with respect to a land use plan emphasizes conflicts with plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. This criterion recognizes that an inconsistency with an individual plan, policy, or regulation does not necessarily equate to a significant physical impact on the environment.

SCAG Regional Comprehensive Plan

The Proposed Project would be consistent with relevant policies of the 2008 RCP that encourage development in infill locations of existing communities and the use of “green” building techniques (including achievement of LEED Gold status, use of solar panels and recycled water infrastructure) that result in efficient use of water and reduction in pollution and waste (policies LU-6.2; OSC-8, -10, -11, -13; WA-11, -12, -32; EN-8, -10, -12; SW-14). Further, the Proposed Project would include provisions for connections of the project to nearby Metro light-rail stations, would include a transportation hub that promotes non-single-occupant vehicle use, and other measures to reduce vehicular trip making, with concomitant reductions in criteria air pollutants, GHG emissions, and transportation energy demands, making the Project consistent with policies EN-8 and -14. Consistent with policies OSN-14, OSC-12, WA-9, WA-27 and -32, and EN-10, the Proposed Project would avoid adverse effects on open spaces and other natural habitats, be designed to avoid material changes to the runoff characteristics of the site, and include a landscaping plan that limits water use and related energy demands.

SCAG Regional Transportation Plan/Sustainable Communities Strategy

The Proposed Project would be consistent with the strategies and principles, as well as Goals 4, 6, and 8, of the 2016 RTP/SCS that are designed to promote a sustainable regional transportation system, land use patterns that facilitate transit and non-motorized transportation, and improving air quality through active transportation, and to reduce vehicle miles traveled and the GHG emissions associated with on-road vehicle travel. The Proposed Project would be infill development that provides a dense mix of recreation and entertainment, office, retail, restaurant, community, and hotel uses, on parcels of infill urban land accessible to and served by public transit and near existing and planned housing.

More specifically, the Proposed Project would be developed on an infill site that is located in a highly urbanized part of the SCAG region and is accessible to numerous transit lines, and would be located immediately adjacent to another major mixed use project that is under development (HPSP). The site is designated on the RTP/SCA high-quality transit area (HQTA) maps of 2012 and 2040 conditions as partially in and immediately adjacent to an HQTA.²⁴ The Project Site is

²⁴ Southern California Association of Governments, 2016–2040 RTP/SCS Appendix: Sustainable Communities Strategy (SCS) Background Documentation, Exhibits 19 and 20, Forecasted Regional Development Types by Land Development Categories (2012 and 2040), April 2016.

adjacent to two LA Metro bus routes (lines 117 and 212/312 stop at the intersection of West Century Boulevard and South Prairie Avenue) and is also within 0.5 miles of a Metro bus route (the combined 740/40 line stops at the intersection of West Century Boulevard and La Brea/Hawthorne Boulevard). These Metro bus routes provide frequent service during peak commute hours. As described in Section 3.0, Introduction to the Analysis, the Inglewood Transit Connector (ITC) (Cumulative Project #74) is a planned 1.8-mile electric train system with a station near the intersection of West Century Boulevard and South Prairie Avenue, adjacent to the Project Site; if approved and constructed, the ITC would provide close connections from the Project Site and the adjacent HPSP development to the LA Metro Crenshaw line Downtown Inglewood station.

On a regional scale, the Proposed Project would provide development in an area served not just by a range of existing local and regional bus lines, but also by airports, regional freeway systems, the Metro Green Line's Hawthorne/Lennox Stations, and three future stations on the Metro/Crenshaw LAX line currently under construction. The Proposed Project would be designed with the complete communities concept in mind by integrating community design with land use planning and transportation planning, and by providing construction and permanent jobs for a variety of skills and education, recreational and cultural events, and a full range of shopping, entertainment and services all within a relatively short distance.

The Proposed Project would be designed and constructed to the standards of LEED Gold, and would include an outdoor plaza, new and improved pedestrian connections, landscaping and edge treatments, sidewalk and pavement improvements and other open spaces that would be designed to facilitate pedestrian movement and activities. An integral element of the Proposed Project would be the plaza; a large outdoor space designed to accommodate crowds associated with Arena events and also serve as a vibrant activity and fan experience center and outdoor space for everyday use. Further, the Proposed Project would comply with the requirements of the City of Inglewood Municipal Code for the provision of short- and long-term bicycle parking (Section 10-151, Transportation Demand and Trip Reduction Measures; Section 12-42.1, Transportation Demand Management Requirements for Carpool Parking and Bicycle Facilities). In addition, the Proposed Project would provide approximately 60 bicycle parking spaces for employees in the Access Pavilion and 23 short- and long-term secured bicycle parking spaces for patrons in the Parking Garage Site and Bus Staging Transportation Network Company Drop-Off Area. The proximity of the Proposed Project to these transportation modes would reduce the need for motor vehicle travel in the area surrounding the Project Site.

As described in Section 2.5.5, Circulation, of Chapter 2, Project Description, the Proposed Project would include an Event TMP designed to facilitate multimodal travel to and from events at the Project Site in a safe and efficient manner during event days. In addition, the Proposed Project will implement a Transportation Demand Management program designed to reduce vehicle trips by attendees, employees, visitors, and customers through the use of alternate modes of transportation including transit, shuttles, ridesharing, walking, and biking.

For the reasons described above, the Proposed Project would be consistent with the 2016 RTP/SCS goals of supporting the sustainable growth through a more consolidated, compact development pattern that encourages new density and intensity in infill opportunity areas that are accessible to a multitude of transportation options, including transit.

Los Angeles County Airport Land Use Plan

Los Angeles County ALUP Policies G-1, G-2, G-4, N-3, and S-7 are applicable to the Proposed Project. These policies direct the City to “[r]equire new uses to adhere to the [ALUP’s] Land Use Compatibility Chart,” “[e]ncourage the recycling of incompatible land uses to uses which are compatible with the airport, pursuant to the Land Use Compatibility Table,” “[p]rohibit uses which will negatively affect safe air navigation,” “[u]tilize the Table Listing Land Use Compatibility for Airport Noise Environments in evacuating projects within the planning boundaries,” and require projects to “[c]omply with the height restriction standards and procedures set forth in FAR Part 77.” The Proposed Project would be consistent with Policies G-1, G-2, and N-3, as project design and uses would be consistent with criteria established in the Los Angeles County ALUP Land Use Compatibility Table, and implementation of the Proposed Project would further the goal of recycling incompatible land uses to uses that are compatible with the airport.

The Proposed Project would comply with the requirements of ALUP Policies G-4 and S-7, through submittal of Form 7460-1, Notice of Proposed Construction or Alteration, initiating preparation of an aeronautical study to determine whether the Proposed Project would include components that would obstruct the airspace and potentially operate as obstructions to air navigation (see further discussion of this in Section 3.8, Hazards and Hazardous Materials.) Finally, as required by the ALUP, the Proposed Project would be submitted to the ALUC for a review of project consistency with the ALUP policies and programs. See also Section 3.11, Noise and Vibration, for an analysis and consistency discussion with the ALUP.

City of Inglewood General Plan

The Proposed Project would include approval of amendments to the Land Use Element with conforming map and text changes to reflect the plan for the Proposed Project, including redesignation of certain properties from Commercial to Industrial, conforming land use map changes, and conforming text changes to the Industrial land use designation text. With the amendments that are included as part of the Proposed Project, the Proposed Project would be consistent with the Land Use Element goals and objectives included in the City of Inglewood General Plan. Therefore, the Proposed Project does not conflict with goals, objectives, or policies in the Land Use Element adopted for the purpose of mitigating environmental effects. The goals, objectives, and policies of other elements of the City’s General Plan, including those that are adopted for the purpose of mitigating environmental effects, are addressed in the respective sections of this EIR (e.g., the policies of the Noise Element are addressed in Section 3.11, Noise and Vibration).

Inglewood International Business Park Specific Plan

The portion of the Arena Site south of West 102nd Street and the entire Well Relocation Site is located within the IIBP Specific Plan area. Although the proposed Arena is not specifically noted as a permitted use in either the M1 or C2 zones, to a considerable extent, the Proposed Project would achieve many of the key goals established by the City, including generation of employment for City residents and revenues to the City, development of uses that would be compatible with the current noise environment and that would be compatible with ALUP policies, and creation of a circulation system that would provide efficient access to the Proposed Project (including parking and loading) that would avoid impacts on neighborhood residents. However, a number of elements of the Proposed Project would be inconsistent with the proposed land uses, circulation, and design guidelines of the of the IIBP Specific Plan. The Proposed Project would include proposed revisions to the City of Inglewood General Plan and City of Inglewood Zoning Code, and would include an action to remove the portions of the Project Site located within the IIBP Specific Plan area. Thus if approved as proposed, the Proposed Project would not be inconsistent with the IIBP Specific Plan.

Overall, implementation of the Proposed Project would be consistent and not conflict with SCAG Compass Blueprint Growth Vision, the SCAG RCP, the SCAG 2016–2040 RTP/SCS, the Los Angeles County ALUP, the City of Inglewood General Plan Land Use Element (after proposed amendments), and the IIBP Specific Plan. Therefore, the Proposed Project would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. This impact would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

As described in Section 3.0, Table 3.0-2, the Cumulative Projects List documents a total of 145 related cumulative projects located in the City of Inglewood and surrounding communities, and which account for anticipated development of 1,903,815 sf of retail/commercial space, 8,675,487 sf of office space, 2,070,210 sf of industrial/warehouse/data center space, 9,315 residential units or beds, approximately 2,430 hotel rooms, and new or expanded schools to accommodate 6,401 students. In addition, the Cumulative Projects List includes two major transit improvements: LAWA’s Land Access Modernization Program (Cumulative Project #82), a 2.2-mile electric train system that would connect LAX to the LA Metro Crenshaw/LAX light-rail line, and the ITC (Cumulative Project #74), a 1.8-mile electric train system that would connect the Project Site and adjacent HPSP area to the LA Metro Crenshaw/LAX light-rail line Downtown Inglewood station.

Impact 3.10-3: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could physically divide an established community. (Less than Significant)

As discussed above, under CEQA, physical division of an established community typically applies to projects, such as highway construction, that would create a barrier that would physically sever two or more connected parts of a community.²⁵ Similar to the Proposed Project, the related cumulative projects are individual land use development projects that would occur on specific development parcels within the existing land use and transportation fabric of the community. The list of related cumulative projects does not include any foreseeable projects that would physically divide or sever existing connected parts of the community or make it impossible or extremely inconvenient for a person to get from one part of the established community to a previously connected part of the community. However, if there were any projects that could physically divide or sever existing connected parts of the community, the Proposed Project would not cumulatively contribute to this potential related cumulative project impact. The project design of each related project would be evaluated on a project-by-project basis to determine compatibility with the surrounding uses. Further, related projects are subject to CEQA review, and review by other regulatory agencies.

The related cumulative projects are in-fill in nature and, while increasing density, would be constructed on parcels that fit in with the existing framework of land use and circulation in the existing community, and would not create physical barriers which would physically divide an established community. As described above, the Proposed Project would have a less-than-significant impact as a result of the vacation of segments of West 101st and West 102nd Streets.

As discussed above, the West Parking Garage Site would provide entrance/exit on South Prairie, and would relocate the existing crosswalk on the north side of the South Prairie Avenue and West 102nd Street intersection; the relocated crosswalk would be immediately south of the garage entrance/exit. The existing south crosswalk at South Prairie Avenue and West 102nd Street would be eliminated. The removal of this crosswalk would not create a physical barrier or obstacle to circulation that would restrict existing patterns of movement between the Project Site and the surrounding neighborhoods. Pedestrians could use the relocated north crosswalk to cross South Prairie Avenue, walk two blocks south to the crosswalks at the South Prairie Avenue and West 104th Street intersection, or walk one block north to use the crosswalk located at the intersection of South Prairie Avenue and West Century Boulevard. None of the related cumulative projects would reduce the connectivity across South Prairie Avenue and, thus, would not combine with the effects of the Proposed Project to physically divide an established community.

Based on the above considerations, the Proposed Project, in conjunction with other cumulative development within the project vicinity, would not result in the physical division of an established community. Therefore, the cumulative impact would be **less than significant**.

²⁵ *Cathay Mortuary, Inc. v. San Francisco Planning Commission*, No. A039937, 207 Cal. App. 3d 275; 254 Cal. Rptr. 778; 1989 Cal. App. LEXIS 22, January 20, 1989.

Mitigation Measures

None required.

Impact 3.10-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. (Less than Significant)

The Project Site is located adjacent to an area planned for redevelopment with high-density residential, mixed-use infill development with improved transit and pedestrian accessibility. The cumulative projects near the Project Site generally are high-density residential, mixed-use development that concentrate multifamily residential with commercial and employment generating uses. The cumulative development projects near the Project Site would increase density in the area and, together with cumulative increases in transit infrastructure, would support increased use of transit and other non-single-occupant vehicle modes of transportation. This type and location of development is consistent with local, regional, and statewide plans that seek to accommodate increased population growth while achieving goals for reduction in GHG emissions and other environmental effects typically associated with suburban sprawl and greenfield development.

The Proposed Project, in conjunction with related cumulative projects would be consistent with the 2016–2040 RTP/SCS. Goal 8 of the 2016–2040 RTP/SCS is to encourage land use and growth patterns that facilitate transit and non-motorized transportation. Combined with the Proposed Project, cumulative projects would tend to increase development densities located within an area served by a range of existing local and regional bus lines, the Metro Green Line’s Hawthorne/Lennox Stations and the future use of three stations associated with the Metro/Crenshaw LAX line currently under construction. The proximity of the Proposed Project and related cumulative projects to these transportation modes would increase density and expand transit options, reducing the need for motor vehicle travel in the area surrounding the Project Site, and would also support the revitalization of the City. As such, it would be consistent with the goals of the City’s General Plan Land Use Element.

The Proposed Project, Adjusted Baseline development, and related cumulative projects would be required to comply with policies G-1, G-2, G-4, N-3, and S-7 of the Los Angeles County ALUP, and consistency with the ALUP would be determined through review by the ALUC.

Impacts related to consistency conflicts with applicable land use plans, policies, or regulations of an agency with jurisdiction over the related projects, generally are specific to the individual related projects and are not cumulative in nature. However, the Proposed Project together with Adjusted Baseline development and related cumulative projects would result in development, including high-density residential, commercial and entertainment uses, concentrated within a transit priority area which would be consistent with the goals and policies of the SCAG Compass Blueprint Growth Vision, the SCAG RCP, the SCAG RTP/SCS, the LA County ALUP, the

City's General Plan and the IIBP Specific Plan. The Proposed Project, in conjunction with other cumulative development, would not conflict with land use plans, policies or regulations adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

3.11 Noise and Vibration

This section describes and evaluates potential noise and vibration impacts that could result from implementation of the Proposed Project. The section contains: (1) a description of the existing noise and vibration environment at, and in the area surrounding, the Project Site; (2) a description of changes under the Adjusted Baseline to establish baseline conditions; (3) a summary of applicable noise laws, regulations, and policies; (4) estimates of future noise and vibration levels at surrounding noise- and vibration-sensitive land uses resulting from construction and operation of the Proposed Project; and (5) identification of the potential for significant impacts and associated mitigation measures, if required.

Comments received in response to the NOP for the EIR regarding noise and vibration can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to noise and vibration as a result of implementation of the Proposed Project are analyzed within this section.

The analysis included in this section was developed based on ambient noise measurements taken by ESA and presented in Appendix J; Project-specific construction data and assumptions (including construction schedule, phasing, and equipment provided by the applicant team); characteristics of the Proposed Project described in Chapter 2, Project Description, and the transportation analysis presented in Section 3.14, Transportation and Circulation, and Appendix K.

3.11.1 Section Outline

The analysis of noise in Section 3.11 describes the anticipated increases in the on-site and off-site noise and vibration environment as a result of construction and operation of the Proposed Project. This Section Outline provides an overview of the analysis undertaken and described in this section. See Chapter S, Summary for a summary of the noise and vibration impacts described in this section.

Noise and Vibration Sensitive Receptors

The focus of the noise analysis is the exposure of certain land uses that the City considers to be more sensitive to noise than others, including residences, schools, hospitals, libraries, and parks. Receptors that are potentially vibration sensitive include buildings that could be damaged; residents, students, the elderly and sick that could be annoyed, and vibration-sensitive equipment that could be disturbed.

Construction Noise Impacts

Study Area: Construction noise results from the operation of heavy-duty equipment and on-road travel of heavy-duty trucks (i.e., haul trucks and vendor trucks). For noise generated by on-site construction equipment, the study area includes analysis of impacts to noise-sensitive receptors identified within areas up to approximately 500 feet from the boundaries of the Project Site. For impacts associated with on-road construction vehicles, the study area consists of the anticipated haul routes. Vibration dissipates rapidly with distance and impacts are analyzed for vibration-sensitive receptors that are adjacent to the Project Site.

Time Periods Evaluated: In addition to evaluating construction noise impacts during the daytime (7:00 AM to 8:00 PM), this analysis evaluates construction noise during the nighttime hours (8:00 PM to 7:00 AM) to account for construction work days that are proposed to vary from 8 hours to continuous 24 hours during certain phases or construction operations on the Arena Site, as needed, with the significance of impact varying throughout the night due to the fluctuation in ambient conditions.

Scenarios Evaluated: Over the course of Proposed Project construction period from July 2021 to October 2024, construction could occur simultaneously on the four Project Site subareas during certain phases or periods of activity. To ensure that the worst case impacts have been identified and analyzed, the construction noise analysis evaluates impacts to noise-sensitive receptors under four scenarios that account for overlap of construction across all four Project Site subareas during the worst case construction days at the Arena Site, the West Parking Garage Site, the East Transportation and Hotel Site, and the Well Relocation Site.

Operational Impacts – Traffic Noise

Study Area: The traffic noise analysis evaluates increases in traffic based on traffic volume data developed as a part of the Transportation and Circulation analysis (see Section 3.14). Traffic noise was evaluated on 113 roadway segments within the approximately 20-square-mile study area considered in the traffic analysis.

Time Periods Evaluated: Traffic noise was analyzed during the Weekday AM Peak Period (7:00–9:00 AM), Weekday PM Peak Period (4:00–6:00 PM), Weekday Pre-Event Period (6:00–7:00 PM), Weekday Post-Event Period (9:30–10:30 PM), Weekend Pre-Event Peak Period (5:00–6:00 PM) and Weekend Post-Event Peak Period (9:30–10:30 PM).

Adjusted Baseline and Cumulative Conditions: Consistent with the Transportation and Circulation analysis, the traffic noise analysis evaluates Proposed Project impacts under both Adjusted Baseline and Cumulative conditions, including concurrent event scenarios. The Adjusted Baseline is the baseline against which the Proposed Project’s potential impacts are measured. Additional information regarding the Adjusted Baseline transportation assumptions is provided in Section 3.0.5 of the Section 3.0, Introduction to Analysis, and in Section 3.14.2. Further discussion of Cumulative condition assumptions is provided in Section 3.0.6, and in Section 3.14.4 following Table 3.14-43.

Scenarios Evaluated: The traffic noise analysis evaluated the following Project scenarios.

- *Non-Event Day, Ancillary Uses:* This scenario includes weekday traffic during the AM and PM peak periods under Adjusted Baseline conditions, and operations of Project ancillary uses (i.e., team practice facility and offices, sports medicine clinic, plaza commercial and community uses, and hotel) on a non-event day.
- *Day-Time Corporate/Community Event:* This scenario includes weekday traffic during the AM peak period under Adjusted Baseline conditions, operations of Project ancillary uses, and a

daytime corporate/community event at the Proposed Project with approximately 2,000 attendees.

- *Other Sporting Event or Gathering:* This scenario includes weekday traffic during the PM peak period under Adjusted Baseline conditions, operations of Project ancillary uses, and a sporting event or gathering at the Proposed Project with approximately 7,500 attendees.
- *Major Event:* This scenario includes weekday pre- and post-event traffic and weekend pre- and post-event peak period traffic. Pre- and post-event traffic assumes 18,000 and 18,500 attendees, respectively. Weekday events are assumed to start at 7:00 PM and weekend events are assumed to start at 6:00 PM

In addition to the Project scenarios listed above, traffic noise was evaluated for the worst case weekday and weekend concurrent event scenarios, as described in Section 3.14, Transportation and Circulation. The concurrent event scenario evaluated on weekdays is the Adjusted Baseline with a Mid-Sized Event at the NFL Stadium and with a concert at The Forum and a Major Event at the Proposed Project. The concurrent event condition evaluated on weekends is the Adjusted Baseline with an NFL Game at the NFL Stadium, a concert at The Forum, and a Major Event at the Proposed Project.

Operational Impacts – Composite On-Site Noise

Study Area: On-site operational noise sources include amplified and crowd noise from arena events, mechanical equipment, vehicle noise (i.e., parking garages and media truck parking), and plaza-related amplified sound and crowd noise. Because the composite noise analysis is focused on noise sources at the Project Site, impacts were evaluated for noise-sensitive uses within approximately 500 feet of the Project Site.

Scenarios Evaluated: On-site activities and associated noise sources would vary based on the type of activity occurring at the Project Site. On-site composite noise was evaluated under the following scenarios:

- *Non-Event Day, Ancillary Uses:* Noise sources include plaza-related noise (patrons of ancillary uses and outdoor dining), pedestrian noise, parking lot and garage activity, and mechanical equipment.
- *Day-Time Corporate/Community Event:* Noise sources include plaza-related noise (patrons of ancillary uses, day-time corporate/community event attendees, and outdoor dining), pedestrian noise, parking lot and garage activity, and mechanical equipment.
- *Other Sporting Event or Gathering:* Noise sources include plaza-related noise (patrons of ancillary uses, other sporting event or gathering attendees, and outdoor dining), pedestrian noise, parking lot and garage activity, and mechanical equipment.
- *Major Event Pre-Event:* Noise sources include plaza-related noise (amplified sound at the outdoor plaza stage, crowd noise from attendees of outdoor performances, patrons of ancillary uses, and outdoor dining), pedestrian noise, parking lot and garage activity, media truck-related noise, and mechanical equipment.
- *Major Event During Event:* Noise sources include plaza-related noise (patrons of ancillary uses and outdoor dining), pedestrian noise, parking lot and garage activity, media truck-

related noise, mechanical equipment, and event noise emanating from the arena when the doors open.

- *Major Event Post-Event:* Noise sources include plaza-related noise (amplified sound at the outdoor plaza stage, crowd noise from attendees of outdoor performances, patrons of ancillary uses, and outdoor dining), pedestrian noise, parking lot and garage activity, media truck-related noise, and mechanical equipment.

Organization of Section 3.11: The Noise and Vibration analysis presented in Section 3.11 is organized into the following five (5) subsections:

Section 3.11.1: Describes the organization of this section.

Section 3.11.2: Describes the environmental setting, including the existing noise and vibration environment.

Section 3.11.3: Describes the Adjusted Baseline Environmental Setting that was developed to evaluate the Proposed Project impacts against the baseline environmental conditions (including land use) anticipated to exist when the Proposed Project would be constructed and opened for operations. Specifically, this section describes the assumptions utilized with respect to reasonably foreseeable development that is anticipated to occur on significant portions of the Hollywood Park Specific Plan area prior to development of the Proposed Project.

Section 3.11.4: Provides a discussion of the relevant federal, State and local regulations pertaining to noise and vibration that are applicable to the Proposed Project.

Section 3.11.5: Discusses the construction and operational noise and vibration impacts of the Proposed Project under Adjusted Baseline and Cumulative conditions, including with concurrent and overlapping events. This section also discusses the construction and operational noise and vibration impacts of the Proposed Project in the cumulative context, taking into account other development in the area that is considered reasonably foreseeable; the analysis focuses on whether the project's noise and vibration impacts are cumulatively considerable.

3.11.2 Environmental Setting

Background

Noise can be generally defined as unwanted sound. Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) which is measured in decibels (dB), with 0 dB corresponding roughly to the threshold of human hearing and 120 to 140 dB corresponding to the threshold of pain and hearing damage, respectively.

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but rather a broad band of frequencies varying in levels of magnitude (sound power). The sound pressure level, therefore, constitutes the additive force exerted by a sound corresponding to the frequency/sound power level spectrum.

The typical human ear is not equally sensitive to all frequencies of the audible sound spectrum. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that de-emphasizes the frequencies below 1,000 Hz and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to low and extremely high frequencies

instead of the frequency mid-range. This method of frequency weighting is referred to as A-weighting and is expressed in units of A-weighted decibels (dBA). Frequency A-weighting follows an international standard methodology of frequency de-emphasis and is typically applied to community noise measurements. Some representative noise sources and their corresponding A-weighted noise levels are shown in **Figure 3.11-1**.

Noise Exposure, Noise Level, and Community Noise

Noise *exposure* is a measure of noise over a period of time. Noise *level* is a measure of noise at a given instant in time. *Community noise* varies continuously over a period of time with respect to the contributing sound sources of the community noise environment. Community noise is primarily the product of many distant noise sources, which constitute a relatively stable background noise exposure, with the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources such as traffic and atmospheric conditions. What makes community noise continuously variable throughout a day, besides the slowly changing background noise, is the addition of short duration single event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual receptor. These successive additions of sound to the community noise environment vary the community noise level from instant to instant, requiring the measurement of noise exposure over a period of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts.

This time-varying characteristic of environmental noise is described using statistical noise descriptors. The most frequently used noise descriptors are summarized below:

- Leq: The energy-equivalent sound level is used to describe noise over a specified period of time, typically one hour, in terms of a single numerical value. The Leq is the constant sound level which would contain the same acoustic energy as the varying sound level, during the same time period (i.e., the average noise exposure level for the given time period).
- Lmax: The instantaneous maximum noise level for a specified period of time.
- Lw: The sound power level, which is the total sound energy radiated by a source. Sound power in decibels is ten times the logarithm of the ratio of the sound power to a sound power reference level of 1 picowatt.
- DNL: Also abbreviated Ldn, it is a 24-hour day and night A-weighted noise exposure level which accounts for the greater sensitivity of most people to nighttime noise by weighting noise levels at night (“penalizing” nighttime noises). Noise between 10:00 PM and 7:00 AM is weighted (penalized) by adding 10 dBA to take into account the greater annoyance of nighttime noises.
- CNEL: Similar to DNL, the Community Noise Equivalent Level (CNEL) adds a 5 dBA “penalty” for the evening hours between 7:00 PM and 10:00 PM in addition to a 10 dBA penalty between the hours of 10:00 PM and 7:00 AM
- SEL: Single Event Noise Exposure Level is the summation of the sound energy from a variable source over the length of time with the sound level greater than certain sound pressure levels in a single event.

Inglewood Basketball and Entertainment Center

Figure 3.11-1
Decibel Scale and Common Noise Sources

As a general rule, in areas where the noise environment is dominated by traffic, the Leq during the peak-hour is generally within 2 dB of the Ldn at that location.¹

Noise Attenuation

Noise attenuates (lessens) with distance between the source and the receiver. Stationary point sources of noise, including stationary mobile sources such as idling vehicles, attenuate at a rate of 6 dBA with a doubling of distance for hard sites and 7.5 dBA for each doubling of distance for soft sites. Hard sites are those with a reflective surface between the source and the receiver such as paved parking lots or smooth bodies of water. No excess ground attenuation is assumed for hard sites and the changes in noise levels with distance (drop-off rate) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface such as soft dirt, grass, or scattered bushes and trees. In addition to geometric spreading, an excess ground attenuation value of 1.5 dBA (per doubling distance) is normally assumed for soft sites. Line sources (such as traffic noise from vehicles on the road) attenuate at a rate of 3 dBA for hard sites and 4.5 dBA for soft sites for each doubling of distance.²

Noise levels may also be reduced by intervening structures, such as a row of buildings, a solid wall, or a berm located between the receptor and the noise source. According to the US Department of Housing and Urban Development (HUD) *Noise Guidebook*,³ standard building construction results in an exterior-to-interior noise reduction of 20 dBA with windows closed.

Effects of Noise on People

When a new noise is introduced to an environment, human reaction can be predicted by comparing the new noise to the *ambient* noise level, which is the existing noise level comprised of all sources of noise in a given location. In general, the more a new noise exceeds the ambient noise level, the less acceptable the new noise will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships occur:⁴

- Except in carefully controlled laboratory experiments, a change of 1 dBA cannot be perceived by human ear;
- Outside of the laboratory, a 3 dBA change is considered a just-perceivable difference;
- A change in level of at least 5 dBA is required before any noticeable change in human response would be expected; and
- A 10 dBA change is subjectively heard as approximately doubling in loudness, and can cause adverse response.

These relationships occur in part because of the logarithmic nature of sound and the decibel system. The human ear perceives sound in a non-linear fashion, hence the decibel scale was

¹ Federal Highway Administration Office of Environmental Policy, 2016. *Advanced Prediction and Abatement of Highway Traffic Noise*. November 2016. p. 4-20.

² California Department of Transportation, 2013. *Technical Noise Supplement*. September 2013. p. 5-17.

³ US Department of Housing and Urban Development, 2009. *Noise Guidebook*. March 2009. p. 14.

⁴ California Department of Transportation, 2013. *Technical Noise Supplement*. September 2013. p. 6-5.

developed. Because the decibel scale is based on logarithms, two noise sources do not combine in a simple additive fashion, rather logarithmically. For example, if two identical noise sources produce noise levels of 50 dBA, the combined sound level would be 53 dBA, not 100 dBA.

Health Effects of Noise

The consequences of exposure of people to excessive noise can include annoyance and disturbance of human activities, as well as effects on human health. The following discussion is provided so that the health implications of noise exposure are fully understood.

Exposure to very high levels of noise can cause permanent hearing impairment. The levels at which noise exposure can lead to hearing loss (140 dB) or pain (120 dB) is a common method of measuring health effects or impacts of noise. The federal Occupational Safety and Health Administration (OSHA) has an established occupational noise exposure program which includes hearing conservation standards for long-term noise exposure. Employers are required to measure workplace noise levels; provide free annual hearing exams, hearing protection, and training; and conduct evaluations of the adequacy of the hearing protectors in use where noise environments exceed 85 dBA for an eight hour daily exposure.

Following the United States Environmental Protection Agency's elimination of its noise investigation and control program in the 1970s, the World Health Organization (WHO) has become a noted source of current knowledge regarding the health effects of noise impacts. In addition to hearing impairment, WHO documents that sleep disturbance is an effect that can affect human health. Although there are no established thresholds with regard to an acceptable level of short-term sleep disturbance, the following information on potential health effects due to sleep disturbance has been provided in order to provide a general correlation of the potential impacts to health that could result from nighttime construction activity. Excessive noise during sleep periods can result in difficulty falling asleep, awakenings, and alterations in sleep stages and depth (e.g., a reduction in proportion of REM-sleep (REM = rapid eye movement)). Exposure to high levels of noise during sleep can also result in increased blood pressure, increased heart rate, increased finger pulse amplitude, vasoconstriction, changes in respiration, cardiac arrhythmia, and an increase in body movements. Secondary physiological effects of exposure to excessive noise during sleep can occur the following day, including reduced perception of quality sleep, increased fatigue, depressed mood or well-being, and decreased performance of cognitive tasks.⁵ WHO Europe reviewed available scientific evidence on the health effects of night noise and published night noise guidelines for Europe in 2009, which compliments their 1999 *Guidelines for Community Noise*. According to WHO, the lowest observed adverse effect level for night noise is an exterior nighttime noise level of 40 dB. At this level, observed effects on sleep include body movements, awakening, self-reported sleep disturbance, and arousals.⁶

Other potential health effects of exposure to excessive noise identified by WHO include decreased performance for complex cognitive tasks, such as reading, attention span, problem solving, and

⁵ World Health Organization, *Guidelines for Community Noise, Chapter 3. Adverse Health Effects of Noise*, 1999. p. 26.

⁶ World Health Organization, *Night Noise Guidelines for Europe, Executive Summary*. 2009. p. XVII.

memorization; physiological effects such as hypertension and heart disease (after many years of constant exposure, often by workers, to high noise levels); and hearing impairment (again, generally after long-term occupational exposure, although shorter-term exposure to very high noise levels, for example, exposure several times a year to concert noise at 100 dBA over several hours, can also damage hearing). Finally, while environmental noise is not believed to be a direct cause of mental illness, it can cause annoyance and is known to intensify such symptoms as anxiety, headaches, emotional stress, changes in moods, and the like.⁷ WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA.⁸

Vehicle traffic, aircraft noise, and continuous sources of machinery and mechanical noise contribute to ambient noise levels. Short-term noise sources, such as truck backup beepers or the sound produced by the loading or unloading of materials, contribute very little to 24-hour noise levels but are capable of causing sleep disturbance and annoyance. The importance of noise to receptors depends on both time and context. For example, long-term high noise levels from large traffic volumes can make conversation at a normal voice level difficult or impossible, while short-term peak noise levels, if they occur at night, can cause sleep disturbance.

Fundamentals of Vibration

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings. The root mean square (RMS) amplitude is most frequently used to describe the effect of vibration on the human body. The RMS amplitude is defined as the average of the squared amplitude of the signal. Decibel notation (Vdb) is commonly used to express RMS. The decibel notation acts to compress the range of numbers required to describe vibration.

Effects of Vibration on Structures

As described in the Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment Manual*,⁹ groundborne vibration can be a serious concern, causing nearby buildings to shake and rumbling sounds to be heard. Some common sources of groundborne vibration are trains, buses on rough roads, and construction activities such as blasting, sheet pile-driving and operating heavy earth-moving equipment. In contrast to airborne noise, groundborne vibration is not a common environmental problem. It is unusual for vibration from sources such as buses and trucks on smooth roadways to be perceptible, even in locations close to major roads.¹⁰

The effects of groundborne vibration include movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. In extreme cases, the vibration can cause damage to buildings. Building damage is not a factor for most

⁷ World Health Organization, *Guidelines for Community Noise, Chapter 3. Adverse Health Effects of Noise*, 1999. p. 30.

⁸ World Health Organization, *Guidelines for Community Noise, Chapter 3. Adverse Health Effects of Noise*, 1999. p. 38.

⁹ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 112.

¹⁰ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 112.

projects, with the occasional exception of blasting and sheet pile-driving during construction that is adjacent to existing buildings.

Effects of Vibration on People

Annoyance from vibration often occurs when the vibration exceeds the threshold of perception by only a small margin. A vibration level that causes annoyance can be well below the damage threshold for normal buildings. As discussed in FTA's *Transit Noise and Vibration Impact Assessment Manual*, the human response to vibration is complex and the degree of annoyance cannot always be explained by the magnitude of the vibration alone.¹¹ Other factors include the rattling and rumbling sounds caused by vibration, the time of day, and the visual effects such as the moving of hanging objects.

Vibration Attenuation

Typically, groundborne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Factors such as soil and subsurface conditions influence the levels of groundborne vibration with some of the most important factors being the stiffness and internal damping of the soil and the depth to bedrock.¹² Vibration levels are higher in stiff-clay-type soil and when bedrock is 30 feet or less below the surface.¹³

Health Effects of Vibration

According to OSHA, those at risk for vibration-related health effects are workers who conduct physical work activities requiring the use of vibrating powered hand tools (e.g., chain saw, electric drill, chipping hammer, etc.) or equipment (e.g., wood planer, punch press, packaging machine, etc.) and standing or sitting in vibrating environments (e.g., driving a truck over bumpy roads, etc.) or using vibrating equipment that requires whole-body movement (e.g., jackhammers).¹⁴ Off-site vibration-sensitive receptors would not come in physical contact with vibratory construction equipment and would not be at risk for vibration-related health effects.

Groundborne Noise

Groundborne noise specifically refers to the rumbling noise emanating from the motion of building room surfaces due to the vibration of floors and walls; it is perceptible only inside buildings.¹⁵ The relationship between groundborne vibration and groundborne noise depends on the frequency content of the vibration and the acoustical absorption characteristics of the receiving room. For typical buildings, groundborne vibration that causes low frequency noise (i.e., the vibration spectrum peak is less than 30 Hz) results in a groundborne noise level that is approximately 50 decibels lower than the velocity level. For groundborne vibration that causes

¹¹ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. West 118.

¹³ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 117.

¹⁴ Occupational Safety and Health Administration. Ergonomics Program Section 1910.918. Publication Date November 23, 1999. Available: <https://www.osha.gov/laws-regs/federalregister/1999-11-23>. Accessed March 25, 2019.

¹⁵ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 112.

mid-frequency noise (i.e., the vibration spectrum peak is between 30 and 60 Hz), the groundborne noise level will be approximately 35 dB lower than the velocity level. For groundborne vibration that causes high-frequency noise (i.e., the vibration spectrum peak is greater than 60 Hz), the groundborne noise level will be approximately 20 dB lower than the velocity level.¹⁶ Therefore, for typical buildings, the groundborne noise decibel level is lower than the groundborne vibration velocity level at low frequencies.

Summary of Surrounding Land Uses

The entire Project Site is comprised of approximately 28 acres and encompasses four specific locations: the Arena Site; the West Parking Garage Site; the East Transportation and Hotel Site; and the Well Relocation Site. The Project Site is surrounded by a mix of commercial, industrial, office, retail, and residential uses. See Section 3.10, Land Use and Planning, for more-detailed descriptions of land uses surrounding the Project Site, as well as corresponding Figure 3.10-1 and Figure 3.10-2.

Arena Site

Adjacent to the Arena Site to the north along West Century Boulevard is an unoccupied structure (formerly the Airport Park View Hotel) and a self-storage facility. To the east along South Doty Avenue is a warehousing and shipping company (S.E.S. International Express) and an industrial use (C D S Cabinets). To the north across West Century Boulevard is the approximately 240-acre area planned for the Hollywood Park Specific Plan (HPSP). Development within the HPSP area includes an NFL Stadium and a mix of commercial, office, retail, residential, mixed use, civic, and recreational development, some of which is currently under construction, including the NFL Stadium. Residential uses are located adjacent to the Arena Site on the east side of South Prairie Avenue between West 102nd and 103rd Streets, and uses across South Prairie Avenue from the Arena Site include automotive body shops, commercial uses, and a religious facility (Iglesia Evangelica Profetica Jesucristo Pronto Viene). Adjacent to the Arena Site to the south is the Inglewood Southside Christian Church, which includes facilities for an early childhood education program that provides other family support services, and residential uses.

West Parking Garage Site

To the north of the West Parking Garage Site across West Century Boulevard are commercial uses, a vacant parcel, the Holly Crest Hotel, and Motel 6. Commercial uses are located immediately to the east. A religious facility and single-family residential uses are located to the south. A motel (Airport Motel), religious facility, and single-family residential uses are located to the west.

East Transportation and Hotel Site

The Hollywood Park Casino is located to the north of the East Transportation and Hotel Site, north of and across West Century Boulevard. Adjacent to the East Transportation and Hotel Site to the east is a United Parcel Service (UPS) facility. Adjacent to the East Transportation and Hotel Site to the west is Transworld Aquatic Enterprises, Inc., a pet store manufacturer and

¹⁶ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 146.

distributor of aquarium supplies. To the south of the East Transportation and Hotel Site are multifamily residential uses and commercial uses.

Well Relocation Site

To the north of the Well Relocation Site is the UPS warehousing and shipping company. To the east of the Well Relocation Site are single-family residential uses. A vacant lot and multifamily residential uses are located to the south. To the west of the Well Relocation Site is an occupied commercial use.

Noise-Sensitive Receptors

Some land uses are considered more sensitive to noise than others, due to the amount of noise exposure (in terms of both exposure duration and insulation from noise) and the types of activities typically involved. Land uses considered to be noise-sensitive, as identified in the Inglewood General Plan, include residences, schools, hospitals, libraries, and parks. The Inglewood General Plan Noise Element considers residences to be especially sensitive because of the time spent by individuals at home, occurrence of outdoor activities, and the likelihood of sleep disturbance to occur.¹⁷ The Federal Highway Administration (FHWA) considers uses where people normally sleep, such as residences, hotels, and motels, noise-sensitive land uses.¹⁸ Commercial and industrial uses are not considered noise-sensitive by either the City or FHWA.

Although the majority of the Project Site consists of vacant land, there are noise sensitive receptors adjacent to the Project Site and in the surrounding area, including single-family and multifamily residences, hotels or motels, religious facilities, and an early childhood educational facility. For the purpose of this analysis, noise sensitive receptors within an approximate 500-foot distance to the Project Site boundaries have been identified and selected for evaluation. Because exposure to noise levels can vary by height, this analysis includes an evaluation of potential noise impacts to multi-story structures that are identified as noise-sensitive receptors.

For the purposes of presenting the results of the potential noise impact analyses in this EIR, the noise sensitive receptors nearest to the Project Site have been organized into groups by geographic proximity, as shown in **Figure 3.11-2**. These receptor groups are used in this EIR to provide a representation of the potential noise impacts on noise-sensitive receptors around the Proposed Project. The borders of the receptor groups generally follow the property boundaries of the identified sensitive receptors. Although the receptor groups shown in Figure 3.11-2 do not include all the receiver points evaluated in the noise modeling analyses prepared for this EIR, these receptor groups include all noise-sensitive receptors nearest to the Project Site and are used in this EIR to represent the greatest (or “worst-case”) potential noise impacts of the Proposed Project. Adjacent commercial and industrial uses that are considered vibration-sensitive (as discussed in more detail below), but not noise-sensitive (specifically, receptor groups R4, R9, R10, R13, R18, and R19) are not listed below.

Figure 3.11-2
Sensitive Receptors and
Noise Monitoring Locations

As shown in Figure 3.11-2, the noise-sensitive receptor groups nearest to the Project Site are comprised of:

- **R1** – Single-family residential uses to the northwest, located across West Century Boulevard and South Prairie Avenue, approximately 310 feet from the Arena Site and West Parking Garage Site. This receptor group includes some two-story structures identified as noise-sensitive receptors.
- **R2** – Single-family residential uses on the north side of West 101st Street, approximately 60 feet west of the West Parking Garage Site and west of R3.
- **R3** – The operational Airport Motel (4054 West Century Boulevard) adjacent to the West Parking Garage Site to the west.
- **R5** – Single-family residential uses between West 101st Street and West 102nd Street located adjacent to the West Parking Garage Site to the west. This receptor group includes one two-story structure identified as a noise-sensitive receptor.
- **R6** – Single-family residential uses located approximately 175 feet west of and across South Prairie Avenue from the Arena Site and approximately 50 feet south of and across West 102nd Street from the West Parking Garage Site. This receptor group includes some two-story structures identified as noise-sensitive receptors.
- **R7** – Single-story religious use, Iglesia Evangelica Profetica Jesucristo Pronto Viene, and residential uses, approximately 90 feet west of and across South Prairie Avenue from the Arena Site and approximately 50 feet south of and across West 102nd Street from the West Parking Garage Site.
- **R8** – Hotel use, formerly known as the Airport Park View Hotel, located immediately north of the Arena Site. These buildings are currently non-operational and dilapidated; however, tenant improvement permits have been filed with the City and renovation activities are underway. Therefore, for conservative purposes, it is assumed that the building will be reused and occupied with sensitive receptors – hotel patrons – at some point in the near future. These structures include a second and third story.
- **R11** – Multifamily residential uses along the east side of South Prairie Avenue between West 102nd Street and West 103rd Street to the west (adjacent to the Arena Site).
- **R12** – Single-family residential uses located along the east side of South Prairie Avenue between West 102nd Street and West 103rd Street to the west (adjacent to the Arena Site).
- **R14** – Single-family and multifamily residential uses adjacent to the east side of the Well Relocation Site. This receptor group includes one two-story structure identified as a noise-sensitive receptor.
- **R15** – Religious use, the Inglewood Southside Christian Church and early childhood educational facilities along West 104th Street to the south (adjacent to the Arena Site).
- **R16** – Single-family and multifamily residential use along West 104th Street to the south (adjacent to the Arena Site). This receptor includes a structure with a second story.
- **R17** – Single-family residential uses to the southeast, located approximately 90 feet southeast of the Arena Site and approximately 60 feet south of the Well Relocation Site.
- **R20** – Multifamily residential uses located approximately 50 feet to the south of and across West 102nd Street from the East Transportation and Hotel Site. This receptor group includes one two-story structure identified as a noise-sensitive receptor.

- **R21** – Multifamily residential uses located within the HPSP area, approximately 900 feet north of the Arena Site (Section 3.11.12 below, regarding the Adjusted Baseline Environmental Setting). This receptor group includes some multi-story structures identified as noise-sensitive receptors.

Vibration and Groundborne Noise Sensitive Receptors

Receptors that are potentially vibration sensitive include structures of all uses with respect to potential building damage (especially older masonry structures), people who spend a lot of time indoors with respect to human annoyance (especially residents, students, the elderly and sick), and vibration-sensitive equipment (such as hospital analytical equipment and equipment used in computer chip manufacturing). Additional sensitive receptors of groundborne vibration would be historic buildings, which are more susceptible to structural damage from vibration. People who spend a lot of time indoors are also susceptible to groundborne noise resulting from groundborne vibration. As for noise-sensitive receptors, vibration-sensitive receptors have been organized into groups by geographic proximity for purposes of presenting the results of this analysis. See Figure 3.11-2 for the location of the vibration-sensitive receptor groups. As presented on Figure 3.11-2, the vibration-sensitive receptor groups (also groundborne noise receptors) to the Project Site include the following:

- **R1** – Single-family residential uses to the northwest, located across West Century Boulevard and South Prairie Avenue, approximately 310 feet from the Arena Site.
- **R2** – Single-family residential uses to the west, on the north side of West 101st Street, approximately 60 feet of the West Parking Garage Site.
- **R3** – The Airport Motel (4054 West Century Boulevard) adjacent to the West Parking Garage Site to the west.
- **R4** – Commercial uses adjacent to the West Parking Garage Site to the east.
- **R5** – Single-family residential uses between West 101st Street and West 102nd Street located adjacent to the West Parking Garage site to the west.
- **R6** – Single-family residential uses located approximately 175 feet west of and across South Prairie Avenue from the Arena Site and approximately 50 feet south of and across West 102nd Street from the West Parking Garage Site.
- **R7** – Single-story religious facility, Iglesia Evangelica Profetica Jesucristo Pronto Viene, and residential uses, approximately 90 feet of and across South Prairie Avenue from the Arena Site and approximately 50 feet south of and across West 102nd Street from the West Parking Garage Site.
- **R8** – Hotel use (former Airport Park View Hotel), located immediately north of the Arena Site. This building is currently non-operational and dilapidated; however, tenant improvement permits are filed with the City and therefore for conservative purposes, it is assumed that the building will be reused and occupied with sensitive receptors – hotel patrons – at some point in the near future. Therefore, this use has been considered a sensitive vibration receptor.
- **R9** – Self-storage use adjacent to the Arena Site to the north.

- **R10** – Warehousing and shipping use (S.E.S. International Express) adjacent to the Arena Site to east along South Doty Avenue.
- **R11** – Multifamily residential use along the east side of South Prairie Avenue between West 102nd Street and West 103rd Street to the west (adjacent to the Arena Site).
- **R12** – Single-family residential use located along the east side of South Prairie Avenue between West 102nd Street and West 103rd Street to the west (adjacent to the Arena Site).
- **R13** – Industrial use (C D S Cabinets) adjacent to the Arena Site to the east and adjacent to the Well Relocation Site to the west.
- **R14** – Single-family and multifamily residential uses to the east adjacent to the Well Relocation Site.
- **R15** – Religious use, the Inglewood Southside Christian Church and early childhood educational facilities along West 104th Street to the south (adjacent to the Arena Site).
- **R16** – Single-family and multifamily residential use along West 104th Street to the south (adjacent to the Arena Site).
- **R17** – Single-family residential uses to the southeast, located approximately 90 feet from the Arena Site and approximately 60 feet south of the Well Relocation Site.
- **R18** – Industrial use (Transworld Aquatic Enterprises, Inc.), adjacent to the East Transportation and Hotel Site to the west.
- **R19** – Shipping and warehouse use (UPS), adjacent to the East Transportation and Hotel Site to the east.
- **R20** – Multifamily residential uses located approximately 50 feet to the south of and across West 102nd Street from the East Transportation and Hotel Site.
- **R21** – Multifamily residential uses located within the HPSP area, approximately 900 feet north of the Arena Site.

Existing Noise Setting

The immediate area surrounding the Project Site as described above is highly urbanized with multiple noise sources including, but not limited to, traffic on local and arterial streets, aircraft arrivals to and departures from the Los Angeles International Airport (LAX), and commercial and industrial activity (e.g., truck loading/unloading).

To quantify the existing noise environment, daytime and nighttime measurements were taken at 17 locations. Long-term (LT) continuous 96-hour noise level measurements were taken at 5 locations at various onsite locations to characterize the existing noise environment within the Project Site. Short-term (ST) 15-minute noise level measurements were taken during daytime hours (between the hours of 7:00 AM and 10:00 PM) and during nighttime hours (between the hours of 9:30 PM and 11:30 PM and between the hours of 12:00 AM and 2:00 AM) at 12 locations near noise-sensitive uses. Noise measurement locations and relation of those locations to the receptor groups are shown in Figure 3.11-2 and described below.

- **M1** – Long-term noise measurement that represents the ambient noise levels within the northwest part of the Arena Site, proximate to the hotel use on West Century Boulevard east

of South Prairie Avenue (former Airport Park View Hotel) (R8), the multifamily residential use along the east side of South Prairie Avenue (R11), and the single-family residential use located along the east side of South Prairie Avenue (R12). Ambient noise levels collected at this location during daytime and nighttime hours were utilized in the construction analysis.

- **M2** – Long-term noise measurement adjacent to the Well Relocation Site that represents the ambient noise levels proximate to the adjacent single and multifamily residential uses (R14) to the east along South Doty Avenue and single-family residential uses (R17) to the south along West 104th Street. Ambient noise levels collected at this location during daytime and nighttime hours were utilized in the construction analysis.
- **M3** – Long-term noise measurement within the southern portion of the Arena Site that represents the ambient noise levels at the adjacent Inglewood Southside Christian Church and early childhood educational use located along West 104th Street (R15), and multifamily residential uses located along West 104th Street (R16). Ambient noise levels collected at this location during daytime and nighttime hours were utilized in the construction analysis.
- **M4** – Long-term noise measurement that represents the ambient noise levels within the East Transportation and Hotel Site and nearby multifamily residential uses (R20). Ambient noise levels collected at this location were utilized for the nighttime construction analysis.
- **M5** – Long-term noise measurement that represents the ambient noise levels within the West Parking Garage Site, single-family residential uses (R1) to the north of West Century Boulevard along South Prairie Avenue, the single-family residential uses (R2), the Airport Motel on West Century Boulevard (R3), the adjacent single-family residential uses (R5) to the west, the single-family residential uses (R6), and the Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses along South Prairie Avenue (R7).
- **M6** – Short-term noise measurement northwest of the intersection of West Century Boulevard and South Prairie Avenue that represents the ambient noise levels for the single-family residential uses (R1) to the north of West Century Boulevard along South Prairie Avenue and future multifamily residential uses located within the HPSP area (R21). Daytime ambient noise levels collected at this location were utilized for the daytime construction and operational impact analysis.
- **M7** – Short-term noise measurement along West 103rd Street west of South Prairie Avenue that represents the ambient noise levels for the single-family residential uses located along West 103rd Street. Although the southern units of receptor group R6 are located along West 103rd Street, noise measurements at location M13 would provide a more representative ambient noise level nearest to the currently vacant West Parking Garage Site. Ambient noise levels collected at this location were not utilized in the construction or operational noise analysis.
- **M8** – Short-term noise measurement along West 104rd Street east of South Prairie Avenue that represents the ambient noise levels for the multifamily residential uses, Inglewood Southside Christian Church and early childhood educational use located along West 104th Street (R15) and multifamily residential uses located along West 104th Street (R16) and single-family residential uses (R17) to the south along West 104th Street. Although the uses at R15 and the southern units of receptor group R16 and R17 are located along West 104th Street, average daytime noise measurements at location M3 were observed to be lower and therefore provide a less noisy baseline noise level from which to determine Project impacts for the north units of receptor group R16. Ambient noise levels collected at this location were not utilized in the construction or operational noise analysis.

- **M9** – Short-term noise measurement along West 104th Street west of South Prairie Avenue that represents the ambient noise levels for the single-family residential uses located along the north of West 104th Street and Whelan Elementary School. Ambient noise levels collected at this location were not utilized in the construction or operational noise analysis.
- **M10** – Short-term noise measurement taken along South Yukon Avenue between West 104th Street and West 105th Street that represents the ambient noise levels for the single-family residential uses along the west of South Yukon Avenue and Morningside High School. Ambient noise levels collected at this location were not utilized in the construction or operational noise analysis.
- **M11** – Short-term noise measurement taken generally at the center of the Arena Site that represents the ambient noise levels within the Arena Site. Ambient noise levels collected at this location were not utilized in the construction or operational noise analysis.
- **M12** – Short-term noise measurement taken along West Century Boulevard west of the West Parking Garage Site that represents the ambient noise levels for the motel use adjacent to the West Parking Garage Site (Airport Motel) (R3). Daytime ambient noise levels collected at this location were utilized for the daytime construction and operational impact analysis.
- **M13** – Short-term noise measurement taken along West 102nd Street west of the West Parking Garage Site that represents ambient noise levels for the adjacent single-family residential uses (R5) to the west, and the single-family residential uses (R6). Daytime ambient noise levels collected at this location were utilized for the daytime construction and operational impact analysis.
- **M14** – Short-term noise measurement taken along South Prairie Avenue south of West 102nd Street that represents the ambient noise levels for the Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses along South Prairie Avenue (R7), the multifamily residential use along the east side of South Prairie Avenue (R11), and the single-family residential use located along the east side of South Prairie Avenue (R12). Daytime ambient noise levels collected at this location were utilized for the daytime construction and operational impact analysis.
- **M15** – Short-term noise measurement taken along West Century Boulevard between South Prairie Avenue and South Doty Avenue and represents the ambient noise levels for the hotel use adjacent to the Arena Site (former Airport Park View Hotel) (R8) in addition to measurement location M1. Daytime ambient noise levels collected at this location were utilized for the daytime construction and operational impact analysis.
- **M16** – Short-term noise measurement taken along West 102nd Street that represents the ambient noise levels for the multifamily residential uses (R20) located across West 102nd Street from the East Transportation and Hotel Site. Daytime ambient noise levels collected at this location were utilized for the daytime construction and operational impact analysis.
- **M17** – Short-term noise measurement taken along West 104th Street between South Doty Avenue and South Yukon Avenue and represents the ambient noise levels for the residential uses along West 104th Street. Ambient noise levels collected at this location were not utilized in the construction or operational noise analysis.

Results of the ambient noise measurements are presented in **Table 3.11-1**.

NOTE:

- ^a CNEL provided for 24-hour measurements only.
- ^b Daytime hours are from 7:00 AM to 10:00 PM The 15-hour daytime average (15-hour Leq) was calculated from 24-hour measurements at long-term measurement locations. The 15-minute Leq is listed from short-term measurement data.
- ^c Nighttime hours are from 10:00 PM to 7:00 AM The 8-hour nighttime average (8-hour Leq) was calculated for 24-hour measurements at long-term measurement locations.
- ^d Data averaged from 24-hour measurements from 9:30 PM to 11:30 PM Short-term measurements were taken between the hours of 9:30 PM and 11:30 PM (15-minute Leq)
- ^e Data averaged from 24-hour measurements from 12:00 AM to 2:00 AM Short-term measurements were taken between the hours of 12:00 AM and 2:00 AM (15-minute Leq)

Existing Traffic-Only Noise

Ambient noise levels measured by ESA and summarized above reflect predominant noise sources including those generated by existing traffic on local and arterial streets, aircraft arrivals to and departures from LAX, and commercial and industrial activity. As recognized by the City of Inglewood General Plan Noise Element and reflected in the monitoring results, traffic noise is considered to be the most common source of noise in urban areas.¹⁹ As a result, noise levels (Leq) associated with peak period traffic volumes along individual roadway segments at 50 feet from the roadway centerline have been calculated to establish the existing traffic noise environment along studied roadway segments.

¹⁹ City of Inglewood General Plan Noise Element. Adopted September 1, 1987.

Traffic volume count data for existing conditions is presented in Section 3.14, Transportation and Circulation, and consists of traffic volumes along roadway segments that exist as of the collection of data. This data accounts for existing traffic volumes and trips generated by development that was currently in operation.

Existing roadway noise levels were calculated for the segments for which existing traffic volume data was collected (see Appendix K for calculations). Calculation of roadway noise levels under existing conditions was accomplished using the methodology described below in Section 3.11.4, and relies on peak hour traffic volume data provided by Fehr & Peers as presented in Section 3.14 and the posted speed limit. The roadway segments located near and immediately adjacent to the Project Site are considered to be those that are expected to be most directly affected by Project-related traffic. As described in Section 3.11.4 below, the roadway segments that would experience the greatest increase in traffic noise generated by the Proposed Project and where noise-sensitive receptors are located have been included in this analysis. As a result, out of the study area examined in Section 3.14, 113 segments have been selected for analysis. Existing traffic volume counts were not collected for all studied roadway segments. However, in order to identify the segments that have been selected for analysis in this section, all 113 segments are listed in **Table 3.11-2**. For calculated traffic noise levels for all roadway segments, see calculations included in Appendix K.

Existing peak hour traffic noise under the Weekday AM Peak Period (7:00–9:00 AM), Weekday PM Peak Period (4:00–6:00 PM), Weekday Pre-Event Peak Period (6:00–7:00 PM), Weekday Post-Event Peak Period (9:30–10:30 PM), Weekend Pre Event Peak Period (5:00–6:00 PM), and Weekend Post Event Peak Period (9:30–10:30 PM) time periods is shown in Table 3.11-2.

Aircraft Noise

The nearest public use airports to the Project Site include LAX and Jack Northrop Field/Hawthorne Municipal Airport (HHR). The Project Site is located approximately two miles east of LAX, along the extended centerlines of Runways 25R and 25L, and approximately 1.4 miles due north of Runway 7-25 at HHR. There are no private airstrips located in the vicinity of the Project Site.

The Project Site is within the planning boundary/airport influence area (AIA) established for LAX in the Los Angeles County Airport Land Use Plan (ALUP) as shown in **Figure 3.11-3** (see further description of the relationship of the Project Site to the ALUP in Section 3.10, Land Use and Planning); it is not within the planning boundary or AIA for HHR. The planning boundary for LAX represents the combined areas around the airport subject to potential noise impacts and safety hazards associated with airport operations. The ALUP provides noise and safety policies governing development of compatible future land uses in areas around LAX. The Project Site is located within the CNEL 65 dBA contour established for LAX in the ALUP, but is not located within the CNEL 65 dBA contour for HHR. As a result of its exposure to noise from LAX, the Project is subject to the noise policies in the ALUP.

The 14 CFR Part 150 noise contours (see Chapter 2, Project Description, Figure 2-4) show that parts of the Project Site located between West 102nd Street and West Century Boulevard are generally located in areas exposed to CNEL 65 dBA -70 dBA. This includes both the West and East Parking Garage sites, the Plaza area including commercial and community uses, most of the Arena and Practice and Athletic Training Facility, Office, and Sports Medicine Clinic, and the Hotel. Parts of the Project Site south of West 102nd Street are generally located in areas exposed to CNEL 70 dBA – 75 dBA. This includes part of the Arena and Practice and Athletic Training Facility, Office, and Sports Medicine Clinic, as well as the South Parking Garage. Although the 14 CFR Part 150 contours shown in Figure 2-4 are more recent than the 65 dBA contour shown in Figure 3.11-3, it has not been formally incorporated into the ALUP by the ALUC, therefore consistency of the Proposed Project in relation to both versions of the contours have been discussed.

Existing Groundborne Vibration Setting

The groundborne vibration level in residential areas is usually 50 VdB or lower, well below the threshold of perception for humans, which is around 65 VdB.²⁰ Most perceptible indoor vibration is caused by sources within buildings such as operation of mechanical equipment, movement of people or slamming of doors. Typical outdoor sources of perceptible groundborne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If the roadway is smooth, the vibration from traffic is rarely perceptible. Although not sources of groundborne vibration, noise-induced building responses such as rattling of windows and walls from aircraft flyovers contribute to the existing vibration setting. The primary sources of existing groundborne vibration in the area surrounding the Project Site would be from adjacent industrial

Inglewood Basketball and Entertainment Center

Figure 3.11-3
ALUP Noise Contours

activities, including truck travel, heavy-duty vehicular travel (bus, refuse trucks, delivery trucks, etc.) on local roadways, and aircraft flyovers. A bus traveling at a distance of 50 feet typically generates groundborne vibration velocity levels of 63 VdB (approximately 0.006 in/sec PPV).²¹ Aircraft flyovers could generate vibration levels that would cause human annoyance; however, they would not generate building vibration levels that would cause building damage.²²

Existing Groundborne Noise Setting

As stated earlier, groundborne noise levels would generally be 20 to 50 decibels lower than the velocity level depending on the frequency level of the source.²³ With a background groundborne vibration level in residential areas of 50 VdB or lower, groundborne noise levels would be approximately 0 to 30 dBA. A bus traveling at a distance of 50 feet would generate groundborne noise levels of approximately 23 to 38 dBA. Typical vibration from construction equipment would fall under the low frequency range with vibratory equipment such as pile drivers falling in the mid frequency range.²⁴ With a vibration velocity of 108 VdB at five feet from the source, a large bulldozer would generate groundborne noise levels of approximately 58 dBA. The approximate level of human perception of groundborne noise is 25 dBA for low frequency vibration (near 30 Hz) and 40 dBA for mid-frequency vibration (near 60 Hz).²⁵

3.11.3 Adjusted Baseline Environmental Setting

Section 3.11, Noise and Vibration, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to noise, the changes associated with the Adjusted Baseline include the operation of an NFL Stadium, performance venue, residential, commercial, and retail uses within the HPSP area referred to as the HPSP Adjusted Baseline projects.

The NFL Stadium is located at the southeastern corner of Pincay Drive and South Prairie Avenue and is designed to provide expandable capacity to accommodate various sporting events, concerts, and activities in addition to NFL games. Although a transparent glass canopy/roof is designed to provide an open-air experience while keeping crowd and event noise contained, the NFL Stadium is not fully enclosed and leakage of event noise from the NFL Stadium, including pre- and post-event activities would contribute to the ambient noise environment, as would the additional traffic generated by the uses on local and arterial streets.

The City of Champions Initiative (Exhibit M, Stadium Alternative Mitigation Measures, in the Initiative) imposed several mitigation measures to limit operational noise from the HPSP development and protect the existing neighborhoods, although it acknowledged that some event noise would be audible outside the boundaries of the property during a limited number of major

²⁵ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 120.

special events. The key measures to address operational noise that are part of the Adjusted Baseline include:

- **G-7** The operation of the stadium shall comply with the provisions of Article 2 (Noise Regulations) of Chapter 5 of the Inglewood Municipal Code.
- **G-8** The use of vibratory rollers within 150 feet, or impact pile driving within 320 feet, of The Forum property line shall be limited to time periods that do not coincide with events occurring at The Forum.
- **G-9** Prior to the issuance of building permits, the project applicant shall utilize an acoustical engineer to demonstrate to the City of Inglewood that the 45 dBA interior noise standard has been achieved at residential dwelling units within the Project boundaries, as measured on a typical day, and not with respect to special events at the stadium.
- **G-10** All rooftop mechanical equipment shall be enclosed or screened from view from public streets with appropriate screening walls.
- **G-11** Firework Shows shall be limited to a maximum of 15 events per year, and each event shall not exceed 20 minutes in duration. All such events shall comply with FAA regulations. For purposes of this mitigation measure, Firework Shows shall be defined as a single, coordinated pyrotechnic display continuing for an uninterrupted period of time lasting longer than five minutes and involving pyrotechnic devices that reach more than 100 feet above the Stadium playing field. Separate from the foregoing limit on Firework Shows, the isolated use of pyrotechnic devices during stadium events shall be allowed.
- **G-12** Loading dock and trash/recycling areas for the stadium shall be located in the subterranean level, which shall preclude noise from this source at exterior locations.
- **G-13** The Project's in-house sound system (including the stadium and music for retail areas, if any) shall utilize a state of the art distributed speaker system capable of aiming the sound toward the seating areas, or other intended areas within the Project, to minimize sound spillage to the exterior of the Project.
- **G-14** Building mechanical/electrical equipment shall be designed such that it will not cause an increase in sound levels at any Off-Site residence of 3 dBA or greater above the Base Ambient Noise Level.

Further, the NFL Stadium and performance venue are located and designed to help reduce noise by locating the NFL Stadium away from the northern edge of the property, and by placing the NFL Stadium playing surface well below existing grade, which reduces line-of-sight noise impacts on adjacent uses.

The City of Champions Initiative modified the City's noise ordinance such that during operation of the NFL Stadium, noise from sporting events and for up to 12 other special events occurring at the NFL Stadium each year (unless a higher number is otherwise permitted by the Permits and Licenses Committee) are exempt from the noise limits provided in Article 2 of the Municipal Code. Noise exceeding code limits from these few major events is not permitted to extend beyond 12:00 AM. With the exception of sporting events, up to 12 other special events, and any special events otherwise permitted by the Permits and Licenses Committee, the NFL Stadium must comply with the City of Inglewood noise ordinance.

Charles M. Salter Associates, Inc. prepared an acoustical model for the NFL Stadium which estimated that amplified music and announcements for a professional sporting event at the nearest residential property line (i.e., exterior noise) would be approximately 46 dBA on the west, 50 dBA on the east, and 51 dBA on the north. The model estimated that approximate sound levels from the NFL Stadium at the property line would range from 65 to 67 dBA on the east and west, and from 64 to 69 dBA on the north, depending on the configuration of concert within the NFL Stadium. The acoustical analysis estimates that these levels would drop by 5 to 10 dBA after the first row of houses.²⁶

Retail/restaurant uses within the HPSP area will be constructed immediately northeast of the intersection of West Century Boulevard and South Prairie Avenue and include a mix of retail shops, fine dining, specialty grocery store, and outdoor plazas. A walkable promenade will provide outdoor spaces for conversation, dining, and live amplified music, and will contribute to the ambient noise environment. Based on ESA's experience conducting noise measurements for live concerts, it is estimated that live music and amplified sound would result in a noise level of approximately 95 dBA at 100 feet from the source. Conversation within the open spaces and outdoor dining areas would result in noise levels of 76 dBA at 3.3 feet from each person as a result of conversation and cheering.²⁷

Trip generation associated with the buildout and operation of the HPSP Adjusted Baseline projects has been estimated and traffic volumes in the area surrounding the Project Site have been projected to establish the Adjusted Baseline traffic environment along the roadway segments selected for analysis (see Section 3.11.4 below for discussion of segments selection). Additionally, trip generation associated with events at the NFL Stadium, The Forum, and concurrent events at both venues has been estimated and traffic volumes projected to establish the combined traffic environment during which one or more events are being held (see Section 3.14.5 for discussion of concurrent events). Based on turning movement volumes provided Section 3.14, Transportation and Circulation, and Appendix K, Adjusted Baseline and event traffic noise have been calculated and included in **Tables 3.11-3 through 3.11-6**.

3.11.4 Regulatory Setting

Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies. Local regulation of noise involves implementation of general plan policies and noise ordinance standards. Local general plans identify general principles intended to guide and influence development plans; local noise ordinances establish standards and procedures for addressing specific noise sources and activities. Noise issues relevant to the Proposed Project are addressed in Title 24 of the California Code of Regulations, City of Inglewood General Plan policies and the City of Inglewood noise ordinance standards.

Federal

In 1972, the Noise Control Act (42 United States Code section 4901 et seq.) was passed by congress to promote limited noise environments in support of public health and welfare. It also established the US Environmental Protection Agency (US EPA) Office of Noise Abatement and Control to coordinate federal noise control activities. US EPA established guidelines for noise levels that would be considered safe for community exposure without the risk of adverse health or welfare effects. **Table 3.11-7** presents noise exposure levels highlighted by the guidelines.

In a 1974 study, US EPA found that to prevent hearing loss over the lifetime of exposure, the yearly average Leq should not exceed 70 dBA. To prevent interference and annoyance, the US EPA found that the Ldn should not exceed 55 dBA outdoors or 45 dBA indoors.²⁸ In 1982, noise control was largely passed to state and local governments.

**TABLE 3.11-7
 NOISE LEVELS REQUISITE TO PROTECT PUBLIC HEALTH AND WELFARE WITH AN ADEQUATE MARGIN OF SAFETY**

Effect	Level Needed to Avoid Effect	Area
Hearing loss	< 70 dBA ^a (Leq, 24-hour)	All areas.
Outdoor activity interference and annoyance	< 55 dBA (Ldn)	Outdoor residential areas and farms as well as other outdoor areas where people spend varying amounts of time and places where quiet is a basis for use.
Outdoor activity interference and annoyance	< 55 dBA (Leq, 24-hour)	Outdoor areas where people spend limited amounts of time, such as school yards, playgrounds, etc.
Indoor activity interference and annoyance	< 45 dBA (Ldn)	Indoor residential areas.
Indoor activity interference and annoyance	< 45 dBA (Leq, 24-hour)	Other indoor areas with human activities, such as schools, etc.

NOTE:

^a Yearly average equivalent sound levels in decibels; the exposure period that results in hearing loss at the identified level is 40 years.

SOURCE: US Environmental Protection Agency, 1974. *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety*. March 1974. p. 4.

²⁸ US Environmental Protection Agency, 1974. *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety*. March 1974. p. 34.

Federal regulations establish noise limits for medium and heavy trucks (more than 4.8 tons, gross vehicle weight rating) under 40 Code of Federal Regulations (CFR), Part 205, Subpart B. The federal truck pass-by noise standard is 80 dBA at 50 feet (approximately 15 meters) from the vehicle pathway centerline under specified test procedures. These requirements are implemented through regulatory controls on truck manufacturers. There are no comparable federal standards for vibration, which tend to be specific to the roadway surface, the vehicle load, and other factors.

Federal Transit Administration

The Federal Transit Administration (FTA) has published guidance for assessing noise and vibration impacts from rail sources.²⁹ Additionally, this guidance provides methodologies for assessing the potential noise impacts from construction. The FTA's Transit Noise and Vibration Impact Assessment is specifically developed for determining significant noise and vibration impacts for transit projects involving rail or bus facilities, although it is commonly applied to non-rail and non-bus transit projects, and includes noise impact criteria.

Federal Aviation Administration

CFR Part 150, Airport Noise Compatibility Planning, sets forth the methodology and procedures to be followed when preparing aircraft noise exposure maps and developing airport /airport environs land use compatibility programs. CFR Part 150 studies typically consist of two primary components: (1) the Noise Exposure Map (NEM) report, which contains detailed information regarding existing and 5-year future airport/aircraft noise exposure patterns, and (2) the Noise Compatibility Program (NCP), which includes descriptions and an evaluation of noise abatement and noise mitigation options/programs applicable to an airport.³⁰

State

The State of California establishes noise limits for vehicles licensed to operate on public roads. For heavy trucks, the state pass-by standard is consistent with the federal limit of 80 dBA. The State pass-by standard for light trucks and passenger cars (less than 4.8 tons, gross vehicle rating) is also 80 dBA at 50 feet (approximately 15 meters) from the centerline. These standards are implemented through controls on vehicle manufacturers and by legal sanction of vehicle operators by state and local law enforcement officials.

The state also has established noise insulation standards for new multifamily residential units, hotels, and motels that would be subject to relatively high levels of transportation-related noise. These requirements are collectively known as the California Noise Insulation Standards (Title 24, California Code of Regulations). The noise insulation standards set forth an interior standard of DNL 45 dBA in any habitable room. They require an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where such units are proposed in

²⁹ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018.

³⁰ City of Los Angeles, Los Angeles World Airports, 2015. Noise Management LAX, LAX Part 150 Noise Exposure Map Update. August 2015.

areas subject to noise levels greater than DNL 60 dBA. Title 24 standards are typically enforced by local jurisdictions through the building permit application process.

Regional

Los Angeles County Airport Land Use Plan

The Project Site is located approximately 1.5 miles east of LAX and approximately 1.5 miles to the north of the HHR. Pursuant to Division 9, Part 1, Chapter 4, Article 3.5, Sections 21670–21679.5 of the California Public Utilities Code, each county in California in which there is an airport served by a scheduled airline and each county with an airport operated for the benefit of the general public, with certain exceptions, is required to establish an airport land use commission (ALUC). Each ALUC must develop a plan for promoting and ensuring compatibility between each airport in the county and surrounding land uses. In Los Angeles County, the Los Angeles County Regional Planning Commission also acts as the ALUC. ALUC's purpose is to coordinate planning for the area around public airports to protect the public health, safety and welfare from land uses that do not minimize the public's exposure to excessive noise and safety hazards. This is achieved through review of proposed development surrounding airports and through policy and guidance provided in the Los Angeles County ALUP, which was adopted on December 19, 1991.³¹

In formulating the Los Angeles County ALUP, the ALUC establishes provisions to ensure safe airport operations, through the delineation of Runway Protections Zones (RPZs) and height restriction boundaries, and to reduce excessive noise exposure to sensitive uses through noise insulation or land reuse. The extent of the planning boundary designated for the airports in the Los Angeles County ALUP is determined by CNEL noise contours. The Los Angeles County ALUP employs a land use compatibility table to identify the level of compatibility for particular land uses within the planning area boundaries/ AIAs for the County's airports based on community noise exposure level. The ALUP Land Use Compatibility Chart is depicted in Section 3.10, Land Use and Planning (Figure 3.10-3). Per the CFR Part 150 Land Use Compatibility Guidelines, residential uses are identified as non-compatible land uses for parcels exposed to 65 dBA CNEL or higher.³² Commercial land uses are identified as compatible with 65 and 70 dBA CNEL noise levels. The CFR Part 150 Land Use Compatibility Guidelines categorizes hotel uses as a transient lodging form of residential.

The Project Site is partially located within the Planning Boundary/Airport Influence Area for the LAX Airport as designated within the Los Angeles County ALUP. As depicted in Figure 2-4 in Chapter 2, Project Description, the Project Site falls within the Airport Influence Area and Airport Compatibility Zone for LAX for the southern LAX runway. As shown, the majority of the Project Site is within the 65 dBA CNEL noise contour. The Project Site is not located within the designated Airport Influence Area for the Hawthorne Municipal Airport. Additional discussion of the Los Angeles County ALUP, including consistency with policies related to safety, are addressed in

³¹ Los Angeles County Airport Land Use Commission, 1991. Los Angeles County Airport Land Use Plan, prepared by the Department of Regional Planning, adopted December 19, 1991.

³² Federal Aviation Administration, Land Use Compatibility and Airports. p.V-10.

Section 3.8, Hazards and Hazardous Materials. The following policies related to noise from the Los Angeles County ALUP are applicable to the Proposed Project:

ALUP Policies Related to Noise:

Policy N-1: Use the CNEL method for measuring noise impacts near airports in determining suitability for various types of land uses.

Policy N-2: Require sound insulation to insure a maximum interior 45 dBA CNEL in new residential, educational, and health-related uses in areas subject to exterior noise levels of 65 dBA CNEL or greater.

Policy N-3: Utilize the Table Listing Land Use Compatibility for Airport Noise Environments in evaluation projects within the planning boundaries.

Policy N-4: Encourage local agencies to adopt procedures to ensure that prospective property owners in aircraft noise exposure areas above a current or anticipated 60 dBA CNEL are informed of these noise levels and of any land use restrictions associated with high noise exposure.

Consistency with ALUP policies related to noise is addressed in the discussion under Impact 3.11-3, below.

Local

City of Inglewood General Plan

The City of Inglewood General Plan Noise Element, adopted September 1, 1987, is “a comprehensive program for including noise control in the planning process,” and “is a tool for local planners to use in achieving and maintaining compatible land use with environmental noise levels.”³³ According to the General Plan, noise-sensitive uses include residential dwellings, schools, churches, and hospitals. **Table 3.11-8** presents the Noise/Land Use Compatibility Matrix from the General Plan Noise Element, adopted in 1987. Noise levels of up to 70 dBA CNEL for single- and multifamily residential use and 65 dBA CNEL for schools, churches, and hospitals are considered “Normally Compatible.”

³³ City of Inglewood, Noise Element of the General Plan, 1987, p. 2.

NOTES:

* Construction of new residential uses will not be allowed in the 65 dBA CNEL for airport noise.

INTERPRETATION:

ZONE A Clearly Compatible	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
ZONE B Normally Compatible	New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.
ZONE C Normally Incompatible	New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise insulation features included in the design.
ZONE D Clearly Incompatible	New construction or development should generally not be undertaken.

SOURCE: City of Inglewood, 1987. Noise Element of the General Plan. Exhibit 6. Adopted September 1, 1987 per Resolution No. 87-61.

The following goals and policies from the City of Inglewood General Plan Noise Element are applicable to the Proposed Project:

Goal 1: Provide for the reduction of noise where the noise environment represents a threat to public health and welfare. In those areas where the environment represents a threat to the

public health and welfare, it is the objective of the City to reduce environmental hazards to levels consistent with the protection of the public health and welfare.

Goal 3: Protect and maintain those areas having acceptable noise environments. In those areas where a quality environment now exists, it is the objective of the City to prevent degradation of that environment.

Goal 4: Provide sufficient information concerning the community noise levels so that noise can be objectively considered in land use planning decisions. Noise and land use incompatibilities can be avoided for new developments when noise is properly considered in the planning and design of the project. It is the objective of the City to prevent future land use and noise conflicts through the planning process.

Policy 4.2: Incorporate noise considerations into land use planning decisions.

- Ensure acceptable noise levels near schools, hospitals, convalescent homes, and other noise sensitive areas.
- Encourage acoustical design in new construction.

Policy 4.3: Develop measures to control non-transportation noise impacts.

- Evaluate noise generated by construction activities.

Policy 4.4: Reduce noise conflicts at the source.

- Actively support the FAR Part 150 Noise Compatibility Program as described in the “Noise Control and Land Use Compatibility Study, Los Angeles International Airport,” (March 1984).

Policy 4.5: Reduce noise conflicts at the receiver.

Policy 4.6: Protect those who live and work in the City from dangerous on-the-job noise exposure.

Consistency with the policies of the City’s General Plan Noise Element are addressed in the discussion of Impacts 3.11-1 and 3.11-3, below.

City of Inglewood Municipal Code

City of Inglewood Municipal Code Chapter 5 (Offenses, Miscellaneous), Article 2 (Noise Regulations), establishes “criteria and standards for the regulation of noise levels within the community.”³⁴ Rather than being adopted to assist the City in guiding land use decisions, like the Noise Element of the General Plan, the City’s Noise Regulations are intended to protect “the comfort, repose, health, or peace of residents in the area,” and define noise levels that are considered public nuisances and are subject to abatement through the City’s exercise of its enforcement authority.³⁵ Relevant sections of the City’s Noise Regulations are presented below for informational purposes.

³⁴ City of Inglewood Municipal Code Chapter 5, Article 2, section 5-24.

³⁵ City of Inglewood Municipal Code, Chapter 5, Article 2, Section 5-49.

Section 5-27 establishes base ambient noise levels within respective times and zones. Where actual noise measurements exceed base ambient noise levels as designated by Section 5-27, the measured noise level shall be employed as the base ambient noise level.³⁶

Sections 5-29, 5-30, and 5-31 establish the City's authority to regulate noise that "disturbs the peace or quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person residing in the area," and identifies maximum lawful noise levels and maximum duration periods that may be generated on residential and non-residential properties.

Section 5-39 of the Code prohibits the operation of any machinery, equipment, device, pump, fan, compressor, air—conditioning apparatus, or similar mechanical device that would cause the noise level at any property line to exceed the ambient noise level by 5 dBA.

Section 5-41 of the Code prohibits construction or repair work and the operation of any pile driver, pneumatic hammer, derrick, excavation or earth moving equipment, or other construction equipment within a residential zone or within a 500-foot radius of a residential zone between the hours of 8:00 PM and 7:00 AM unless a permit is obtained from the Permits and Licenses Committee of the City.

Section 5-43 of the Code prohibits the operation of any motor driven vehicle due to the nature of the operation of the vehicle, condition of the vehicle, or modification made to the vehicle, that would generate noise so that a reasonable person is caused discomfort or annoyance.

Section 5-51 of the Code states that the commercial (for the purpose of advertising any business, goods, or services and/or for the purpose of advertising or attracting the attention of the public to or soliciting patronage for any performance, entertainment, exhibition or event) and noncommercial (other than "commercial purpose" including, but not limited to philanthropic, charitable, political, and patriotic purposes) use of sound amplifying equipment shall be subject to the following regulations:

- a. The only sounds permitted shall be either music or human speech, or both.
- b. The operation of sound amplifying equipment shall only occur between the hours of 8 AM and 10 PM each day. No operation of sound amplifying equipment for commercial purposes shall be permitted on Sundays or legal holidays.
- c. No sound emanating from sound amplifying equipment shall exceed 15 dB(A) above the ambient noise base level as measured at any property line.
- d. Notwithstanding the provisions of subsection (c) of this section, sound amplifying equipment shall not be operated within 200 feet of churches, schools and hospitals.
- e. In any event, the volume of sound shall be so controlled that it will not be unreasonably loud, raucous, jarring, disturbing, or a nuisance to persons of normal sensitiveness within the area of audibility.

³⁶ City of Inglewood Municipal Code, Chapter 5, Article 2, Section 5-27.

The City's Noise Regulations guide the exercise of the City's authority in protecting the public health and welfare through enforcement action, while the Noise Element of the General Plan, guides land use decision making in the City. As described further in the analysis below, construction and operation of the Proposed Project could be inconsistent with some of the existing City Noise Regulations. The applicant has proposed revisions to Chapter 5, Article 2, and Chapter 12 of the Municipal Code. If approved, the Proposed Project would not be inconsistent with the City Noise Regulations.

3.11.5 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts from noise and vibration. The following threshold of significance is consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
2. Generate excessive groundborne vibration or groundborne noise levels; or
3. For a project located within the vicinity of a private air strip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the region surrounding the Project Site to excessive noise levels.

In considering further how to quantitatively define this threshold for construction noise, the City is mindful that although construction noise is temporary and only occurs at any location during a period or phase of construction, the City of Inglewood Municipal Code section 5-41 regulates construction noise and specifies that construction or repair work and the operation of any pile driver, pneumatic hammer, derrick, excavation or earth moving equipment, or other construction equipment within a residential zone or within a 500-foot radius of a residential zone between the hours of 8:00 PM and 7:00 AM is prohibited unless a permit is obtained from the Permits and Licenses Committee of the City. This prohibition of nighttime construction in or near residential zones, without first obtaining a permit authorizing such nighttime construction, reflects that the City does not regulate construction noise during daytime hours (7:00 AM to 8:00 PM).

Because the Proposed Project would include nighttime construction on a periodic basis throughout the project construction period, for this EIR the City has elected to identify a threshold of significance to apply to the proposed nighttime construction work. Further, because of the unique size, scale, planned construction schedule, and proximity of the Proposed Project to noise sensitive uses, for this EIR the City has elected to apply a threshold of significance for daytime construction noise, which could occur on a fluctuating and intermittent basis over a period of approximately 40 months.

Applied Criteria

For the reasons described above, the City has decided that in this EIR it will define “a substantial temporary or permanent increase in ambient noise levels” by utilizing the following additional thresholds. These thresholds are adapted from, but not identical to, the City of Los Angeles CEQA Thresholds Guide:³⁷

- Construction activities between the hours of 7:00 a.m. and 8:00 p.m. that would exceed existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use; or
- Construction activities between the hours of 8:00 p.m. and 7:00 a.m. that would exceed the ambient exterior noise level by 5 dBA at a noise sensitive use.

These thresholds are similar to those in the City of LA CEQA Thresholds Guide but have been adapted to reflect the City of Inglewood’s Municipal Code noise control sections.

As stated above, the use of these thresholds in this Draft EIR responds to the unique circumstances of the Proposed Project and the Project Site. By utilizing these quantitative thresholds in this Draft EIR, the City is not making a decision whether to use these thresholds in CEQA documents on other proposed projects in the future. The City would, however, retain its authority as CEQA lead agency to utilize these or other thresholds, including relying exclusively on the provisions of Municipal Code section 5-41, for the consideration of construction noise, as appropriate to the circumstances of other projects in the future.

For operational impacts, the City recognizes that such impacts occur on the long-term, and, as a result, the City has determined that in this case the significance threshold should be more conservative. An increase in noise level of 3 dBA is generally regarded as an increase in noise that is barely perceivable.³⁸ For this reason, increases of less than 3 dBA would have no physical effect on the environment, and are not considered significant.³⁹ Therefore, for the purposes of this EIR, an increase in traffic noise of 3 dBA Leq and an increase in composite operational noise of 3 dBA Leq over existing ambient noise levels at a noise-sensitive use is considered a significant impact.⁴⁰

As described above, the City has adopted Noise Regulations that prohibit noise in excess of specified levels, depending on base ambient noise levels, the nature of the use where noise levels are measured, and the duration period of such noise. The Noise Regulations may prohibit any increase in ambient noise levels under specified circumstances. The City has not previously relied on the Noise Regulations to serve as significance thresholds for operational noise. The City has determined that the Noise Regulations should not serve as operational noise thresholds for the Proposed Project. The reason for this determination is that an increase in ambient noise would be imperceptible, or at most

³⁷ City of Los Angeles, L.A. CEQA Thresholds Guide, *Your Resource for Preparing CEQA Analyses in Los Angeles*, 2006, p. I.1-3.

³⁸ California Department of Transportation, 2013. *Technical Noise Supplement*. September 2013. p. 6-5.

³⁹ City of Los Angeles, L.A. CEQA Thresholds Guide, *Your Resource for Preparing CEQA Analyses in Los Angeles*, 2006, p. I.2-3.

⁴⁰ California Department of Transportation, 2013. *Technical Noise Supplement*. September 2013. p. 6-5.

barely perceptible, where that increase is less than 3 dBA. Such an increase in ambient noise levels would not have a significant effect on the physical environment. The City has instead determined that the threshold should be set at a level that is actually perceivable. The City has therefore adapted its threshold from the City of LA CEQA Thresholds Guide, as described above.

In the cumulative context, the Proposed Project's noise and vibration impacts are considered in conjunction with other reasonably foreseeable development, using the same thresholds set forth above.

Methodology and Assumptions

Construction Noise

On-Site Sources of Construction Noise

Construction noise impacts were assessed based on a comparative analysis of the noise levels resulting from operation of specified construction equipment and the noise levels of existing conditions at noise-sensitive off-site land uses. Noise impacts from on-site construction were evaluated by determining the noise levels generated by the different types of construction activity anticipated, calculating the construction-related noise level generated by the mix of equipment assumed for all construction activities at nearby noise-sensitive receptor locations, and comparing these construction-related noise levels to existing ambient noise levels (i.e., noise levels without construction noise) at those receptors.

The Computer Aided Noise Abatement (CadnaA) noise propagation program (Version 2019) was used to estimate the propagation of noise from Project construction. CadnaA is a Windows-based software program that predicts and assesses noise levels in the vicinity of noise sources based on International Organization for Standardization 9613-2 algorithms for noise propagation calculations. The calculations account for classical sound wave divergence plus attenuation factors resulting from air absorption, basic ground effects, and barrier/shielding.

Figure 3.11-2 identifies the location of noise-sensitive receptors evaluated in this analysis and the receptor groups used to present the results. For purposes of providing a range of construction noise levels experienced by various noise-sensitive receptors within each receptor group, the model evaluated multiple receiver points (along the property lines and near buildings at noise-sensitive uses at ground and upper levels) within each receptor group. For construction noise levels calculated at each of the receiver points and the location of each receiver point, see Appendix J.

Over the course of the construction of the Proposed Project, construction activities are anticipated to occur during both daytime hours (7:00 AM to 8:00 PM) as well as during nighttime hours (8:00 PM to 7:00 AM) during certain phases of construction activities. Construction activity during nighttime hours is expected to occur at the Arena Site and the Well Relocation Site during certain phases of construction, but not at the West Parking Garage Site or the East Transportation and Hotel Site. Activities such as nighttime delivery of large project materials that would disrupt daytime traffic conditions, foundation concrete pours which must be completed continuously, and construction of portions of the arena bowl involving placement of precast segments on the Arena

Site, and the drilling of the new groundwater well on the Well Relocation Site would extend beyond the City of Inglewood’s allowable hours of 7:00 AM and 8:00 PM on Mondays through Fridays and on Saturdays, and would require the approval of a permit from the City’s Permits and Licenses Committee pursuant to section 5-41 of the Municipal Code. Nighttime construction activity is expected to occur periodically on the Arena Site between September 2022 and November 2023, and during September 2021 and December 2021 on the Well Relocation Site.

The estimated type, number, and duration of use of construction equipment was provided by the project applicant and was utilized for the analysis (see Section 3.2, Air Quality, for discussion of construction assumptions). Construction noise levels for the Proposed Project were estimated using the FHWA Roadway Construction Noise Model (RCNM) reference noise levels, shown in **Table 3.11-9, Construction Equipment Reference Noise Levels**. The reference noise levels shown in Table 3.11-9 are the Lmax at 50 feet from the noise source.

**TABLE 3.11-9
 CONSTRUCTION EQUIPMENT REFERENCE NOISE LEVELS**

Construction Equipment	Estimated Usage Factor	Noise Level at 50 Feet (dBA, Lmax)
Air Compressor	40%	80
Backhoe	40%	80
Cement and Mortar Mixers	40%	85
Compactor	20%	80
Concrete/Industrial Saw	20%	90
Cranes	16%	85
Crushing/Proc. Equipment	20%	87
Dumpers/Tenders	40%	76
Excavator	40%	85
Forklift	50%	85

Scrapers	40%	85
Skid Steer Loaders	40%	80

SOURCE: Federal Highway Administration (FHWA), *FHWA Roadway Construction Noise Model User’s Guide*, January 2006.

During each construction phase, there would be a different mix of equipment. As such, average construction activity noise levels at and near the Project Site would fluctuate depending on the particular type, number, and duration of use of the various pieces of construction equipment. Combined noise levels (Leq) from equipment required for each construction phase were calculated based on the reference noise levels listed in Table 3.11-9. The Leq was calculated assuming that not all pieces of construction equipment would be operated at full power by taking into account usage factors listed in Table 3.11-9.

The calculated combined noise levels (Leq) from the worst-case mix of equipment on each Project Site location were modeled as area sources. The worst-case Leq was assumed to occur within multiple areas of the Project Site in order to calculate the worst-case noise level reaching all modeled receiver points. The modeling takes into consideration the overlap of construction phases and construction activities that may occur simultaneously on the four Project Site locations, the Arena Site, the West Parking Site, the East Transportation and Hotel Site, and the Well Relocation Site, as specified in the information provided by the project applicant (see Chapter 2, Table 2-5, Anticipated IBEC Construction Phasing). The overlap scenario with the worst-case construction noise at each of the four Project Site locations was modeled, combined with construction activity that would occur at the other three Project Site locations during the same time period (total of 4 overlap scenarios, one worst-case condition for each Project Site location). The maximum worst-case overall construction noise level at each receptor has been reported herein.

Average daytime construction noise levels (Leq) under the worst-case condition at each Project Site location were calculated and compared to observed/measured daytime ambient noise levels. Where observed measured noise level data was not collected within the Project Site due to lack of access, it was collected along the public right-of-way (e.g., public sidewalk). In order to accurately determine the impact of Project construction, ambient noise levels from the nearest representative noise measurement location have been adjusted for each receptor, as needed, based on proximity of the roadway and to the actual measurement location.

Nighttime construction noise was calculated based on the location of equipment operation and construction activity within the Arena Site and the Well Relocation Site, which are the only Project Site locations on which nighttime construction would occur. Nighttime construction is not proposed for the West Parking Garage Site or the East Transportation and Hotel Site. To account for the fluctuation in ambient levels that could occur throughout the night, nighttime construction noise levels (Leq) were calculated and compared against a threshold of 5 dBA above the hourly Leq of observed/measured ambient noise levels during nighttime hours. In order to accurately determine the impact of nighttime construction on an hourly basis, ambient noise levels from the nearest representative long term noise measurement location have been adjusted for each receptor, as needed, based on proximity of the roadway and to the actual measurement location.

The potential health consequences of noise impacts associated with construction-related noise impacts on sensitive receptors, including sleep disturbance, potential hearing loss, and pain, have also been considered. The levels at which noise exposure could lead to potential hearing loss or

pain is a common method of measuring health effects or impacts of noise. Noise levels of 120 dB and 140 dB correspond to the threshold of pain and hearing damage for short term exposure.⁴¹

With respect to potential sleep disturbance, there are several factors that contribute to an individual's response to noise exposure. Long-term exposure to noise leading to sleep disturbance can potentially result in health effects as described above, in Section 3.11.2, Environmental Setting. Although nighttime Project construction would not result in long-term exposure to elevated nighttime noise levels, for purposes of correlating nighttime construction activity with the potential for noise-related health effects, the potential for sleep disturbance has been estimated. When construction work days extend into nighttime hours, the Single Event Noise Exposure Level (SEL) is the appropriate measure of the potential for impacts. Based on FHWA Sound Level Descriptor (FHWA-HEP-17-053) the SEL is generally 5 to 10 dB higher than the Leq. Using the calculated Leq for nighttime construction activity at the receiver building façade, the SEL can be estimated with a 10 dB factor added to the Leq level, for a worst-case scenario of estimating the corresponding SEL level.

According to the Acoustical Society of America, receivers that would experience an indoor SEL of 50 dBA or lower would have an awakening probability of zero.⁴² As noted above, the SEL is assumed to be 10 dB higher than the nighttime construction Leq. Based on the assumption that standard building construction in warm climate area such as southern California offers an exterior-to-interior attenuation rate of 12 dB, it is assumed that indoor SEL would be 12 dB lower than exterior construction noise levels.⁴³ Based on the assumption that an indoor SEL of 50 dBA and lower would not result in awakenings, CadnaA was utilized to identify the area within which there is potential for awakening due to construction activity. The area surrounding the Project Site that would experience an indoor SEL of greater than 50 dBA (exterior construction noise level of greater than 52-dBA Leq) was identified.

There are several factors to consider with regard to potential sleep disturbance such as each individual's sensitivity of nighttime noise exposure, an individual's age, and the number of noise events. Non-acoustic factors such as temperature, humidity, and sleep disorders could also affect the quality of an individual's sleep.⁴⁴ According to WHO, an individual's ability to adapt to a new noise or new sleeping environment is rapid and awakenings are a relatively rare occurrence.⁴⁵ Due to the high variability of each individual's sensitivity to nighttime noise, uncertain factors related to nighttime construction activity such as number of peak noise level occurrences, and lack of an established or adopted threshold designating acceptable occurrences of awakenings, the estimated percent awakenings presented in this analysis is for informational

purposes only, and is not intended to be an actual estimate of sleep disturbance that would be caused by nighttime Project construction, or a prediction of any related health effects.

Off-Site Sources of Construction Noise (Construction-Related Traffic)

Noise impacts to noise-sensitive uses along routes that would carry Project-related construction traffic have been evaluated using a spreadsheet model developed based on the methodologies provided in the FHWA Traffic Noise Model (TNM) Technical Manual. This method considers Project-specific data such as truck trips (delivery and export) and construction worker trips, and allows for the definition of roadway configurations, barrier information (if any), and the location of noise-sensitive receptors. Construction traffic is assumed to utilize designated haul route(s). Trips using the I-110 are assumed to travel to and from the Project Site via Manchester Avenue and South Prairie Avenue. Trips using the I-405 are assumed to travel to and from the Project Site via Manchester Boulevard and South Prairie Avenue or West Century Boulevard. Trips using the I-105 are assumed to travel to and from the Project Site via South Prairie Avenue.

Average daily traffic (ADT) volumes were calculated based on the assumption that weekday (non-event) peak hour volumes would account for ten percent of average daily volumes. Adjusted baseline weekday (non-event AM and PM) traffic volumes along the haul route were averaged and then multiplied by ten to estimate average daily volumes. Traffic attributable to construction of the Proposed Project was calculated and compared to the calculated Adjusted Baseline average daily traffic volumes. According to FHWA, traffic noise levels increase by 3 dBA where traffic volumes double (100 percent increase). Therefore, where Project construction traffic along a haul route results in the doubling of ADT, a significant impact would occur.

Operational Noise

As described above, residences and places where people normally sleep are considered sensitive uses.^{46,47} Commercial and industrial uses are not considered noise-sensitive by the City.

Off-Site Operational Traffic Noise

Similar to the method used to evaluate impacts from construction traffic noise, noise impacts from operational off-site and on-road traffic has been evaluated using a spreadsheet model developed based on the methodologies provided in the FHWA TNM Technical Manual. The model is based on operational trip generation and turning movements presented in Section 3.14, Transportation and Circulation. Traffic analysis time periods include Weekday AM Peak Period (7:00–9:00 AM), Weekday PM Peak Period (4:00–6:00 PM), Weekday Pre-Event Period (6:00–7:00 PM), Weekday Post-Event Period (9:30–10:30 PM), Weekend Pre-Event Peak Period (5:00–6:00 PM) and Weekend Post-Event Peak Period (9:30–10:30 PM). Trip generation conditions for the four Project-related event conditions analyzed in Section 3.14, Transportation and Circulation, are summarized below.

- The Non-Event Day, Ancillary Uses condition includes weekday traffic during the AM and PM peak period under existing conditions, operations of the HPSP Adjusted Baseline land

⁴⁶ City of Inglewood General Plan Noise Element. Adopted September 1, 1987.

⁴⁷ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 23.

uses that do not involve an event at the NFL Stadium, and operations of non-event related Project uses or ancillary uses (i.e., team practice facility and offices, sports medicine clinic, plaza commercial and community uses, and hotel) on a non-event day.

- The Day-Time Corporate/Community Event condition includes weekday traffic during the AM peak period under existing conditions, operations of Adjusted Baseline HPSP land uses that do not involve an event at the NFL Stadium, Project ancillary uses, and a day-time corporate/community event at the Project Site with approximately 2,000 persons in attendance.
- The Other Sporting Event or Gathering condition includes weekday traffic during the PM peak period under existing conditions, operations of Adjusted Baseline HPSP land uses that do not involve an event at the NFL Stadium, operations of Project ancillary uses, and a sporting event or gathering at the Project Site with approximately 7,500 persons in attendance.
- The Major Event condition includes weekday pre- and post-event traffic and weekend pre- and post-event peak period traffic. Pre- and post-event traffic assumes 18,000 persons and 18,500 persons, respectively.⁴⁸ Weekday events are assumed to start at 7:00 PM and weekend events are assumed to start at 6:00 PM

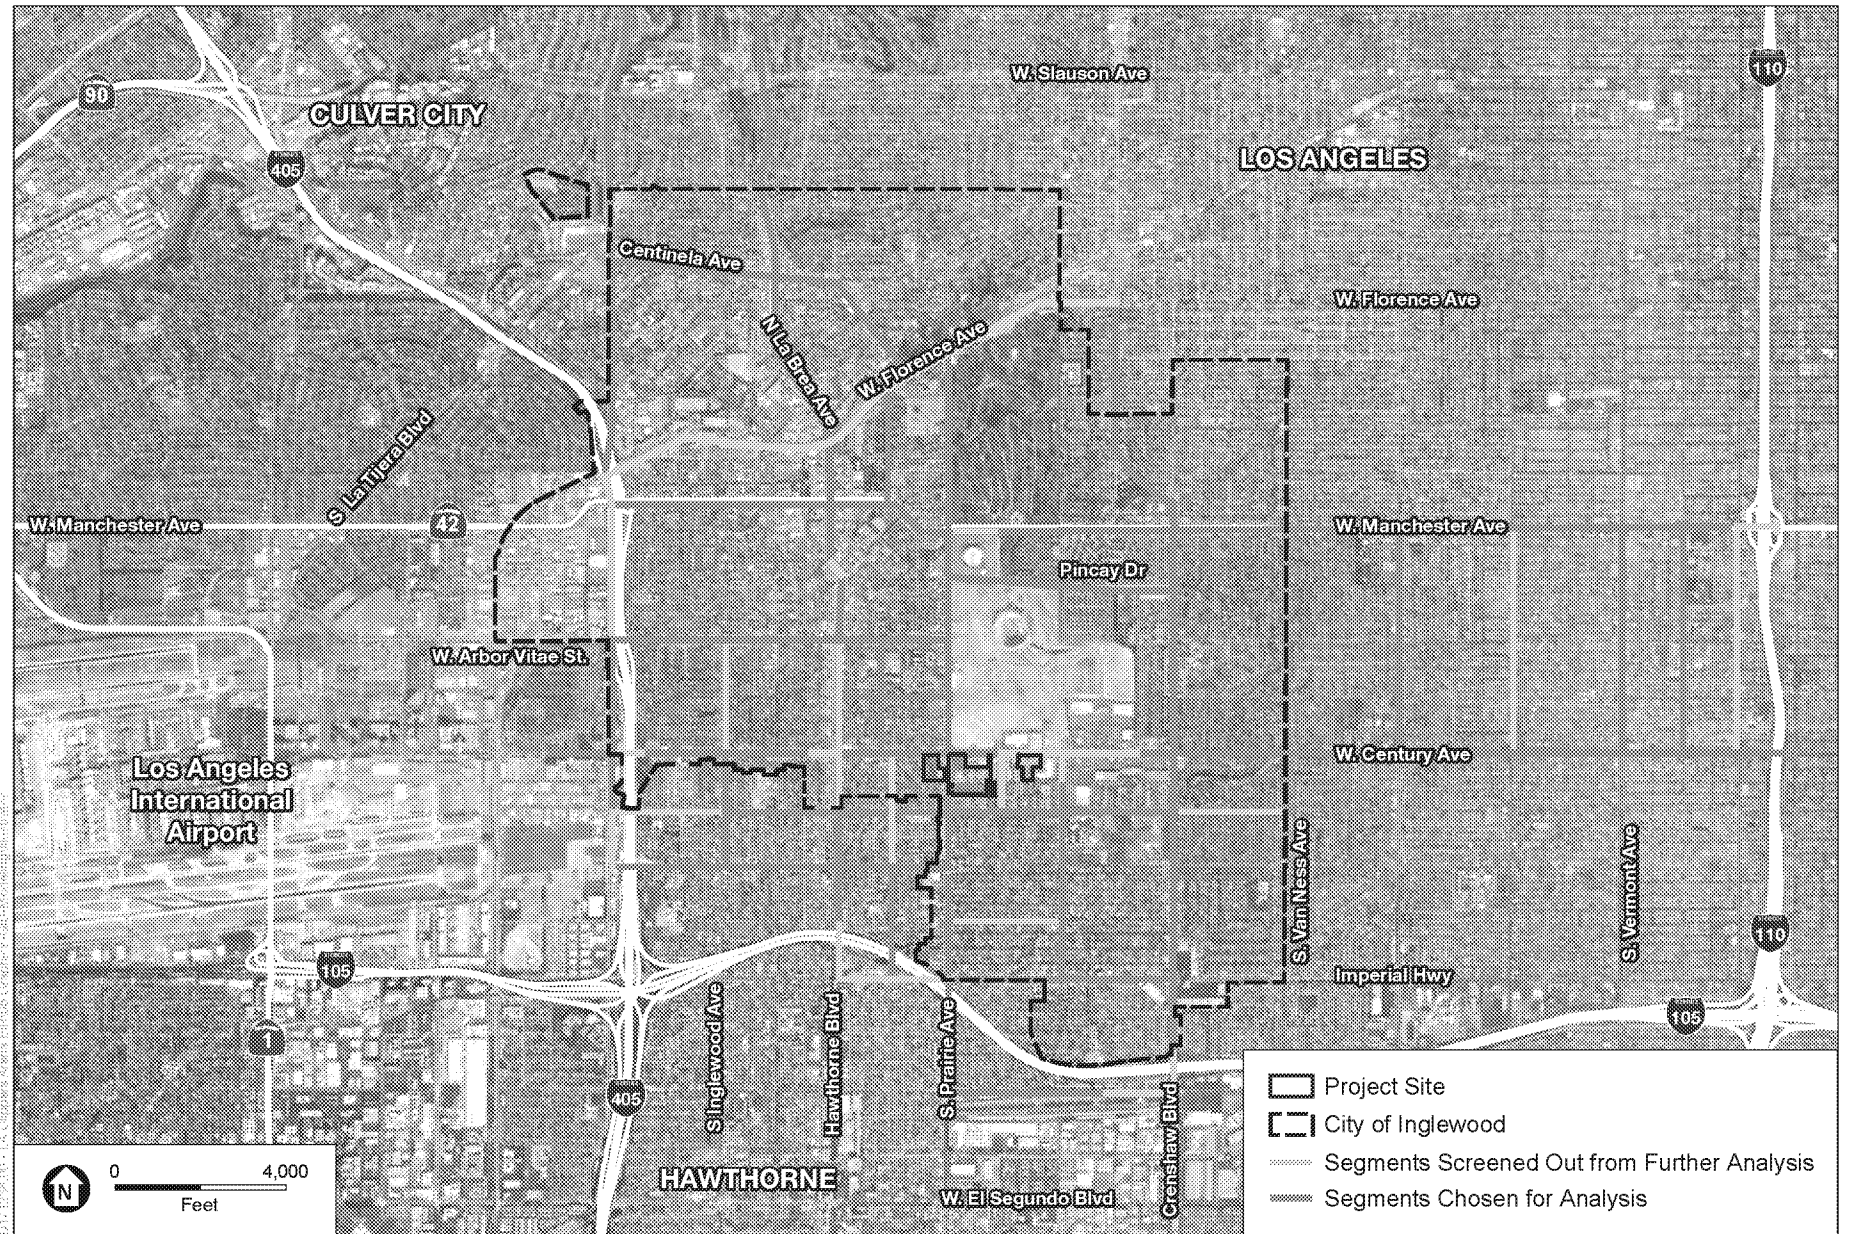

The traffic noise analysis utilizes projected traffic volumes generated as part of the analysis of Transportation and Circulation in Section 3.14 (see Appendix K). These volumes were used to determine Project-related operational traffic noise impacts for Proposed Project event conditions by evaluating the increase in Project-related traffic under all four Project-related event conditions over Adjusted Baseline conditions.

Traffic noise was calculated for the study area roadway segments analyzed in Section 3.14 (see Appendix K). The roadways that would not experience a 3.0 dBA Leq increase in traffic noise under at least one of the analyzed conditions and/or do not have sensitive receptors (as described above) adjacent to the roadway were screened out for inclusion in the analysis. As a result, out of the roadway segments for which traffic noise was calculated, noise levels for 113 roadway segments where sensitive receptors are located and perceivable increases in traffic noise are anticipated have been included in this section (see **Figure 3.11-4**). For calculated traffic noise levels for all roadway segments, see calculations included in Appendix K.

Concurrent Event Traffic Noise

Trip generation conditions based on potential concurrent events at The Forum, the NFL Stadium, and/or the Proposed Project with consideration of ambient growth in traffic and full project development were evaluated (see Appendix K). The worst-case concurrent event scenario for traffic noise on weekdays was determined to be the Adjusted Baseline with a Mid-Sized Event at the NFL Stadium and with a concert at The Forum with a Major Event at the Proposed Project. The worst-case concurrent event scenario for traffic noise on weekends was determined to be the Adjusted Baseline with an NFL Game at the Stadium, a concert at The Forum, and a Major Event at the Proposed Project.

⁴⁸ For analysis purposes, the Transportation and Circulation analysis (see Section 3.14) assumes that Project Major Events consist of a 18,000-person NBA Game for pre-event peak period analysis, and a 18,500-person concert for post-event peak period to capture the maximum (worst-case) number of trips during each respective peak period.

Inglewood Basketball and Entertainment Center

Figure 3.11-4
Studied Roadway Segments

Roadway noise under these worst case weekday and weekend concurrent event days was calculated and compared to Adjusted Baseline plus concurrent event conditions without the Proposed Project to determine the overall change in the traffic noise environment and the contribution of the Proposed Project to this change. **Table 3.11-10** summarizes the studied event scenarios. Traffic noise was calculated for all roadway segments evaluated in the study area and impacts were assessed for the 113 roadway segments that met the criteria for inclusion in this analysis, as described above. Calculation spreadsheets are included in Appendix J of this EIR.

SOURCE: Fehr & Peers, 2019 (Appendix K)

Health Effects

The potential health consequences of noise impacts on sensitive receptors associated with Project-related traffic noise impacts was considered based on whether any significant increases in traffic noise (3 dBA or more) would expose noise-sensitive receptors to traffic noise levels greater than 85 dBA. As discussed above, long-term exposure to high levels of noise (85 dBA) can cause permanent hearing impairment.⁴⁹

Operational Noise Sources

Non-vehicular sources of noise are called stationary point-sources and include outdoor activities (such as amplified sound and crowd noise), stationary mechanical equipment (such as generators or heating, ventilation, and air conditioner (HVAC) systems), loading area truck activity, and parking lot/structure activity. Potential noise impacts from stationary point-sources were evaluated by identifying the types of sources included in the Proposed Project and the noise levels generated by these sources, calculating the future hourly Leq noise level from each noise source at receptor property lines, and comparing the calculated future noise levels to existing observed/measured ambient noise levels with a significance threshold of a 3 dBA increase over ambient conditions at the receptor property line.⁵⁰

Existing ambient noise levels (see Table 3.11-1) were measured between the hours of 9:30 PM and 11:30 PM to capture the existing noise environment during the time period that a major event would conclude (typically 10:00 to 10:30 PM). Observed/measured noise levels do not account for any increases in ambient noise contributed by development within the HPSP (Adjusted Baseline). The Adjusted Baseline noise environment is expected to be somewhat louder than existing conditions. Therefore, comparing Proposed Project impacts against a lower ambient noise level provides a conservative analysis because the change in noise level would be greater. On-site noise sources as well as pedestrian activity along West Century Boulevard and South Prairie Avenue have been incorporated into the model to obtain a combined, or composite operational noise level for the Proposed Project under six conditions: Non-Event Day, Daytime Corporate/Community Event, Other Sporting Event or Gathering, Major Event Weekday Pre Event, Major Event During Event, and Major Event Post Event.

The CadnaA noise propagation program was used to calculate noise from a variety of sources within the plaza (including amplified sound, crowd and pedestrians, arena sound leakage, etc.), mechanical equipment, parking noise, and media truck parking, accounting for reductions in noise levels provided by Proposed Project buildings (barrier-insertion loss) and proposed permanent noise barriers. It has been assumed that the Proposed Project hotel would not host outdoor events or include any outdoor amplified noise sources. Therefore, noise sources from the hotel, other than mechanical equipment and parking, were not accounted for in the analysis.

⁴⁹ United States Department of Labor, Occupational Safety and Health Administration. Occupational Safety and Health Standards Part 1910, Standard 1910.95.

⁵⁰ California Department of Transportation, 2013. *Technical Noise Supplement*. September 2013. p. 6-5.

The CadnaA program is a Windows-based software program that assesses and predicts noise levels in the vicinity of noise sources based on International Organization for Standardization 9613-2 algorithms for noise propagation calculations. The calculations account for classical sound wave divergence plus attenuation factors resulting from air absorption, basic ground effects, and barriers/shielding. Assumptions associated with stationary noise sources are summarized below and noise sources associated with each of the six modeled Project Conditions is shown in **Table 3.11-11**. For further detail on model assumptions, see the Proposed IBEC Noise Contours memorandum included in Appendix J of this Draft EIR.

Amplified Sound in the Plaza

The Proposed Project includes an outdoor plaza within the Arena Site with an approximate area of 80,000 square feet (sf) including landscaped areas and an outdoor community gathering space. The plaza would connect the surrounding sidewalks to the Arena Structure and would include approximately 48,000 sf of retail/restaurant uses, up to 15,000 sf of uses that would accommodate community and youth-oriented educational programming, and an outdoor event stage. The back of the stage would be completely enclosed with a sound shell extending up to 30 feet in height. The outdoor stage would have amplified sound and could be used for musical and other performances events under the Project Major Event, Pre-Event, and Post-Event conditions.

The analysis accounted for five speaker locations extending from the top of the sound shell at 30 feet. Noise contours from amplified sound (music through speakers) has been calculated at multiple receiver points within each of the noise-sensitive receptors listed above and shown in

Figure 3.11-2. Based on noise measurement data for live concerts, an aggregated reference noise level of 92 dBA at 100 feet from the front edge of the stage has been assumed and modeled.⁵¹

Plaza Crowd Noise

The plaza is anticipated to be utilized seven days per week with pedestrians associated with the commercial and community uses, as well as other activities independent of events hosted within the proposed Arena; under event conditions the plaza would facilitate pedestrian movement to and from the proposed Arena before, during, and after the event.

During the Major Event Pre Event and Post Event conditions, it has been assumed that live performances would be held at the outdoor stage. Crowd noise during a live performance has been calculated based on a reference noise level for “shouting” of 89 dBA for one-third of the attendees shouting at the same time, noise level for “loud” of 76 dBA for one-third of the attendees, and noise level for “raised” of 65 dBA for one-third of the attendees at 3.3 feet from the source.⁵² An approximate area of 40,000 sf within the plaza would have direct views of the stage. Therefore, based on the occupancy load factor of 15 sf per person, 2,666 people have been assumed for analytical purposes.⁵³

During the Major Event During Event condition, it has been assumed that the majority of people at the Project Site would be attending the event that is occurring within the proposed Arena. Based on a plaza area of 80,000 sf, a conservative maximum occupancy of 5,334 people (15 sf per person) has been assumed. The occupant load of the plaza during an event is assumed to be 25 percent of the maximum 5,334, approximately 1,334 people. Crowd noise during a major event has been calculated based on a reference noise level for “raised” voice of 65 dBA at 3.3 feet from the source.⁵⁴

During an Other Sporting Event or Gathering and Day-Time Corporate/Community Event, it is assumed that the majority of the people at the Project Site would be attending the event that is occurring within the proposed Arena. Under Non Event day conditions, there would not be an event otherwise drawing people to the plaza. Therefore, the occupancy of the plaza for an Other Sporting Event or Gathering, Day-Time Corporate/Community Event, and Non-Event day is assumed to be 25 percent of the maximum 5,334, approximately 1,334 people.

Plaza Rooftop Restaurant

The Proposed Project includes a potential for up to 15,000 sf of rooftop restaurant space that could be provided in the plaza and contribute to Project operational noise under all three Project

⁵¹ City of Santa Clara, 2009. *49ers Santa Clara Stadium Project Environmental Impact Report – Volume I*, July 2009.

⁵³ California Building Code Table 1004.1.2, Maximum Floor Area Allowances per Occupancy

⁵⁴ Olsen, W. O., 1998. “Average Speech Levels and Spectra in Various Speaking/Listening Conditions: A Summary of the Pearson, Bennett, & Fidell (1977) Report”. *American Journal of Audiology*, vol. 7, no. 1059-0889, October 1998. p. 3.

analysis conditions. A portion of the 15,000 sf would consist of kitchen, storage, and office space. However, it has been conservatively assumed that the rooftop restaurant space would be located along West Century Boulevard and the total 15,000 sf area would include capacity for up to 1,000 people. Crowd noise under Major Event, Other Sporting Event or Gathering, Day-Time Corporate/Community Event, and Non-Event conditions has been calculated based on a reference noise level for “normal” speech of 58 dBA at 3.3 feet from the source.⁵⁵

Arena Noise

The exterior of the Arena Structure would be comprised of a range of textures and materials, including metal and glass, with integrated solar panels in the most exposed locations. The analysis of the Project Major Event During Event condition considers the potential for the Arena entrance doors to be open, with noise from a sold-out crowd cheering and from amplified sound inside the arena potentially being audible at nearby noise-sensitive receptors. For this analysis, the model assumes that a sold-out crowd of 18,000 people would be cheering with ten amplified speakers in use within the Arena, and that the noise level of 89.8 dBA Leq for “shouting” and 84.6 dBA Leq from amplified speakers would emanate from the Arena Structure entrance.

Pedestrian Noise

Under Project Major Event Pre Event, Major Event Post Event, Other Sporting Event or Gathering, Day-Time Corporate/Community Event, and Non-Event day conditions, it is anticipated that pedestrians would walk across the pedestrian bridge from the West Parking Garage to the Arena Site. According to Table 3.14-38 (see Section 3.14, Transportation and Circulation), the pedestrian bridge would provide comfortable walking area for 50 people at a given time. Pedestrians are also expected to walk along West Century Boulevard and the north-side sidewalk on West 102nd Street between the Arena Site and the East Transportation and Hotel Site. During Major Event Pre Event and Major Event Post Event conditions, it is anticipated that pedestrians would walk along West Century Boulevard and South Prairie Avenue. For an Other Sporting Event or Gathering, it is anticipated that pedestrians would walk along West Century Boulevard between the Arena Site and the East Transportation and Hotel Site. The average number of pedestrians that sidewalk facilities along West Century Boulevard and South Prairie Avenue could accommodate, in accordance with Table 3.14-38 (see Section 3.14, Transportation and Circulation) has been utilized. Pedestrian noise has been calculated based on a reference noise level for “raised” speech of 65 dBA at 3.3 feet from the source.⁵⁶

Stationary Mechanical Equipment

The Proposed Project would include operation of mechanical equipment for the Proposed Project, such as HVAC systems, fans, emergency generators, and related equipment, at the Arena Site,

⁵⁵ Olsen, W. O., 1998. “Average Speech Levels and Spectra in Various Speaking/Listening Conditions: A Summary of the Pearson, Bennett, & Fidell (1977) Report”. American Journal of Audiology, vol. 7, no. 1059-0889, October 1998. p. 3.

⁵⁶ Olsen, W.O., 1998. “Average Speech Levels and Spectra in Various Speaking/Listening Conditions: A Summary of the Pearson, Bennett, & Fidell (1977) Report”. American Journal of Audiology, vol. 7, no. 1059-0889, October 1998. p. 3.

West Parking Garage Site, and the East Transportation and Hotel Site. Reference noise levels of 98 dBA Lw (sound power level at the source), 81.5 dBA Lw, and 103.2 dBA Lw were used for HVAC units, electrical transformers, and emergency generators, respectively, based on the CadnaA source library. For the Arena Site, mechanical equipment would be located on the ground level to the southeast of the Arena Structure. Emergency generators would not be tested during events and are not anticipated to be operational unless there is a power outage. Therefore, noise from emergency generators have been accounted for during a non-event day. Mechanical equipment for the proposed West Parking Garage, East Parking Garage, and Hotel are assumed to be located at the center of the rooftop.

Service and Delivery Access and Loading

Small service and delivery vehicles providing services or materials for retail and food service venues would enter the Project Site via a site access road accessed from West Century Boulevard, approximately 350 feet east of South Avenue, and immediately west of the existing Airport Park View Hotel parcel.

Large delivery vehicles such as semi-trucks, trash collection trucks, and large food service trucks would access the Arena Site from a new, gated service ramp from West Century Boulevard, approximately 200 feet west of South Doty Avenue, between two existing commercial buildings. This service ramp would slope downward, providing access to a loading and staging area, at the below-grade event level of the Arena Structure. The Arena Structure would include six loading docks to provide loading and unloading of materials and supplies at the event level.

Due to loading activities being located below grade and fully enclosed within the Arena Structure, loading area noise associated with truck movements/idling and loading/unloading operations would not result in increases in ambient noise levels. Additionally, it is anticipated that such vehicles would not access the Project Site during event conditions in order to avoid any conflicts in circulation and access. Therefore, noise associated with deliveries has not been analyzed for purposes of a composite Project noise analysis which considers worst-case event conditions. However, vehicle trips generated by the Proposed Project have been accounted for in the traffic analysis (see Section 3.14) and, therefore, are accounted for in the traffic noise analysis.

Parking Lot and Parking Garage Activity

The Proposed Project would include parking structures and surface lots. The South Parking Garage with 650 spaces immediately south of the Arena Structure would be located on the Arena Site. The West Parking Garage would include approximately 3,110 parking spaces, west of the Arena Site on South Prairie Avenue between West Century Boulevard and West 102nd Street.

The East Transportation and Hotel Site, located approximately 1,300 feet east of the Arena Structure between West Century Boulevard and West 102nd Street, would include a three story parking garage with the first floor serving as a transportation hub. The ground-level Transportation Hub would include on the first floor of the parking garage a staging area for private or charter buses and a drop-off and pick-up area for Transportation Network Company

(TNC) vehicles and taxis serving the Arena Site; south of the garage, also on the ground level, would be a surface lot that would provide staging for TNC vehicles and taxis. The second and third floors of the garage would provide 365 parking spaces for patrons of the Arena Site.

For the purposes of composite noise analysis, a series of conservative assumptions were made regarding the use of the parking garages during relevant peak hours. For a Non-Event Day, it is assumed that the South Parking Garage would be parked to capacity and that about two-thirds of the West Parking Garage would be parked. For a Day-Time Corporate/Community Event condition, it is assumed that the South and West Parking Garages would be parked to capacity. For an Other Sporting Event or Gathering Event and for a Major Event, it is assumed that the South, West, and East Parking Garages would each be parked to capacity.

Sources of noise associated with parking facilities typically include vehicle engines and accelerating, doors slamming, car alarms, and people talking. Noise levels at Proposed Project parking garages and surface lot would fluctuate throughout the day depending on the amount of vehicle and human activity. Noise levels would generally be the highest when the largest number of people would enter and exit the parking facility. Parking related noise levels were estimated using the methodology recommended by the FTA for the general assessment of stationary transit noise sources.⁵⁷

Media Truck/Broadcast Access and Parking

Media/broadcast trucks can be a feature of NBA basketball games or other major events, and require parking in areas that provide clear access to the southern sky for satellite link-ups. Media and associated truck parking would be provided on a designated media parking area located on the east side of the Arena Structure. Certain media trucks that do not require clear sky access would be accommodated in parking areas located at the below-grade event level, accessed via the service ramp from West Century Boulevard. Media trucks would access the Arena Site media truck surface parking area from the internal roadway accessed from West Century Boulevard.

Truck movements/idling and loading/unloading of media equipment would generate noise levels within the designated media parking area. In order to observe and document noise levels associated with loading and unloading activities, a survey was conducted by ESA at a loading dock that included loading/unloading activity (specifically the idling of semi-trucks and back-up alarm beeps) from one loading dock would generate noise levels of approximately 70.5 dBA Leq at a reference distance of 50 feet from the noisiest portion of the truck (i.e., to the side behind the cab and in line with the engine and exhaust stacks).⁵⁸ This observed noise level is conservative since media trucks are typically smaller than semi-trucks, and was assumed for each media truck that would park in this area. The Proposed Project would include capacity for 12 media trucks in

⁵⁷ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 47.

⁵⁸ The loading dock facility noise measurements were conducted at a loading dock facility at a Wal-Mart store using the Larson-Davis 820 Precision Integrated Sound Level Meter (“SLM”) in May 2003. The Larson-Davis 820 SLM is a Type 1 standard instrument as defined in the American National Standard Institute S1.4. All instruments were calibrated and operated according to the applicable manufacturer specification. The microphone was placed at a height of approximately 5 feet above the local grade.

the designated surface parking lot. Therefore, 12 media trucks were included in the model with each truck generating 70.5 dBA Leq at a distances of 50 feet. It was assumed that media truck activity would occur under Major Event Pre-Event and Major Event Post-Event conditions.

Vibration

The evaluation of potential building damage impacts related to construction vibration levels is based on published data in the FTA's *Transit Noise and Vibration Impact Assessment Manual*.⁵⁹ The vibration damage criteria adopted by the FTA and applied in this analysis are shown in **Table 3.11-12**. The PPV is defined as the maximum instantaneous positive or negative peak of the vibration and is often used in monitoring of vibration because it is related to the stresses experienced by structures. The building damage threshold is 0.3 in/sec PPV for engineered concrete and masonry buildings.⁶⁰

**TABLE 3.11-12
CONSTRUCTION VIBRATION DAMAGE CRITERIA**

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

SOURCE: Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment*, September 2018, p. 186.

The FTA has also adopted standards associated with human annoyance for groundborne vibration impacts for the following three land-use categories: Category 1, High Sensitivity; Category 2, Residential; and Category 3, Institutional:

Category 1 refers to buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes;

Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals; and

Category 3 refers to institutional land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment, but still have the potential for activity interference.

The vibration thresholds associated with human annoyance for these three land-use categories are shown in **Table 3.11-13**. No vibration thresholds have been adopted or recommended by the FTA for commercial and office uses. For purposes of this analysis, the human annoyance threshold is

⁵⁹ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018.

⁶⁰ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018, p. 186.

72 VdB for residences and buildings where people normally sleep and 75 VdB for commercial uses, industrial uses, and churches with primarily daytime use.

TABLE 3.11-13
GROUNDBORNE VIBRATION IMPACT CRITERIA FOR GENERAL ASSESSMENT

Land Use Category	Frequent Events ^a	Occasional Events ^b	Infrequent Events ^c
Category 1: Buildings where vibration would interfere with interior operations	65 VdB ^d	65 VdB ^d	65 VdB ^d
Category 2: Residences and buildings where people normally sleep	72 VdB	75 VdB	80 VdB
Category 3: Institutional land uses with primarily daytime use	75 VdB	78 VdB	83 VdB

NOTES:

- ^a "Frequent Events" is defined as more than 70 vibration events of the same source per day.
- ^b "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
- ^c "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day.
- ^d This criterion is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.

SOURCE: Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment*, September 2018, p. 126.

On-Site Sources of Construction Vibration

Sources of on-site construction vibration include heavy-duty construction equipment such as bulldozers, drill rigs, and loaded trucks (i.e., haul trucks). Groundborne vibration levels resulting from construction activities at the Project Site were estimated using data and equations published by the FTA as described above. Potential vibration levels resulting from Project construction are identified for land uses that are sensitive to vibration, including existing nearby residences and hotels, accounting for the distance of the structure from construction activities. The PPV vibration velocities for several types of construction equipment that can generate perceptible vibration levels are identified in **Table 3.11-14**, *Vibration Source Levels for Construction Equipment*. Based on the information presented in Table 3.11-14, vibration velocities could range from 0.003 to 0.089 in/sec PPV at 25 feet from the source of activity.

TABLE 3.11-14
VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	Approximate PPV (in/sec)					
	12 Feet	20 Feet	25 Feet	50 Feet	75 Feet	100 feet
Vibratory Roller	0.631	0.293	0.210	0.074	0.040	0.026
Large Bulldozer	0.268	0.124	0.089	0.031	0.017	0.011
Caisson Drilling/Drill Rig	0.268	0.124	0.089	0.031	0.017	0.011
Loaded Trucks	0.229	0.106	0.076	0.027	0.015	0.010
Jackhammer	0.105	0.049	0.035	0.012	0.007	0.004
Small Bulldozer	0.009	0.004	0.003	0.001	0.0006	0.000

SOURCE: Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment*, September 2018, p. 184.; ESA, 2017.

Off-Site Sources of Construction Vibration

Sources of off-site construction vibration include heavy-duty trucks delivering construction supplies and materials, concrete trucks, and haul trucks. As described above, it is unusual for vibration from sources such as trucks on roadways to be perceptible, even in locations close to major roads.⁶¹ Nonetheless, groundborne vibration resulting from heavy-duty construction truck travel along area roadways has been estimated and impacts determined based on FTA guidance described above.

Operational Vibration

Operational sources of vibration include heavy-duty vehicle travel along area roadways. According to the FTA's *Transit Noise and Vibration Impact Assessment Manual*, it is unusual for vibration from vehicular sources (including buses and trucks) operating on smooth road or surface to be perceptible, even in locations close to major roads.⁶² As such, no sources of "excessive" groundborne vibration or noise levels are anticipated during operations of the Proposed Project.

Groundborne Noise

According to the FTA, airborne noise levels would be higher than groundborne noise levels.⁶³ Unless indoor receptors have substantial sound insulation (e.g., recording studio) and would be exposed to vibration velocities great enough to cause substantial levels of groundborne noise, groundborne noise does not need to be assessed. There are no substantially insulated indoor receptors located within the area surrounding the Project Site. Therefore, the effects of airborne noise would still be higher than groundborne noise levels. In addition, groundborne noise generated by a large bulldozer within five feet of a receptor building would reach an approximate level of 58 dBA, which is not greater than the airborne noise levels generated by construction equipment. Impacts related to groundborne noise are therefore not discussed further.

Sound Barriers

The placement and construction of temporary and permanent sound barriers on locations around the Project Site at the start of the first phase of construction would be included as project design features of the Proposed Project (see Chapter 2, Project Description, Figure 2-19). The temporary sound barriers would be placed during the initial phase of any construction activities on portions of the Project Site, and would only be present during the construction of the Proposed Project. The proposed permanent barriers would remain in place during the operational life of the Proposed Project.

Arena Site

A proposed 15-foot-high permanent sound barrier would be constructed along the southern boundary of the Arena Site, with a temporary, additional 7-foot-high sound barrier "topper" placed along the length of this permanent wall for the duration of construction activities on the Arena Site.

⁶¹ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 112.

⁶² Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 112.

⁶³ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 124.

Proposed permanent 12-foot-high sound barriers would be constructed along the shared boundaries of the Arena Site and the residences located at 10204 South Prairie Avenue and 10226 South Prairie Avenue prior to the start of any major construction activities on the Arena Site.

Two temporary 12-foot-high sound barriers are proposed along the western boundary of the Arena Site to be constructed along South Prairie Avenue between the residences located at 10204 South Prairie Avenue and 10226 South Prairie Avenue and from the northern boundary of 10204 South Prairie Avenue to approximately mid-block between West 101st Street and West 102nd Street.

A temporary 16-foot-high sound barrier is proposed along the shared boundary of the Arena Site and the Airport Park View Hotel, which would be replaced with a permanent 12-foot-high sound wall after the conclusion of major construction activities on the Arena Site. Similarly, the temporary 12-foot-high sound barrier proposed at the northeast corner of the Arena Site and West 102nd Street during construction would be replaced with a permanent 8-foot-high sound wall at the conclusion of major construction activities. A temporary 12-foot-high sound barrier is also proposed at the southeast corner of the Arena Site and West 102nd Street between the southern sidewalk of West 102nd Street and the northern facade of the industrial use located adjacent to the Arena Site to the east, south of West 102nd Street.

West Parking Garage Site

A proposed temporary 12-foot-high sound barrier would be placed along the western and southern boundaries of the West Parking Garage Site to remain in place during any construction activities occurring on this portion of the Project Site.

East Transportation and Hotel Site

A proposed temporary 8-foot-high sound barrier would be placed along the southern boundary of the East Transportation and Hotel Site during construction activities on this portion of the Project Site. Portions of this temporary sound barrier would extend along the southerly east and west boundaries of the site.

Well Relocation Site

A temporary sound barrier ranging between 15-feet and 26-feet is proposed along the length of the south and east boundaries of the Well Relocation Site and along a portion of the west boundary of the site, which would be removed after completion of construction activities on the Well Relocation Site.

Impacts and Mitigation Measures

Impact 3.11-1: Construction of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Significant and Unavoidable)

On-Site Construction Activity and Related Noise

The Proposed Project includes as a project design feature the installation of permanent and temporary sound barriers at the start of the first phase of construction and prior to the initiation of intensive construction activities. Therefore, the unmitigated construction noise levels presented herein incorporate noise level reductions provided by the proposed sound barriers.

Daytime Construction Noise

Average daytime construction noise levels (Leq) were calculated for overlapping construction across all four Project Site locations during the worst case construction day at each of the four Project Site locations: the Arena Site; the West Parking Garage Site; the Well Relocation Site; and the East Transportation and Hotel Site. As described above under Methodology and Assumptions, the model calculates noise levels at multiple receiver points within each receptor group. As a result, impacts within each receptor group may vary depending on the distance of each receiver point within the specific receptor group and the location of shielding (i.e., Project noise barriers and/or existing structures). **Figure 3.11-5** shows the maximum impact at modeled receiver points within each receptor group across all four worst-case overlap conditions.

As shown in **Figure 3.11-5**, there are some receptor groups where the nearest receiver points within that group are significantly impacted by Proposed Project construction while noise impacts at other receivers within the same receptor group, typically located at a greater distance from the Project Site and/or situated behind existing structures, would be less than significant. In addition, there are some cases where a multi-story noise-sensitive receptor would not experience a significant impact at a receiver point on the ground floor, but would experience a significant impact at a receiver point above the first floor. **Table 3.11-15** shows the worst-case construction noise level at each noise-sensitive receptor as well as the ambient daytime noise levels for the most-impacted (highest noise level increase over ambient conditions) receiver point at the ground floor, second floor (where appropriate) and third floor or higher (where appropriate) within each receptor group. Daytime construction noise levels from worst-case construction activity would exceed the threshold of 5 dBA over ambient noise levels (Leq) at noise-sensitive receptors around the Project Site, producing maximum noise levels that exceed the threshold that would be experienced by residential uses west of the West Parking Garage, at the hotel use to the north and east north of the Arena Site (former Airport Park View Hotel), at religious, educational, and residential uses south of the Arena Site, along West 104th Street, and residential uses to the east of the Well Relocation Site.

NOTES:

- ^a A range of ambient noise levels have been estimated based on the observed/measured noise levels collected from measurement locations and distance of various receivers within each Receptor Group (shown in Figure 3.11-2).
- ^b A range of construction noise levels have been calculated based on the location of various receivers within each Receptor Group.
- ^c The receiver point within each Receptor Group with the highest construction noise level over ambient conditions is shown.

SOURCE: ESA, 2019

More specifically, the results presented in Table 3.11-5 show that worst-case construction noise would exceed ambient noise levels by a maximum of 5.6 dBA Leq at a second floor receiver point within receptor group R5 (residential uses between West 101st and 102nd Streets, west of the West Parking Garage Site); a maximum of up to 15.4 dBA Leq at a ground floor receiver point, a maximum of up to 19.0 dBA Leq at a second floor receiver point, and a maximum of up to 19.6 dBA Leq at a third floor receiver point within receptor group R8 (hotel use adjacent to the

Arena Site); a maximum of up to 11.9 dBA Leq at a ground floor receiver point within receptor group R14 (residential uses east of the Well Relocation Site); a maximum of up to 15.1 dBA Leq at a ground floor receiver point and a maximum of up to 6.8 dBA Leq at a second floor receiver point within receptor group R15 (Inglewood Southside Christian Church and early childhood educational use); a maximum of up to 14.7 dBA Leq at a ground floor receiver point and a maximum of up to 10.3 dBA Leq at a second floor receiver point within receptor group R16 (residential uses south of the Arena Site); and a maximum of up to 9.5 dBA Leq at a ground floor receiver point within receptor group R17 (residential uses located south of the Well Relocation Site).

As demonstrated by the evaluation of impacts to noise-sensitive receptors within the receptor groups discussed above, daytime construction noise levels from worst-case construction activity would exceed the threshold of 5 dBA over ambient noise levels (Leq) to noise-sensitive receptors around the Project Site. Therefore, the daytime construction noise impacts of the Proposed Project would be **potentially significant**.

Nighttime Construction Noise

Hourly average nighttime construction noise levels (Leq) were calculated for nighttime construction activity at the Arena Site and the Well Relocation Site and compared to hourly ambient levels which decrease incrementally through the night before starting to rise in the early morning. No nighttime construction is proposed at the West Parking Garage Site or the East Transportation Hub and Hotel Site.

The model accounts for multiple receiver points within each receptor group. As a result, impacts within each receptor group may vary depending on the distance of each receiver point within the specific receptor group and the location of shielding (i.e., Project noise barriers and/or existing structures). **Figure 3.11-6** shows receiver points that would be impacted by worst-case nighttime construction at any point during the nighttime hours (8:00 PM – 7:00 AM). There are some cases where the nearest receivers are significantly impacted by Proposed Project construction while the impact other receivers, typically located at greater distances from the Project Site and/or situated behind existing structures, would be less than significant. **Table 3.11-16** shows the maximum hourly nighttime construction noise levels (Leq) as well as hourly ambient noise levels. As shown, impacts vary throughout the nighttime hours as ambient conditions naturally fluctuate.

NOTES:

- ^a A range of ambient noise levels have been estimated based on the observed/measured noise levels collected from measurement locations and distance of various receivers within each Receptor Group (shown in Figure 3.11-2). The ambient noise level reported for each receptor group is the ambient level for the receiver point within that receptor group that would experience the greatest exceedance over ambient conditions during the specified hour.
- ^b A range of construction noise levels have been calculated based on the location of various receivers within each Receptor Group. The construction noise level for the receiver point with the greatest construction noise level over ambient is reported for each receptor group during the specified hour.
- ^c The maximum increase over ambient shown is the maximum for each Receptor Group.

See Appendix J for calculations for each receiver within each Receptor Group.

SOURCE: ESA, 2019

Nighttime construction activity at the Arena Site would result in maximum noise levels that exceed the threshold of 5 dBA over ambient Leq levels during at least one nighttime hour at residences to the north, west, and south of the Arena Site, the hotel use at the former Airport Park View Hotel site to the north of the Arena Site, the Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses to the west of the Arena Site, the Inglewood Southside Christian Church and early childhood education uses to the south of the Arena Site, and residences east of the Well Relocation Site. More specifically, worst-case construction noise levels would exceed ambient noise levels during at least one nighttime hour by a maximum of up to 5.4 dBA Leq at a ground floor receiver point and a maximum of up to 7.1 dBA Leq at a second floor receiver point within receptor group R1 (residences north of West Century Boulevard, west of South Prairie Avenue); a maximum of up to 7.4 dBA Leq at a second floor receiver point within receptor group R6 (residences between West 102nd Street and West 103rd Street); a maximum of up to 6.8 dBA Leq at a ground floor receiver point within receptor group R7 (Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses west of South Prairie Avenue, west of the Arena Site); a maximum of up to 11.2 dBA Leq at a second floor receiver point and a maximum of up to 15.0 dBA Leq at a third floor receiver point within receptor group R8 (hotel uses at the former Airport Park View Hotel site); within receptor group a maximum of up to 14.2 dBA Leq at a ground floor receiver point within receptor group R14 (residences east of the Well Relocation Site); a maximum of up to 9.4 dBA Leq at a second floor receiver point within receptor group R15 (Inglewood Southside Christian Church and early childhood educational use south of the Arena Site); and a maximum of up to 11.3 dBA Leq at a second floor receiver point within receptor group R16 (residences on West 104th Street, south of the Arena Site). Nighttime construction activity at the Well Relocation Site is not anticipated to result in noise levels experienced by noise-sensitive receptors greater than 5 dBA over ambient Leq conditions.

As demonstrated by the evaluation of impacts to noise-sensitive receptors within the receptor groups discussed above, nighttime noise from worst-case nighttime construction activity would exceed the threshold of 5 dBA over ambient levels (Leq) at noise-sensitive receptors around the Project site. Therefore, the impacts from nighttime construction activity would be **potentially significant**.

Off-Site Construction Activity and Related Noise

Construction truck trips would occur during the Project construction period and would be associated with hauling material and excavated soil from the Project Site and delivering building materials, supplies, and concrete to the Project Site. Construction haul trucks would travel a designated haul route. Trips using the I-110 are assumed to travel to and from the Project Site via Manchester Avenue and South Prairie Avenue. Trips using the I-405 are assumed to travel to and from the Project Site via Manchester Boulevard and South Prairie Avenue or West Century Boulevard. Trips using the I-105 are assumed to travel to and from the Project Site via South Prairie Avenue. The construction phase with the greatest number of daily trucks is grading/excavation of the West Parking Garage Site with 760 daily one-way truck trips (380 round trips).

According to the construction schedule, grading/excavation of the West Parking Garage Site could overlap with Arena Site demolition and site preparation, site preparation and drainage/

utilities/trenching of the West Parking Garage Site, site preparation of the East Transportation and Hotel Site, and Well Relocation Site demolition and sound wall installation. During the maximum overlap day, there is the potential for 1,104 one-way truck trips (552 trucks). The sound power from one heavy-duty truck is greater than the sound power from one passenger vehicle (i.e., car). According to Caltrans, the noise levels from one heavy-duty truck at a speed of 35 miles per hour is equivalent to 19 passenger vehicles traveling at a speed of 35 miles per hour traveling at a speed of 35 miles per hour. Applying this multiplier to the estimated 1,104 one-way Project construction trips, Project construction would generate a potential maximum sound power equivalency of up to 20,976 passenger vehicles.⁶⁴ According to FHWA, assuming all other factors remain the same, it takes a doubling of traffic volumes (100 percent increase) in order to increase traffic noise levels by 3 dBA.⁶⁵

Table 3.11-17 summarizes the range of calculated daily traffic volumes for each roadway based on turning movement data collected as a part of the traffic analysis (see Section 3.14). Traffic volume data was provided for multiple segments along each roadway, resulting in multiple different daily volumes. Table 3.11-17 shows the volumes for the segments with the lowest observed average daily traffic volume (ADT) and the highest observed ADT along West Century Boulevard, Manchester Boulevard, and South Prairie Avenue. As indicated, the lowest existing volumes along West Century Boulevard, Manchester Boulevard, and South Prairie Avenue are 10,000 trips, 12,565 trips, and 13,505 trips, respectively, and the highest existing volumes along West Century Boulevard, Manchester Boulevard, and South Prairie Avenue are 14,395 trips, 30,955 trips, and 34,150 trips, respectively.

**TABLE 3.11-17
 HAUL ROUTE ADJUSTED BASELINE AVERAGE DAILY TRAFFIC VOLUMES**

Roadway	Lowest ADT	Highest ADT
Manchester Boulevard	12,565	14,395
West Century Boulevard	10,000	30,955
South Prairie Avenue	13,505	34,150

NOTE:

Adjusted Baseline ADT was calculated based on the assumption that the average of Adjusted Baseline Weekday AM and PM peak hour volumes would make up 10 percent of daily volumes. Lowest ADT values are from the segment with the lowest ADT, and Highest ADT values are from the segment with the highest ADT.

SOURCE: Fehr & Peers, 2019; ESA, 2019

Although it is unlikely that all Project-related heavy-duty construction trucks would travel along the same haul route, due to the uncertainty of the route trucks would take it has been conservatively assumed that the maximum anticipated number of heavy-duty construction trucks could potentially travel along the same route. As described above, the additional sound power of 1,104 daily heavy duty construction trucks would be equivalent to the sound power of 20,976

⁶⁴ California Department of Transportation, 2013. Technical Noise Supplement. September 2013. p. 3-19.

⁶⁵ Federal Highway Administration, FHWA Highway Traffic Noise Prediction Model, December 1978, <https://ia801807.us.archive.org/3/items/fhwahighwaytraff00barr/fhwahighwaytraff00barr.pdf>.

passenger vehicles. As compared to existing average daily traffic volumes along the roadways, the sound power generated by the maximum anticipated number of heavy-duty construction trucks would not be equivalent or greater to a doubling of the maximum ADT along West Century Boulevard or South Prairie Avenue and therefore would not result in a 3 dBA increase along those roadways under the highest ADT conditions. However, the sound power generated by the maximum anticipated number of heavy-duty construction trucks during construction of the Proposed Project would be equivalent or greater to a doubling of the maximum ADT along Manchester Boulevard, and a doubling of the minimum ADT along West Century Boulevard, South Prairie Avenue, and Manchester Boulevard, and could therefore result in a 3 dBA increase in traffic noise levels along those roadways. Therefore, noise impacts from off-site construction traffic would be **potentially significant**.

General Plan Consistency

Noise generated by construction of the Proposed Project would not be inconsistent with the goals and policies of the General Plan Noise Element. Goal 1 of the General Plan Noise Element calls for the reduction of noise where the noise environment represents a threat to public health and welfare. While the generation of construction noise would exceed ambient noise levels the noise would occur over a temporary period and would not result in the type of long term exposure that is known to result in hearing loss. For these reasons, construction noise would not represent a threat to public health or welfare.

Goal 3 of the General Plan Noise Element calls for the protection and maintenance of acceptable noise environments. The Proposed Project would generate temporary construction noise that would potentially increase ambient noise levels in the area, but these temporary increases would not represent a long-term change to the noise environment around the Project Site, and thus would not be inconsistent with Goal 3.

Consistent with Goal 4 and Policy 4.3, this Draft EIR includes substantial information and analysis of noise from Project construction, allowing for the consideration of noise effects in decision making regarding the Proposed Project. Consistent with Policy 4.4, the Proposed Project has integrated several features to reduce noise from Project construction, including the construction of temporary noise walls during construction, the use of an auger drilled pile system rather than the use of driven piles for foundation support.

The City's General Plan Noise Element Noise/Land Use Compatibility Matrix, (see Table 3.11-8) identifies that "Normally Compatible" noise levels are up to 80 dBA CNEL for restaurants and retail and up to 75 dBA CNEL for professional office buildings and commercial recreation. As shown in Table 3.11-1, the existing noise environment at the Project Site (long-term measurement locations M1 through M5) would be within the "Normally Compatible" range for the proposed uses. Therefore, the Proposed Project would be compatible with the existing and future noise environment.

For these reasons, construction of the Proposed Project would not be inconsistent with the goals and policies of the General Plan Noise Element that were adopted for the purposes of avoiding or mitigating environmental effects.

Potential Health Effects of Construction Noise Impacts

Short-term noise levels constituting the threshold of pain and hearing damage are 120 dB and 140 dB, respectively.⁶⁶ Table 3.11-15 shows average daytime construction noise levels and Table 3.11-16 shows the maximum nighttime construction noise levels at each of the studied receptors. As shown, average daytime and maximum nighttime construction noise levels would not reach the point at which pain or hearing damage would occur. Therefore, Project construction would not result in adverse health effects related to pain and hearing loss.

With respect to potential nighttime awakenings due to construction noise, the area surrounding the Project Site where there is the potential for sleep disturbance during nighttime construction has been identified. According to the Acoustical Society of America, receivers that would experience an indoor SEL of 50 dBA or lower would have an awakening probability of zero.⁶⁷ The area surrounding the Project Site that would experience an indoor SEL of greater than 50 dBA (exterior construction noise level of greater than 52 dBA Leq) during a worst-case or loudest maximum nighttime construction noise level event was identified and shown in **Figure 3.11-7**. This does not take into account the existing indoor SEL currently experienced due to aircraft flyovers from LAX and or other existing noise sources in the area such as traffic and industrial operations.

Due to the high variability of each individual's sensitivity to nighttime noise, uncertain factors related to nighttime construction activity such as number of peak noise level occurrences, and lack of an established or adopted threshold designating acceptable occurrences of awakenings, the estimated area for awakenings presented in this analysis represents the City's best effort to disclose the potential sleep disturbance effects of nighttime construction, but do not represent predictions of sleep awakenings for any specific location or population.

As discussed above under Environmental Setting, there are no established thresholds with regard to an acceptable level of short-term sleep disturbance. While exposure to high levels of noise during sleep can result in physiological responses, it is not possible to predict such effects in any particular population.

Conclusion

As described above, noise generated by daytime and nighttime construction activity during the three-year construction period would exceed applicable adapted thresholds at noise sensitive receptors adjacent to and near the Project Site, and, thus, these impacts would be **significant**.

Figure 3.11-7
Potential Sleep Disturbance Area - Worst-Case Nighttime Construction

Mitigation Measure 3.11-1

Construction Noise Reduction Plan. Prior to the issuance of any demolition or construction permit for each phase of project development, the project applicant shall develop a Construction Noise Reduction Plan to minimize daytime and nighttime construction noise at nearby noise sensitive receptors. The plan shall be developed in coordination with an acoustical consultant and the project construction contractor, and shall be approved by the City Chief Building Official. The Plan shall include the following elements:

- *A sound barrier plan that includes the design and construction schedule of the temporary and permanent sound barriers included as project design features for the Project, or sound barriers that achieve an equivalent or better reduction in noise levels to noise-sensitive receptors.*
- *Buffer distances and types of equipment selected to minimize noise impacts.*
- *Haul routes subject to preapproval by the City.*
- *Construction contractors shall utilize equipment and trucks equipped with the best available noise control techniques, such as improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically-attenuating shields or shrouds, wherever feasible.*
- *Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible.*
- *Stationary noise sources (e.g., generators) shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or other measures to the extent feasible. Pole power shall be utilized at the earliest feasible point in time, and to the maximum extent feasible in lieu of generators. If stationary construction equipment such as diesel- or gasoline-powered generators, must be operated continuously, such equipment must be located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.*
- *Use of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions.*
- *Designate a Community Affairs Liaison and conspicuously post this person's number around the project site, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding to any local complaints about construction activities. This Community Affairs Liaison shall receive all public complaints about construction noise disturbances and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem. The Community Affairs Liaison shall coordinate with a designated construction contractor representative for the purpose of investigating the noise disturbance and undertaking all feasible measures to protect public health and safety.*

- *Adjacent noise-sensitive residents and commercial uses (i.e., educational, religious, transient lodging) within 500 feet of demolition and pile driving activity shall be notified of the construction schedule, as well as the name and contact information of the project Community Affairs Liaison.*

Significance after Mitigation: Significant on-site construction noise levels would occur during daytime and nighttime construction, and off-site construction truck traffic would result in significant increases in traffic noise. Mitigation Measure 3.11-1 would reduce impacts by requiring a Construction Noise Reduction Plan.

Due to the lack of specificity of the construction plan at this point in time, the effectiveness of the noise-reduction techniques identified the mitigation measure, and the uncertainty of haul route designation and distribution of trucks, it is not practicable to calculate a numeric reduction in mitigated noise levels. The Proposed Project includes the installation of temporary and permanent sound walls, the most effective measure to reduce construction noise impacts, prior to commencement of heavy construction activity and reductions provided have been accounted for in the analysis. Although restrictions on equipment usage such as the number of equipment pieces that could operate simultaneously within the same area of the Project Site and restrictions on the number of heavy-duty construction trucks that can travel along the same roadways could potentially reduce impacts at noise-sensitive receptors, such restrictions are not considered feasible because these limitations could result in extension of the construction schedule that would expose noise-sensitive receptors to longer durations of construction activity, could affect safety during construction activities, and could interfere with achievement of project applicant Objective 1a. Therefore, these impacts would be **significant and unavoidable**.

Impact 3.11-2: Operation of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Significant and Unavoidable)

Traffic Noise

Traffic noise impacts associated with the Proposed Project have been evaluated under Non-Event Day (Ancillary Uses), Day-Time Corporate/Community Event, Other Sporting Event or Gathering, and Major Event conditions for relevant weekday and weekend scenarios. Additionally, concurrent events at the Proposed Project Arena, NFL Stadium, and The Forum were evaluated for the relevant weekday and weekend scenarios. As summarized below (and in Table 3.11-3), Project-related traffic noise has been calculated and compared against Adjusted Baseline traffic noise levels under the following specific conditions: the weekday AM and PM peak hours for a Non-Event Day, the AM peak hour for a Day-Time Corporate/Community Event, the PM peak hour for an Other Sporting Event or Gathering, the weekday pre-event and post-event peak period and weekend pre-event peak period for a Major Event. In order to exceed the significance threshold of a 3 dBA increase over ambient conditions, traffic volumes on any affected roadway segment would need to double (increase by 100 percent). Based on traffic volumes under Adjusted Baseline AM and PM peak hour conditions, it is not anticipated that significant impacts would occur under Non-Event Day, Day-Time Corporate/Community Event, or Other Sporting Event or Gathering conditions.

Pre-event traffic volumes on weekdays and weekends are not anticipated to result in significant impacts because background traffic volumes in the Project area would remain similar to PM peak hour volumes. Under post-event conditions, background traffic volumes and corresponding ambient traffic noise levels would be lower and it is anticipated that Major Event post-event traffic volumes would result in significant increases in traffic noise on weekdays and weekends. These impacts during post-event conditions are **significant**.

In order to demonstrate the magnitude of traffic noise increase, analysis was undertaken for all scenarios for which traffic information is available from the analysis presented in Section 3.14, Transportation and Circulation. For Major Events, that analysis considers weekday pre- and post-event scenarios, and a weekend pre-event scenario. The weekend post-event scenario was not studied in Section 3.14 for traffic-related impacts because, based on preliminary traffic counts undertaken for this Draft EIR, ambient traffic volumes during the weekend post-event time period would be lower than the weekday post event period, resulting in lower intersection levels of service. The weekend post-event time period is studied in this noise analysis, however. The traffic levels during the post-event period (9:30–10:30 PM) on Saturday are approximately seven percent lower than the worst-case weekday, and on Sunday are approximately 19 percent lower than the worst-case weekday. Lower traffic volumes would result in lower ambient traffic noise. As such, when Project-related traffic is added to this background condition, the additional Project-related traffic could thus result in a more noticeable increase in traffic noise.

In order to estimate traffic noise impacts under the weekend post-event scenario, adjusted baseline weekday post-event traffic volumes were scaled to approximate weekend post-event traffic volumes based on a 19 percent lower volume as observed by traffic counts. Project-associated trips were then added to the scaled adjusted baseline volumes and traffic noise under the plus Project scenarios have been compared against the scaled adjusted baseline volumes. Based on the analysis presented below, there are 22 segments with significant traffic noise increases during weekday post-event conditions. The significance of traffic noise would be similar to or greater on weekend post-event conditions, with an estimated 28 segments with significant traffic noise increases.

Project Traffic Noise Analysis

Non-Event Day

Impacts of the Proposed Project under the Non-Event Day condition are shown in **Table 3.11-18**. As indicated, the change in traffic noise along studied roadway segments would range from a decrease of 0.1 dBA Leq (where traffic is anticipated to decrease) up to an increase of 0.3 dBA Leq. These changes would not exceed the 3 dBA Leq increase significance threshold during the weekday AM or PM peak hour. Therefore, impacts of the Proposed Project related to traffic generated noise on non-event days would be **less than significant**.

NOTES:

N/A – Traffic along these segments are most affected by event-related traffic and not by daily AM or PM peak hour traffic. Therefore, traffic volumes for these segments were not simulated under the weekday AM or PM peak hours.

SOURCE: ESA, 2019 (Appendix J)

Day-Time Corporate/Community Event

Impacts in the weekday AM peak hour under the Day-Time Corporate/Community Event condition are shown in **Table 3.11-19**. As indicated, the change in traffic noise along studied roadway segments would range from a decrease of 0.1 dBA Leq (where traffic is anticipated to decrease) up to an increase of 1.3 dBA Leq. These changes would not exceed the 3 dBA Leq increase significance threshold during the weekday AM peak hour. Therefore, impacts of the Proposed Project during Day-Time Corporate/Community Events would be **less than significant**.

Other Sporting Event or Gathering

Impacts in the weekday PM peak hour under the Other Sporting Event or Gathering condition are shown in **Table 3.11-20**. As indicated, the increases in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 2.0 dBA Leq and therefore would not exceed the 3 dBA Leq increase significance threshold during the weekday PM peak hour. Therefore, impacts of the Proposed Project related to traffic generated noise during Other Sporting Event or Gathering conditions would be **less than significant**.

Major Event

Impacts under the Major Event condition are shown in **Table 3.11-21**. As indicated, during the weekday Pre Event Peak Period, the increases in traffic noise along studied roadway segments would range from a low of 0.0 dBA Leq up to an increase of 2.1 dBA Leq. These increases would not exceed the 3 dBA Leq increase significance threshold. Therefore, impacts of the Proposed Project during Major Event Weekday Pre Event conditions would be **less than significant**.

During the Major Event Weekday Post Event Peak Period, increases in traffic noise along studied roadway segments would range from a low of 0.0 dBA Leq up to an increase of 4.6 dBA Leq. Under this condition, 22 roadway segments (see **Figure 3.11-8**) would experience increases in traffic noise of 3.0 dBA Leq or greater and, thus, would result in **potentially significant** impacts.

Inglewood Basketball and Entertainment Center

Figure 3.11-8
Significant Traffic Noise Impact Locations –
Adjusted Baseline Plus Project Major Event (Weekday Post Event)

During the Major Event Weekend Pre Event Peak Period, increases in traffic noise along studied roadway segments would range from a low of 0.0 dBA Leq up to an increase of 2.3 dBA Leq. These increases would not exceed the 3 dBA Leq significance threshold. Therefore, impacts of the Proposed Project during Major Event Weekend Pre Event conditions would be **less than significant**.

During the Major Event Weekend Post Event Peak Period, increases in traffic noise along studied roadway segments would range from a low of 0.0 dBA Leq up to an increase of 5.3 dBA Leq. Under this condition, 28 roadway segments (see **Figure 3.11-9**) would experience increases in traffic noise of 3.0 dBA Leq or greater and, thus, would result in **potentially significant** impacts.

Summary

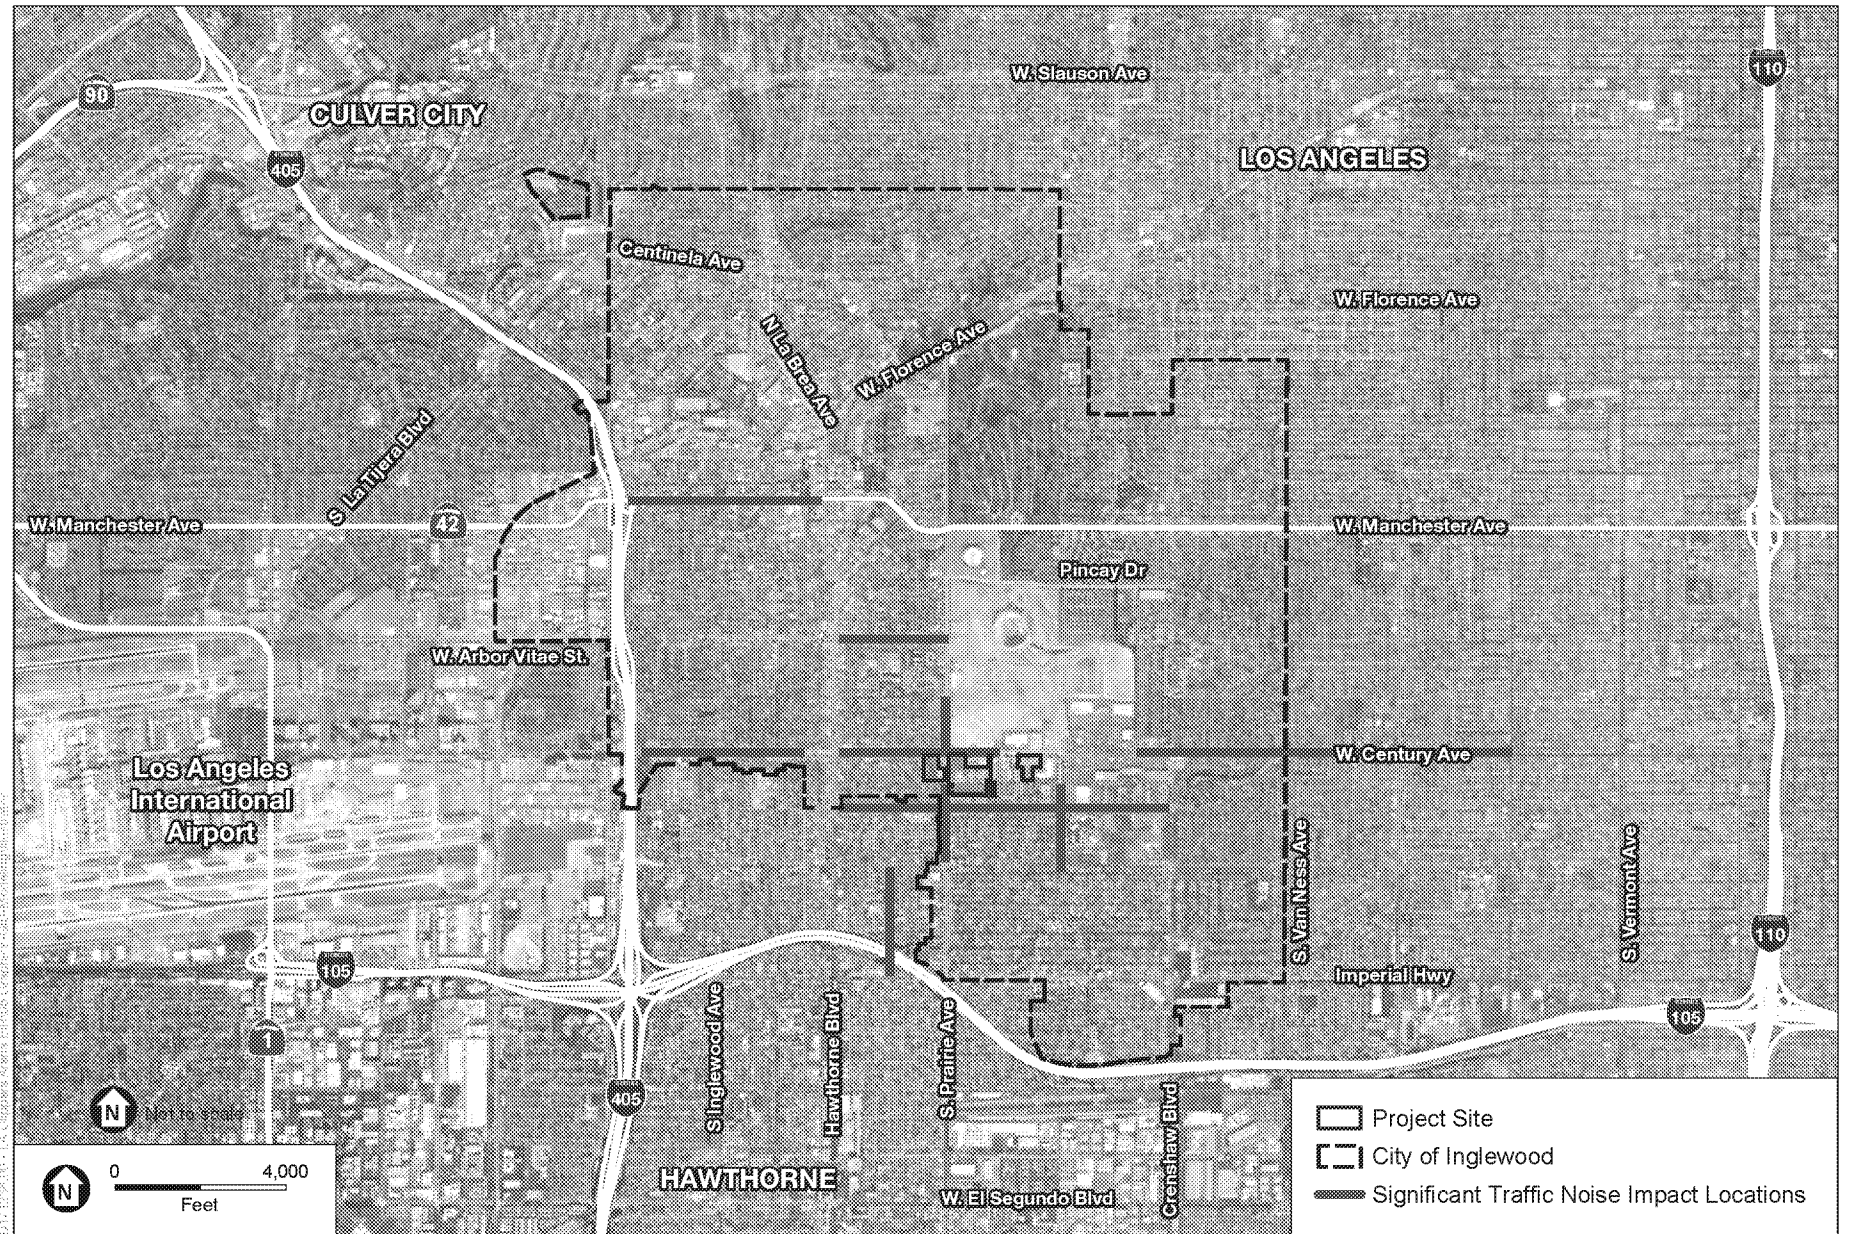

Traffic noise increases resulting from the Proposed Project under Non-Event Day AM and PM peak period, and Day-Time Event, Other Sporting Event or Gathering, Major Event Weekday Pre Event, and Major Event Weekend Pre Event peak conditions would not result in increases in traffic noise exceeding perceptible levels along roadway segments where sensitive uses are present. Therefore, impacts under these conditions would be less than significant. Under the Major Event Weekday Post Event condition, traffic noise increases caused by the Proposed Project would increase by 3.0 dBA Leq or greater and would exceed the established significance threshold on 22 roadway segments where sensitive uses are present. Under the Major Event Weekend Post Event condition, traffic noise increases caused by the Proposed Project are anticipated to be 3.0 dBA Leq or greater on 28 roadway segments where sensitive uses are present. Therefore, impacts of the Proposed Project under Major Event Weekday and Weekend Post Event conditions would be **potentially significant**.

Traffic Noise Analysis – Concurrent Events

Stadium Mid-Sized Event Plus Forum Concert Plus Project Major Event

Impacts of the Proposed Project under the Stadium Mid-Sized Event Plus Forum Concert Plus Project Major Event condition are shown in **Table 3.11-22**. As indicated, during the Weekday Pre Event Peak Period the Proposed Project would cause increases in traffic noise along studied roadway segments ranging from 0.0 dBA Leq up to 2.2 dBA Leq. These increases would not exceed the 3 dBA Leq increase significance threshold. Therefore, impacts of the Proposed Project during the Major Event Weekday Pre Event period under Stadium Mid-Size Event plus Forum Concert conditions would be **less than significant**.

During the Post Event Peak Period under Stadium Mid-Size Event plus Forum Concert conditions, the Proposed Project would cause increases in traffic noise along studied roadway segments that would range from 0.0 dBA Leq up to 4.3 dBA Leq. Under these conditions, five (5) roadway segments (see **Figure 3.11-10**) would experience increases in traffic noise of 3.0 dBA Leq or greater and would exceed the significance threshold, resulting in **potentially significant impacts**.

SOURCE: ESA, 2019 (Appendix J)

Stadium NFL Game Plus Forum Concert Plus Project Major Event

Impacts of the Proposed Project under the Stadium NFL Game Plus Forum Concert Plus Project Major Event condition are shown in **Table 3.11-23**. As indicated, during the Weekend Pre Event Peak Period the increase in traffic noise along studied roadway segments would range from 0.0 dBA Leq up to 2.4 dBA Leq. These increases would not exceed the 3 dBA Leq increase significance threshold. Therefore, impacts of the Proposed Project during the Major Event Weekend Pre Event period under Stadium NFL Game plus Forum Concert conditions would be **less than significant**.

As indicated in Table 3.11-23, during the Weekend Post Event Peak Period under Stadium NFL Game plus Forum Concert conditions, the Proposed Project is anticipated to cause increases in traffic noise along studied roadway segments that would range from 0.0 dBA Leq to 4.9 dBA Leq. Under this condition, six roadway segments (see **Figure 3.11-11**) would experience increases in traffic noise of 3.0 dBA Leq or greater and would exceed the significance threshold, resulting in **potentially significant impacts**.

Potential Health Effects of Roadside Noise Impacts

Traffic noise impacts would increase noise levels along roadways and noise levels of 56 to 72.8 dBA are predicted. While up to 28 roadway segments where noise-sensitive receptors are located are predicted to experience an increase of more than 3 dBA as discussed above, exposure to these levels of traffic noise would not rise to the level that would result in permanent hearing loss.⁶⁸

With respect to sleep disturbance, impacts related to Project-related traffic noise would occur during Major Event Post-Event conditions (9:30 PM – 10:30 PM) on weekdays and weekends. post-Major Event peak hour traffic, which could generate significant noise levels late into the evening hours up to 15-25 times a year, could disturb sleep during nighttime hours. However, after post-event traffic leaves the Project area, affected roadway segments would no longer be exposed to elevated traffic noise due to major events hosted at the Proposed Project arena. For the discussion regarding the health effects of sleep disturbance see Section 3.11.1. Taken together, significant traffic noise increases of the Proposed Project would not be expected to result in adverse health impacts.

SOURCE: ESA, 2019 (Appendix J)

On-Site Operational Noise Sources

As discussed above, non-vehicular on-site sources of noise include activities at the arena including crowd noise and amplified noise, outdoor activities (such as amplified sound and crowd noise), stationary mechanical equipment, loading area activity, parking lot/structure activity, and media truck/broadcast access activity. The composite operational noise levels, including off-site vehicular noise sources, on-site noise sources, and off-site pedestrian activity, generated as a result of the Proposed Project during Non-Event, Daytime Corporate/Community Event, and Other Sporting Event or Gathering conditions at each of the sensitive receptor property lines are shown in **Table 3.11-24**. Based on Chapter 2, Project Description, Table 2-3, increases in ambient noise related to Other Sporting Events or Gatherings with attendance up to 7,500 persons would occur approximately 35 days per year, and increases in ambient noise related to Corporate/Community Events with an attendance of a maximum 2,000 persons approximately 100 days per year.

The model accounts for multiple receiver points within each receptor group, and noise impacts within each receptor group may vary depending on the distance of each receiver point within the specific receptor group and the location of shielding (i.e., Project noise barriers and/or existing structures). The ambient noise level and Proposed Project composite operational noise level for the receiver point anticipated to experience the highest increase in ambient conditions is reported in Table 3.1-24. As indicated, under the Project Non Event, Daytime Corporate/Community Event, and Other Sporting Event or Gathering conditions, composite operational noise would not result in significant impacts at any of the receptor property lines (see **Figures 3.11-12, 3.11-13, and 3.11-14**). Operational impacts on non-Major Event days would be **less than significant**.

Table 3.11-25 shows the composite operational noise levels at each of the sensitive receptor property lines during Major Event Pre Event, Major Event During Event, and Major Event Post Event conditions, each of which is discussed below. The modeled results described below were conducted for weekday conditions because overall background noise conditions would result in the highest sound levels. Nevertheless, the impacts described below are indicative of the impacts that would be experienced before, during, and after major events on weekends as well, when background noise levels would be expected to be lower but project noise generation could still be significant.

As described above under Methodology and Assumptions, the model accounts for multiple receiver points within each receptor group. As a result, impacts within each receptor group may vary depending on the distance of each receiver point within the specific receptor group and the location of shielding (i.e., Project noise barriers and/or existing structures). Specially, ground floor receivers may be shielded from Project operational noise when noise barriers and existing structures are present. However, upper floors may not be offered these same shielding effects based on the height of noise barriers and/or the height of surrounding structures.

NOTES:

^a Operational noise levels have been calculated at multiple receivers within each Receptor Group (shown in Figure 3.11-2). The ambient noise level and operational noise level for the receiver point with the greatest increase in ambient noise caused by Project operations has been reported in this table. For Receptor Groups where the maximum increase in ambient levels would be significant, the noise levels for the receiver point with the lowest increase in ambient levels has been included in this table. For operational noise levels at all calculated receiver points, see Appendix J.

^b Ambient noise based on average daily Leq for Pre-Event and During Event conditions and based on the 10:00 PM hour for Post-Event conditions (see Table 3.11-1)

^c An increase of 3 dBA or greater would be considered significant.

SOURCE: ESA, 2019

Major Event Pre Event

Under the Major Event Pre Event condition, which could include an outdoor amplified event at the Plaza stage, significant increases in ambient noise levels due to Project pre-event operations are expected to occur at noise sensitive receptors the northwest and southwest of the Arena Site.

The ambient noise level and Project composite operational noise level for the receiver point in each receptor group anticipated to experience the highest increase in ambient conditions has been reported in Table 3.1-25.⁶⁹ More specifically, the results presented in Table 3.11-25 show that Major Event Pre-Event noise could exceed ambient noise levels by a maximum of up to 5.2 dBA Leq at a second floor receiver point within receptor group R6 (residential uses located between West 102nd Street and West 103rd Street south of the West Parking Garage Site), and a maximum of up to 3.7 dBA Leq at a second floor receiver point and a maximum of up to 7.7 dBA Leq at a third floor receiver point within receptor group R8 (hotel use at the former Airport Park View Hotel site, adjacent to the Arena Site to the north and east) (see **Figure 3.11-15**). The greatest contributors to composite noise at these locations are amplified sound and crowd noise from a post-event performance in the plaza. Therefore, impacts under the Major Event Pre-Event condition would be **potentially significant**.

Major Event During Event

As indicated in Table 3.11-24, composite operational noise sources at the Proposed Project would not result in significant increases in ambient noise at noise-sensitive receptors around the Project Site (see **Figure 3.11-16**) under the Major Event During Event conditions.

⁶⁹ Note that there are occurrences where ambient levels shown in Table 3.11-25 may not be consistent with ambient levels shown elsewhere in this section for the same receptor group. In order to analyze the worst-case noise impacts of different Project noise sources, there are some situations where there is variation in the location of the reported ambient noise level within the receptor group. This results in the reporting of a different receiver point within the same receptor group because that specific receptor would experience the greatest increase in ambient noise from a particular noise source.

Figure 3.11-16
 Operational Noise Contours - Project Major Event During Event

Major Event Post Event

Based on similar facilities in California, an outdoor amplified event at the Plaza stage could occur after a major event up to 15-25 times a year. In such conditions, significant increases in ambient noise levels due to Proposed Project post-event operations would be expected at noise-sensitive receptors located in areas around the Arena Site.

The ambient noise level and Project composite operational noise level for the receiver points within the receptor groups anticipated to experience the highest increase in ambient conditions are reported in Table 3.11-25.⁷⁰ More specifically, the results presented in Table 3.11-25 show that Major Event Post-Event noise could exceed ambient noise levels by a maximum of up to 7.9 dBA Leq at a ground floor receiver point and a maximum of up to 10.2 dBA Leq at a second floor receiver point within receptor group R1 (residential uses located north of West Century Boulevard and west of South Prairie Avenue), a maximum of up to 8.3 dBA Leq at a second floor receiver point within receptor group R6 (residential uses located between West 102nd Street and West 103rd Street south of the West Parking Garage Site), a maximum of up to 3.4 dBA Leq at a receiver point within receptor group R7 (the Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses located west of South Prairie Avenue), a maximum of up to 3.5 dBA Leq at a second floor receiver point and a maximum of up to 7.4 dBA Leq at a third floor receiver point within receptor group R8 (hotel use at the former Airport Park View Hotel site located adjacent to the Arena Site to the north and east), and a maximum of up to 3.7 dBA Leq at a third floor receiver point within receptor group R21 (residential uses within the HPSP area) (see **Figure 3.11-17**). The greatest contributors to composite noise at these locations are amplified sound and crowd noise from a post-event performance in the plaza.

As described above, during Major Event Pre-Event and Post-Event weekday and weekend conditions, composite noise levels would exceed significance thresholds at noise-sensitive receptors within receptor groups northwest and southwest of the Project Site (see **Figure 3.11-18**). Therefore, impacts under the Major Event Pre- and Post-Event condition on weekday and weekend evenings would be **potentially significant**.

⁷⁰ Note that there are occurrences where ambient levels shown in Table 3.11-25 may not be consistent with ambient levels shown elsewhere in this section for the same receptor group. In order to analyze the worst-case noise impacts of different Project noise sources, there are some situations where there is variation in the location of the reported ambient noise level within the receptor group. This results in the reporting of a different receiver point within the same receptor group because that specific receptor would experience the greatest increase in ambient noise from a particular noise source.

General Plan Consistency

Noise generated by operation of the Proposed Project would not be inconsistent with the goals and policies of the General Plan Noise Element. Goal 1 of the General Plan Noise Element calls for the reduction of noise where the noise environment represents a threat to public health and welfare, and Goal 3 calls for the protection and maintenance of acceptable noise environments. While the generation of noise from project operations would exceed the ambient noise levels, because the noise would occur over a temporary period of a few hours at a time on a limited number of times per year, and because the resulting noise levels would be well below the short- or long-term thresholds related to hearing damage, it would not represent the kind of permanent change to the noise environment that would make the noise environment unacceptable or create a threat to public health or welfare.

Goal 4 of the General Plan calls for consideration of noise and land use incompatibilities in the planning and design of projects. Consistent with Goal 4 and Policies 4.2 and 4.3, this Draft EIR includes substantial information and analysis of noise from project construction, allowing for the consideration of noise effects in decision making regarding the Proposed Project. For the most part, the sensitive receptors near the project site are residences and religious uses. There is an educational use, a Head Start preschool, immediately south of the Arena Site. The significant operational impacts affecting the school site would not represent inconsistencies with Policy 4.2 because (1) the impact would be a result of traffic noise on West 104th Street during a post-event period when the school is not in operation (typically approximately 10:00–10:30 PM), and (2) the impacts would be generated due to an incremental increase in traffic noise at the site, but resultant noise levels at the site would remain under 60 dBA which is considered “clearly acceptable” in the General Plan Noise/Land Use Compatibility Matrix (see Table 3.11-8).

Thus, while the Proposed Project would generate permanent intermittent traffic and operational noise that would potentially increase ambient noise levels in the area before, during, and after certain events, operation of the Proposed Project would not result in inconsistencies with the goals and policies of the General Plan Noise Element.

Potential Health Effects of On-Site Operational Noise

Short-term noise levels constituting the threshold of pain and hearing damage are 120 dB and 140 dB, respectively.⁷¹ Table 3.11-24 and Table 3.11-25 show composite operational noise levels at each of the studied receptors. As shown, composite noise levels would not reach the point at which pain or hearing damage would occur. Therefore, Project operations would not result in adverse health effects related to pain and hearing loss. Proposed uses at the Arena Site include uses that would operate under business hours and during events. With respect to sleep disturbance, Proposed Project operations, which could generate significant noise levels late into the evening hours up to 15-25 times a year, could disturb sleep during nighttime hours. For the discussion regarding the health effects of sleep disturbance see Section 3.11.1. The hotel use

⁷¹ Kinsler, Lawrence E., Frey, A.R., Coppens, A.B., and Sanders, J.V., 1982. *Fundamentals of Acoustics*, Third Edition. 1982

would not include any outdoor noise-generating activities that could occur throughout the nighttime hours. Constant sources of nighttime noise would include mechanical equipment such as HVAC systems.

Mitigation Measure 3.11-2(a)

Noise Reduction Plan. The project applicant shall prepare a Noise Reduction Plan for major event pre- and post-event conditions that results in composite noise levels from amplified sound and mechanical equipment of no more than 3 dBA over ambient conditions at any noise-sensitive receptor. The level of noise reduction shall be documented by a qualified noise consultant and submitted to the City. The Noise Reduction Plan shall be submitted to and approved by the City prior to the first major event at the Arena. Noise reduction strategies could include, but are not limited, the following.

- *Construction of the permanent sound barriers included in the Project as project design features, or construction of permanent sound barriers that achieve an equivalent or better noise reduction as the permanent sound barriers proposed as project design features.*
- *Equip noise generating mechanical equipment, including emergency generators, transformers, and HVAC units with sound enclosures.*
- *Locate noise generating mechanical equipment at the furthest distance from sensitive receptors as feasible.*
- *Design the outdoor stage and sound amplification system (placement and/or number of speakers, and maximum volume) so as to limit noise levels near noise-sensitive receptors.*
- *Utilize sound-absorbing materials on the exterior of Plaza buildings.*
- *Enclose the rooftop restaurant space with a material that would serve as a noise barrier such as glass.*

Mitigation Measure 3.11-2(b)

Implement Mitigation Measure 3.14-2(b) (Implementation of a comprehensive Transportation Demand Management (TDM) program).

Significance after Mitigation: Implementation of Mitigation Measure 3.11-2(a) would reduce Proposed Project composite noise levels. Due to distance attenuation and the effectiveness of screening materials such as steel, enclosing mechanical equipment and placing it as far away from receptors as possible would lower the contribution of mechanical equipment from composite levels. Design of the outdoor stage and sound amplification system to limit amplified sound levels leaving the Project Site would reduce composite noise levels at affected receptors. However, the effectiveness of noise reduction strategies such as sound enclosures for mechanical equipment and the design of the amplified sound system would be dependent on the final design of the Proposed Project and thus are uncertain at this time. Due to the uncertainty with feasibility and effectiveness of noise reduction strategies, composite noise impacts on weekday and weekend evenings would be **significant and unavoidable**.

Significant increases in traffic noise would occur under the Major Event Weekday Post Event and the Mid-Size Event at NFL Stadium plus concert at The Forum plus Project Weekday Post Event conditions. Mitigation that could reduce impacts from on-road traffic along impacted segments includes the construction of sound walls along the roadway segments adjacent to noise-sensitive receptors. However, the Proposed Project does not have control over the public right-of-way or noise-sensitive receptors that could allow installation of sound walls. Therefore, installation of sound walls would not be feasible. Mitigation Measure 3.14-2(b) would require the implementation of a comprehensive TDM program that would reduce Project-related traffic. A reduction in Project-related traffic would result in reductions in traffic noise. The extent to which this measure would reduce trips along impacted segments is uncertain. Therefore, impacts would be **significant and unavoidable**.

Impact 3.11-3: Construction of the Proposed Project would generate excessive groundborne vibration levels. (Significant and Unavoidable)

On-Site Construction Equipment

Although no high-impact activities, such as pile-driving or blasting, would be used, construction activities at the Project Site have the potential to generate groundborne vibration through the operation of heavy equipment (i.e., dozer, vibratory roller, drill rigs, and loaded trucks such as haul trucks, etc.). Based on FTA reference vibration levels presented in Table 3.11-13, potential vibration velocities experienced at vibration-sensitive receptors have been calculated and summarized in Tables 3.11-26 through 3.11-30. Vibration impacts that would occur as a result of construction on different parts of the Project Site are described further below.

Arena Site

As indicated in Table 3.11-26, the use of a vibratory roller at the Project Site boundary nearest each vibration-sensitive receptor could generate vibration velocities of up to 2.348 in/sec PPV (115.4 VdB) at the self-storage facility adjacent to the Arena Site to the north (R9), the warehousing and shipping structure adjacent to the Arena Site to the east (R10), multifamily residential use adjacent to the Arena Site to the west (R11), and the industrial structure adjacent to the Arena Site to the east (R13), velocities of up to 0.830 in/sec PPV (106.3 VdB) at the multiple family residential uses adjacent to the Arena Site to the south (R16), and velocities of up to 0.452 in/sec PPV (101.1 VdB) at the single-family residential use adjacent to the Arena Site to the east (R12) (see Figure 3.11-19), exceeding the structural damage threshold of 0.3 in/sec PPV. These velocities would be generated when the use of vibratory rollers would occur five feet or closer, 10 feet or closer, and 15 feet or closer, respectively, to a vibration-sensitive receptor. Vibration velocities from on-site construction equipment would not exceed the structural damage threshold for any of the other receptors.

Inglewood Basketball and Entertainment Center
Figure 3.11-19
 Significant Construction Vibration Impacts

With respect to human annoyance, the use of vibratory rollers along the Project Site property line would generate vibration velocities in excess of applicable thresholds (72 VdB at residences and 75 VdB at commercial, industrial, and religious uses) at commercial uses adjacent to the West Parking Garage Site to the west (R4), the Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses to the south of the West Parking Garage Site (R7), the hotel use at the former Airport Park View Hotel site adjacent to the Arena Site to the north and east (R8), the warehousing and shipping use adjacent to the Arena Site to the east (R10), multifamily residential use adjacent to the Arena Site to the west (R11), single-family residential use adjacent to the Arena Site to the east (R12), the industrial use adjacent to the Arena Site to the east (R13), the multi-family residential uses adjacent to the Arena Site to the south (R16), and single-family residential uses to the south of the Well Relocation Site (R17) (see Figure 3.11-19). Vibration velocities would not exceed applicable thresholds for any of the other receptors. Therefore, construction activity at the Arena Site would result in the generation of groundborne vibration in excess of applicable thresholds and impacts would be **potentially significant**.

West Parking Garage Site

As indicated in **Table 3.11-27**, the use of a vibratory roller at the Project Site boundary nearest each vibration-sensitive receptor could generate vibration velocities of up to 2.348 in/sec PPV (115.4 VdB) at the Airport Motel adjacent to the West Parking Garage Site to the west (R3), commercial uses adjacent to the West Parking Garage Site to the east (R4), and single-family residential uses adjacent to the West Parking Garage Site to the west (R5) (see Figure 3.11-19), exceeding the structural damage threshold of 0.3 in/sec PPV. These velocities would be generated when the use of vibratory rollers would occur at five feet or closer from a vibration-sensitive receptor. Vibration velocities from on-site construction equipment would not exceed the structural damage threshold for any of the other receptors.

With respect to human annoyance, the use of large bulldozers and bore/drill rigs along the Project property line would generate vibration velocities in excess of applicable thresholds (72 VdB at residences and 75 VdB at commercial, industrial, and religious uses) at single-family residential uses to the west of the West Parking Garage Site (R2), the motel use (Airport Motel) adjacent to the West Parking Garage Site to the west (R3), commercial uses adjacent to the West Parking Garage Site to the west (R4), single-family residential uses adjacent to the West Parking Garage Site to the west (R5), single-family residential uses to the south of the West Parking Garage Site (R6), and the Iglesia Evangelica Profetica Jesucristo Pronto Viene and residential uses located west of South Prairie Avenue to the south of the West Parking Garage Site (R7) (see Figure 3.11-19). Vibration velocities would not exceed applicable thresholds for any of the other receptors. Therefore, construction activity at the West Parking Garage Site would result in the generation of groundborne vibration in excess of applicable thresholds and impacts would be **potentially significant**.

NOTES:

N/A – Receptor not vibration-sensitive with respect to human annoyance.

SOURCE: ESA, 2019; FTA, Transit Noise and Vibration Impact Assessment Manual, 2018

East Transportation and Hotel Site

Transportation Hub

As indicated in **Table 3.11-28**, the use of a vibratory roller at the Project Site boundary nearest each vibration-sensitive receptor could generate vibration velocities of up to 2.348 in/sec PPV (115.4 VdB) at the industrial use (Transworld Aquatic Enterprises, Inc.) adjacent to the East Transportation Site to the west (R18) (see Figure 3.11-19), exceeding the structural damage threshold of 0.3 in/sec PPV. These velocities would be generated when the use of vibratory rollers would occur at five feet or closer from a vibration-sensitive receptor. Vibration velocities from on-site construction equipment would not exceed the structural damage threshold for any of the other receptors.

With respect to human annoyance, the Proposed Project would generate vibration velocities in excess of applicable thresholds (72 VdB at residences and 75 VdB at commercial, industrial, and religious uses) at the industrial use located adjacent to the East Transportation Site to the west (R18), the shipping facility use (UPS) adjacent to the East Transportation and Hotel Site to the east (R19), and multifamily residential uses to the south of the East Transportation Site (R20) (see Figure 3.11-19). Vibration velocities would not exceed applicable thresholds for any of the other receptors. Therefore, construction activity for the parking garage and transportation hub at the East Transportation and Hotel Site would result in the generation of groundborne vibration in excess of applicable thresholds and impacts would be **potentially significant**.

Hotel

As indicated in **Table 3.11-29**, the use of a vibratory roller at the Project Site property line could generate vibration velocities of up to 0.014 in/sec PPV (63.6 VdB) at the shipping facility (UPS) adjacent to the East Transportation and Hotel Site to the east (R19), which is the nearest vibration-sensitive receptor to the proposed hotel building. This velocity would not exceed the structural damage threshold of 0.3 in/sec PPV or the applicable human annoyance threshold (72 VdB at residences and 75 VdB at commercial, industrial, and religious uses). Therefore, construction activity for the hotel at the East Transportation and Hotel Site would not result in the generation of groundborne vibration in excess of applicable thresholds and impacts would be **less than significant**.

Well Relocation Site

As indicated in **Table 3.11-30**, the use of a vibratory roller at the Project Site property line could generate vibration velocities of up to 2.348 in/sec PPV (115.4 VdB) at the industrial structure adjacent to the Well Relocation Site to the west (R13) and single-family and multifamily residential uses adjacent to the Well Relocation Site to the east (R14) (see Figure 3.11-19), exceeding the structural damage threshold of 0.3 in/sec PPV. These velocities would be generated when the use of vibratory rollers would occur at five feet from a vibration-sensitive receptor. Vibration velocities from on-site construction equipment would not exceed the structural damage threshold for any of the other receptors.

NOTES:

N/A – Receptor not vibration-sensitive with respect to human annoyance.

SOURCE: ESA, 2019; FTA, Transit Noise and Vibration Impact Assessment Manual, 2018

With respect to human annoyance, the use of vibratory rollers along the Project Site property line would generate vibration velocities in excess of applicable thresholds (72 VdB at residences and 75 VdB at commercial, industrial, and religious uses) at the warehousing and shipping use adjacent to the Arena Site to the east (R10), the industrial use adjacent to the Well Relocation Site to the west (R13), single-family and multifamily residential uses adjacent to the Well Relocation Site to the east (R14), the multi-family residential uses adjacent to the Arena Site to the south (R16), and single-family residential uses to the south of the Well Relocation Site (R17) (see Figure 3.11-19). Vibration velocities would not exceed applicable thresholds for any of the other receptors. Therefore, construction activity at the Well Relocation Site would result in the generation of groundborne vibration in excess of applicable thresholds and impacts would be **potentially significant**.

Off-Site Construction Traffic

As described above, construction haul trucks would travel on designated haul routes, which include Manchester Avenue and South Prairie Avenue when using I-110, Manchester Avenue, South Prairie Avenue, and West Century Boulevard when using the I-405, and South Prairie Avenue when using the I-105. Heavy-duty construction trucks would generate groundborne vibration as they travel along the anticipated haul route(s). The vibration generated by a typical heavy-duty truck would be approximately 0.00566 in/sec PPV (63 VdB) at a distance of 50 feet from the truck.⁷² There are existing buildings along the anticipated haul route(s) that are situated as close as 10 feet to the roadway right-of-way and would be expected to experience groundborne vibration levels of approximately 0.0633 in/sec PPV (84 VdB). This estimated vibration generated by construction trucks traveling along the anticipated haul route(s) would be well below the threshold of 0.3 in/sec PPV for structural damage. However, the anticipated vibration velocity of 84 VdB would exceed the 72 VdB and 75 VdB thresholds for residential and commercial/industrial uses, respectively. Therefore, off-site construction vibration impacts with respect to human annoyance would be **potentially significant**.

Conclusion

As described above, the potential exists for the generation of groundborne vibration in excess of structural damage and human annoyance thresholds at a number of locations around the Project Site. Therefore, these impacts would be **potentially significant**.

Mitigation Measure 3.11-3(a)

Minimize Construction Equipment Vibration. To address potential structural damage impacts, the operation of construction equipment that generates high levels of vibration, such as vibratory rollers, large bulldozers/drill rigs and loaded trucks, shall occur no nearer than 20 feet from neighboring structures, if feasible.

Mitigation Measure 3.11-3(b)

Vibration, Crack, and Line and Grade Monitoring Program. If vibratory rollers, large bulldozers or loaded trucks are required to operate within 20 feet of existing structures,

⁷² Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment*, Figure 5-4.

implement a vibration, crack, and line and grade monitoring program at existing buildings located within 20 feet of demolition/construction activities. The following elements shall be included in this program:

a) Pre-Demolition and Construction:

- i. Photos of current conditions shall be included as part of the crack survey that the construction contractor will undertake. This includes photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labeled in detail and dated.*
- ii. The construction contractors shall identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities. Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the project.*
- iii. The construction contractor shall determine the number and placement of vibration receptors at the affected buildings in consultation with a qualified architect. The number of units and their locations shall take into account proposed demolition and construction activities so that adequate measurements can be taken illustrating vibration levels during the course of the project, and if/when levels exceed the established threshold.*
- iv. A line and grade pre-construction survey at the affected buildings shall be conducted.*

b) During Demolition and Construction:

- i. The construction contractor shall regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in post-construction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.*
- ii. The construction contractor shall collect vibration data from receptors and report vibration levels to the City Chief Building Official on a monthly basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels, along with proposed corrective actions to avoid vibration levels approaching or exceeding the established threshold.*

c) Post-Construction

- i. The applicant (and its construction contractor) shall provide a report to the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the project and/or show how the project*

did not cause physical damage to the buildings. The report shall include annotated analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a post-construction line and grade survey shall also be included in this report.

- ii. The project applicant (and its construction contractor) shall be responsible for repairs from damage to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.*

Mitigation Measure 3.11-3(c)

Designate Community Affairs Liaison. Designate a Community Affairs Liaison and conspicuously post this person's contact information around the project site, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complaints about construction activities. This Community Affairs Liaison shall receive all public complaints about construction vibration disturbances and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem. The Community Affairs Liaison shall have the authority to coordinate with a designated construction contractor representative for the purpose of investigating the noise disturbance and undertaking all feasible measures to protect public health and safety, and shall ensure that steps be taken to reduce construction vibration levels as deemed appropriate and safe by the designated construction contractor representative. Such steps could include the application of vibration absorbing barriers, substitution of lower vibration generating equipment or activity, rescheduling of vibration-generating construction activity, or other potential adjustments to the construction program to reduce vibration impacts at the adjacent vibration-sensitive receptors.

Significance After Mitigation: The potential for building damage due to typical construction techniques such as those expected to be used in the construction of the Proposed Project is rare except in extreme cases such as blasting or pile driving. The potential structural response from vibration velocities generated by Proposed Project construction would include minor cosmetic damage for fragile buildings.⁷³ Buildings that would be impacted by Project construction with regard to potential structural damage are not designated as historic, therefore would not be considered “fragile”. With the implementation of Mitigation Measures 3.11-3(a) and 3.11-3(b), the Proposed Project would not result in the generation of excessive groundborne vibration levels exceeding structural damage thresholds during on-site construction activity, and any structural damage that may be created would be repaired. Thus, this impact with regard to structural damage would be considered **less than significant**.

Although vibration velocities may not be lowered by Mitigation Measure 3.11-3(c), annoyance would be addressed within 24 hours of complaint. Similar to structural damage mitigation, required setbacks for vibratory construction equipment from vibration sensitive receptors required under Mitigation Measures 3.11-3(a) and 3.11-3(b) would

⁷³ Federal Transit Administration, 2018. *Transit Noise and Vibration Impact Assessment Manual*. September 2018. p. 113.

reduce vibration velocities. However, such restrictions on equipment usage would potentially result in delays in the construction schedule that would expose vibration-sensitive receptors to longer durations of construction activity, and thus may not be feasible to reduce the impact to insignificance. Therefore, impacts with regard to human annoyance would be considered **significant and unavoidable**.

As described above, heavy-duty construction truck travel along the designated haul route(s) could result in exceedance of human annoyance thresholds. The distance at which heavy-duty trucks need to travel in order to avoid exceedance of human annoyance thresholds of 72 VdB for residential uses and 75 VdB for commercial and industrial uses is 25 feet and 20 feet, respectively. Potential mitigation to address this impact includes prohibiting travel along the right lane of the roadway. Limiting the lanes of travel for construction trucks, including haul trucks, where residential, commercial, or industrial uses could be impacted would not be feasible because there would be no mechanism for enforcement. Additionally, the drivers of construction vehicles may not be under the management of the Project Proponent. Therefore, no feasible mitigation is available to mitigate on-road construction vibration impacts with regard to human annoyance and impacts would be **significant and unavoidable**.

Impact 3.11-4: The Proposed Project is located within the Planning Boundary/Airport Influence Area for LAX as designated within the airport land use plan and could expose people residing or working in the region surrounding the Project Site to excessive noise levels. (Less than Significant)

The Project Site is located within the Planning Boundary/AIA for LAX as designated within the ALUP. The Planning Boundary/AIA is based in part on the 65 dBA CNEL contour included in the ALUP, as shown in Figure 3.11-3. Figure 2-4 (see Chapter 2, Project Description) depicts the 14 CFR Part 150 Noise Exposure Map for LAX. As shown in Figure 2-4, parts of the Project Site located between West 102nd Street and West Century Boulevard are generally located in areas exposed to CNEL 65 dBA -70 dBA in the 14 CFR Part 150 study. This includes both the West and East Parking Garage sites, the Plaza area including commercial and community uses, most of the Arena and Practice and Athletic Training Facility, Office, and Sports Medicine Clinic, and the Hotel. Parts of the Project Site south of West 102nd Street are generally located in areas exposed to CNEL 70–75 dBA in the 14 CFR Part 150 study. This includes part of the Arena and Practice and Athletic Training Facility, Office, and Sports Medicine Clinic, as well as the South Parking Garage.

Pursuant to ALUP Policies G-1 and N-3, the compatibility of proposed land uses is determined by consulting the land use compatibility table provided in Section V of the ALUP. The land use compatibility table identifies land uses by category, including residential, commercial, and industrial land use; the Proposed Project components would all generally fall within the commercial and recreational land use categories. The compatibility criteria provided in the land use compatibility table is the same for both commercial and recreational land uses. The compatibility criteria require that commercial and recreational land uses located in areas exposed to noise levels of CNEL 65 dBA – 75 dBA must be reviewed for noise insulation needs. Noise

insulation is unlikely to be required for elements of the Proposed Project that are not considered noise sensitive or where it is not feasible, including the arena outdoor plaza areas, the West Parking Garage, or the parking structure and related facilities on the East Transportation Hub and Parking Garage.

Standard building construction practices and compliance with applicable building codes for the commercial structures in the Plaza area and for the Hotel would typically reduce interior noise levels to acceptable levels. Among other applicable standards, the California Green Building Standards Code (Title 24) sets forth specific standards for non-residential structures within the 65 CNEL noise contour of an airport, including requirements that the wall and roof-ceiling assemblies achieve a composite sound transmission class (STC) rating of at least 50, or a composite outdoor-indoor transmission class (OITC) rating of not less than 40 and exterior windows be rated with a minimum STC of 40, or OITC of 30.⁷⁴ The California Building Code, as incorporated into the Inglewood Municipal Code, requires that new hotel uses be constructed or insulated to achieve interior background sound levels due to exterior-to-interior outdoor noise intrusion of no greater than 45 dBA CNEL.⁷⁵ With compliance with such standards implemented during the design process and verified in the building inspection process, the Proposed Project would comply with ALUP Policies G-1 and N-3, and would not expose people residing (staying in the hotel), working in the project area, or attending events in the Arena to excessive noise levels. Impacts would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic context for the analysis of cumulative impacts for noise and vibration depends on the impact being analyzed. For example, the Project's contribution to localized impacts, such as those associated with Project construction and Project operation/traffic noise, could affect the local neighborhood and Project's traffic study area. This cumulative impacts discussion provides separate analyses of cumulative construction and operational impacts in light of the variation of timing of construction and operational activities.

In addition to the Proposed Project, there are 145 cumulative projects that have been taken into consideration when developing the cumulative context, although the context varies by impact type. The locations of the cumulative projects are shown in Section 3.0, Introduction to Analysis, at Figure 3.0-1, Approximate Locations of Cumulative Projects.

⁷⁴ California Green Building Standards Code California Code of Regulations, Title 24, Part 11, Division 5.5, Section 5.507.4.

⁷⁵ Inglewood Municipal Code, Chapter 11, Article 2, Section 11-3.

While the majority of the cumulative projects are located a substantial distance from the Proposed Project, the closest cumulative projects in the vicinity of the Project Site that could contribute to cumulative impacts are:

- Cumulative Project 67 (HPSP Remaining Development). This project represents the full buildout of the remaining development within HPSP area immediately to the north of the Project Site that is not included in the Adjusted Baseline, including development of the northern 60-acres which would require an amendment to the HPSP. When combined with the HPSP Adjusted Baseline Projects described in Section 3.0.5, the development included in Cumulative Project 67 is assumed to result in a total 890,000 sf of retail space, 2,500 dwelling units, a 300-room hotel and over 4,000,000 sf of office space within the HPSP area.
- Cumulative Project 73 (Hotel project located at 3900 West Century Boulevard). This project involves the renovation or rehabilitation of the former Airport Park View Hotel. As described above, this site is located within noise- and vibration-sensitive receptor group R8 and the future hotel use is assumed to be operational for the purposes of evaluating potential noise impacts associated with the Proposed Project. Construction of this project has been initiated at the time of the writing of this Draft EIR, and while it is likely, it is unknown whether construction will be completed prior to the start of construction of the Proposed Project. In addition, because building on the site is currently non-operational and dilapidated, the reoccupation of the site with a hotel use would potentially add to the existing noise environment.
- Cumulative Project 74 (Inglewood Transit Connector Project). The Inglewood Transit Connector is a proposed elevated transit project. The alignment selected by the City of Inglewood as the “locally preferred alternative” for further review would extend from a northern terminus at the future Crenshaw/LAX Downtown Inglewood light rail station to the southern terminus of the system near the Proposed Project at a station located in the northern quadrant of the South Prairie Avenue/West Century Boulevard intersection. See Section 3.14.4 for a more detailed description of this cumulative project.

Impact 3.11-5: Construction of the Proposed Project, in conjunction with other cumulative development, would result in cumulative temporary increases in ambient noise levels. (Significant and Unavoidable)

The geographic scope for the consideration of cumulative construction noise impacts would be primarily the areas immediately surrounding the Project Site, and, to a lesser degree, along designated routes where heavy construction truck traffic would travel during Project construction periods. Generally, noise impacts are limited to the area directly surrounding the noise source, as noise attenuates with distance at a higher rate in proximity to the source, and based on the rate of attenuation only has the potential to combine with other noise sources occurring simultaneously within 500 feet from the construction site.

Cumulative Project 67, the cumulative HPSP development, is located within the HPSP area immediately to the north across West Century Boulevard. This project is located approximately 500 feet from noise-sensitive receptors within receptor group R1 (residential uses north of West Century Boulevard and west of South Prairie Avenue) and other noise-sensitive receptors along South Prairie Avenue.

Cumulative Project 73, located at 3900 West Century Boulevard, would be located adjacent to the Arena Site and was analyzed as noise-sensitive receptor group R8. Cumulative Project 73 is located approximately 550 feet from the nearest noise-sensitive receptor in receptor group R1. Cumulative Project 74 (Inglewood Transit Connector) would be constructed above South Prairie Avenue, and would extend to the north side of the South Prairie Avenue/West Century Boulevard intersection near the Project Site. Cumulative Project 74 is located adjacent to noise-sensitive receptors along South Prairie Avenue, including receptor groups R1 and R21 (residential uses within HPSP area).

The timing of the construction activities for those cumulative projects cannot be defined, and any quantitative analysis of those projects to assume concurrent construction would be entirely speculative. Both Cumulative Projects 67 and 74 are of sufficient scale that depending upon the specifics of future project construction that are unknown at this time, construction of those projects could overlap with Proposed Project construction. Considering the uncertainty regarding completion of construction of Cumulative Project 73, the construction period of the Proposed Project could also overlap with the its construction. Should construction activities (day or night) at the Project Site occur concurrently with construction of Cumulative Projects 67, 73 and/or 74, receptors, including receptors along South Prairie Avenue and in receptor group R1, could be exposed to construction noise that results in temporary noise increases in excess of the 5 dBA above ambient exterior noise level significance threshold.

No noise-sensitive receptors (i.e., residential, hotel, school, etc.) are located within 500 feet of Cumulative Project 73 that could be impacted by combined construction noise levels from the Proposed Project and Cumulative Project 73. No other cumulative projects, as shown in Figure 3.0-1, are located within 500 feet of the Project Site.

Should construction of Cumulative Projects 67, 73 and/or 74 overlap with construction (day or night) of the Proposed Project, cumulative construction noise impacts would result. While it could reasonably be assumed that cumulative projects would implement mitigation measures to lessen to the extent feasible potential noise impacts from on-site construction, potential cumulative impacts as a result of the cumulative projects and the Proposed Project could occur. Because the cumulative exceedances of the significance thresholds in the absence of the Proposed Project construction, the contribution of the Proposed Project would be cumulatively considerable. Therefore, the cumulative impact would be **potentially significant**.

It is assumed that heavy-duty construction trucks associated with construction of any of the cumulative projects would utilize designated haul routes. Should use of the same designated haul routes by any of the cumulative projects overlap with use of those haul routes by the Proposed Project during the same period, traffic volumes could potentially increase such that the resulting cumulative noise increase due to construction traffic along the haul routes would exceed 3 dBA over ambient noise levels at noise-sensitive receptors along those routes. Because the cumulative exceedances of the significance thresholds in the absence of the Proposed Project construction truck traffic, the contribution of the Proposed Project would be cumulatively considerable. Therefore, cumulative impacts associated with off-site construction noise would be **potentially significant**.

Mitigation Measure 3.11-5

Implement Mitigation Measure 3.11-1. (Construction Noise Reduction Plan).

Significance after Mitigation: Significant on-site construction noise levels would occur during construction, and off-site construction truck traffic would result in significant increases in traffic noise in combination with cumulative construction-related noise levels if construction of the cumulative projects identified above were to overlap with construction of the Proposed Project. Implementation of the Construction Noise Reduction Plan in combination with proposed permanent and temporary noise barriers would reduce Proposed Project contribution to cumulative construction-related noise levels from on-site activities and off-site construction traffic.

Although implementation of Mitigation Measure 3.11-1 would ensure that feasible measures to minimize construction noise from the Proposed Project would be undertaken, the close proximity of affected noise sensitive receptors to potentially overlapping construction activities from the Proposed Project and nearby Cumulative Projects 67, 73 and/or 74 could result in cumulative impacts in excess of applicable thresholds at nearby noise-sensitive receptors. In addition, overlapping construction traffic, even with implementation of Mitigation Measure 3.11-1, could result in cumulative noise level increases at noise-sensitive land uses along truck routes in excess of 3 dBA.

The Proposed Project includes the installation of temporary and permanent sound walls, the most effective measure to reduce construction noise impacts, prior to commencement of heavy construction activity and reductions provided have been accounted for in the analysis. However, because the Proposed Project construction plan is not final at this point in time, and it is unknown whether construction of other projects in the area including Cumulative Projects 67, 73, and/or 73 would overlap with construction of the Proposed Project, it is not practicable to calculate a numeric reduction in mitigated noise levels attributable to the noise-reduction techniques identified in Mitigation Measure 3.11-1. Due to the uncertainty with feasibility and effectiveness of noise reduction strategies, the Proposed Project contribution to cumulative noise impacts could remain considerable, and the impacts would be **significant and unavoidable**.

Impact 3.11-6: Operation of the Proposed Project, in conjunction with other cumulative development, would result in cumulative permanent increases in ambient noise levels. (Significant and Unavoidable)

The operation of the Proposed Project would generate pedestrian noise, parking lot noise, outdoor plaza noise from live performances, mechanical equipment at the West Parking Garage, Arena Structure, East Transportation Hub and hotel, media truck noise, and mobile sources (e.g., vehicle trips). Noise generated from mechanical equipment, parking lot noise, media truck noise, and outdoor plaza noise associated with the Proposed Project would be generated on the Project Site while pedestrian noise would be generated along West Century Boulevard and South Prairie Avenue.

The development of other cumulative development, including cumulative projects in proximity to the Project Site, as well as other cumulative projects and development throughout the region, would add noise generators to the vicinity of the Project Site, and traffic to roads and highways that would serve the Project Site.

On-Site Operational Noise

Cumulative Project 73 (the Hotel Project at the former Airport Park View Hotel site) is adjacent on two sides to the Arena Site, and is located approximately 500 feet from noise-sensitive receptors within receptor group R1 (single-family residential uses northwest of the intersection of West Century Boulevard and South Prairie Avenue), and Cumulative Project 74 (Inglewood Transit Connector) is located within the right-of-way of South Prairie Avenue, just north of West Century Boulevard, immediately to the east of receptor R1.

Noise sources associated with Cumulative Project 73 includes the operation of mechanical equipment and parking lot activity. The final design of the hotel, and any outdoor components or noise-generating features it may include, are unknown at this time; however, commercial hotel uses are not typically associated with the creation of excessive exterior noise levels. However, there are no noise-sensitive uses within 500 feet of Cumulative Project 73. Therefore, Project operations would not combine with operational noise from Cumulative Project 73 to generate a cumulative impact.

The specific program of development to be included in Cumulative Project 67 is unknown at this time, but is anticipated to include commercial retail, dining, and hotel uses, residential uses, and office uses. Noise sources associated with Cumulative Project 67 are anticipated to include the operation of mechanical equipment, pedestrian noise, and parking activity noise similar to other large mixed-use developments. Operational noise from Cumulative Project 67, which includes an NFL Stadium, could combine with Project operational noise during event days at the Proposed Project.

Noise sources associated with Cumulative Project 74 includes pedestrian activity and transit noise from an elevated transit facility and station. Noise sources from operation of Cumulative Project 74 could combine with Proposed Project operations to increase ambient noise levels at noise-sensitive receptors in the vicinity of the Project Site, particularly during Proposed Project event days. For this reason, the cumulative noise impacts associated with these sources would be **potentially significant**. As discussed above, Proposed Project operations would result in significant increases in the ambient noise environment in excess of significance thresholds under Major Event Pre-Event and Post Event conditions. Therefore, the Project contribution to the cumulative impact would be considerable, and, thus, the cumulative impact is **significant**.

Off-Site Operational Traffic Noise

Traffic conditions associated with the future cumulative conditions described in Section 3.0.6 were evaluated in Section 3.14, Transportation and Circulation. Future roadway noise levels accounting for traffic from cumulative projects were calculated along various arterial segments adjacent to the Project Site based on the information provided in Section 3.14. Cumulative traffic noise levels under Non-Event Day, Day-Time Corporate/Community Event, Other Sporting Event or Gathering, and Major Event conditions were calculated using the traffic noise model previously described and compared to the applicable Adjusted Baseline traffic noise levels.

Cumulative Plus Project Non-Event Day

Impacts under the Cumulative Plus Project (Non-Event Day) condition are shown in **Table 3.11-31**. As indicated, increases in traffic noise during the weekday PM peak period would range from 0.1 dBA Leq up to 1.7 dBA Leq, and would not exceed the significance threshold of 3 dBA Leq. Therefore, cumulative traffic noise impacts during the weekday PM peak period on a non-event day would be less than significant.

During the weekday AM peak period on a non-event day, cumulative increases in traffic noise along studied roadway segments would range from 0.2 dBA Leq up to 3.9 dBA Leq. The cumulative increase in traffic noise along one roadway segment, Myrtle Avenue between Hardy Street and West Century Boulevard, would exceed the 3 dBA Leq significance threshold during the weekday AM peak hour of a non-event day. Because the significance threshold would be exceeded on one roadway segment during the AM peak hour under the Cumulative Plus Project (Non-Event Day) condition, the cumulative impact would be **potentially significant**.

Although cumulative increases in traffic noise would result in significant impacts along Myrtle Avenue between Hardy Street and West Century Boulevard, Project-only traffic would result in an increase of 0.1 dBA Leq (see Table 3.11-18) during the Non-Event Day AM Peak Period. This increase of less than 1 dBA Leq would not be perceptible unless in controlled laboratory setting.⁷⁶ Because the cumulative effect would be significant without contribution of the Proposed Project, and the incremental difference would not be a perceptible change in noise levels, the Proposed Project's contribution would be less than considerable, and thus would be **less than significant**.

Cumulative Plus Project Day-Time Corporate/Community Event

Impacts under the Cumulative Plus Project Day-Time Corporate/Community Event condition are shown in **Table 3.11-32**. As indicated, the cumulative increase in traffic noise along one roadway segment, Myrtle Avenue between Hardy Street and West Century Boulevard, would exceed the significance threshold of a 3 dBA Leq increase, resulting in an increase in traffic noise of 3.9 dBA Leq for a Day-Time Corporate/Community Event during the weekday AM peak period. Therefore, cumulative impacts under the Cumulative Plus Project Day-Time Corporate/Community Event condition would be **potentially significant**.

Although cumulative increases in traffic noise would result in a significant impact along Myrtle Avenue between Hardy Street and West Century Boulevard, Project-only traffic would result in an increase of 0.0 dBA Leq, which is an increase that would not be perceptible (less than 1 dBA) unless in controlled laboratory setting (see Table 3.11-19).⁷⁷ Because the contribution of the Proposed Project would be unmeasurable and imperceptible, the contribution is considered less than considerable, and would be **less than significant**.

⁷⁶ California Department of Transportation, 2013. Technical Noise Supplement. September 2013. p. 6-5.

⁷⁷ California Department of Transportation, 2013. Technical Noise Supplement. September 2013. p. 6-5.

NOTES:

N/A – Traffic along these segments are most affected by event-related traffic and not by daily AM peak hour traffic. Therefore, traffic volumes for these segments were not simulated under the weekday AM peak hour.

SOURCE: ESA, 2019 (Appendix J)

Cumulative Plus Project Other Sporting Event or Gathering

Impacts during the weekday PM peak period under the Cumulative Plus Project Other Sporting Event or Gathering condition are shown in **Table 3.11-33**. Increases in traffic noise along studied roadways under Cumulative Plus Project (Other Sporting Event or Gathering) conditions would not exceed the 3 dBA Leq or greater increase significance threshold. Therefore, this cumulative impact would be **less than significant**.

Cumulative Plus Project Major Event

Impacts under the Cumulative Plus Project (Major Event) condition are shown in **Table 3.11-34**. As indicated, during the weekday Pre Event Peak Period the increase in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 3.1 dBA Leq. During the weekday Pre Event Peak Period the increase in traffic noise along one roadway segment, Manchester Boulevard between Ash Avenue and La Brea Avenue, would exceed the 3 dBA Leq increase significance threshold. Therefore, traffic noise under the Cumulative Plus Project Major Event Weekday Pre Event condition would be **potentially significant**.

As is shown in Table 3.11-21, Project-only traffic on Manchester Boulevard between Ash Avenue and La Brea Avenue would result in an increase of 1.2 dBA Leq, which would be an increase that would be perceptible under a controlled laboratory setting.⁷⁸ Because the Proposed Project would contribute a perceptible cumulative increase in traffic noise during the Pre Event Peak Period of a Major Event along Manchester Boulevard between Ash Avenue and La Brea Avenue (see Table 3.11-21 and **Figure 3.11-20**), the contribution of the Proposed Project would be considerable and **potentially significant**.

During the Cumulative Plus Project Major Event Weekday Post Event Peak Period condition, the increase in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 4.9 dBA Leq. Under this condition, 28 roadway segments would experience increases in traffic noise of 3.0 dBA Leq or greater and the cumulative impact would be **potentially significant**. Of those 28 roadway segments where potentially significant cumulative impacts could occur, the Proposed Project contribution would result in increases greater than 1 dBA Leq, which is an increase that would be perceptible in a controlled laboratory setting, along 27 segments (all segments except for La Cienega between the I-405 on/off ramps and West 104th Street) (see Table 3.11-21 and **Figure 3.11-21**).⁷⁹ Therefore, the project's contribution would be cumulatively considerable and the cumulative impact is **potentially significant**.

⁷⁸ California Department of Transportation, 2013. Technical Noise Supplement. September 2013. p. 6-5.

⁷⁹ California Department of Transportation, 2013. Technical Noise Supplement. September 2013. p. 6-5.

Inglewood Basketball and Entertainment Center

Figure 3.11-21
Significant Cumulative Traffic Noise Impact Locations -
Project Major Event (Weekday Post Event)

During the Cumulative Plus Project Major Event Weekend Pre Event Peak Period, the cumulative increase in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 3.6 dBA Leq. Under this condition, four roadway segments would experience increases in traffic noise of 3.0 dBA Leq or greater and the cumulative impact would be **potentially significant**. Of those four roadway segments, the Proposed Project would not result in increases of greater than 1 dBA Leq, which is an increase that would be perceptible in a controlled laboratory setting, along any segments (see Table 3.11-21).⁸⁰ Therefore, the project's contribution is less than cumulatively considerable and the cumulative impact is **less than significant**.

During the Cumulative Plus Project Major Event Weekend Post Event Peak Period, the cumulative increase in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 5.4 dBA Leq. Under this condition, 33 roadway segments would experience increases in traffic noise of 3.0 dBA Leq or greater and the cumulative impact would be **potentially significant**. Of those 33 roadway segments, the Proposed Project would result in increases of greater than 1 dBA Leq for all segments, which is an increase that would be perceptible in a controlled laboratory setting, along any segments (see Table 3.11-21 and **Figure 3.11-22**).⁸¹ Therefore, the project's contribution would be cumulatively considerable and the cumulative impact is **potentially significant**.

Cumulative Plus Stadium Mid-Sized Event Plus Forum Concert Plus Project Major Event (Weekday) Impacts under the Cumulative Plus Stadium Mid-Sized Event Plus Forum Concert Plus Project Major Event (Weekday Pre Event) condition are shown in **Table 3.11-35**. As indicated, the cumulative increase in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 6.4 dBA Leq during the weekday Pre Event Peak Period. The increase in traffic noise along studied roadway segments would exceed the significance threshold of a 3 dBA Leq increase during the weekday Pre Event Peak Period along 21 roadway segments. Therefore, impacts under the Cumulative Plus Stadium Mid-Size Event Plus Forum Concert Plus Project Major Event (Weekday Pre Event) condition would be **potentially significant**. Although cumulative increase in traffic noise would result in significant impacts along 21 roadway segments, the Proposed Project contribution would not result in increases greater than 1 dBA Leq, which is an increase that would be perceptible unless in controlled laboratory setting (see Table 3.11-22).⁸² Therefore, the project's contribution would be less than cumulatively considerable and the cumulative impact is **less than significant**.

During the Cumulative Plus Stadium Mid-Sized Event Plus Forum Concert Plus Project Major Event (Weekday Post Event) condition, the increase in traffic noise along studied roadway segments would range from 0.1 dBA Leq up to 8.5 dBA Leq. Under this condition, 74 roadway segments would experience increases in traffic noise of 3.0 dBA Leq or greater and, thus, the cumulative impacts on these segments would be **potentially significant**. Of those 74 roadway segments where potentially significant cumulative impacts could occur, the Proposed Project

Inglewood Basketball and Entertainment Center

Figure 3.11-22
 Significant Cumulative Traffic Noise Impact Locations -
 Project Major Event (Weekend Post Event)

would result in increases greater than 1 dBA Leq, which is an increase that would be perceptible in a controlled laboratory setting along 67 segments (see Table 3.11-22 and **Figure 3.11-23**).⁸³ Therefore, the project's contribution would be cumulatively considerable and the cumulative impact is **potentially significant**.

Cumulative Plus Stadium NFL Game Plus Forum Concert Plus Project Major Event (Weekend) Impacts under the Cumulative Plus Stadium NFL Game Plus Forum Concert Plus Project Major Event (Weekend Pre Event) condition are shown in **Table 3.11-36**. As indicated, the cumulative increase in traffic noise along studied roadway segments would range from a decrease of -1.6 dBA Leq (where traffic volumes are anticipated to decrease) up to an increase of 6.6 dBA Leq. Under this condition, 21 roadway segments would experience increases in traffic noise of 3.0 dBA Leq or greater and the cumulative impact would be **potentially significant**. Of those 21 roadway segments, the Proposed Project would result in increases greater than 1 dBA Leq, which is an increase that would be perceptible in a controlled laboratory setting, along 12 segments (see Table 3.11-23 and **Figure 3.11-24**).⁸⁴ Therefore, the project's contribution would be cumulatively considerable and the cumulative impact is **potentially significant**.

During the Cumulative Plus Stadium NFL Game Plus Forum Concert Plus Project Major Event (Weekend Post Event) condition, the cumulative increase in traffic noise along studied roadway segments would range from a decrease of 1.0 dBA Leq up to an increase of 9.6 dBA Leq. Under this condition, West 108 roadway segments would experience increases in traffic noise of 3.0 dBA Leq or greater and the cumulative impact would be **potentially significant**. Of those 108 roadway segments, the Proposed Project would result in increases greater than 1 dBA Leq, which is an increase that would be perceptible in a controlled laboratory setting, along 47 segments (see Table 3.11-23 and **Figure 3.11-25**).⁸⁵ Therefore, the project's contribution would be cumulatively considerable and the cumulative impact is **potentially significant**.

The following Mitigation Measures were identified and would avoid or substantially lessen the project contribution to cumulative operational noise impacts under Non-Event Day, Day-Time Corporate/Community Event, Other Sporting Event or Gathering, and Major Event conditions, as described further below.

Mitigation Measure 3.11-6(a)

Implement Mitigation Measure 3.11-2(a). (Noise Reduction Plan).

Mitigation Measure 3.11-6(b)

Implement Mitigation Measure 3.14-2(b) (Implementation of a comprehensive Transportation Demand Management (TDM) program).

Figure 3.11-25
 Significant Cumulative Traffic Noise Impact Locations -
 Stadium NFL Game Plus Forum Concert Plus Project Major Event (Weekend Post Event)

Significance after Mitigation: Implementation of the noise reduction strategies included in Mitigation Measure 3.11-2(a) would reduce Project composite noise levels. However, effectiveness of noise reduction strategies incorporated within Mitigation Measure 3.11-2(a) are dependent on the final design of the Proposed Project and thus are uncertain at this time. Due to the uncertainty with feasibility and effectiveness of noise reduction strategies, cumulative operational noise impacts would be considered **significant and unavoidable**.

Significant increases in traffic noise would be lessened by implementation of Mitigation Measure 3.14-2(b) which would require the implementation of an expanded TDM program that would reduce Project-related traffic. A reduction in Project-related traffic would result in reductions in cumulative traffic noise. The extent to which this measure would reduce trips along impacted segments is uncertain. Therefore, impacts would be **significant and unavoidable**.

Impact 3.11-7: Construction of the Proposed Project, in conjunction with other cumulative development, would generate excessive groundborne vibration. (Significant and Unavoidable)

As previously discussed for vibration under Impact 3.11-3, the use of large bulldozers and bore/drill rigs near the project boundaries, in combination with use of other heavy construction equipment, could generate vibration velocities that exceed the structural damage threshold of 0.3 in/sec PPV at certain sensitive receptors. Cumulative Project 73, located at 3900 West Century Boulevard, is adjacent to the Arena Site and was analyzed as noise-sensitive receptor R8. Vibration-sensitive receptor R9 (self-storage facility use) is adjacent to both Cumulative Project 73 and the Proposed Project.

Should construction of the Arena Site and Cumulative Project 73 overlap and large bulldozers or drill/bore rigs used on both sites along the property line of receptor R9, cumulative impacts would occur. Although groundborne vibration attenuates rapidly and generally has a non-additive nature, the cumulative impact of multiple projects causing potentially structurally damaging groundborne vibration on R9 is potentially significant. The heavy equipment used to construct the Proposed Project would be within five feet of vibration-sensitive receptor R9, and would have a considerable contribution to a vibration-related impact. Therefore, Proposed Project impacts on R9 would be cumulatively considerable and this cumulative impact is **significant**.

With respect to human annoyance, overlap of Proposed Project construction with cumulative projects could result in significant impacts on vibration-sensitive receptors. Should the construction of Cumulative Projects 67, 73, and/or 74 overlap with Proposed Project construction and be located adjacent to vibration-sensitive receptors affected by the Proposed Project, cumulative impacts would be **potentially significant**. There are no vibration-sensitive receptors (with respect to human annoyance) that would be adjacent to both the Proposed Project and one of the three nearby cumulative projects. As described above under Impact 3.11-3, the operation of vibratory construction equipment for the Proposed Project could result in significant impacts with regard to human annoyance. However, vibration-sensitive receptors impacted by Proposed

Project construction would not be located adjacent to any cumulative projects. Therefore, Proposed Project impacts would not be affected by cumulative project construction activity. Therefore, the cumulative impact would be **less than significant**.

As described above, heavy-duty construction truck travel along the designated haul route(s) could result in exceedance of human annoyance thresholds. Should the construction of cumulative projects, especially Cumulative Project 67 which is a potentially large and proximate cumulative project, overlap with Proposed Project construction and should heavy-duty construction trips from cumulative projects utilize the same haul routes as the Proposed Project, the cumulative impact would be **potentially significant**. Because of the size and intensity of expected construction activity for the Proposed Project, the Proposed Project contribution would be cumulatively considerable. Thus, this cumulative impact would be **significant**.

Mitigation Measure 3.11-7

Implement Mitigation Measure 3.11-3(a, b, c). (Minimize Construction Equipment Vibration; Vibration, Crack, and Line and Grade Monitoring Program; and Designate Community Affairs Liaison).

Significance After Mitigation: With the implementation of Mitigation Measure 3.11-7, the Proposed Project would not result in the generation of excessive groundborne vibration levels exceeding structural damage thresholds during on-site construction activity by ensuring that vibration-inducing equipment are used at distances from existing building such that the generation of significant vibration levels would be avoided, and buildings would be protected through a crack monitoring and repair program. Vibration annoyance related to onsite construction activity would be addressed through the designation of a Community Affairs Liaison. Thus, with implementation of Mitigation Measure 3.11-7, the contribution of the Proposed Project to the cumulative vibration-related structural damage impact would be less than considerable, and this cumulative impact would be considered **less than significant**.

As described above, heavy-duty construction truck travel along the designated haul route(s) could result in exceedance of human annoyance thresholds. The distance at which heavy-duty trucks need to travel in order to avoid exceedance of human annoyance thresholds of 72 VdB for residential uses and 75 VdB for commercial and industrial uses is 25 feet and 20 feet, respectively. Potential mitigation to address this impact includes prohibiting travel along the right lane of the roadway. Limiting the lanes of travel for construction trucks, including haul trucks, where residential, commercial, or industrial uses could be impacted would not be feasible because there would be no mechanism for enforcement. Additionally, the drivers of construction vehicles for cumulative projects would not be under the management of the project applicant or its construction contractors. While designation of a Community Affairs Liaison would address vibration impacts with regard to human annoyance, the impact would not be reduced to a less-than-significant level. Therefore, no feasible mitigation is available to mitigate cumulative on-road construction vibration impacts with regard to human annoyance and impacts would be **significant and unavoidable**.

Impact 3.11-8: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could expose people residing or working in the region surrounding the Project Site to excessive noise levels from airport noise. (Less than Significant)

The Proposed Project along with all other past, present, or reasonably foreseeable future projects located within the County's ALUP Planning Area/AIA are required to be consistent with the ALUP policies. In addition to the Proposed Project, a total of 35 projects on the Cumulative Project List in Section 3.0, Introduction to the Analysis, Table 3.0-2, would be located within the LAX Planning Boundary/AIA. The ALUP noise contour shown in Figure 3.11-3 shows that the AIA falls within the CNEL 65 dB Contour for LAX. The 14 CFR Part 150 contours shown in Figure 2-4 show the 65 dB – 70 dB and 70 dB – 75 dB Contours.

As discussed in Section 3.8, Hazards and Hazardous Materials, the ALUP Land Use Compatibility Table identifies land use by category, including residential, commercial, and industrial land use. The elements of the Proposed Project generally fall within the commercial and recreational land use compatibility categories. Almost all the cumulative projects are residential or commercial in nature. The compatibility criteria provided in the Land Use Compatibility Table advises review of noise insulation needs for residential, commercial, and recreational land uses in areas exposed to CNEL 65 dB–70 dB within the ALUP CNEL Contour. The same criteria apply to commercial and recreational land uses in areas exposed to CNEL 70 dB–75 dB within the ALUP CNEL Contour. While the ALUP advises avoiding development of residential uses, reduction of interior noise levels to acceptable levels is typically achieved through standard residential and commercial building construction practices, and thus is reasonably foreseeable that no significant noise impacts would occur within the cumulative projects. As such, people residing or working in the cumulative projects that would occur within the LAX Planning Boundary/AIA would not be exposed to excessive noise from airport operations. Impacts would be **less than significant**.

Mitigation Measures

None required.

3.12 Population, Employment, and Housing

This section identifies and describes existing levels of and trends in population, employment, and housing in the City of Inglewood and analyzes the effects that would be caused by development of the Proposed Project. The section contains: (1) a description of the City's existing population, employment data, and housing stock as well as a description of the Adjusted Baseline; (2) a summary of the regulations related to population, employment, and housing; and (3) an analysis of the potential impacts associated with the implementation of the Proposed Project.

Comments received in response to the NOP for the EIR regarding population, employment, and housing can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to population, employment, and housing as a result of implementation of the Proposed Project are analyzed within this section.

The analysis included in this section was developed based on Project-specific construction and operational information, along with City population, employment, and housing characteristics under the Adjusted Baseline. Sources of information for population-, employment-, and housing-related estimates include the City of Inglewood General Plan and Housing Element, the U.S. Census American Fact Finder, the California Department of Finance, and the Southern California Association of Governments (SCAG) 2016 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS) and the 2013–2020 Regional Housing Needs Assessment (RHNA).

3.12.1 Environmental Setting

Population

The Project Site is located in the City of Inglewood. The City's population has varied over the years, reflecting a decrease during the economic downturn in the late 2000s (and the job loss that took place throughout the United States and California) and a more recent increase. In 2000, the City had a population of 112,580, having grown by an average of nearly 0.3 percent per year in the decade from 1990 to 2000.¹ Between 2000 and 2010, the population of the City dropped by an average of nearly 0.3 percent per year, which was followed by an increase of equal amount from 2010 to 2019. According to the California Department of Finance, the City of Inglewood's 2019 population is approximately 112,549, essentially the same as its pre-recession population.² According to SCAG's 2016 RTP/SCS growth forecast, the City is expected to see its population grow to 129,000 people in 2040; this would represent a nearly 0.7 percent annual growth rate from 2019. **Table 3.12-1** summarizes the population trends for the City of Inglewood from 1990 to 2019, and growth forecasts to 2040.

¹ State of California, Department of Finance, E-4 Historical Population Estimates for City, County and the State, 1991–2000, with 1990 and 2000 Census Counts. Sacramento, California, August 2007. Available: www.dof.ca.gov/Forecasting/Demographics/Estimates/E-4/1991-2000/.

² State of California, Department of Finance, E-5 Population and Housing Estimates for Cities, Counties and the State—January 1, 2011–2019. Sacramento, California, May 2019. Available: www.dof.ca.gov/Forecasting/Demographics/Estimates/e-5/.

**TABLE 3.12-1
 TRENDS IN POPULATION GROWTH FOR THE CITY OF INGLEWOOD AND SCAG REGION (1990–2040)**

Year	City of Inglewood			SCAG Region		
	Population	Population Growth ^a	Avg. Annual Percent Growth ^b	Population	Population Growth ^a	Avg. Annual Percent Growth ^b
1990 ^c	109,602	—	—	14,640,832	—	—
2000 ^c	112,580	2,978	0.27%	16,516,703	1,875,871	1.28%
2010 ^d	109,673	-2,907	-0.29%	18,051,534	1,534,831	1.03%
2019 ^d	112,549	2,876	0.26%	19,155,405	1,103,871	0.61%
2040	129,000	16,451	0.70%	22,138,000 ^e	2,982,595	0.74%

NOTES:

- ^a "Population Growth" considers the delta between the population associated with listed "Year" row and population of that that under the prior "Year" row.
- ^b "Average Annual Percent Growth" is calculated by dividing the population growth value by the population of the prior comparison year to obtain the overall percent change. The overall percent change is then divided by the number of years this growth represents in order to present a comparable annual change (i.e., 1990–2000 = 10 years, 2010–2018 = 8 years, and 2018–2040 = 22 years). For example, population growth from 1990 to 2000 was 26,005. (26,005 population growth / 372,242 population) x 100 = 7% growth over a 10-year period. 7% overall growth/10 years = 0.70% growth per year.
- ^c 1990 and 2000 data is provided by State of California, Department of Finance, E-4 Historical Population Estimates for City, County and the State, 1991–2000, with 1990 and 2000 Census Counts.
- ^d 2010 and 2019 data are sourced from State of California, Department of Finance, E-5 Population and Housing Estimates for Cities, Counties and the State—January 1, 2011–2019.
- ^e 2040 projected data for the SCAG Region is sourced from SCAG, *Regional Transportation Plan Sustainable Communities Strategy 2016–2040*, p. 51.

- SCAG, 2016. *Regional Transportation Plan Sustainable Communities Strategy 2016–2040*, p. 51.

The City of Inglewood is one of eighty communities that form the greater Los Angeles metropolitan area. The City is located within the planning area of SCAG, the Southern California region’s federally designated metropolitan planning organization.³ The SCAG region includes six counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. Region-wide, the population grew from 14.64 million people in 1990 to 16.52 million in 2000, a growth rate of nearly 1.28 percent per year. From 2000 to 2010, while the population of Inglewood dropped at an average rate of 0.3 percent per year, the region grew at an average rate of 1.03 percent per year. From 2010 to 2019, region-wide population growth slowed to an average of 0.61 percent per year, reaching a total of 19.16 million people in 2019.⁴ As discussed in Section 3.0, Introduction to the Analysis, the RTP/SCS forecasts region-wide growth to nearly 22.14 million as of 2040, which would represent an average growth rate of 0.73 percent per year from 2019,

³ Southern California Association of Governments, 2019. *About SCAG*. Available: www.scag.ca.gov/about/Pages/Home.aspx. Accessed February 10, 2019.

⁴ State of California, Department of Finance, E-5 Population and Housing Estimates for Cities, Counties and the State—January 1, 2011–2019. Sacramento, California, May 2019. Available: www.dof.ca.gov/Forecasting/Demographics/Estimates/e-5/.

similar to potential citywide growth. Table 3.12-1 summarizes the existing population trends for the SCAG region from 1990 to 2019 and estimated population forecasts to 2040.

Housing

From 1990 to 2019, similar to the population of Inglewood, occupied housing units (or households) within the City reached a peak in 2000 before dropping to 1990 levels in 2010.^{5,6} By 2019, occupied units reached a nearly 30-year high with 36,808 households, in 38,691 units. The total supply of housing units decreased by approximately 22 units over this time. **Table 3.12-2** shows total housing, vacancy rates, households and persons per household within the City of Inglewood and the surrounding SCAG region. As shown in the table, while the number of housing units in the City of Inglewood generally remained stagnant from 1990 to 2019, region-wide housing supply increased from 5.33 million to 6.59 million units.⁷

Employment

According to the U.S. Census, in 2017, there were approximately 51,474 employees in the City.⁸ Of these employees, approximately 24 percent were made up of the management, business, science and arts occupations, 25 percent consisted of the service industry (healthcare support, food preparation, building and grounds cleaning), 30 percent consisted of sales and office jobs, 8 percent were made up of natural resources, construction, and maintenance jobs, and 13 percent consisted of production, transportation, and material moving jobs.⁹

Table 3.12-3 shows existing and forecasted employment in the City and region. Similar to the changes related to the City's households and population, the City's employment decreased in the late 2000s due to the nation-wide economic downturn. As Table 3.12-3 shows, the employment forecast for the City for 2040 is significantly lower than existing employment in the City as of 2017. The reason is that SCAG's employment forecast for the City was prepared in 2012, at a time when employment levels were depressed during the downturn in the economy. Since that date, City employment has recovered at a rate that exceeds SCAG's forecast. From 2013 to 2017, the City has increased jobs by an estimated 2.13 percent per year. Similar to the City, regional employment decreased in the late 2000s due to the economic downturn, and has increased in the years since then. According to SCAG's RTP/SCS, regional employment is expected to increase over time to an

⁵ 1990 and 2000 data is provided by State of California, Department of Finance, E-8 Historical Population and Housing Estimates for Cities, Counties, and the State, 1990–2000. As employment has increased and is expected to continue to increase, in turn, unemployment in the region is expected to decrease. Unemployment in the County of Los Angeles was 10.2 percent in 2012, and decreased to 4.7 percent in 2017.^{10,11} Similar to this trend, unemployment in the state was 9.8 percent in 2012 and decreased to 4.8 percent in 2017.

SCAG, 2016. *Regional Transportation Plan Sustainable Communities Strategy 2016–2040*.

The City has an unemployment rate exceeding that of Los Angeles County and California. According to the California Employment Development Department, the City’s unemployment rate in 2017 was 5.4 percent, higher than the State’s unemployment rate (4.8 percent) and Los Angeles County (4.7 percent).

Existing Project Site and LA Clippers Employment

The Project Site is mostly vacant, and is partially developed with a fast-food restaurant, a motel, a light manufacturing/warehouse facility, a warehouse, a commercial catering business, and a groundwater well. The Project Site does not contain any residential or dwelling units within the site’s boundaries, and therefore has no permanent resident population. Existing employment at the Project Site is estimated to be approximately 119 people, as estimated below in **Table 3.12-4**.

As detailed in Chapter 2, Project Description, the LA Clippers currently maintain approximately 254 full-time equivalent employees, which includes approximately 54 basketball operations employees such as players, coaches, and staff, and other employees associated with the practice facilities, and approximately 200 employees in executive management, business operations and various support capacities. These employees currently work at the Clippers team offices in downtown Los Angeles and at their athletic training facilities located in the Playa Vista neighborhood within Los Angeles.

TABLE 3.12-4
ESTIMATED EXISTING PROJECT SITE EMPLOYMENT

Land Use ^a	Size	Generation Rate (Employees per Square Foot [sf])	Total
Commercial (Fast-Food Restaurant)	1,118 sf	2.24/1,000	2.5
Commercial (Motel)	16,806 sf	1.13/1,000	19.0
Light Manufacturing/Warehouse	28,809 sf	2.69/1,000	77.5
Warehouse	6,231 sf	2.69/1,000	16.8
Commercial (Catering)	1,134 sf	2.24/1,000	2.5
Total			119

NOTES:

^a Other Project Site uses include a City water well and vacant land, which do not generate employment.

SOURCE: Inglewood Unified School District, 2018. Commercial/Industrial Development School Fee Justification Study Employment Impacts per sf. p. ES-3.

3.12.2 Adjusted Baseline Environmental Setting

Section 3.12, Population, Employment, and Housing, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. The residential, office, retail, and entertainment uses associated with the Hollywood Park Specific Plan (HPSP) Adjusted Baseline projects would result in changes to the City’s population, employment, and housing stock. **Table 3.12-5** details the land uses and associated residential and employment generation for the HPSP Adjusted Baseline projects. Overall, the HPSP Adjusted Baseline projects would generate an increase of approximately 9,470 jobs and 314 residential units. By using the City’s average household size of 3.04 persons per household,¹² the addition of 314 residential units would generate an estimated 955 people. Overall, as shown in **Table 3.12-6**, under Adjusted Baseline conditions, the City has a residential population of 113,491 persons, employment of 60,944 jobs, and a housing stock of 39,005 units.

¹² U.S. Census, American Community Survey (ACS), 2017 American Community Survey 1-Year Estimates, Table B25032: Tenure by Units in Structure, Table B25038: Tenure by Year Householder Moved into Unit, and Table B25039: Median Year Householder Moved into Unit by Tenure; and ALH Urban & Regional Economics.

**TABLE 3.12-5
 HPSP ADJUSTED BASELINE PROJECTS POPULATION, EMPLOYMENT, AND HOUSING CHARACTERISTICS**

Land Use	Size	Generation Rate	Employee Population	Residential Population
Stadium ^a	70,000 seats	—	6,000 ^d	—
Performance Venue ^b	6,000 seats	2.24 employee /1,000 sf	683	—
Retail ^c	518,077 sf	2.24 employee/1,000 sf	1,161	—
Office ^c	466,000 sf	3.49/1,000 sf	1,626	—
Housing Unit	314 units	3.04 persons/unit	—	955
Total			9,470	955

NOTE:

- ^a "Stadiums" are not common land uses, and the City and surrounding jurisdictions do not have an existing employment generation rates for this use. Therefore, the employment total for the stadium was based on that provided in the San Francisco 49ers Stadium, which had a similar seat count (68,500 seats). See City of Santa Clara, 2009. *The 49ers Stadium Project EIR*. p. 176.
- ^b "Performance Venues" are not common land uses, and the City and surrounding jurisdictions do not have an existing employment generation rates for these uses. Consistent with the City's Hollywood Park Redevelopment Draft Environmental Impact Report, and to be conservative, the "Performance" land use is assumed to use the "Retail Use" for the City generation rates. The square footage for this Performance Venue was based off of the Proposed Project, which has approximately triple the seat count of the HPSP performance venue (18,000 seats or 915,000 sf). Thus, this analysis assumes square footage for Performance Venue is that of the Proposed Project divided in by three, to become 305,000 sf.
- ^c Based on employment generation factors from Inglewood Unified School District, 2018 Developer Fee Justification Study. Table 4. Assumes employee generation rate of 2.24 employee per square foot for Retail and Service uses, and 3.49 employee per square foot for Office uses.
- ^d Anticipated Peak Stadium employment under HPSP is provided by Appendix K, Transportation Data. It is assumed that the vast majority of these jobs are event-related employment and were estimated for the purposes of transportation analysis. Although details are not available to the City, an assessment of full-time-equivalent employment at the Stadium would be materially less than the total of 6,000.

3.12.3 Regulatory Setting

Federal

There are no federal laws, regulations, plans, or policies related to population, employment, and housing issues that are applicable to the Proposed Project.

State

California Housing Element Requirement

California law (Government Code Section 65580, et seq.) requires cities and counties to include as part of their General Plans a housing element to address housing conditions and needs in the community. Housing elements are prepared approximately every 5 years (eight following implementation of SB 375), following timetables set forth in the law. The housing element must identify and analyze existing and projected housing needs and “make adequate provision for the existing and projected needs of all economic segments of the community,” among other requirements. The City’s Housing Element was updated in 2013 (adopted in January of 2014), and is detailed below.

Regional Housing Needs Assessment

The RHNA is mandated by State Housing Law as part of the periodic process of updating local housing elements of the General Plan. The RHNA quantifies the need for housing within each jurisdiction during specified planning periods. The current planning period, 2013 to 2021, is considered the 5th RHNA Planning Cycle. As of fall 2017, SCAG initiated planning for the 6th RHNA Planning Cycle began; this cycle covering the 2021 to 2029 period is expected to be adopted in October 2020.¹³ Communities use the RHNA in land use planning, prioritizing local allocation, and in deciding how to address identified existing and future housing needs resulting from population, employment, and housing growth. The RHNA does not necessarily encourage or promote growth, but rather is designed to enable communities to anticipate growth, so that collectively the region and sub-region can grow in ways that enhance quality of life, improve access to jobs, promotes transportation mobility, and addresses social equity and fair share housing needs.

The RHNA determines the “fair share” allocation required of each jurisdiction; that is, the number of housing units for each household income level that should be provided in each jurisdiction to meet both current needs and projected needs. **Table 3.12-7** shows the City of Inglewood’s 2013–2021 RHNA by income level. The RHNA determined that the City currently needs to provide a total of 1,013 new housing units, and of these 400 need to be affordable units for low and very low income households in order to satisfy the City’s share of regional housing needs for the current planning period.¹⁴

SCAG Regional Comprehensive Plan

As part of its past planning obligations, SCAG prepared the Regional Comprehensive Plan (RCP), the most recent of which was the 2008 RCP released on February 9, 2009. The RCP was an advisory plan prepared by SCAG that addressed significant regional issues such as traffic/ transportation, housing, water, and air quality. The RCP served as an advisory document to local agencies within the Southern California region for information and voluntary use for the preparation of local plans and handling local issues of regional significance. The RCP presented a vision of how Southern California could balance resource conservation, economic vitality, and quality of life. The plan identified voluntary best practices to approach growth and infrastructure challenged in an integrated and comprehensive way. The RCP further included goals and outcomes to measure progress toward a more sustainable region.¹⁵ Because the RCP served as an advisory document for local jurisdictions on their planning-level efforts and not for project-level analysis, it would not be applicable to the Proposed Project and is not evaluated further in this EIR.

SCAG 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy

As previously detailed, the City is located within the planning area of SCAG, the Southern California region’s federally designated metropolitan planning organization. On April 7, 2016, SCAG’s Regional Council adopted the 2016–2040 RTP/SCS. The RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. The plan charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The RTP/SCS includes land use policies to guide the region’s development, including planning for additional housing and jobs near transit, and planning for changing demand in types of housing. One goal of the 2016 RTP/SCS is to encourage land use and growth patterns that facilitate transit and active transportation.

Local

City of Inglewood General Plan

The City of Inglewood General Plan sets forth goals, objectives, and policies for the future development of the City and designates the location of desired future land uses within the City and therefore the Project Site. A summary of the General Plan Elements is provided under Section 3.10, Land Use and Planning. Specific elements that apply to population, employment and housing relevant to the Proposed Project are described below.

Housing Element

The City of Inglewood General Plan Housing Element 2013–2021, adopted on January 28, 2014, presents a framework upon which the City can implement a comprehensive housing program from 2013 to 2021 to provide its residents with decent and affordable housing. The program established policies to create or preserve quality residential neighborhoods. The Housing Element identifies current and future housing needs and established policies and programs to mitigate or correct housing deficiencies.

The Project Site currently does not include any housing, nor is it zoned for residential, or identified as a site for housing within the Housing Element. Because of this setting and because the Proposed Project would not construct any housing, goals or policies identified in the General Plan Housing Element are not applicable to the Proposed Project.

Land Use Element

A. General:

Goal: Help promote sound economic development and increase employment opportunities for the City's residents by responding to changing economic conditions.

Goal: Develop a land use element that facilitates the efficient use of land for conservation, development and redevelopment.

Goal: Promote Inglewood's image and identify as an independent community within the Los Angeles Metropolitan area.

C. Commercial:

Goal: Create and maintain a healthy economic condition within the present business community and assist new business to located within the City.

Goal: Protect local businessmen and encourage the importance of maintaining a strong commercial district in the downtown.

Goal: Continue to promote the development of high quality commercial/office space at appropriate locations within the City through the redevelopment process.

Goal: Promote the development of commercial/recreational uses which will complement those which already are located in Inglewood.

D. Industrial:

Goal: Provide a diversified industrial base for the City. Continue to improve the existing industrial districts by upgrading the necessary infrastructure and by eliminating incompatible and/or blighted uses through the redevelopment process.

Goal: Continue the redevelopment of Inglewood by promoting the expansion of existing industrial firms and actively seek the addition of new firms that are environmentally non-polluting.

Goal: Increase the industrial employment opportunities for the city's residents.

3.12.4 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to population, employment, and housing. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure); or
2. Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

Methodology and Assumptions

The following analysis is based on Project-specific construction and operational information along with City population, employment, and housing characteristics under the Adjusted Baseline. Sources of information for population-, employment-, and housing-related estimates include the City of Inglewood General Plan and Housing Element, U.S. Census American Fact Finder, the California Department of Finance, SCAG RTP/SCS,¹⁶ and the RHNA.

The information contained in this chapter is used as a basis for analysis of project and cumulative impacts in the technical sections in Chapter 3 of this EIR. However, changes in population and housing, in and of themselves, are social and economic effects and under CEQA are not physical effects on the environment. CEQA provides that economic or social effects are not considered significant effects on the environment unless the social and/or economic effects are connected to physical environmental effects. A social or economic change related to a physical change may serve as a linkage between the Proposed Project and a physical environmental effect, or may be considered in determining whether the physical change is significant (CEQA Guidelines section 15382). The direction for treatment of economic and social effects is stated in section 15131(a) of the CEQA Guidelines:

“Economic or social effects of a project shall not be treated as significant effects on the environment. An EIR may trace a chain of cause and effect from a

¹⁶ Note that, because the SCAG RTP/SCS is a regional tool to plan for possible future growth, it does not represent a growth ceiling, or limit.

proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis shall be on physical changes.”

Impacts and Mitigation Measures

Impact 3.12-1: Construction and operation of the Proposed Project could induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure). (Less than Significant)

Construction Impacts

The Proposed Project would generate temporary employment opportunities during the Project-construction phase. Construction-related jobs generated by the Proposed Project would likely be filled by employees within the construction industry within the City of Inglewood and the greater Los Angeles County region. In 2017, approximately 5 percent of the City’s employed population was based in the construction industry.¹⁷ Construction industry jobs generally have no regular place of business and many construction workers are highly specialized (i.e., crane operators, steel workers, masons, etc.). Thus, construction workers commute to job sites throughout the region that may change several times a year dictated by the demand for their specific skills. The work requirements of most construction projects are also highly specialized and workers are employed on a job site only as long as their skills are needed to complete a particular phase of the construction process. For these reasons, employment opportunities associated with construction of the Proposed Project would not likely result in any measurable relocation of construction worker households to the vicinity of the Project Site. Therefore, impacts related to unplanned population growth due to construction of the Proposed Project would be **less than significant**.

Operational Impacts – Employment Growth

Construction and operation of the Proposed Project would eliminate the current uses at the Project Site, which are estimated to provide approximately 119 jobs. The Proposed Project would generate approximately 768 non-event jobs at the Project Site, a net increase of 649 jobs. Specifically, as detailed in Chapter 2, Project Description, the LA Clippers currently maintain approximately 254 permanent full-time equivalent employees, which includes approximately 54 basketball operations employees such as players, coaches, and staff, and approximately 200 employees in executive management, business operations and various support capacities. These employees currently work at the Clippers team offices in downtown Los Angeles, and at the practice and training facility in Playa Vista, and would relocate to the Project Site. The Proposed Project would also result in an estimated increase of 75 permanent employees to provide operations and management services for the Arena and 439 permanent employees in other uses

¹⁷ U.S. Census, American Community Survey (ACS), “Table S2401: Occupation by Sex for the Civilian Employed Population 16 Years and Over,” 2017 American Community Survey 1-Year Estimates; and ALH Urban & Regional Economics.

within the Proposed Project. A complete breakdown of Proposed Project permanent employment is provided in Table 2-4.

In addition to the increase in permanent employment, there would be part time employment for employees to support an average of approximately 143 arena and/or plaza events throughout the year; depending on the type of event, such event employment could range from 25 to 1,320 persons (see description of events and event-related employment in Table 2-3). As described in **Table 3.12-8**, based upon the anticipated number of events and assuming 4 hours of employment for each event, total event employment would be equal to an additional 319 full-time-equivalent jobs. Combined with the 768 non-event jobs, the Proposed Project would result in a total of 1,087 jobs, a net increase of 968 jobs over Adjusted Baseline conditions.¹⁸

**TABLE 3.12-8
 PROPOSED IBEC EVENT EMPLOYMENT FULL-TIME EQUIVALENCY**

Event Type	Number of Events	Employees/Event	Total Employee Days
NBA	49	1,200	58,800
Concerts – Large	5	1,120	5,600
Concerts – Medium	8	795	6,360
Concerts – Small	10	530	5,300
Family Shows	20	530	10,600
Other Events	35	480	16,800
Corporate/Civic	100	25	2,500
Plaza Events	16	25	400
Total PT Employee Days			106,360

Estimated FT Employee Equivalent^b			319

NOTES:
^a Assumes 6 hours per event
^b Assumes 250 work days per year

SOURCE: ESA, 2019

When accounting for the removal of existing uses, the Proposed Project would result in an increase of approximately 968 jobs within the City. The Proposed Project net new employment would increase employment in the City from 60,944 under the Adjusted Baseline to approximately 62,912 with the Proposed Project.¹⁹

¹⁸ This net increase accounts for loss of estimated 119 existing on-site jobs.

¹⁹ The employment increase is based on the Adjusted Baseline Environmental Setting of 9,470 more jobs (see Table 3.12-5) plus the existing setting of 51,474 jobs, for a total of 60,944 jobs (see Table 3.12-6). The Adjusted Baseline employment includes approximately 6,000 jobs associated with the operation of the NFL Stadium. It is assumed that the vast majority of these jobs are event-related employment estimated for the purposes of transportation analysis. Although details are not available to the City, an assessment of full time equivalent employment at the Stadium would be materially less than the total of 6,000.

As is discussed above under Environmental Setting, in 2017 total employment in the City of Inglewood exceeded that projected by SCAG RTP/SCS for 2020, as well as employment projections through 2040,²⁰ due in large part to the SCAG projection taking place during the economic downturn of the Great Recession. Thus, the 968 net new jobs added as a result of the Proposed Project would represent employment growth beyond that forecast for the City.²¹ Nevertheless, the evaluation of physical environmental effects presented in this Draft EIR is based on existing conditions adjusted by actual projects that have been proposed in the vicinity, considered in light of baseline service and infrastructure capacity, as described throughout sections of Chapter 3 of this Draft EIR (in particular, see discussions of impacts in Sections 3.13, Public Services; 3.14, Transportation and Circulation; and 3.15, Utilities and Service Systems; and related Sections 3.2, Air Quality; 3.5, Energy Demand and Conservation; 3.7, Greenhouse Gas Emissions; and 3.11, Noise and Vibration). Therefore, the increase in employment in the City over past projections would not result in any significant physical environmental impacts not otherwise disclosed in this Draft EIR.

The City of Inglewood General Plan has several goals and policies to foster redevelopment of infill sites that would support healthy economic development. In particular, the following General Goal appears in the Land Use Element:

Help promote sound economic development and increase employment opportunities for the City's residents by responding to changing economic conditions.²²

As addressed under Section 2.4, Project Site Existing Conditions and Section 3.10, Land Use and Planning, the Project Site is intended to support employment uses and the Proposed Project would add a net new total of 968 jobs, consistent with the economic development and employment goals of the City of Inglewood General Plan.

As described above, and in analyses in Sections 3.2, Air Quality; 3.7, Greenhouse Gas Emissions; 3.10, Land Use and Planning; and 3.14, Transportation, the Proposed Project, an infill project proposed to be constructed and operated on the Project Site in an area that is served by existing infrastructure, including transit, would be consistent with the goals and policies of the SCAG 2016 RTP/SCS. Those goals and policies were informed by SCAG's projections of demographic characteristics of the region. Further, although the employment in the Proposed Project would add to the City's employment base that has grown beyond that projected by SCAG in light of past economic conditions, such employment growth would not result in any significant physical environmental impacts not otherwise disclosed in this Draft EIR. For the reasons discussed above, the impact of the Proposed Project on employment would be considered **less than significant**.

²⁰ 2016 RTP/SCS Growth Forecast by Jurisdiction, p. 1. See also, Table 3.12-3.

²¹ Although not an environmental issue, the unemployment rate in the City suggests that the new jobs can be accommodated by existing workers in the City and region.

²² City of Inglewood, *City of Inglewood General Plan*, Land Use Element, Section II, Statement of Objectives, p. 6.

Operational Impacts – Housing and Residential Population Growth

The Project Site is currently developed with a fast-food restaurant, a motel, a light manufacturing/warehouse facility, a warehouse, a commercial catering business, and a groundwater well and related facilities. The Project Site does not contain any housing units within the site's boundaries, and therefore has no existing permanent resident population. The Proposed Project would not include housing uses, and thus would not directly increase the residential population of the City beyond that projected based on the existing and future housing stock. Therefore, the Proposed Project would not directly induce substantial unplanned population growth in the City, and **no impact** would occur.

The RHNA concludes that the City must provide a total of 1,013 new housing units, and of these 400 need to be affordable units for low and very low income households in order to satisfy the City's share of regional housing needs for the current planning period. None of these units, however, are expected to be provided at the site of the Proposed Project. For this reason, the Proposed Project would not interfere with the City's ability to meet its RHNA obligations, and **no impact** would occur.

Mitigation Measures

None required.

Impact 3.12-2: Construction and operation of the Proposed Project could displace substantial numbers of existing people or housing units necessitating the construction of replacement housing elsewhere. (Less than Significant)

Direct Displacement

The Project Site is currently developed with a fast-food restaurant, a motel, a light manufacturing/warehouse facility, a warehouse, a commercial catering business, and a groundwater well and related facilities. The Project Site does not contain any residential or dwelling units, and therefore has no existing permanent resident population. For this reason, no residents would be directly displaced as a result of the Proposed Project.

Existing businesses would be displaced. The up to 119 employees associated with existing businesses are reasonably assumed to have housing in the City or region. Based on the availability of land suitable for relocation, these businesses should be able to locate elsewhere in the region. For this reason, there is no evidence that employees at these existing businesses would have to move, or that the displaced businesses would generate the need for new housing. The Proposed Project would therefore not displace substantial numbers of existing people or housing

units necessitating the construction of replacement housing elsewhere.²³ Therefore, this impact is considered **less than significant**.

Indirect Displacement

Several comments on the Notice of Preparation requested that the City consider the potential for the Proposed Project to indirectly cause displacement of housing and residents as a result of it causing the process of gentrification. The City undertook a study to determine if there is evidence to suggest that gentrification and indirect housing displacement are foreseeable socioeconomic effects pursuant to development of the Proposed Project (see Appendix S).²⁴

As described above, in general CEQA does not require analysis of socioeconomic issues such as gentrification, displacement, environmental justice, or effects on “community character.” The CEQA Guidelines state, however, that while the economic or social effects of a project are not appropriately treated as significant effects on the environment, it is proper for an EIR to examine potential links from a Proposed Project to physical effects as a result of anticipated economic or social changes.

Gentrification is a widely studied and discussed process. Although there is no single definition for the term, the process of gentrification is commonly perceived to be an influx of new, higher-income residents, into a traditionally low-income neighborhood. Displacement has been defined as the process that occurs “when any household is forced to move from its residence by conditions that affect the dwelling or immediate surroundings, and which:

1. Are beyond the household’s reasonable ability to control or prevent;
2. Occur despite the household’s having met all previously-imposed conditions of occupancy; and
3. Make continued occupancy by that household impossible, hazardous or unaffordable.”²⁵

Academic studies conclude that the process of gentrification frequently has both positive and negative effects depending on specific neighborhood characteristics. These studies also show that the link between the process of gentrification and the displacement of existing residents is tenuous and difficult to demonstrate.

In considering the potential for gentrification and displacement effects associated with the Proposed Project, it is notable that a series of land use changes have been occurring in Inglewood, set in motion as many as 10 years ago in 2009. Some of these changes, especially the HPSP and Transit Oriented Development plans, are indicative of City expectations and desires for growth and new development. These plans and investments have been pursued because they are perceived as having an overall benefit on the City. There is a concern that such plans and investments may result in

²³ For additional discussion related to growth-inducing effects or urban decay, refer to Chapter 4, Other CEQA Required Considerations.

²⁴ ALH Urban & Regional Economics, *Inglewood Sports and Entertainment Venue Displacement Study*, July 2019.

²⁵ Miriam Zuk, Ariel H. Bierbaum, Karen Chapple, Karolina Gorska, and Anastasia Loukaitou-Sideris, “Gentrification, Displacement, and the Role of Public Investment.” Available: <https://journals.sagepub.com/doi/abs/10.1177/0885412217716439>. Published in *Journal of Planning Literature*, 2018, 33(I).

higher property costs or rents, which in turn could displace existing, lower-income residents. Predicting the extent to which such displacement may occur is, however, extremely difficult.

The City's report acknowledged that when looking at residential pricing data since the end of the Great Recession, both median rents and sales prices have been increasing in Los Angeles County's cities and places. These increases coincide with the strengthening economy countywide and increasing housing demand resulting from the inability of regional housing supply to keep pace with demand. As an example of the strengthening economy, in 2011 Los Angeles County added 42,700 jobs. By 2013 the annual increase was 117,000 jobs, and over the 4-year period 2013 through 2016, nearly 400,000 jobs were added in Los Angeles County, for a 9 percent increase over the 2012 job base of 4.38 million jobs. Over the same period, the unemployment rate in Los Angeles County declined from a high of 12.5 percent in 2010 to 4.7 percent in 2018.²⁶

The level of economic activity has resulted in increased demand for housing and associated increases in housing costs in Inglewood, as well as throughout Los Angeles County. Inglewood has long been one of the more affordable places to live in Los Angeles County. In 2015, rental housing in 79 percent of the cities and places in Los Angeles County were more expensive than Inglewood. Between 2015 and 2019, Inglewood experienced one of the fastest rates of increased rents in the County, with a 39 percent increase in rents, similar to the rates of increase of rents in Long Beach, Hawthorne, Bellflower, and Burbank. Despite the rate of increase, in 2019 Inglewood remains more affordable than 69 percent of the cities and places in Los Angeles County.²⁷In tracking the price increases, there were no discernable spikes in housing costs (rents or sales prices) in the time periods following the announcement of the NFL Stadium or the Proposed Project; instead, around the periods when the NFL Stadium and the Proposed Project became public knowledge, rents and prices in Inglewood increased at more or less the same rate they have increased throughout the last decade.²⁸

The City's report examined numerous studies of the effects of sports facilities on property values and other effects that can be part of gentrification. The report concludes that neither the gentrification literature nor an analysis of housing cost changes over time provide evidence that development of a professional sports stadium or arena like the Proposed Project causes or contributes to gentrification that could result in physical displacement of existing residents. As a result of a lack of evidence to connect the Proposed Project to gentrification and related displacement that could result in the need for the construction of replacement housing, this impact is **less than significant**.

Mitigation Measures

None required.

²⁸ ALH Urban & Regional Economics, *Inglewood Sports and Entertainment Venue Displacement Study*, July 2019, p. 37.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to population, employment, and housing includes those past, present, and reasonably foreseeable cumulative projects within the boundaries of the City of Inglewood. Future cumulative increases in employment and population as a result of development included in the cumulative project list is presented in **Table 3.12-9**.

**TABLE 3.12-9
 CUMULATIVE INCREASES IN POPULATION AND EMPLOYMENT**

Place/Land Use	Square Footage/Units	Employees per KSF/ Population/Unit	Total Employment/ Population
Cumulative List			
Retail/Commercial	1,903,815 sf	2.24/1,000 sf	4,265 employees
Office	8,675,487 sf	3.49/1,000 sf	30,277 employees
Industrial/Warehouse/Data Center	2,070,210 sf	2.7/1,000 sf	5,590 employees

Schools	0	1/10 students	0 employees
Total Employment			14,990 employees
Residential	3,091	2.97/unit	9,180 persons

SOURCE: ESA, 2019

Impact 3.12-3: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could contribute to cumulative substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads and other infrastructure). (Less than Significant)

Employment Growth

The Proposed Project would generate an estimated operational employment of approximately 968 employees. Future growth from projected employment generating uses identified by the cumulative project list (see Table 3.0-2, Cumulative Projects List) would result in approximately 14,990 jobs within Inglewood. Together, the Proposed Project, HPSP Adjusted Baseline, and cumulative project list employment is estimated to be 25,428 jobs (968 + 9,470 + 14,990 =

25,428).²⁹ Added to existing 2017 employment conditions of 51,474 jobs, the City would have estimated employment of 76,902 jobs under cumulative conditions.

With or without the Proposed Project, the City of Inglewood's cumulative employment would exceed SCAG RTP/SCS employment projections through 2040. As noted above, the exceedance is largely attributable to the fact that SCAG's RTP/SCS employment projections were prepared in 2012, in the wake of severe economic downturn that commenced in 2008. Since then, employment in the City has largely recovered to its pre-recession levels. As described above, the difference in future estimated employment does not represent an inconsistency with the goals and policies of the 2016 RTP/SCS physical effects of additional employment are described in other sections of this Draft EIR. In and of itself, exceedance of regional employment projections does not represent a significant cumulative impact.

Housing and Residential Population Growth

The Proposed Project would not include housing units and would, thus, not directly increase the residential population or number of households of the City. The Proposed Project would, therefore, not contribute to cumulative housing and residential population growth within the City. While cumulative population and housing growth would result in increased demand for public services and utilities and service systems, the physical effects of these future conditions are addressed in other sections of this EIR. Further, Chapter 4 of the EIR includes further discussion of the potential for growth inducement as a result of the Proposed Project.

For all of these reasons, there would be no significant cumulative impact. This impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.12-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could displace substantial numbers of existing people or housing units necessitating the construction of replacement housing elsewhere. (Less than Significant)

Direct Displacement

Because the Proposed Project would not directly displace any people or housing units, it could not contribute to cumulative displacement of a substantial number of existing people or housing units necessitating the construction of replacement housing elsewhere. Therefore, the Proposed Project would not contribute to a cumulative impact.

²⁹ The Adjusted Baseline employment includes approximately 6,000 jobs associated with the operation of the NFL Stadium. It is assumed that the vast majority of these jobs are event-related employment estimated for the purposes of transportation analysis. Although details are not available to the City, an assessment of full time equivalent employment at the Stadium would be materially less than the total of 6,000.

Indirect Displacement

As discussed under Impact 3.12-2, above, a significant indirect displacement impact would occur if the Proposed Project, in conjunction with Adjusted Baseline projects and other cumulative development, would cause the process of gentrification and result in displacement of substantial existing population or housing units resulting in the need for construction of new residential units.

In addition to the Proposed Project and the HPSP Adjusted Baseline projects, cumulative development presented in Section 3.0, Table 3.0-2, Cumulative Projects List, would include 145 cumulative projects that would add 9,315 housing units/beds, 8,675,487 sf of office space, 1,903,815 sf of retail and other commercial space, 2,070,210 sf of industrial/warehouse/data center space, 2,430 hotel rooms, and schools with a capacity of 6,401 students, as well as the Inglewood Transit Connector. Of this total, only 33 projects are located in the City of Inglewood, representing a total development of approximately 3,091 residential units, 443,059 sf of commercial and industrial uses, 451,923 sf of retail uses, 3,567,314 sf of office uses, 424 hotel rooms, 30,000 sf of civic center uses, and approximately 13 acres of open space. Of these 33 cumulative projects, five (Cumulative Projects 53, 54, 65, 67, and 73) are located within South Inglewood (District 4), and would result in the construction of approximately 2,192 residential units, 371,923 sf of retail uses, 3,567,314 sf of office uses, 424 hotel rooms, 30,000 sf of miscellaneous uses, and approximately 13 acres of open space.

This combination of the Proposed Project, Adjusted Baseline projects, and cumulative development would add housing units and employment in the City and surrounding areas, could increase demand for housing in the City of Inglewood, and would expand both public services and transit opportunities. Taken together, this development and related investments could contribute to increased housing costs at existing residences. The Proposed Project would increase employment opportunities in the City and, as such, could contribute to this larger trend.

The City's report acknowledged that when looking at residential pricing data since the end of the Great Recession, both median rents and sales prices have been increasing in Los Angeles County's cities and places. These increases coincide with the strengthening economy countywide and increasing housing demand resulting from the lack of housing supply region-wide. As an example of the strengthening economy, in 2011 Los Angeles County added 42,700 jobs. By 2013 the annual increase was 117,000 jobs, and over the four-year period 2013 through 2016, nearly 400,000 jobs were added in Los Angeles County, for a 9 percent increase over the 2012 job base of 4.38 million jobs. Over the same time period, the unemployment rate in Los Angeles County declined from a high of 12.5 percent in 2010 down to 4.7 percent in 2018.³⁰

As described above, the residential pricing data indicate that both median rents and sales prices have been increasing in Los Angeles County's cities and communities, including the City of Inglewood. In 2015, Inglewood was the fourth most affordable city in Los Angeles County, out of a total of 19 reported by Zillow. By 2019, Inglewood was the 17th most affordable city, out of a

³⁰ ALH Urban & Regional Economics, *Inglewood Sports and Entertainment Venue Displacement Study*, July 2019, p. 35.

total of 55 cities and places reported. While the absolute affordability rank decreased, relative to the larger set of cities and communities, the proportional increase is more muted. In 2015, 79 percent of the cities and communities were more expensive than Inglewood. In 2019, this percentage had decreased to 69 percent.³¹ In other words, in terms of affordability, in 2015 Inglewood was in the 21st percentile, and in 2019 Inglewood was in the 31st percentile. Thus, the general trend is that Inglewood is, compared to other cities and communities in the region, becoming somewhat less affordable, although it remains significantly more affordable than the average city or community.

These increases coincide with the strengthening economy and increasing housing demand resulting from the general perception of a lack of housing supply region-wide. Although the City is unable to estimate with precision, the consequences of the regional lack of housing supply and increases in housing costs, these consequences could include displacement of current rental housing tenants, especially those that are low income households. Such displacement, if it were to occur, could result in such households looking for housing in lower cost parts of the Los Angeles region, and could further result in the construction of new housing units in these areas. Although it would be speculative to estimate the quantity or location of new housing that could be constructed to meet the needs of displaced households, it is reasonable to conclude that such effects, if they occur, could result in physical environmental impacts. Thus, this cumulative impact is considered **potentially significant**.

Where a potentially significant cumulative impact is identified, CEQA requires a determination of whether the Proposed Project contribution to the cumulative impact is “considerable.” In evaluating the contribution of the Proposed Project to this potentially significant cumulative impact, a relevant question is whether the prospect of the future NFL Stadium or the Proposed Project has heretofore contributed to these increases in housing costs. Looking back to early 2015 when the NFL Stadium was approved indicates that Inglewood’s median rents and median home prices did not exhibit a measurable spike relative to neighboring cities. Especially in the year after the announcement of the NFL Stadium project, the change in median rents and median home prices were in the range of those in nearby cities.³² This evidence suggests that the change in median rents is attributable to the broader region and economy, rather than to a specific project – even a project as large in scope as the NFL Stadium project.

Further, Inglewood did not experience a spike in median rents or sales prices immediately after the June 2017 IBEC proposal announcement. Nevertheless, rents did trend upwards in 2018 compared to neighboring areas, and this increase has continued in 2019 at the same level as in early 2018.³³

The lack of market effect as a result of the announcement of the NFL Stadium in 2015 and the Proposed Project in 2017 support the conclusion that factors other than the presence of sports

³¹ ALH Urban & Regional Economics, *Inglewood Sports and Entertainment Venue Displacement Study*, July 2019, p. 30.

³² ALH Urban & Regional Economics, *Inglewood Sports and Entertainment Venue Displacement Study*, July 2019, pp. 33–39.

³³ ALH Urban & Regional Economics, *Inglewood Sports and Entertainment Venue Displacement Study*, July 2019, p. 32.

venues has driven recent increases in housing prices in Inglewood. Rather, while the Proposed Project could have some minor, indistinguishable contribution to increased land values and related housing prices in the vicinity of the Project Site, the evidence suggests that increases in housing costs in Inglewood are instead more attributable to the strong economy in Los Angeles County. In fact, over the four-year period 2013 through 2016, nearly 400,000 jobs were added in Los Angeles County, for a 9 percent increase over the 2012 job base of 4.38 million jobs. Over this time period, the unemployment rate in Los Angeles County declined from a high of 12.5 percent in 2010 down to 4.7 percent in 2018.³⁴ During this time housing costs in higher cost cities and places have become even more costly, shifting demand to well-located close-in cities and places with relatively lower housing costs, such as Inglewood, as well as to more far-flung locations.³⁵

In summary, a number of local and regional factors appear to affect housing prices in Inglewood. However, there is no evidence directly connecting such increases to substantial housing displacement that would result in the need for construction of new housing. In addition, as discussed in Impact 3.12-2, no evidence in the record supports a conclusion that a new sports venue would indirectly contribute to such effects that would result in displacement of existing housing units or residents in such substantial numbers that the construction of new housing elsewhere would be necessitated. For the reasons described above, the contribution of the Proposed Project is less than cumulatively considerable and thus is considered **less than significant**.

Mitigation Measures

None required.

3.13 Public Services

This section describes and evaluates potential adverse physical environmental impacts related to public services that could result from implementation of the Proposed Project. Public services analyzed within this section include fire protection and emergency medical services, police protection, parks or recreational services, and public schools. This section contains: (1) a description of the existing environmental setting for public services; (2) a description of the Adjusted Baseline Environmental Setting that serves as the basis for impact analysis; (3) a summary of the regulations related to public services; and (4) an analysis that addresses whether potential impacts to public services would require the need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives. This section also includes an analysis of whether the Proposed Project would result in significant environmental impacts related to parks and recreational resources.

Comments received in response to the NOP for the EIR regarding public services can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to public services as a result of implementation of the Proposed Project are analyzed within this section.

The analysis in this section was developed based on information provided in correspondence with the Los Angeles County Fire Department (LACFD), the City of Inglewood Police Department (Inglewood PD or Police Department), the City of Inglewood Parks, Recreation, and Library Services (Parks Department), and the Inglewood Unified School District (IUSD).

Fire Protection and Emergency Medical Services

3.13.1 Environmental Setting

Regional and Local Setting

Fire Protection, Facilities, and Emergency Medical Services

Los Angeles County Fire Department Resources

In the City of Inglewood, fire protection and emergency medical services are provided by the LACFD. The LACFD provides 24-hour, all-risk emergency services to a population of over 4 million residents living and working in 59 cities and all unincorporated communities within Los Angeles County. The LACFD provides emergency services and response to a wide range of incidents including structure fires, wildfires, commercial fires, hazardous materials incidents, urban search and rescue, and swift water rescue. There are three major geographic regions (the North Regional Operations Bureau, the Central Regional Operations Bureau, and the East Regional Operations Bureau), nine emergency operation divisions, and 22 battalions within the LACFD service area. The LACFD is comprised of 173 fire stations, 9 wildland fire camps, and 159 lifeguard towers and includes 109 paramedic squads/units and 8 helicopters of which three would be designated as paramedic air squads. LACFD staff consists of 4,696 total emergency responders and business professionals, including 3,157 firefighters, who are also trained in

infectious disease response, and 681 paramedics. There are approximately 1,100 emergency responders on duty each day.¹

The Project Site is located within Division VI, Battalion 20, of LACFD's Central Regional Operations Bureau.² Division VI consists of Battalions 13 and 20 with 14 fire stations, which serve six cities including Cudahy, Huntington Park, Inglewood, Lynwood, Maywood, and South Gate. Battalion 20 operates six fire stations; five of which have first due-in jurisdiction within the City, and four of which are located within the City. These fire stations have primary responsibility for the City.³ In addition, 10 fire stations are located within a 3-mile radius of the City and are located within the cities of Hawthorne and Lawndale, and within the unincorporated communities of Lennox, Westmont, Baldwin Hills, and Ladera Heights. The Battalion 20 Headquarters is located within Fire Station 171 at 141 W. Regent Street, Inglewood.⁴

LAFCD Stations Serving the Project Site

The LACFD operates under a regional concept in its approach to providing fire protection and emergency medical services. Emergency response units are dispatched as needed to an incident anywhere in the Division's service territory based on distance and availability without regard to jurisdictional or municipal boundaries. Specifically, calls received by the dispatch center are dispatched to the jurisdictional engine company for the incident location. If the jurisdictional engine company is not available, the next nearest available unit will respond. Depending on the incident type, several units may be dispatched to an incident in accordance with the level of service required. For instance, an emergency medical service incident will require the nearest available basic life support unit (i.e., engine), the nearest advance life support unit (i.e., paramedic squad) and an ambulance.⁵

There are three fire stations that provide primary fire protection and emergency medical services to the Project Site (i.e., the Arena Site, the West Parking Garage Site, the East Parking and Hotel Site, and the Well Relocation Site), the locations of which are shown in **Figure 3.13-1**.

Table 3.13-1 includes the fire station number and location, approximate drive distance/direction from the Project Site, staffing, and equipment.

Station No. and Location	Approximate Drive Distance/ Direction From Project Site ^a	Staffing (24-hour duty)	Equipment
LACFD Fire Station 170 10701 South Crenshaw Boulevard, Inglewood	1.3 miles southeast	Quint ^b : 1 captain, 1 firefighter specialist, 1 firefighter paramedic, 1 firefighter. Engine: 1 firefighter specialist, 1 firefighter.	4-person assessment quint and a 2-person engine.
LACFD Fire Station 18 4518 West Lennox Boulevard, Inglewood	1.3 miles southwest	Engine: 1 captain, 1 firefighter specialist, 2 firefighter paramedics.	4-person paramedic engine company.
LACFD Fire Station 173 9001 South Crenshaw Boulevard, Inglewood	1.5 miles northeast	Engine: 1 captain, 1 firefighter specialist, 1 firefighter paramedic Squad: 2 firefighter paramedics.	3-person engine company and a 2-person paramedic squad.

NOTES:

^a Approximate drive distance was measured from the approximate center of the Arena Site.

^b A quintuple combination pumper or “quint” is a fire apparatus that serves the dual purpose of an engine and a ladder truck.

SOURCE: Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated October 25, 2018; Los Angeles County Fire Department, Fire Station Locator, <https://locator.lacounty.gov/fire/Search?find=&near=3900+W+Century+Blvd+Inglewood%2C+CA+90303&cat=&tag=&loc=&lat=33.944963505492886&lon=-118.34210286941102>. Accessed October 2018.

As shown in Table 3.13-1 and Figure 3.13-1, there are three fire stations located within 1.5 miles of the Project Site. These three fire stations would be the first stations to respond to an incident at the Project Site. Fire Station 170, located at 10701 S. Crenshaw Boulevard, is the jurisdictional station and first due-in fire station,⁶ which is the fire station with primary responsibility, for the portions of the Project Site east of South Prairie Avenue, including the Arena Site, the East Parking and Hotel Site, and the Well Relocation Site. Fire Station 170 is the second due-in fire station for the West Parking Garage Site. Fire Station 18 at 4518 W. Lennox Boulevard, is the jurisdictional station and first due-in fire station for the West Parking Garage Site and is the second due-in fire station for the Arena Site, the East Parking and Hotel Site, and the Well Relocation Site. Fire Station 173 at 9001 S. Crenshaw Boulevard, is the third due-in fire station for all portions of the Project Site.

Fire Station 173 is the jurisdictional station and the first due-in fire station for the Hollywood Park Specific Plan (HPSP) area, including the NFL Stadium, as well as for The Forum. If needed and available, Fire Station 170 could be dispatched to provide backup service to an incident in Fire Station 173’s jurisdiction. Additionally, Fire Stations 162, 171, 161, and 172, all located

⁶ The term “due-in” is used to establish the order of response. So the first due-in station would respond first, the second due-in station would respond next, and so on depending on the magnitude of the incident and corresponding need for LACFD response.

within approximately 2.5 miles of the Project Site, would provide further backup in the event of a major fire at the Arena Site.^{7,8}

In the event that Fire Station 170 could not meet the immediate needs of a call for services independently or does not have the capability to address the full extent of a larger incident, the nearest available LACFD resources would respond to provide support.⁹ The LACFD dispatches multiple units from multiple fire stations in the event of a large incident. An acceptable equipment level is maintained throughout the Department's jurisdictional boundaries to enable the appropriate response to all incidents. For similar venues, the LACFD's first response to a fire incident would be 5 engines, 2 quints (combination engine/ladder truck apparatus), 1 squad, and 2 battalion chiefs. Additional resources would be deployed as needed.¹⁰

LAFCD Response Times

The LACFD uses the national guidelines of a 5-minute response time for the first arriving unit for fire and emergency medical service responses and an 8-minute response time for the advanced life support (paramedic) unit in urban areas.¹¹ According to the LACFD, Fire Station 170, the first due-in station for the Project Site east of South Prairie Avenue, is estimated to have an emergency average response time of 5 minutes to the Arena Site, the East Parking and Hotel Site, and the Well Relocation Site. Fire Station 18, the first due-in station for the Project Site west of South Prairie Avenue, is estimated to have an emergency average response time of 5 minutes to the West Parking Garage Site. Therefore, both Fire Stations 170 and 18, the first due-in stations for the entirety of the Project Site, are currently meeting the response time guidelines of the LACFD.^{12,13}

Average response times are not necessarily representative of the actual time required to reach a site from a fire station, but are an indication of the average time needed to reach any given destination within each station's respective service area. Actual response time to a given location depends on individual factors such as distance between a fire station and a location, traffic volumes, roadway characteristics, and topography.

Emergency Access

The Project Site is generally accessible by LAFCD emergency vehicles from a number of major roadways (i.e., West Century Boulevard, South Doty Avenue, West 102nd Street, and South Prairie Avenue), as described below.

- Fire Station 170 has access to the Project Site from South Crenshaw Boulevard to West Century Boulevard, from South Crenshaw Boulevard to West 104th Street to South Prairie Avenue, or from South Crenshaw Boulevard to West 104th Street to South Doty Avenue to West 102nd Street.
- Fire Station 18 has access to both the Project Site from West Lennox Boulevard to Hawthorne Boulevard to West Century Boulevard, or from West Lennox Boulevard to South Prairie Avenue.
- Fire Station 173 has access to the Project Site from South Crenshaw Boulevard to West Century Boulevard, from South Crenshaw Boulevard to West Century Boulevard to South Doty Avenue to West 102nd Street, or from South Crenshaw Boulevard to West Century Boulevard to South Prairie Avenue.

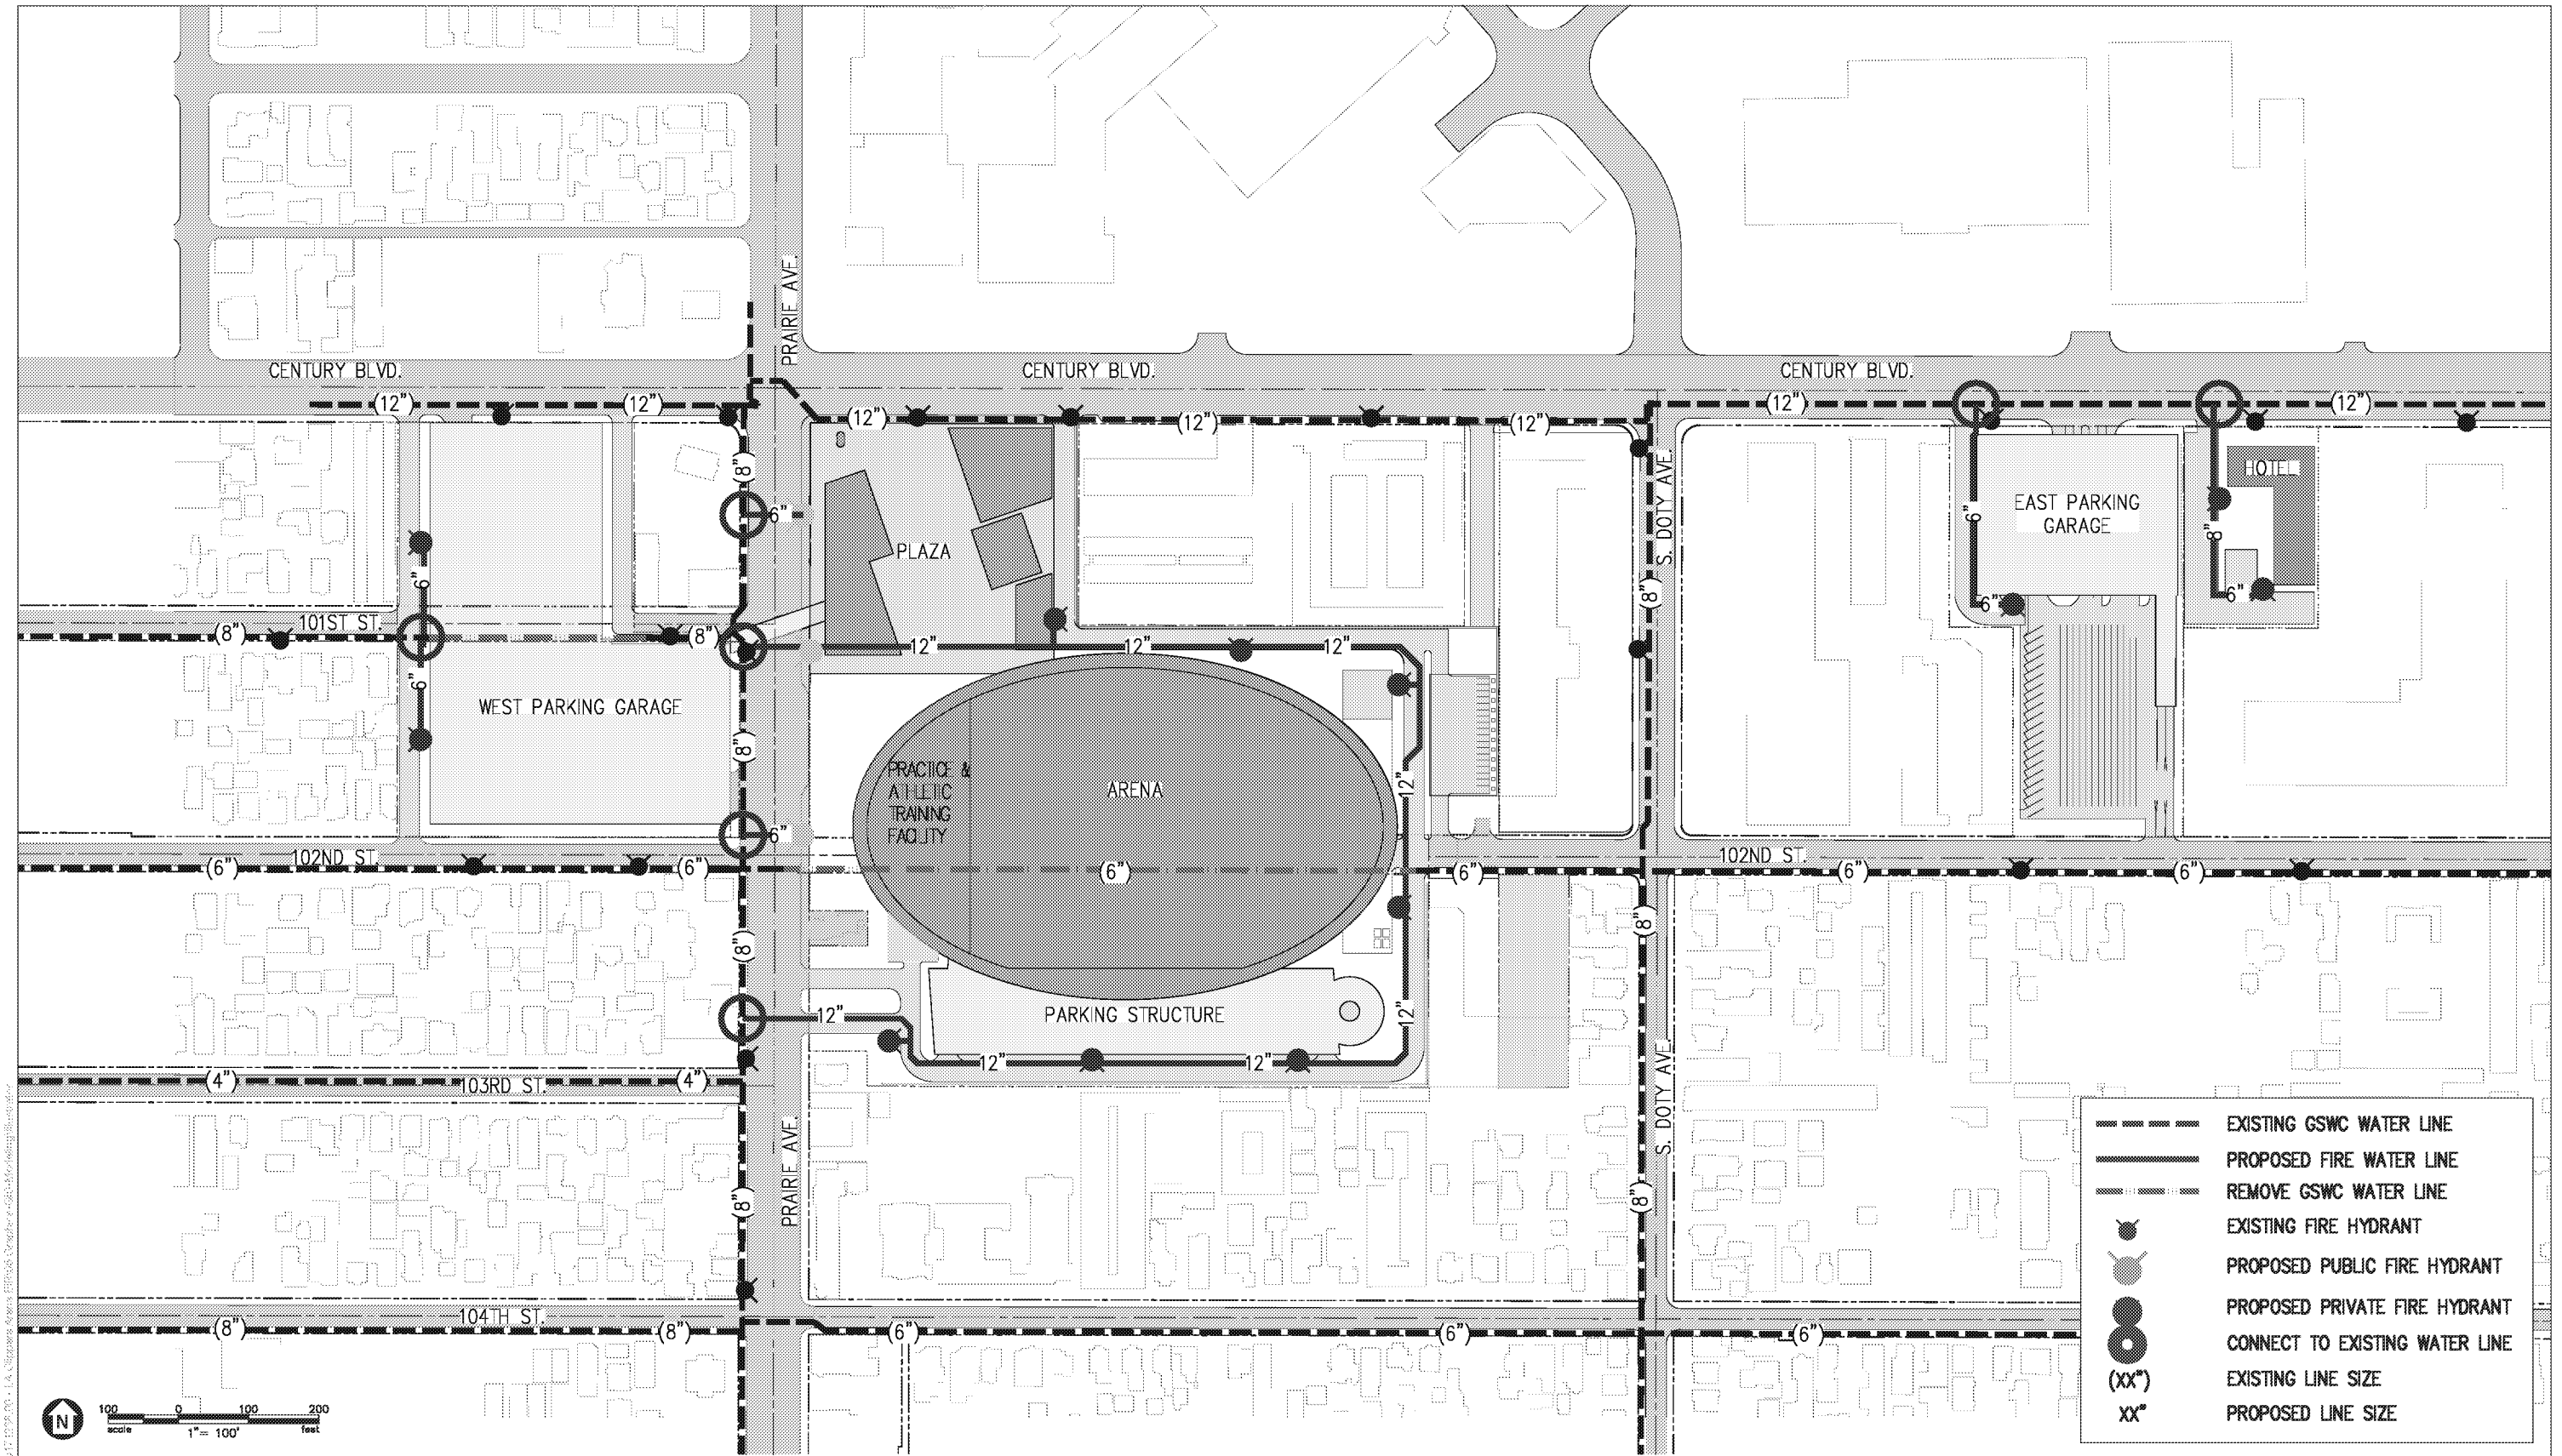

Water Infrastructure/Fire Flow for Firefighting Services

All but six of the parcels that make up the Project Site are currently vacant. The six developed parcels include a fast food restaurant, a motel, a light manufacturing/warehouse facility, a commercial catering business, and a groundwater well and related facilities, all of which are currently operational and in use. The existing water infrastructure serving the Project Site is shown in **Figure 3.13-2**, and consists of potable water mains located within West Century Boulevard, West 101st Street, West 102nd Street, West 103rd Street, South Prairie Avenue, and South Doty Avenue. Specifically, 12-inch mains are located within West Century Boulevard north of the Project Site; 8-inch mains run down South Prairie Avenue and South Doty Avenue, and within West 101st and West 104th Street west of South Prairie Avenue; 6-inch mains within West 102nd Street and West 104th Street east of South Prairie Avenue; and 4-inch main within West 102nd Street west of South Prairie Avenue. The Project Site is currently protected by existing public fire hydrants located in the nearby vicinity, the locations of which are shown in Figure 3.13-2.

Water for firefighting purposes is supplied to the Project Site by the Golden State Water Company (GSWC) Southwest District water system located in Los Angeles County. In general, fire flow requirements are closely related to land use as the quantity of water necessary for fire protection varies with the type of development, life hazard, type of occupancy, and degree of fire hazard.

3.13.2 Adjusted Baseline Environmental Setting

Section 3.13, Public Services, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to Fire Protection, the changes associated with the HPSP Adjusted Baseline projects include provision of fire protection infrastructure to serve the HPSP development (water mains, fire hydrants, code-required sprinkler systems, etc.). No other changes to the existing environmental setting related to fire protection would occur under the Adjusted Baseline.

Existing and Proposed Water Infrastructure

This page intentionally left blank

3.13.3 Regulatory Setting

Federal

There are no federal regulations, plans, or policies applicable to fire protection and emergency medical services relevant to the Proposed Project.

State

California Code of Regulations, Title 24, Part 2, 2016 California Building Code; Part 9, 2016 California Fire Code

The California Code of Regulations (CCR), Title 24, Part 2, 2016 California Building Code (2016 CBC) is a compilation of building and fire safety standards.¹⁴ The 2016 CBC standards comprise a combination of building standards that have been adopted by State agencies without change from a national model code; building standards based on a national model code that have been changed to address particular California conditions; and building standards authorized by the California legislature, not covered by the national model code.

The CCR, Title 24, Part 9, 2016 California Fire Code (2016 CFC) is part of the 2016 CBC.¹⁵ The purpose of the 2016 CFC is to establish the minimum requirements consistent with nationally recognized good practices to safeguard the public health, safety and general welfare from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises, and to provide safety and assistance to firefighters and emergency responders during emergency operations. Typical fire safety requirements of the 2016 CFC include: the installation of sprinklers in all high-rise buildings; the establishment of fire resistance standards for fire doors, building materials, and particular types of construction. The 2016 CFC applies to all occupancies in California, except where more stringent standards have been adopted by local agencies. Specific 2016 CFC regulations have been incorporated by reference with amendments in the Los Angeles County Fire Code, which has been adopted by the City of Inglewood and discussed further below.

California Occupational Safety and Health Administration

In accordance with California Code of Regulations, Title 8, sections 1270 “Fire Prevention” and 6773 “Fire Protection and Fire Equipment,” the California Occupational Safety and Health Administration (Cal OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hose size requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance and use of all firefighting and emergency medical equipment.

¹⁴ California Building Standards Commission, 2016. *California Building Code, California Code of Regulations, Title 24, Part 2, Volumes 1 and 2*. Available: <http://www.bsc.ca.gov/Codes.aspx>. Accessed August 2018.

¹⁵ California Building Standards Commission, 2016. *California Fire Code, California Code of Regulations, Title 24, Part 9*, July 2017.

Local

Los Angeles County Fire Department Strategic Plan 2017–2021

The 2017–2021 LACFD Strategic Plan (Strategic Plan)^{16,17} serves as a roadmap to communicate the LACFD’s goals and actions needed to achieve the goals. The Strategic Plan is designed to address short and long term challenges and to carry out the County’s public safety mission in meeting the current and future needs of over four million residents living and working in communities throughout the County.

Los Angeles County Developer Fee Detailed Fire Station Plan

The 2017 LACFD Developer Fee Detailed Fire Station Plan (Plan)¹⁸ reflects the Consolidated Fire Protection District’s (Fire District) fire service requirements as of September 2017 based upon growth projections and contacts with cities and developers who have shared their development plans with the Fire District. The Plan identifies 18 additional fire stations, one replacement station, one station expansion, two helispots, and the necessary capital equipment that will be required in the areas of benefit. The Plan also identifies the anticipated costs and time frames of development. The anticipated costs identified in the Plan will be funded by developer fee revenues or funds that the Fire District has advanced from Fire District general revenues or certificates of participation. These advances will be repaid to the Fire District when sufficient developer fee revenue is generated. If no amount is budgeted, the development of the fire stations may be delayed until developer fee revenues are sufficient to fund the site acquisition and/or construction of the fire station.

Los Angeles County, Code of Ordinances, Title 32, Fire Code

The Los Angeles County, Title 32, Fire Code,¹⁹ establishes regulations affecting or relating to structures, processes, premises, and safeguards regarding: conditions affecting the safety of the firefighters and emergency responders during emergency operations; and fire hydrant systems, water supply, fire equipment access, posting of fire equipment access, parking, lot identification, weed abatement, abatement of combustible brush and vegetation that represents an imminent fire hazard, debris abatement, combustible storage abatement including flammable liquid storage, hazardous material storage and use, open-flame and open-burning, and burglar bars at State-regulated mobile home and special occupancy parks within the jurisdiction of the LACFD.

City of Inglewood Municipal Code, Chapter 6, Fire Prevention

Per Chapter 6, Fire Prevention, Article 1, Fire Code and Amendments, Section 6-1, Los Angeles County Fire Code Adopted,²⁰ of the City of Inglewood Municipal Code (Municipal Code), the City has adopted by reference and incorporated the Los Angeles County, Title 32, Fire Code, as the City's Fire Code. Section 6-2 of the City's Fire Code includes additions to the Los Angeles County Fire Code.

City of Inglewood General Plan

The City of Inglewood General Plan, Land Use Element, adopted in 1980 and amended in 1986, 2009, and 2016, presents a long-range plan for the distribution and future use of land within the City. The Land Use Element analyzes population, existing and future land use requirements, and proposed implementation techniques. It provides a framework upon which the development of public and privately owned land can be based.²¹

The City of Inglewood General Plan, Safety Element, adopted in July 1995, is designed to ensure that the citizens of Inglewood can be protected from unreasonable risks caused by natural and manmade disasters. The City's goals are to minimize the dangers associated with natural and manmade hazards by implementing standards, regulations and laws that will reduce loss of life, injuries and property damage resulting from disasters, and to provide for the continuity of governmental operations and civilian life during and after a major disaster.²²

The following goals and objectives from the City of Inglewood General Plan Land Use Element and the Safety Element are applicable to the Proposed Project:

Land Use Element

Goal: Maintain the present high level of police and fire services to the extent it is fiscally prudent.

Safety Element

Goal 6: Public safety personnel provide improved response and services to the community.

Policy: Provide sufficient manpower and equipment to respond adequately to fire emergencies and civil disturbances.

As further discussed below in Impact 3.13-1, three fire stations are located within 1.5 miles of the Project Site and four additional fire stations are located within 2.5 miles of the Project Site. According to the LACFD, the estimated average response time to the Project Site from Fire Station 170, the first due-in station, is 5 minutes, which meets the response time guidelines of the LACFD. Further, the Proposed Project would generate revenue for both the Los Angeles County Developer Fee Detailed Fire Station Plan and the City's general fund that could be used to fund LACFD expenditures as necessary to offset incremental Proposed Project effects on fire

²⁰ City of Inglewood. *Municipal Code, Chapter 6, Fire Prevention*. Available: <https://www.qcode.us/codes/inglewood/>. Accessed August 2018.

²¹ City of Inglewood, 2016. *City of Inglewood General Plan, Land Use Element*, September 14, 2016.

²² City of Inglewood, 1995. *City of Inglewood General Plan, Safety Element*, July 1995.

protection manpower or equipment. The Proposed Project has no potential inconsistencies with the above-referenced goals and policies of the City of Inglewood General Plan Land Use and Safety Elements. Ultimately, it is within the authority of the City Council to determine if the Proposed Project is consistent with the City of Inglewood General Plan.

3.13.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to fire protection and emergency services. The following threshold of significance is consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Result in substantial adverse physical impacts associated with the provision of or need for new or physically altered facilities for the provision of fire protection and emergency medical services, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection.

Consistent with the requirements of CEQA as articulated in California First District Court of Appeal decision in *City of Hayward v. Trustees of California State University* (2015) 242 Cal.App.4th 833,²³ significant impacts under CEQA involve adverse physical changes in the environment as a result of implementation of a project. Pursuant to this case, “the city has a constitutional obligation to provide adequate fire protection services,” and potential effects on public safety services are not in and of themselves an environmental impact that CEQA requires a project applicant to mitigate. The Court stated that “the obligation to provide adequate fire and emergency medical services is the responsibility of the city.” (Cal. Const., art. XIII, § 35, subd. (a)(2) [“The protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services.”].) Thus, the focus of analysis in this section is not on whether the Proposed Project would result in the need for additional fire protection and emergency medical services (i.e., personnel, equipment), per se, but rather is on the question of whether provision of any required resources (e.g., construction of a new fire station) would result in significant physical adverse impacts on the environment.

Methodology and Assumptions

Fire protection and emergency medical service needs relate to the size of the population and geographic area served, the number and types of calls for service, and the physical characteristics of the City’s built environment and infrastructure. Changes in these factors resulting from construction and operation of the Proposed Project may increase demand for or delivery of public services. The LACFD evaluates the demand for fire protection and emergency medical services on a project-by-project basis, including review of a project’s emergency features and/or design

²³ Court of Appeal of the State of California, First Appellate District, Division Three, 2015. *City of Hayward v. Board of Trustees* (Alameda County Superior Court No. RG09480852); *Hayward Planning Association et al., v. Board of Trustees of the California State University*, Filed November 30, 2015.

features, to determine if a project would require additional equipment, personnel, new facilities, or alterations to existing facilities. Beyond the standards included in the City's Fire Code, consideration is given to the size (height and physical configuration) of a project, uses proposed, fire flow necessary to accommodate a project, distance to the site for engine and truck companies, response time, fire hydrant sizing and placement standards, access, and the project's potential to use or store hazardous materials. The proposed closure of portions of West 101st and West 102nd Streets is also considered in the analysis.

The LACFD was consulted for this analysis and the responses provided regarding the Proposed Project were incorporated. In addition, the LACFD website and applicable provisions of the City of Inglewood's Fire Code were reviewed. Based on this information and consultation with the LACFD, a determination was made as to whether the LACFD would require new or physically altered facilities for the provision of fire protection and emergency medical services in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection. If such facilities would be required, the analysis considers whether the LACFD's construction of such facilities would reasonably be expected to cause significant environmental impacts. The potential impacts associated with use or storage of hazardous materials are discussed in Section 3.8, Hazards and Hazardous Materials. For a discussion of the effects of projected future traffic and transportation conditions on emergency access, please refer to Section 3.14, Transportation and Circulation.

Impacts and Mitigation Measures

Impact 3.13-1: Construction and operation of the Proposed Project could result in substantial adverse physical impacts associated with the provision of new or physically altered facilities for the provision of fire protection and emergency medical services, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives. (Less than Significant)

Construction

There are a number of ways in which construction of the Proposed Project could result in increased demand for fire protection and emergency medical services as discussed further below.

Response to Construction Accidents

Construction of the Proposed Project would occur over approximately 39 months starting in 2021 and concluding in 2024. The estimated number of construction workers is described in Chapter 2, Project Description (see Section 2.5 Project Elements), and would vary on a day-to-day basis, depending on the specific construction activities being performed and the overlap between construction phases.

The risks associated with construction activities would vary depending on the nature of the activity that is occurring. Construction activities associated with the demolition of the existing on-site structures, excavation, and construction of the Proposed Project could result in accidents that could require fire protection and emergency medical services response. Construction accidents could result from occasional exposure of workers to combustible materials, such as wood,

plastics, sawdust, coverings and coatings, to heat sources including machinery and equipment sparking, exposed electrical lines, welding activities, and chemical reactions in combustible materials and coatings. Construction accidents could also occur in the use of construction equipment, or as a result of falls or other mishaps. Although the Proposed Project is relatively large in size and scope, the construction activities, methods, and equipment that would be employed are typical for the construction of large projects.

In compliance with the Cal OSHA and fire and building requirements of the City's Fire Code, all of which are regularly enforced through the City's Building Safety Division building inspection services, construction personnel for the Proposed Project would be trained in fire prevention and emergency response, and fire suppression equipment specific to construction vehicles would be maintained on site. Additionally, construction of the Proposed Project would comply with applicable existing codes and ordinances related to the maintenance of mechanical equipment, handling and storage of flammable materials, and cleanup of spills of flammable materials.

Through compliance with City and State regulations, which would be enforced and monitored by City building inspectors, the Proposed Project would avoid creating a new material demand for fire protection and emergency medical services that could require construction of new facilities that could adversely affect the environment. Further, according to the LACFD, an acceptable equipment level is maintained throughout the Department's jurisdictional boundaries to enable the appropriate response to all incidents.²⁴ It should be noted that the LACFD has provided emergency response through the construction of the NFL Stadium at the Los Angeles Entertainment and Sports District, without need for augmented services. The Proposed Project is a smaller structure with a smaller construction staff and shorter construction period than the NFL Stadium. This suggests that existing LACFD capacity is sufficient to meet the needs of construction accidents that could occur during construction of the Proposed Project. Additionally, further discussion of the effects of construction-related traffic on emergency access is provided in Section 3.14, Transportation and Circulation.

Operation

Demand for Fire Protection, Facilities, and Emergency Medical Services

The adequacy of fire protection and emergency medical services for a given area is based on the size of a project, the uses proposed, operational-related traffic congestion, the number of people who intermittently or permanently occupy the project site, the fire flow necessary to accommodate a project, the distance to the site for engine and truck companies, the response time, fire hydrant sizing and placement standards, access, and the project's potential to use or store hazardous materials. According to the LACFD, there are no planned improvements to fire

²⁴ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated January 24, 2019.

stations or expansion of existing facilities in the immediate area of the Project Site or area surrounding the Project Site.²⁵

Patron, Employee, Customer, and Visitor Effects on Demand

The Proposed Project would result in an increased number of people at and in the vicinity of the Project Site, including patrons attending LA Clippers homes games and other events such as concerts, conventions, family shows, corporate/community events, plaza events and other events; employees of the LA Clippers; temporary event-related employees; LA Clippers employees, as well as customers and employees of the restaurant, retail, sports medicine clinic, and hotel uses; and visitors to the community uses and plaza. Because the Proposed Project would not include residential uses, there would be no permanent increase in residential population at the Project Site.

The average attendance at LA Clippers home basketball games is anticipated to be 16,000 with a maximum attendance of 18,000 attendees and up to 1,320 event-related employees. Other events such as concerts, family shows, conventions and corporate or civic events, and non-LA Clippers sporting events would take place in the Proposed Project arena throughout the year, with attendance ranging from small events up to 2,000 attendees (average of 300 attendees) to large center-stage concert capacity of 18,500 attendees. Intermittent increases in pedestrian activity and the number of people at and in the vicinity of the Project Site, as well as the potential increase in vehicle/pedestrian conflicts and accidents before, during and after events, would likely result in periodic increases in demand for fire protection and emergency medical services from the LACFD compared to baseline conditions. Based on discussions with the LAFCD, because of the LAFCD's regional approach to service delivery, which allows for the response from any number of available fire stations in the vicinity of the Project Site (the closest are Stations 170, 18, and 173), the periodic increase in demand would be accommodated by the LAFCD without causing the need for new or physically altered facilities.²⁶

Project Design

The Proposed Project would be designed and operated in compliance with the City's Fire Code. New construction would also be subject to other requirements of the City's Fire Code, the City's Building Code, and the LACFD that address structure and plaza design and building materials. The Proposed Project design would include fire resistant doors and materials, as well as walkways, stairwells, and elevator systems (including emergency and fire control elevators) that meet code requirements. The Proposed Project's fire safety features would include the installation of automatic fire sprinkler systems, smoke detectors, fire extinguishers, a fire alarm system, building emergency communication system and smoke control system, and appropriate signage and internal exit routes to facilitate a building evacuation if necessary.

²⁵ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated October 25, 2018.

²⁶ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated January 24, 2019.

Arena operations would include procedures that would be in place to assist the LACFD during an emergency incident. These procedures would include (1) a drill procedure to prepare for emergency incidents; and (2) an on-site emergency assistance center/first aid station with emergency equipment and on-site medical personnel to provide first aid to game/event patrons or employees that may require medical assistance. Further, ambulance services would be on site and available during all large sporting events and other large events, as may be determined appropriate by the LACFD.

The arena design would include two locations within the Arena Structure that would be used by the LACFD, Inglewood PD, and/or the arena operator's private security and emergency medical personnel for security/command center functions, including coordination of incident response, communication and surveillance, and deployment of traffic control officers and/or City public works personnel prior to, during, and after events. The two security and command center spaces would include:

- An approximately 3,000 square-foot security space included on the event level (below grade), which would be designed to serve as the command center and primary security area for staging, vehicle and equipment storage, and performing security checks for entry at the event level; and
- A second approximately 4,000 square-foot security space included on the plaza level (at grade) which would be designed to serve as the secondary staging area for security personnel, along with providing employee and press check-in.

The Proposed Project would provide access for LACFD apparatus and personnel to the Project Site in accordance with LACFD requirements, inclusive of standards regarding fire lane widths, driveways and turning radii and with capacities needed to support fire fighting vehicles, and markings and on-site vehicle restrictions to ensure safe access. All water systems and driveways would be completed to the satisfaction of the LACFD prior to issuance of building permits.

Implementation of the Proposed Project would include the vacation of portions of two existing City streets:

- An approximately 900-foot linear section of West 102nd Street from South Prairie Avenue to a line approximately 335 feet west of South Doty Avenue, to be developed as part of the Arena Site; and
- An approximately 350-foot linear section of West 101st Street between South Prairie Avenue and South Freeman Avenue to be developed with a portion of the parking garage building within the West Parking Garage Site.

As discussed above, the estimated response time to the Project Site from the first due-in Fire Stations 170 and 18 meet the 5-minute response time guidelines of the LACFD. According to the

LACFD, the street vacations would not change the response times from Fire Stations 170, 18, and other responding fire stations to the Project Site.²⁷

Due to the building design, fire safety features, emergency safety provisions, LACFD access, construction measures, water system improvements, and hydrant spacing,²⁸ the design of the Proposed Project would not result in a substantial increase in demand for additional fire protection and emergency medical services that would exceed the capability of the LACFD to serve the Proposed Project such that it would require construction of new fire facilities.

As discussed in Section 3.0, Introduction to the Analysis, because of current and anticipated construction schedules, the City is reasonably assured that the HPSP Adjusted Baseline projects will be built and operational by 2024 when the Proposed Project is expected to be opened. Thus, the analysis of the Proposed Project's effects assumes construction and operation of the portions of the HPSP identified as part of the Adjusted Baseline, including the NFL Stadium. Based on review of submitted plans and discussions with the LAFCD, it is anticipated that the HPSP Adjusted Baseline projects would include safety features similar to those described for the Proposed Project. Input provided by the LAFCD indicates that no additional fire protection or emergency service facilities would be necessary to serve both the Proposed Project and the HPSP Adjusted Baseline projects.²⁹

As such, under the Adjusted Baseline conditions, it is not anticipated that the Proposed Project would result in a substantial increase in demand for additional fire protection and emergency medical services that would exceed the capability of the LACFD such that it would require construction of new fire protection or emergency service facilities.

Traffic Effects on Emergency Response

An analysis of the effects of projected future traffic and transportation conditions on emergency access, including a discussion of the Event Transportation Management Plan (TMP), is provided in Section 3.14, Transportation and Circulation. For informational purposes, the TMP is discussed summarily here, and in further detail in Section 3.14, Transportation and Circulation, and is included in Appendix K.4 in this Draft EIR.

The arena operator would coordinate with the LACFD, the Inglewood PD, and the City of Inglewood Public Works Department to implement the traffic control measures included in the Event Transportation Management Plan (TMP). The Event TMP is a management and operating plan designed to facilitate multi-modal travel to and from events at the Project Site in a safe and efficient manner during event days. Pursuant to approvals by the City Public Works and Police Departments, the arena operator would provide traffic control personnel and services on public

²⁷ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated January 24, 2019.

²⁸ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated October 25, 2018.

²⁹ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, letter correspondence dated January 24, 2019.

streets in the vicinity of the Project Site, as necessary to facilitate safe movement of pedestrians, bicycles, and vehicles. The Event TMP would be designed to ensure access to/from the Project Site and vicinity of the Project Site through techniques potentially including, but not limited to, traffic signal controls and timing, traffic control officers positioned in key locations around the Project Site, temporary lane or street closures, and/or changeable message signs. The Event TMP would be a working document that could be adaptively managed and refined over time by the arena operator, the LACFD, the Inglewood PD, and the City of Inglewood Public Works Department. The Event TMP is further described in Section 3.14, Transportation and Circulation.

Water Infrastructure/Fire Flow for Firefighting Services

As discussed above under Environmental Setting, the local water distribution network includes water mains beneath West Century Boulevard, West 101st Street, West 102nd Street, West 103rd Street, South Prairie Avenue, and South Doty Avenue. There are 19 existing public fire hydrants located in public rights-of-way adjacent to the Project Site. Under the Adjusted Baseline, in addition to existing public fire hydrants, proposed public and private fire hydrants would be located within the HPSP area. The fire flows and location/spacing of the proposed private and public fire hydrants of the HPSP Adjusted Baseline projects would meet the requirements of the City's Fire Code and the LACFD.

Dedicated fire water infrastructure for the Proposed Project would involve a combination of tying into existing water lines, removing and relocating water lines, construction of new water mains and lines, and new fire hydrants. A total of 12 private and 3 public fire hydrants would be installed, as described below. Proposed fire-related water infrastructure is shown in Figure 3.13-2. A new 12-inch dedicated fire water line would wrap around the perimeter of the Arena Site within a new access road, connecting with the existing 8-inch water line within South Prairie Avenue. This fire pipeline would connect to 7 private fire hydrants within the Arena Site. Three 6-inch fire hydrant connections to the existing 8-inch water line within South Prairie Avenue to the east side of the street, would connect to the three proposed new public fire hydrants. On the West Parking Garage Site, approximately 340 linear feet of water main line within West 101st Street would be removed. An existing water line in the section of West 102nd Street within the Arena Site to be vacated would be removed and relocated. Two new private fire hydrants would be installed and connected via 6-inch dedicated fire water lines on the west side of the West Parking Garage Site. At the East Transportation and Hotel Site, a 6-inch dedicated fire line would connect to a private fire hydrant at the parking garage, and a dedicated 8-inch fire line would connect to two private fire hydrants at the proposed hotel location. Impacts associated with the construction of these water facilities are analyzed in Section 3.15, Utilities and Service Systems.

The required flow demand of the Proposed Project is 4,000 gpm. Through the 19 existing fire hydrants, the three proposed new public fire hydrants, and 12 proposed private fire hydrants, there would be adequate capacity to meet the estimated fire flow demand of the Proposed Project. Further, fire flow would be in compliance with the requirements of the City's Fire Code and subject to the review and approval of the LACFD. Because the Proposed Project would include fire flows and additional private and public fire hydrants that would meet the

requirements of the City's Fire Code and the LACFD, there would be no need for new or physically altered facilities beyond those included in the Proposed Project.

As discussed above, the HPSP Adjusted Baseline projects include, in addition to existing public fire hydrants, proposed public and private fire hydrants. The fire flows and location/spacing of the proposed private and public fire hydrants of the HPSP Adjusted Baseline projects would meet the requirements of the City's Fire Code and the LACFD. Thus, operation of the Proposed Project under Adjusted Baseline conditions would not require the need for new or physically altered facilities for the provision of fire protection and emergency medical services, the construction of which would result in substantial adverse physical environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection and emergency medical services. Therefore, the Proposed Project's operational impacts on fire protection, facilities, and emergency medical services would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to fire protection and emergency medical services includes those past, present, and reasonably foreseeable cumulative projects located within the LACFD service area, with a focus on the areas served by the same three LACFD fire stations that would primarily serve the Proposed Project (e.g., Fire Station 170, Fire Station 18, and Fire Station 173). As described further below, Fire Stations 170, 18, and 173 would serve a total of 108 cumulative projects, in addition to the Proposed Project. The development of the 108 cumulative projects consists of approximately 7,266 residential units, 1,260,863 square feet (sf) of commercial uses, 679,683 sf of retail uses, 9,353 sf of restaurant uses, 4,316,866 sf of office uses, 657,704 sf of industrial/warehouse uses, 128,402 sf of hotel uses which would include 1,705 hotel rooms, 1,234,725 sf of miscellaneous uses (i.e., athletic training facility, recreation center, conference center, ice skating rink, civic site, bus facility, and a church), and 13 acres of open space.

Impact 3.13-2: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could result in substantial adverse physical impacts associated with the provision of or need for new or physically altered facilities for the provision of fire protection and emergency medical services, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection. (Less than Significant)

Construction

Because the LACFD operates under a regional concept in its approach to providing fire protection and emergency medical services, it is conservatively assumed the LACFD would provide either first due-in or backup services to all 145 cumulative projects included in Table 3.0-2, Cumulative

Projects List (see Section 3.0, Introduction to the Analysis). Of these 145 cumulative projects, 108 projects would be located within the LACFD service areas of the same three LACFD fire stations that would primarily serve the Proposed Project (e.g., Fire Station 170, Fire Station 18, and Fire Station 173). **Table 3.13-2** provides the list of those cumulative projects located in the City of Inglewood within the LACFD service area of Fire Stations 170, 18, and 173 and the distances from the cumulative projects to the respective servicing fire stations.

NOTES:

FS = fire station

^a Fire stations located within 2.5 miles of the cumulative project were included.

^b Portion of the HPSP not included within the Adjusted Baseline Environmental Setting.

SOURCE: County of Los Angeles Fire Department Website, *Fire Station Locator*. Available: <https://locator.lacounty.gov/fire>. Accessed November 2018; ESA.

In compliance with the requirements of Cal OSHA and the City’s Fire Code, all construction personnel working on cumulative projects would be trained in fire prevention and emergency response, and fire suppression equipment specific to construction vehicles would be maintained within individual project sites of the cumulative projects. Construction of the cumulative projects would comply with applicable existing codes and ordinances related to the maintenance of mechanical equipment, handling and storage of flammable materials, and cleanup of spills of flammable materials. Similar to the Proposed Project, when a building or grading permit is required, the City’s Department of Public Works and the LACFD review construction plans and determine appropriate requirements to ensure that construction avoids creating major traffic congestion or adverse effects on adjacent properties. Truck routes for material and equipment deliveries, as well as for soil export and disposal, would require approval by the City prior to construction activities of cumulative development. Construction of the Proposed Project, in combination with the

construction of other cumulative development, would not increase demand for fire protection and emergency medical services that could require construction of new or expanded facilities.

There are multiple routes from multiple fire stations to the cumulative development of which LACFD can use in the event of heavy roadway congestion. All road closures and detours should be approved by the LACFD so as not to adversely impact emergency responses.³⁰ Further, emergency response to a site is routinely facilitated, particularly for high priority calls, through use of sirens to clear a path of travel, driving in the lanes of opposing traffic, use of alternative routes, and multiple emergency vehicle response. According to the LACFD, there are no planned improvements to fire stations in the immediate area of the Project Site or area surrounding the Project Site.³¹ The LACFD dispatches multiple units from multiple fire stations in the event of a large fire. An acceptable equipment level is maintained throughout the Department's jurisdictional boundaries to enable the appropriate response to all incidents.³²

Based on the above considerations, construction of the Proposed Project, in conjunction with construction of the HPSP Adjusted Baseline projects and cumulative development within the LACFD service area, would not result in the need for new or expanded fire facilities in order to maintain acceptable service ratios, response times, or other performance objectives. Therefore, the cumulative impact would be **less than significant**.

Operations

As discussed above, the LACFD provides services to a population of over four million residents living and working in 59 cities and all unincorporated communities within Los Angeles County. It is conservatively assumed the LACFD would provide either first due-in or backup services to all 145 cumulative projects. Of these 145 cumulative projects, 108 projects are located within the service areas of the same three LACFD fire stations that would be the primary responders to emergencies at the Proposed Project (e.g., Fire Station 170, Fire Station 18, and Fire Station 173); refer to Table 3.13-2.

Fire Station 170 would provide fire protection and emergency medical services to 57 cumulative projects; Fire Station 18 would provide service 76 cumulative projects; and Fire Station 173 would service 70 cumulative projects. Operation of the Proposed Project, along with the operations of past, present, and reasonably foreseeable future projects, including the HPSP Adjusted Baseline projects and projects on the cumulative list, would increase the demand for fire protection and emergency medical services.

Although the cumulative demand on LACFD services would increase, cumulative impacts on fire protection and emergency medical services would be less than significant because each

³⁰ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, *letter correspondence* dated January 24, 2019.

³¹ Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, *letter correspondence* dated October 25, 2018.

³² Michael Y. Takeshita, Acting Chief, Forestry Division, Prevention Services Bureau, *letter correspondence* dated January 24, 2019.

cumulative project would be required to comply with the City and State Fire Codes and LAFCD design review, and include site-specific design and safety features. It is reasonable to assume such compliance because these codes are fully enforced through the City of Inglewood's and other local communities plan check and building inspection functions. Each cumulative project would be subject to the required review by the LACFD for compliance with Fire Code and Building Code regulations related to emergency response, emergency access, fire flow, and fire safety. Implementation of the Fire Code and Building Code requirements, along with any other LAFCD requirements, combined with the LAFCD's regional multiple fire station response approach, and the fact that each cumulative project within the LACFD service area, including the Proposed Project and the HPSP Adjusted Baseline projects, would be required to comply with regulatory requirements related to fire protection and emergency medical services would reduce potential impacts to fire protection and emergency services.

As discussed above for the Proposed Project, the LACFD has indicated that additional staffing of one fire captain post position in the City is anticipated to be required in order to offset the cumulative effect on fire protection services due to substantial growth in the project area but that it does not anticipate the need to expand fire or emergency response facilities within the vicinity of the Project Site, even in consideration of cumulative development within the LACFD service area.³³ The LACFD's 2017–2021 Strategic Plan is designed to address short and long term challenges and to carry out the County's public safety mission in meeting the current and future needs. Similar to the Proposed Project, cumulative projects would generate revenue (e.g., developer fees, property and sales tax revenue) that could be used to offset LACFD expenditures necessary to meet increased demand for fire protection and emergency medical services consistent with its Strategic Plan.

Based on the above considerations and according to the LAFCD, the Proposed Project, in conjunction with cumulative development within the LAFCD service area, would not result in the need for the construction of new or expanded fire facilities in order to maintain acceptable service ratios, response times or other performance objectives.³⁴ Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

³⁴ Lorraine Buck, Supervising Planning Analyst, Planning Division, LACFD, letter correspondence dated April 15, 2019.

Police Protection

3.13.5 Environmental Setting

Regional and Local Setting

Police protection for the City, including the Project Site, is provided by the Inglewood PD, which serves the entire population of the City (estimated at 110,598 persons in 2017).³⁵ The Police Department employs 191 sworn personnel and 92 civilian support personnel. Of the 191 sworn personnel, approximately 56 officers are available in the field throughout the day and another 35 officers are available from the Inglewood Police Station.³⁶ The Inglewood PD also has the ability to call upon mutual assistance from surrounding law enforcement agencies.³⁷ The Inglewood PD operates from a single police station (the Inglewood Police Station) located at 1 West Manchester Boulevard, approximately 1.5 miles northwest of the Project Site. The location of the Inglewood Police Station is shown on Figure 3.13-1.

The Inglewood PD is comprised of multiple resources and special service teams including the special weapons and tactics (SWAT) team, specialty trained canine teams including vapor wake dogs, the crisis negotiation team, the special enforcement team, directed enforcement units, the narcotics unit, scientific service investigators, traffic division, bike teams, community affairs, and fiscal services and recruitment. All of these units have assigned emergency vehicles to them for immediate response capabilities.^{38,39}

The Inglewood PD provides traffic control for all large-scale events within the City. Specifically, the Inglewood PD coordinates with Serco, a private traffic control company, to provide traffic control for all large-scale events at The Forum. For all large-scale public and private events at the new NFL Stadium the Inglewood PD will have specific responsibilities for traffic control that will be outlined in a Transportation Management and Operations Plan (TMOP), currently under development by the City.⁴⁰

The Inglewood PD consists of four bureaus: the administrative services bureau, the support services bureau, the detective bureau, and the patrol bureau. The administrative services bureau is the support branch of the Inglewood PD tasked with operating the administrative services, the background unit, grants, fiscal services, the training unit, personnel/recruitment, and the records division. The support services bureau consists of vice/intelligence, emergency services, property, narcotics, policy, and training. The detective bureau includes two divisions, crimes against property and crimes against persons. The detective bureau includes economic crimes, burglary/

⁴⁰ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

theft, missing persons, digital forensic, crime analysis, and court liaison. The patrol bureau includes the communications division, the K-9 unit, traffic control, and parking enforcement.⁴¹

The Inglewood PD includes four geographic patrol beats.⁴² The Project Site is located within portions of both Beat 2 and reporting district (RD) 25 and Beat 4 and RD 30. Beat 2 consists of the portion of Inglewood north of West 104th Street and west of South Prairie and Beat 4 consists of the portion of Inglewood south of West Century Boulevard and east of South Prairie Avenue.^{43,44}

The Police Department provides a 24-hour telephone service to the public for information and for routine or emergency assistance. The Inglewood PD uses two-way radio capability, for official use only, which provides continuous communication between the dispatchers and Police Department members in the field.⁴⁵ According to the Inglewood PD, the current average response time citywide is 5 minutes and 12 seconds for emergency calls. A service call is considered an emergency call when there is an immediate or potential threat to life or the infliction of serious injury. A service call is considered a non-emergency call when it involves a crime against property or other types of crimes that do not meet the criterion for emergency. The Inglewood PD's goal is to maintain or improve upon the 5-minute-12-second response time for emergencies for the City of Inglewood as a whole.^{46,47}

Table 3.13-3 presents the types and number of crimes reported in the City of Inglewood for 2017 (the latest whole year for which detailed annual crime data is available). As shown, a total of 7,140 crimes were reported in the City, with the crimes most prevalent crimes being property crimes and larceny (theft). In 2018, the City of Inglewood experienced a 2.9 percent decrease in crimes compared to 2017, including an 8 percent decrease in violent crimes. Within the immediate area surrounding the Project Site,⁴⁸ the Inglewood PD reports a 7 percent decrease in crimes from 2017 to 2018.⁴⁹

The Los Angeles County Sheriff's Department (LASD) and the 47 local police departments within Los Angeles County provide each other mutual aid in the event of a major unplanned event which impacts law enforcement resources. To best utilize mutual aid resources, Los Angeles County is divided into eight geographic areas "A" through "H" which are currently based on disaster management area configurations which were redefined in the mid-1990s. LASD

⁴⁶ Mark Fronterotta, Chief of Police, letter correspondence dated October 11, 2018.

⁴⁷ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

⁴⁸ Per the letter correspondence from Inglewood PD dated January 10, 2019, the project area is described as being located on West Century Boulevard to the north, 355 feet east of South Doty Avenue on the east, 462 feet west of South Prairie Avenue on the west and West 103rd Street on the south between South Prairie Avenue and South Doty Avenue.

⁴⁹ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

maintains “contact” stations within each disaster management area. These contact stations are typically the nearest located station to a particular local police department. The Inglewood PD is located in Area “G” and the following local law enforcement agencies would provide immediate assistance to the Inglewood PD: El Camino College PD, El Segundo PD, Gardena PD, Hawthorne PD, Hermosa Beach PD, Manhattan Beach PD, Palos Verdes Estates PD, Redondo Beach PD, Torrance PD, and California Highway Patrol (CHP) West LA. The LASD contact station would be LASD-South LA station.⁵⁰

**TABLE 3.13-3
 INGLEWOOD POLICE DEPARTMENT ANNUAL CRIME STATISTICS (2017)**

Crime	Number	Percent of Inglewood Crime
Violent Crimes	791	11%
Homicide	13	0%
Rape	45	1%
Robbery	390	5%
Aggravated Assault	343	5%
Property Crimes	2,779	39%
Burglary	492	7%
Larceny (Theft)	1,469	21%
Auto Theft	802	11%
Arson	16	0%
Total	7,140	100%

NOTE:

Crime data for 2017 (the latest whole year for which annual crime data was available).

SOURCE: City of Inglewood Police Department, *Annual Crime Statistics 1978–2017*, revised July 3, 2018.

3.13.6 Adjusted Baseline Environmental Setting

Section 3.13, Public Services, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to police protection, the changes associated with the HPSP Adjusted Baseline projects include construction of an Inglewood PD substation to be located inside one of the HPSP parking structures. The substation will be equipped with offices, an interview room, and work area for use by Inglewood PD officers and personnel. No other changes from the existing setting related to police protection are anticipated under the Adjusted Baseline.

3.13.7 Regulatory Setting

Federal

There are no federal regulations, plans, or policies applicable to police protection relevant to the Proposed Project.

⁵⁰ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

State

There are no state regulations, plans, or policies applicable to police protection relevant to the Proposed Project.

Local

City of Inglewood General Plan

The following goals and objectives from the City of Inglewood General Plan Land Use Element and the Safety Element are applicable to the Proposed Project:

Land Use Element

Goal: Maintain the present high level of police and fire services to the extent it is fiscally prudent.

Safety Element

Goal 6: Public safety personnel provide improved response and services to the community.

Policy: Provide sufficient manpower and equipment to respond adequately to fire emergencies and civil disturbances.

As further discussed below in Impact 3.13-3, due to the Project Site's close proximity to the Inglewood Police Station, approximately 1.5 miles northwest of the Project Site, emergency responses are not expected to be substantially affected. Further, the Proposed Project would generate revenue for the City's general fund that could be used to fund Inglewood PD expenditures as necessary to offset any incremental impact from the Proposed Project on police services. It is the opinion of City staff that the Proposed Project has no potential inconsistencies with the above-referenced goals and policies of the City of Inglewood General Plan Land Use and Safety Elements. Ultimately, it is within the authority of the City Council to determine if the Proposed Project is consistent with the City of Inglewood General Plan.

3.13.8 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to police protection. The following threshold of significance is consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Result in substantial adverse physical impacts associated with the provision of or need for new or physically altered facilities for police protection services, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police protection.

Consistent with the requirements of CEQA as articulated in the California First District Court of Appeal decision in *City of Hayward v. Trustees of California State University* (2015) 242

Cal.App.4th 833,⁵¹ significant impacts under CEQA involve adverse physical changes in the environment as a result of implementation of a project. Pursuant to this case, “the city has a constitutional obligation to provide adequate fire protection services,” and potential effects on public safety services are not in and of themselves an environmental impact that CEQA requires a project applicant to mitigate. The Court stated that “[T]he obligation to provide adequate fire and emergency medical services is the responsibility of the city.” (Cal. Const., art. XIII, § 35, subd. (a)(2) [“The protection of the public safety is the first responsibility of local government and local officials have an obligation to give priority to the provision of adequate public safety services.”].) Although the case focused on fire protection and emergency medical services, its reasoning applies to police protection services. Thus, the focus of analysis in this section is not on whether the Proposed Project would result in the need for additional police protection, per se, but rather is on the question of whether provision of any required resources (e.g., construction of a new police station) would result in significant physical adverse impacts on the environment.

Methodology and Assumptions

Police protection needs relate to the size of the population and geographic area served, the number and types of calls for service, and the physical characteristics of the City. Changes in these factors resulting from construction and operation of the Proposed Project may increase the demand for police protection services. The Inglewood PD evaluates the demand for police protection on a project-by-project basis, including review of a project’s security and/or design features, to determine if a project would require additional equipment, personnel, new facilities, or alterations to existing facilities.

The Inglewood PD was consulted for this analysis and the responses provided regarding the Proposed Project were incorporated. According to the Inglewood PD, the Police Department does not maintain service ratios such as an officer-to-resident ratio. The Inglewood PD is a data driven law enforcement agency and deploys according to the study of crime and crime trends.⁵² The Police Department does not currently have a strategic plan or long-term master plan. Due to the rapid evolution and expansion entertainment segment of the City, the planning process for the Inglewood PD is ongoing. The Inglewood PD remains engaged with the City’s CEQA consultants in regard to traffic forecasting and analysis processes.⁵³

Based on this information and in consultation with the Inglewood PD, a determination was made as to whether the Inglewood PD would require new or physically altered facilities for the provision of police protection in order to maintain acceptable response times or other performance objectives for police protection services. If such facilities would be required, the

⁵¹ Court of Appeal of the State of California, First Appellate District, Division Three, 12015.15; *City of Hayward v. Board of Trustees* (Alameda County Superior Court No. RG09480852); *Hayward Planning Association et al., v. Board of Trustees of the California State University*, November 30, 2015.

⁵² Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

⁵³ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

analysis considers whether the Inglewood PD's construction of such facilities would reasonably be expected to cause significant environmental impacts.

Impacts and Mitigation Measures

Impact 3.13-3: Construction and operation of the Proposed Project could result in substantial adverse physical impacts associated with the provision of or need for new or physically altered facilities for police protection services, the construction of which could cause significant environmental impacts, in order to maintain acceptable response times or other performance objectives for police protection. (Less than Significant)

Construction

The Proposed Project could result in increased demand for police protection during project construction phases as a result of theft or vandalism at the construction site, as discussed further below.

Theft or Vandalism of Construction Site

During construction of the Proposed Project, equipment, building materials, vehicles, and temporary offices would be temporarily located on the Project Site. As such, the Project Site, if not properly secured, could be subject to theft or vandalism, potentially requiring Inglewood PD involvement. The Proposed Project would incorporate a number of temporary security measures, including security barriers and fencing, security lighting, and locked entry to limit access by the general public, secure construction equipment, and minimize trespassing, vandalism, short-cut attractions, and attractive nuisances. Regular daily and multiple security patrols during non-construction hours (e.g., nighttime hours, weekends, and holidays) will also be provided to minimize trespassing, vandalism, and short-cut and other attractions. Due to the on-site security measures, construction of the Proposed Project would not result in an increased demand for police protection that could require the construction or expansion of police facilities.

As discussed above, construction of the Proposed Project would not create a demand for increased police protection services that would result in the need for new or physically altered police protection facilities, in order to maintain acceptable response times, or other performance objectives. Therefore, potential impacts on police protection services due to construction activities would be **less than significant**.

Operation

Operation of the Proposed Project could result in increased demand for police protection as a result of increases in pedestrian activity and population density at the Project Site, as discussed further below.

Demand for Police Protection, Facilities, Equipment, and Officers

Patron, Employee, Customer, and Visitor Effects on Demand

The Proposed Project would result in an increase in the level of activity on the Project Site. The increased population at the Project Site would be comprised of patrons attending games/events; employees of the LA Clippers and/or arena operator; temporary event-related employees;

customers and employees of the restaurant, retail, sports medicine clinic, and hotel uses; and visitors to the community uses and outdoor plaza. The increase in pedestrian activity and the number of people in and around the Project Site, as well as the potential increase in vehicle/pedestrian conflicts and accidents before, during and after events at the Proposed Project arena, would result in periodic increases in demand for police protection from the Inglewood PD compared to baseline conditions.

During non-event periods, the Proposed Project would require typical Inglewood PD police protection services, similar to other entertainment, office, commercial, hotel, and parking uses in the City. The arena operator would provide private security personnel to regularly patrol the buildings and grounds. The 3,000 square-foot command center located within the event level of the Arena Structure would be staffed and provide communication resources seven days per week, 24 hours a day. Additionally, private security personnel and/or security equipment (e.g., security lighting, video surveillance, and security gates/locks) would be provided for the office, commercial, hotel, and parking uses.

During LA Clipper games and other large events at the arena, an increased level of Inglewood PD police protection personnel would be required on and/or off site for patrolling and potential response to incidences associated with the large crowds and increase in pedestrian activity. As it does with The Forum, the City would require the provision of traffic control for large-scale events at the arena. The Inglewood PD and Public Works Department would determine in advance if additional staff would be required based upon attendance at the arena during games and large events.⁵⁴ It is anticipated that for games/events at the arena, typical police responses would be associated with actions such as public intoxication, theft from vehicles, low-level assaults, or ejections of fans from the arena and any related arrests.

During games and other large events at the arena, the arena operator would provide private security to assist in on-site crowd management and public safety. The arena operator would coordinate with the Inglewood PD and the City of Inglewood Public Works Department to implement the traffic control measures included in the Event TMP. The arena operator and/or event sponsor would contract with the Inglewood PD to provide traffic control personnel and services on public streets in the City as necessary to facilitate safe movement of, and minimize potential conflicts among pedestrians, bicycles, and vehicles. Further, the Proposed Project would generate revenue (e.g., developer fees, property and sales tax revenue) for the City's general fund that could be used to fund Inglewood PD expenditures as necessary to offset increased demand for police services. Through the use of private security and traffic control personnel, installation of proper security equipment, and implementation of the Event TMP, the Proposed Project would avoid creating new demand for police protection services that could require construction of new facilities.

Based on review of submitted plans and discussions with the Inglewood PD, HPSP Adjusted Baseline projects would include construction of a police substation that will be used as a base for police services in the vicinity of the NFL Stadium equipped with offices, an interview room, and

⁵⁴ Mark Fronterotta, Chief of Police, letter correspondence dated October 11, 2018.

work area for use by Inglewood PD officers and personnel. The HPSP police substation would also have numerous security features similar to those described for the Proposed Project. Input provided by the Inglewood PD indicates that no additional police protection facilities would be necessary to serve both the Proposed Project and the HPSP Adjusted Baseline projects.

Street Vacations and Response Routes

Implementation of the Proposed Project would include the vacation of an approximately 900-foot linear section of West 102nd Street between South Prairie Avenue and approximately 335 feet west of South Doty Avenue to be developed with portions of the Arena Structure and related uses. Similarly, implementation of the Proposed Project also would include the vacation of an approximately 350-foot linear section of West 101st Street between South Prairie Avenue and South Freeman Avenue to be developed with a portion of the parking garage within the West Parking Garage Site.

As discussed above, the Inglewood PD goal is to maintain or improve upon the 5 minutes and 12 seconds response time for emergencies for the City of Inglewood as whole, even after the opening of the Proposed Project.⁵⁵ The proposed street vacations could alter police response routes to the Arena Site, the West Parking Garage Site, the East Parking and Hotel Site, and the Well Relocation Site, and/or nearby neighborhoods. Despite the changes to the street network, according to the Inglewood PD, sufficient field resources are maintained in all areas of the City to respond to calls for services, and the impact to response times, if any, is not expected to be substantial.⁵⁶

Please also see Section 3.14, Impact 3.14-14, for a discussion of effects of the Proposed Project on emergency response.

Project Design

The Proposed Project would include space within the Arena Structure for Inglewood PD personnel to use during games/events for police administrative and operational functions, and could include police-related facilities such as temporary detention. Two main areas proposed for security/command center functions in the Arena Structure would be used prior to, during, and after games/events by the Inglewood PD, LACFD, and/or other private security and emergency medical personnel to coordinate incident response, facilitate communication and surveillance, implement the Event TMP, and deploy traffic control officers.

The Proposed Project would include a 24-hour security camera network throughout the arena, including concourses, loading and access areas, elevators, common and amenity spaces, and plaza areas, as well as in and around parking garages. All security camera footage would be maintained for at least 30 days, and such footage would be provided to the Inglewood PD, upon request. The Proposed Project landscaping would be designed so as to not impede visibility. Overall, the safety features within the Arena Structure, including the command center and temporary detention

⁵⁵ Mark Fronterotta, Chief of Police, letter correspondence dated October 11, 2018.

⁵⁶ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

facilities, would help ensure that the increased demand for police service would be met without the construction of new or expanded police protection facilities.

As discussed above, while the Proposed Project may result in the need for additional sworn officers and related equipment, it would not require the construction of a new or expanded police station or other physical facilities other than those included in the Arena Structure.^{57,58} Because operation of the Proposed Project would not create a demand for increased police protection services that would result in the need for new or physically altered police protection facilities in order to maintain acceptable response times, or other performance objectives, there is no potential that construction of new facilities for the delivery of police protection services would result in substantial adverse environmental impacts. Therefore, potential impacts related to demand for police protection services due to operation of the Proposed Project would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to police protection includes those past, present, and reasonably foreseeable cumulative projects located in the City of Inglewood within area served by the Inglewood PD. This would include Cumulative Projects 42 through 74 as presented in Table 3.0-2, Cumulative Projects List (see Section 3.0, Introduction to the Analysis). Projects located in other jurisdictions would be primarily served by their respective city police departments, the LASD, and/or the California Highway Patrol. The LASD and the 47 local police departments within Los Angeles County provide mutual aid in the event of a major unplanned event which would affect the provision of appropriate law enforcement resources.⁵⁹

Impact 3.13-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could contribute to cumulative substantial adverse physical impacts associated with the provision of or need for new or physically altered facilities for police protection services, the construction of which could cause significant environmental impacts, in order to maintain acceptable response times or other performance objectives for police protection. (Less than Significant)

Construction

The Inglewood PD would provide police protection services to 33 of the 145 cumulative projects listed in Table 3.0-2, Cumulative Projects List (see Section 3.0, Introduction to the Analysis) which would be constructed within the City of Inglewood and within the service areas of the Inglewood PD. Similar to the Proposed Project, each of the cumulative projects developed in Inglewood, particularly those of a larger nature, would be subject to review by the Inglewood PD

⁵⁷ Mark Fronterotta, Chief of Police, letter correspondence dated October 11, 2018.

⁵⁸ Mark Fronterotta, Chief of Police, letter correspondence dated April 10, 2019.

⁵⁹ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

on a project-by-project basis to ensure that appropriate temporary security measures are implemented to reduce potential impacts to police protection during construction. As appropriate based on this review and in order to avoid adverse effects on adjacent or nearby properties, the City's Department of Public Works and the Inglewood PD impose construction management requirements on construction projects.

As a result of project-level review of construction plans for cumulative projects, as well as review of construction plans for the Proposed Project and the HPSP Adjusted Baseline projects, construction of the Proposed Project, in combination with the construction of the HPSP Adjusted Baseline projects and cumulative development within the City of Inglewood, would not create a new material demand for police protection that could require construction of new facilities. Please also see Section 3.14, Transportation and Circulation, Impact 3.14-14, for a discussion of effects of construction impacts to emergency services access. Therefore, this cumulative impact would be **less than significant**.

Operation

As described above, of the 145 projects included on the Cumulative Project List, 33 are located within the City of Inglewood and within the service areas of the Inglewood PD. The development of these 33 cumulative projects located within the service area of the Inglewood PD would result in approximately 3,091 residential units, 443,059 sf of commercial and industrial uses, 451,923 sf of retail uses, 3,567,314 sf of office uses, 424 hotel rooms, 30,000 sf of miscellaneous uses, and 13 acres of open space. Operation of the Proposed Project, along with the operations of past, present, and reasonable future projects, would increase the demand for police protection.

Plans for all large-scale cumulative projects proposed in the City of Inglewood would be reviewed by the Inglewood PD to ensure that sufficient security measures are implemented to reduce potential impacts to police protection services. Some of the cumulative projects would also be expected to provide on-site security, personnel and/or design features for their residents and patrons per standard development practices for the given uses.

The Inglewood PD has indicated that it does not plan for staffing, equipment, or facilities based on any specific population-based or demographic standard. Rather, it undertakes analysis of crime activity and statistics in the City and allocates resources in response. The Inglewood PD has confirmed that it maintains sufficient field resources in all areas of the City to respond to calls for services anticipated in the future with the Proposed Project and cumulative development.⁶⁰ Police services are typically funded through the City's General Fund. Cumulative projects would generate revenue through developer fees and property and sales tax revenue, for example, that could provide revenue to the City's General Fund which could be used at the City's discretion to augment police resources as determined necessary by the Inglewood PD. Further, the Inglewood PD has indicated that new or expanded facilities would be not necessary to meet cumulative demand.⁶¹

⁶⁰ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

⁶¹ Mark Fronterotta, Chief of Police, letter correspondence dated January 10, 2019.

Based on the above considerations, the Proposed Project, in conjunction with other cumulative development within the Inglewood PD service area, would not result in need for the construction of new or expanded police facilities in order to maintain acceptable response times or other performance objectives.⁶² Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Parks and Recreational Services

3.13.9 Environmental Setting

Regional and Local Setting

Park and recreational services and facilities in the City are managed by the City of Inglewood Parks Department. The Parks Department manages approximately 89.6 acres of parkland with 11 recreation and open space areas which include: Ashwood Park, Center Park, Centinela Adobe Park, Circle Park, Darby Park, Edward Vincent Park, Grevillea Park, North Park, Queen Park, Rogers Park, and Siminski Park. Facilities include 8 softball fields, 7 basketball courts, 1 volleyball court, 8 play fields, 18 tennis courts, 16 playgrounds, 12 picnic areas, 2 skate parks, and 8 community/cultural centers.⁶³

As discussed below, the 1995 Open Space Element is the most recently adopted Open Space Element by the City, and it sets a City goal of 1 acre of parkland per 1,000 residents.⁶⁴ This ratio is used to determine the Proposed Project's impacts on parks and recreational services.⁶⁵ The City's existing ratio is 0.81 acres of parkland per 1,000 residents.⁶⁶ Thus, the City currently does not meet its goal for park and recreation facilities. The Project Site is located within South Inglewood (District 4), which is considered "park poor."⁶⁷ Center Park, which is classified as a neighborhood park, is the only park located within District 4 and does not fully address the needs of the community. See **Table 3.13-4** for quantification of the current parkland per 1,000 residents in the City of Inglewood and in the South Inglewood subarea.

⁶² Mark Fronterotta, Chief of Police, letter correspondence dated April 10, 2019.

⁶³ City of Inglewood, *Facilities*. Available: <https://www.cityofinglewood.org/Facilities>. Accessed August 2018.

⁶⁴ City of Inglewood, 1995. *City of Inglewood General Plan, Open Space Element*, p 7, December 1995.

⁶⁵ Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, letter correspondence dated October 2, 2018.

⁶⁶ Per the United States Census (<https://www.census.gov/quickfacts/inglewoodcitycalifornia>, accessed January 2019), the City of Inglewood population as of July 1, 2017 was 110,598 persons. $110,598 \text{ persons} / 1,000 = 110.598$.

$89.6 \text{ acres of existing parkland} / 110.598 = 0.81 \text{ acres of parkland per } 1,000 \text{ persons}$.

⁶⁷ Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, letter correspondence dated October 2, 2018.

**TABLE 3.13-4
 IBEC PARKLAND ANALYSIS**

	City of Inglewood			South Inglewood (District 4)		
	Population	Park Acres	Park Acres/ 1,000 Residents	Population	Park Acres	Park Acres/ 1,000 Residents
Existing (2017)	110,598	89.60	0.81	6,510	1.8	0.28
Adjusted Baseline Development	955	11.89	12.45	955	11.89	12.45
<i>Adjusted Baseline Subtotal</i>	<i>111,553</i>	<i>101.49</i>	<i>0.91</i>	<i>7,465</i>	<i>13.69</i>	<i>1.83</i>
Cumulative Projects	9,073	13.06	1.44	6,510	13.06	2.01
Cumulative Total	120,626	11.55	0.95	13,975	26.76	1.91

SOURCE: ESA, 2019.

The nearest park to the south of the Project Site is Center Park, located at 3660 West 111 Street, approximately 1 mile southeast of the Project Site. Center Park is approximately 1.8 acres in size and includes two playgrounds, an open space play area, two gazebos, and one restroom. This neighborhood park is heavily used primarily by families and elementary school-aged children living nearby, or children who attend the Worthington Elementary School adjacent to the park. The park is classified as a neighborhood park, and is the only park located within South Inglewood (District 4). Center Park had a grand-reopening in April 2018. The recent renovation of Center Park included the acquisition of 0.6 acres from the IUSD. There are no further plans for expansion of Center Park at this time. Any future expansion of the park would require acquisition of abutting residential properties and/or the neighboring elementary school which, through a joint use agreement, currently utilizes the park site as a school playground.⁶⁸

Accounting for Center Park, South Inglewood has a ratio of parkland per 1,000 residents of 0.28 acres and is considered “park poor.”⁶⁹

3.13.10 Adjusted Baseline Environmental Setting

Section 3.13, Public Services, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Under the HPSP Adjusted Baseline, Lake Park will be located within the HPSP area approximately 0.25 miles north of the Project Site. Lake Park will be approximately 11.89 acres in size and will be the central public open space area of the HPSP. Lake Park will provide multi-use programming, shade structures, a restroom, terrace seating along the lake edge, barbeque pavilions, open lawns for picnic and play, multipurpose paths including a lake edge walking path, and an active wetland. Lake Park will be privately owned, but publicly accessible for use from dawn until dusk through the conveyance of public

⁶⁸ Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, letter correspondence dated October 2, 2018.

⁶⁹ Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, letter correspondence dated October 2, 2018.

use easements, and therefore available as a recreational facility that can be used by those working at the Proposed Project.

As described in Table 3.13-4, with the inclusion of 955 residents and 11.89 acres of park under the Adjusted Baseline, the ratio of parkland per 1,000 residents would increase from 0.81 acres under existing conditions to 0.91 acres under Adjusted Baseline. While the ratio of parkland per 1,000 residents would increase, it would remain below the City's goal of 1 acre of parkland per 1,000 residents.

Under existing conditions, in South Inglewood (District 4) with only Center Park available as parkland, the ratio of parkland per 1,000 residents is 0.28 acres. With the added residents and parkland that would be added to South Inglewood under the Adjusted Baseline, the parkland per 1,000 residents in District 4 would increase to 1.84, well above the Citywide average and in excess of the General Plan goal.

No other changes from the existing setting related to Parks and Recreation are anticipated under the Adjusted Baseline.

3.13.11 Regulatory Setting

Federal

There are no federal regulations, plans, or policies applicable to parks or recreational services relevant to the Proposed Project.

State

State Public Park Preservation Act

The primary instrument for protecting and preserving parkland is the State Public Park Preservation Act (California Public Resources Code sections 5400–5409). Under the Public Park Preservation Act, cities and counties may not acquire any real property that is in use as a public park for any non-park use unless compensation or land, or both, are provided to replace the parkland acquired. This provides for no net loss of parkland and facilities.

Quimby Act

California Government Code section 66477, referred to as the Quimby Act, which is part of the Subdivision Map Act (Government Code sections 66410–66499.58) permits local jurisdictions to require the dedication of land and/or the payment of in-lieu fees solely for park and recreation purposes. The required dedications and/or fees are based upon the residential density and housing type, land cost, and other factors. Land dedicated and fees collected pursuant to the Quimby Act may be used for developing new, or rehabilitating existing park or recreational facilities.

Local

City of Inglewood General Plan

The City of Inglewood General Plan, Open Space Element,⁷⁰ was designed to address the current and future needs of the community for park land and recreational facilities. This element serves as a plan for the conservation or creation of open space to mitigate the effects of the increasing urbanization of the City. The City's 1995 Open Space Element provides standards for the provision of recreational facilities through the City, including local recreation standards. The 1995 Open Space Element explained that the City's 1973 Open Space and Parks Element recommended a standard ratio of 4 acres of recreational park land per 1,000 residents, and that the City's more ambitious Community Review Program prepared in 1972 recommended a standard of 7 acres per 1,000 residents which was recommended by the 1972 Community Review Program. Due to the lack of undeveloped and underutilized land in the City, and due to the increased cost of acquiring and clearing land that is already developed and inhabited, the 1995 Element determined that the City may never achieve the standards advocated in 1972 and 1973. Instead, the 1995 Element recommended that the City strive for a more realistic and achievable standard: a minimum threshold of 1 acre per 1,000 residents.⁷¹ As the 1995 Open Space Element is the most recently adopted Element by the City, the recommended standard of 1 acre per 1,000 residents is used to determine the Proposed Project's impacts on parks or recreational services.⁷² The following goals and objectives from the City of Inglewood General Plan Land Use Element and Open Space Element are applicable to the Proposed Project:

Land Use Element

Goal: Pursue the continued acquisition and development of parks and recreation facilities to the extent feasible within the City's budgetary capability.

Open Space Element

Goal: The primary goal of the Open Space Element is to provide recreational park facilities for all residents in Inglewood.

Goal: The second goal of the Open Space Element, after providing recreational park facilities, is to provide additional types of open space and to preserve existing open space resources.

Policy 1: The City of Inglewood and its redevelopment agency, in reviewing and approving development plans, shall require the provision of landscaped plazas and gardens when possible, and the provision of landscaping within building setbacks and parking lots.

The Proposed Project would not include residential uses, and thus would not increase the residential population of the City nor impact the City's standard ratio of 1 acre of parkland per 1,000 residents. The Proposed Project would not be inconsistent with each of the goals and policies listed above.

⁷⁰ City of Inglewood, 1995. *City of Inglewood General Plan, Open Space Element*, December 1995.

⁷¹ City of Inglewood, 1995. *City of Inglewood General Plan Open Space Element*, December 1995.

⁷² Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, letter correspondence dated October 2, 2018.

As further discussed below in the discussion of Impacts 3.13-5, 3.13-6, and 3.13-7, the Proposed Project would include an outdoor plaza, new pedestrian networks, landscaping and edge treatment, sidewalk and pavement improvements and other open spaces that would be designed to facilitate pedestrian movement and activities. The plaza would include outdoor gathering spaces, and an outdoor stage on the east side of the plaza that could be used for community performances, small musical shows, or supplemental events related to arena activities. However, because the Proposed Project would not provide on-site park space to meet the park requirements of the City, the Proposed Project would be required to pay the applicable park development fees to offset potential impacts on parks or recreational facilities in the City. The Proposed Project has no potential inconsistencies with the above-referenced goals and policies of the City of Inglewood General Plan Open Space Element. Ultimately, it is within the authority of the City Council to determine consistency of the Proposed Project with the City of Inglewood General Plan.

3.13.12 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to parks or recreational services. The following thresholds of significance have been adapted from CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Result in substantial adverse physical impacts associated with the need for or provision of new or physically altered parks or recreational facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for parks or recreational facilities;
2. Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; or
3. Include recreational facilities or require the construction or expansion of recreation facilities which might have an adverse physical effect on the environment.

Methodology and Assumptions

Analysis of parks or recreational impacts is typically based on an estimate of a project's resident population size, given the number of proposed residential units, and a description of a project's park, recreation and open space features and their effects in serving a project's residents and thereby reducing potential impacts on local park facilities. The Proposed Project does not propose residential uses. However, the Proposed Project would increase the number of people at the Project Site and in the vicinity of the Project Site, which includes visitors, customers, and employees which could use park and recreational facilities. The analysis also addresses potential impacts on park facilities that might occur due to construction activities.

The Parks Department was consulted on this analysis and the responses provided regarding the Proposed Project were incorporated. Based on this information and consultation with the Parks Department, a determination was made as to whether the City would require new or physically altered facilities for the provision of parks or recreational services in order to maintain acceptable service ratios or other performance objectives for parks or recreational services. If such facilities

would be required, the analysis considers whether the construction of such facilities would reasonably be expected to cause significant environmental impacts. A determination was also made as to whether the Proposed Project would increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated; or if the Proposed Project would include recreational facilities or require the construction or expansion of recreation facilities which might have an adverse physical effect on the environment.

Impacts and Mitigation Measures

Impact 3.13-5: Construction and operation of the Proposed Project could result in substantial adverse physical impacts associated with the need for or provision of new or physically altered parks or recreational facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for parks or recreational facilities. (Less than Significant)

The demand for parks and recreation facilities is created by both residents who live in the City of Inglewood, as well as by people who work, do business, and attend events or other activities within the City. The potential effects of all of these sources of demand during construction and operation of the Proposed Project are addressed below.

Construction

Construction of the Proposed Project would result in a temporary increase in the number of construction workers at the Project Site. Due to the employment patterns of construction workers in Southern California, and the operation of the market for construction labor, the likelihood that construction workers would relocate their households to become residents of Inglewood as a consequence of working on the Proposed Project is negligible.

Because the nearest publicly accessible park, Lake Park, which is part of the Adjusted Baseline, and which would be operational when the Proposed Project is operational, is located approximately 0.25 miles north of the Project Site, it is possible that a small number of construction workers may visit the park to eat lunch or for recreation. Construction workers are temporary employees with high turnover rates associated with the various phases of construction, and are unlikely to frequently use park facilities such as Lake Park; it is much more likely that construction workers take lunch breaks on the Project Site and travel home after the work day. As such, use of Lake Park or other City parks by Project-associated construction workers would be infrequent and intermittent. Therefore, the construction workers associated with the Proposed Project would not result in an increase in the residential population of the City, or an increase in demand for parks or recreational facilities in the vicinity of the Project Site.

Based on the above, construction of the Proposed Project would not generate a demand for park or recreational facilities that would not be adequately accommodated by existing facilities and services, nor would construction of the Proposed Project interfere with existing park usage in the vicinity of the Project Site. Construction of the Proposed Project would not necessitate the provision of new or physically altered parks or recreational facilities, the construction of which

would cause significant adverse physical impacts in order to maintain acceptable service ratios or other performance objectives. Therefore, impacts on parks and recreational facilities during construction of the Proposed Project would be **less than significant**.

Operation

The Proposed Project would include a privately owned outdoor plaza, new pedestrian networks, landscaping and edge treatment, sidewalk and pavement improvements and other open spaces that would be designed to facilitate pedestrian movement and activities; refer to Figure 2-18 in Chapter 2, Project Description. An integral element of the Proposed Project would be the privately owned outdoor plaza, an approximately 80,000 square-foot (1.8-acre) large outdoor space designed to accommodate crowds associated with arena events, and also serve as an activity center and outdoor space for everyday use by visitors and employees. The plaza would include outdoor gathering spaces, and an outdoor stage on the east side of the plaza that could be used for community performances, small musical shows, or supplemental events related to arena activities.

The Proposed Project would not include residential uses, and thus would not increase the residential population of the City nor impact the City's standard ratio of 1 acre of parkland per 1,000 residents.

The Proposed Project would result in an increased number of people at the Project Site and project vicinity comprised of patrons attending LA Clippers homes games and other events such as concerts, conventions, family shows, corporate/community events, plaza events and other events at the proposed arena; customers visiting the proposed retail and restaurant uses; visitors to the proposed community uses; hotel guests; and employees of the arena, the LA Clippers, and the various retail, restaurant, community, and hotel uses that would be developed as part of the Proposed Project. The increased daily population at the Project Site could increase the demand for parks and recreational facilities.

Retail customers, hotel patrons, and employees of the Proposed Project could be users of local parks, either as part of trips to the City, or daytime work breaks. However, these uses would be expected to be limited and would not place a material demand on park or recreation facilities. Most people utilize parks in the vicinity of their homes for weekend family recreation, or use by children for organized sports or non-organized play. As such, the relatively small number of employees and patrons associated with the Proposed Project are not expected to place a substantial demand on local parks and recreation resources.

Most of the events with the largest anticipated attendance in the arena, and thus the majority of arena attendees, would occur primarily during evening hours when most City and other publicly accessible parks, including Lake Park and Center Park, are closed for operation. All City parks operate from 8:00 AM to 8:00 PM except for Siminski Park, which closes at dusk. Athletic field usage at Rogers Park, Darby Park, and Edward Vincent Park is allowed until 10:00 PM.⁷³ Based

⁷³ Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, email correspondence dated January 2, 2019.

on the hours of operation, use of City parks in post-event hours would not occur. It is possible that daytime customers and event attendees, and evening attendees during pre-event hours, could use City parks. Based on the City's long experience with The Forum, there is no pattern of regular or frequent use of City parks by event attendees who typically travel to the vicinity of the venue in the hour prior to the event (see Section 3.14, Transportation and Circulation, for information on arrival patterns). Thus, the City considers the potential use of public parks by event attendees to be limited and infrequent.

For the above reasons, event attendees, customers, hotel patrons, and/or employees associated with the Proposed Project would not create a substantial demand on local parks or recreation facilities such that a need for new or physically altered facilities for the provision of park or recreation facilities is created. Therefore, potential impacts on parks and recreation facilities due to operation of the Proposed Project would be **less than significant**.

Mitigation Measures

None required.

Impact 3.13-6: Construction and operation of the Proposed Project could increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of a facility would occur or be accelerated. (Less than Significant)

As is explained above under Impact 3.13-5, the Project Site is located within South Inglewood, District 4. Under the Adjusted Baseline, District 4 includes the 11.89-acre Lake Park and 1.8-acre Center Park, and maintains a ratio of parkland per 1,000 residents of 1.84 acres.

As also discussed above under Impact 3.13-5, it is unlikely that there would be a material use of City and other publicly accessible parks and recreational facilities in the City of Inglewood by attendees to events at the proposed arena, nor is it reasonably expected that retail customers, restaurant patrons, hotel patrons, or employees associated with the Proposed Project would substantially use existing parks or recreational facilities in the City.

The Adjusted Baseline includes Lake Park, just 0.25 miles north of the Project Site. Lake Park would be designed and constructed to withstand substantial use and is capable of serving large numbers of visitors. Pursuant to the development agreement approved as part of the City of Champions Initiative, Lake Park would be operated and regularly maintained at levels consistent with the City's requirements for City parks, to ensure substantial deterioration from use does not occur. Similarly, Center Park and other City-owned parks are regularly maintained by the City. Lake Park would serve the HPSP demand and by adding to the total publicly accessible park acreage in the City is anticipated to serve the Proposed Project's demand for parks and recreational facilities. The addition of nearly 12 acres of publicly accessible park just 0.25 miles from the Project Site would satisfy any limited incremental demand for use of parks or

recreational facilities. Because of the magnitude of publicly accessible parks and recreation facilities in vicinity of the Project Site, it is unlikely that the incremental use of parks in the City of Inglewood would cause physical deterioration of these facilities.

Because any potential use of City parks by event attendees, customers, and/or employees associated with the Proposed Project would be very limited, and given the availability of the approximately 12-acre Lake Park to accommodate any demand for parks or recreational facilities created by the Proposed Project, it is not foreseeable that such use could result in substantial physical deterioration of such facilities. Thus, the Proposed Project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated, and the impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.13-7: Construction and operation of the Proposed Project could include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment. (Less than Significant)

The Proposed Project would include a privately owned outdoor plaza, new pedestrian networks, landscaping and edge treatment, sidewalk and pavement improvements and other open spaces that would be designed to facilitate pedestrian movement and activities. These amenities and open space areas would be developed within the Project Site, and no new or expanded off-site parks or recreational facilities are proposed. The construction and operation of the Proposed Project's plaza and pedestrian facilities could have adverse physical environment effects, which are analyzed and disclosed in other sections of Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, of this EIR. In large part, the Proposed Project is analyzed as a singular set of proposed development components. There are some effects that are specific to the plaza, such as the noise effects of amplified sound emanating from the stage that is proposed to be included in the plaza (see Section 3.11, Noise and Vibration, Impact 3.11-X). For most other issues, such as potential effects on cultural resources, aesthetic effects of plaza lighting and signage, effects of runoff from the plaza and pedestrian facilities, and the like, the impacts of construction of the plaza and pedestrian facilities are not distinguishable from the effects of the overall Proposed Project. The construction of the plaza and pedestrian facilities included in the Proposed Project would have no additional environmental impacts that are not already analyzed and disclosed in the other resource sections of this EIR (e.g., Section 3.3, Biological Resources, Section 3.4, Cultural and Tribal Cultural Resources, and Section 3.9, Hydrology and Water Quality). Therefore, this impact would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic context for analysis of cumulative impacts related to parks or recreational facilities includes the City of Inglewood because it is the City that operates and maintains neighborhood and City parks in the City. The geographic context is further defined as those cumulative projects located within South Inglewood (District 4), since the Parks Department addresses the needs for parks or recreational services by each of the four City Council Districts.^{74,75} Cumulative development located in other jurisdictions would typically be served by local parks or recreational facilities located in the cities or county where the development is located.

Based on evaluation of the cumulative projects list presented in Table 3.0-2, 33 of the 145 cumulative projects are located within the City of Inglewood (Cumulative Projects numbers 42 through 74). The development of these 33 cumulative projects is anticipated to result in construction of approximately 3,091 residential units, 443,059 sf of commercial and industrial uses, 451,923 sf of retail uses, 3,567,314 sf of office uses, 424 hotel rooms, 30,000 sf of civic center uses, and approximately 13 acres of open space.

Of these 33 cumulative projects, five (Cumulative Projects 53, 54, 65, 67, and 73) are located within South Inglewood (District 4), and would result in the construction of approximately 2,192 residential units, 371,923 sf of retail uses, 3,567,314 sf of office uses, 424 hotel rooms, 30,000 sf of miscellaneous uses, and approximately 13 acres of open space.

Impact 3.13-8: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could contribute to cumulative substantial adverse physical impacts associated with the need for or provision of new or physically altered parks or recreational facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for parks or recreational facilities. (Less than Significant)

Construction

As discussed above under Impact 3.13-5, use of City and other publicly accessible parks and recreation facilities by construction workers, if any, would be infrequent and intermittent and could be dispersed throughout the Adjusted Baseline of 101.49 acres of parkland and 11 recreation open space areas within the City. Use of parks is more determined by location of residence rather than place of employment. Because construction workers do not tend to choose a place of residence based on the location of an individual construction project, the construction

⁷⁴ Sabrina Barnes, Director, Parks, Recreation, and Library Services, City of Inglewood, letter correspondence dated October 2, 2018.

⁷⁵ City of Inglewood, *Council Districts 2006 Map*. January 2006.

workers who work on the Proposed Project and the 33 cumulative projects located within the City of Inglewood would not result in a substantial increase of residential population within the City.

Based on the above considerations, construction of the Proposed Project, in conjunction with cumulative development in the City of Inglewood, would not necessitate the provision of new or physically altered parks or recreational facilities, the construction of which would cause significant adverse physical impacts in order to maintain acceptable service ratios or other performance objectives. Therefore, this would be **less than significant**.

Operation

According to the Open Space Element, the northern and northeastern parts of the City are adequately served by parks having recreational facilities, while the southern portions of the City are not adequately served for such parks. The cumulative development of 3,091 residential units within the City would increase park demand in the City by 9.07 acres under the City's standard ratio of 1 acre of parkland per 1,000 residents, but would add over 13 acres of parks and open space land.⁷⁶ The development of the five cumulative projects located within District 4, i.e., South Inglewood (Cumulative Projects 53, 54, 65, 67, and 73) would include approximately 2,192 residential units, which would increase park demand in District 4 by 6.51 acres while adding over 13 acres of parks and open space.⁷⁷ Therefore, operation of the Proposed Project, along with other reasonably foreseeable cumulative development would increase the demand for parks or recreational services, but would add parks and open space in excess of the demand created by cumulative residential development.

As described above under Regulatory Setting, the City maintains a minimum threshold of 1 acre per 1,000 residents to determine the need for parks and recreational facilities. Under the Adjusted Baseline, including the City's existing 89.6 acres of parkland plus the development of the 11.89-acre Lake Park within the HPSP Adjusted Baseline projects, there are a total of 101.49 acres of parkland in Inglewood, approximately 0.91 acres of parkland per 1,000 residents.⁷⁸ Under the Adjusted Baseline the parkland per 1,000 residents ratio would increase from 0.81 under existing conditions to 0.91. Nevertheless, under the Adjusted Baseline, the City would not meet its goal for provision of parkland.

The HPSP area is located immediately north of the Proposed Project and within South Inglewood (District 4). Cumulative Project 67, which includes the remainder of the HPSP not included in the

⁷⁶ 3,055 residential units x 2.97 persons per household (per the City of Inglewood General Plan 2014 Housing Element) = 9,073 residents. 9,073 residents/1,000 persons = 9.07 acres (per the City of Inglewood General Plan 1995 Open Space Element recommendation of 1 acre per 1,000 residents which is used to determine a project's impacts on parks or recreational services).

⁷⁷ 2,192 residential units x 2.97 persons per household (per the City of Inglewood General Plan 2014 Housing Element) = 6,510 residents. 6,510 residents/1,000 persons = 6.51 acres (per the City of Inglewood General Plan 1995 Open Space Element recommendation of 1 acre per 1,000 residents which is used to determine a project's impacts on parks or recreational services).

⁷⁸ Per the US Census (<https://www.census.gov/quickfacts/inglewoodcitycalifornia>, accessed January 2019), the City of Inglewood population as of July 1, 2017 was 110,598 persons. 110,598 persons + 955 residents (total residents from the HPSP Adjusted Baseline projects) = 111,553 persons. 111,553 persons/1,000 = 111.553. 89.6 acres of existing parkland + 11.89 acres of parks/open space from the HPSP (Lake Park) = 101.49 acres of parkland for the Adjusted Baseline. 101.49/111.553 = 0.91 acres/1,000 people.

Adjusted Baseline, would include the development of the approximately 2.5-acre Arroyo Park, the approximately 10.57-acre Bluff Park, and the Champion Plaza. Like Lake Park, the Arroyo Park and Bluff Park would both be privately owned, but publicly accessible for use from dawn until dusk through the conveyance of public use easements. Arroyo Park would be a naturalistic park organized around shallow, vegetated swales that would also provide stormwater management with park amenities. Bluff Park would be an active recreation park, that would include a venue for outdoor activity and recreation, open fields for informal sports, a tot-lot, picnic space, dog park, a restroom, and parking. Champion Plaza would be a large open plaza providing a variety of program amenities such as a central gathering area for events, outdoor steps and terraced seating, and an interactive water feature.

If all 33 cumulative projects located within the City of Inglewood are constructed, including the proposed 2.5-acre Arroyo Park and 10.57-acre Bluff Park of the HPSP, excluding the Adjusted Baseline projects, the City's ratio of parkland per 1,000 residents would rise from 0.91 acres to 0.96 acres,⁷⁹ which would still not meet the City's goal of 1 acre per 1,000 residents. Cumulative development would improve the City's parkland ratio. Additionally, cumulative projects with a residential component would be required to comply with the City's Municipal Code, Article 30, Park Land Dedication, In-Lieu Fees and Park Development Fees, which require the provision of on-site open space and park facilities and/or payment of in-lieu fees to offset a project's impact to off-site park and recreational facilities.

As described above, the Proposed Project would not include residential uses, and thus, would not increase the residential population of the City, although the Proposed Project would increase the number of visitors, customers, and employees at the Project Site. Most major events with the anticipated largest attendance in the arena would occur primarily during evening hours when most City parks, including Lake Park and Center Park, are closed for operation. However, although negligible, event attendees could use these parks during the pre-event hours. Retail customers and employees associated with the Proposed Project are more likely to continue the use of existing parks or recreational facilities near their homes during non-work hours. Event attendees, customers, or employees associated with the Proposed Project would not be expected to increase the demand on local parks resulting in a need for new or physically altered facilities for the provision of park or recreation facilities.

For the reasons described above, operation of the Proposed Project, in conjunction with cumulative development in the City of Inglewood, would not necessitate the provision of new or physically altered parks or recreational facilities, the construction of which would cause

⁷⁹ Per the US Census (<https://www.census.gov/quickfacts/inglewoodcitycalifornia>, accessed January 2019), the City of Inglewood population as of July 1, 2017 was 110,598 persons. $110,598 \text{ persons} + 9,073 \text{ persons (total population from the 33 cumulative projects located within the City of Inglewood)} = 119,671 \text{ persons}$. $119,671 \text{ persons} / 1,000 = 119.67$. $101.49 \text{ acres of parkland under the Adjusted Baseline} + 13 \text{ acres of parks/open space from the cumulative projects} = 114.56 \text{ acres of Adjusted Baseline and future cumulative parkland}$. $114.56 \text{ acres of parks/open space} / 119.67 \text{ persons} = 0.96 \text{ acres} / 1,000 \text{ persons}$.

significant adverse physical impacts in order to maintain acceptable service ratios or other performance objectives. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.13-9: Construction and operation of the Proposed Project, in conjunction with related cumulative development, could contribute to the increased use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. (Less than Significant)

As described under Impact 3.13-8 and in Table 3.13-4, under cumulative conditions in the City of Inglewood the ratio of parkland per 1,000 residents would rise to 0.96 acres, but would remain below the goal of 1 acre per 1,000 residents. In South Inglewood (District 4), the ratio of parkland per 1,000 residents would rise to 1.91 acres, nearly double the City's goal.

Despite the fact that the citywide ratio of parkland per 1,000 residents would remain below the City's goal, cumulative development including the Proposed Project would improve conditions as compared to the Adjusted Baseline conditions. The Proposed Project would contribute neither residents nor parkland to the City, but would add private open space in the form of an approximately 1.8-acre private plaza that would serve as the primary entry to the Proposed Project Arena. In addition to adding parkland and improving the ratio of residents to parkland in the city, cumulative projects with residential uses would be required to comply with the City's Municipal Code, Article 30, Park Land Dedication, In-Lieu Fees and Park Development Fees, which require the provision of on-site open space and park facilities and/or payment of in-lieu fees to offset a project's impact to off-site park and recreational facilities.

Based on the above considerations, the Proposed Project in conjunction with cumulative development in the City of Inglewood, would result in improved conditions related to the availability of parks and recreation facilities in the City and in South Inglewood, and any potential use of City parks by event attendees, customers, and/or employees associated with the Proposed Project would be very limited, it is not foreseeable that cumulative development would result in substantial physical deterioration of such facilities. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.13-10: Construction and operation of the Proposed Project, in conjunction with related cumulative projects, could include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment. (Less than Significant)

As described above, cumulative development within the City of Inglewood would include approximately 13 acres of parks which will be publicly accessible (see Cumulative Project 67). Therefore, implementation of the Proposed Project in conjunction with the HPSP Adjusted Baseline projects, along with the operations of cumulative projects, would include recreational facilities, or could require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

Development of the approximately 13 acres of park and open space within cumulative project 67 could have an adverse physical effect on the environment, but these effects are addressed in the discussions of potential cumulative impacts analyzed under other environmental topics in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, of this EIR (e.g., Section 3.3, Biological Resources, Section 3.4, Cultural and Tribal Cultural Resources, and Section 3.9, Hydrology and Water Quality). The parks and open space included within the cumulative projects would not have any environmental impacts, cumulative or otherwise, that are not already analyzed in the other resource sections. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Public Schools

3.13.13 Environmental Setting

Regional and Local Setting

The IUSD provides education to students in grades kindergarten through 12 residing within the City, portions of the cities of Culver City, Hawthorne, and Los Angeles, and a portion of the unincorporated County of Los Angeles. IUSD rules also provide that people employed within the IUSD boundaries may enroll their children in IUSD schools.

During the 2017–2018 school year, the IUSD operated 18 schools which consisted of 10 elementary schools, one transitional K–8 school, three middle schools, three high schools, and one continuation school;⁸⁰ refer to **Figure 3.13-3** for the locations of the schools within the IUSD. Also located within the school boundaries of the IUSD are 8 charter schools which include

⁸⁰ California Department of Education website, *2017–2018 data*. Available: <https://www.cde.ca.gov/ds/sd/sd/filesenr.asp>. Accessed March 2019.

SOURCE: Open Street Map, 2018; Inglewood USD, 2018, City of Inglewood, 2018; ESA, 2019.

Inglewood Basketball and Entertainment Center

Location of IUSD Schools

one elementary school, four transitional K–8 schools, two middle schools, and one high school.⁸¹ Further, nonpublic, nonsectarian schools⁸² are also located within the school boundaries of the IUSD.⁸³ The IUSD employed approximately 450 teachers, 60 administrators, 40 pupil-services personnel, and 470 support staff during the 2017–2018 school year.⁸⁴

Collectively, the IUSD’s school facilities in school year 2017–2018 had a capacity of 10,199 student seats based on classroom utilization information provided by the IUSD; refer to **Table 3.13-5**. Of these 10,199 seats, 5,247 seats were at the elementary school level, 2,873 seats were at the middle school level, and 2,079 seats were at the high school level.⁸⁵ This capacity includes all permanent facilities in the IUSD except those at the Clyde Woodworth Elementary School since this campus was closed in school year 2018–2019 and combined with the Albert F. Monroe Magnet Middle School. Portable classrooms are excluded because the existing leased portable classrooms are being returned, and the owned portable classrooms are being removed due to their current conditions and to reduce operational inefficiencies.⁸⁶ The total enrollment of the IUSD in school year 2017–2018, excluding charter schools and nonpublic, nonsectarian schools located within the school boundaries of the IUSD, was 8,499 students. As shown in Table 3.13-5, the IUSD’s facilities capacity exceeded student enrollment for all school levels in school year 2017–2018. The IUSD had a surplus of 597 elementary school seats, a surplus of 1,016 middle school seats, and a surplus of 87 high school seats.⁸⁷

⁸¹ California Department of Education website, *2017–2018 data*. Available: <https://www.cde.ca.gov/ds/sd/sd/filesenr.asp>. Accessed March 2019.

⁸² California Education Code section 56034 states “‘Nonpublic, nonsectarian school’ means a private, nonsectarian school that enrolls individuals with exceptional needs pursuant to an individualized education program and is certified by the department. It does not include an organization or agency that operates as a public agency or offers public service, including, but not limited to, a state or local agency, an affiliate of a state or local agency, including a private, nonprofit corporation established or operated by a state or local agency, or a public university or college. A nonpublic, nonsectarian school also shall meet standards as prescribed by the Superintendent and board.”

SCHOOL FACILITIES CAPACITY AND STUDENT ENROLLMENT 2017–2018**

School Level	2017–2018 Facilities Capacity ^a	2017–2018 Student Enrollment ^b	Excess/(Shortage) Capacity
Elementary School (Grades K–5)	5,247	4,650	597
Middle School (Grades 6–8)	2,873	1,857	1,016
High School (Grades 9–12)	2,079	1,992	87
Existing Total	10,199	8,499	1,700

NOTES:

2017–2018 is the most recent school year information available.

^a Capacity based on classroom utilization information provided by the IUSD in the Inglewood Unified School District Commercial/Industrial Development School Fee Justification Study.

^b 2017–2018 student enrollment provided by the California Department of Education.

SOURCE: Inglewood Unified School District, *Commercial/Industrial Development School Fee Justification Study*, May 17, 2018, and California Department of Education website, 2017–2018 data, <https://www.cde.ca.gov/ds/sd/sd/filesenr.asp>, accessed March 2019.

In recent years, the IUSD has experienced declining student enrollment, changing demographics, challenging socioeconomic conditions for families, a drop in school funding, and the expansion of charter schools. Overall, year-to-year annual student enrollment in the IUSD has steadily declined while enrollment in area charter schools has slightly increased.⁸⁸ During the 2017–2018 school year, charter schools located within the school boundaries of the IUSD included 1,644 elementary students, 776 middle school students, and 634 high school students for a total enrollment of 3,054 students.⁸⁹ During the 2017–2018 school year nonpublic, nonsectarian schools located within the school boundaries of the IUSD included 356 elementary students, 100 middle school students, 77 high school students for a total enrollment of 533 students.⁹⁰ Specifically, enrollment in the IUSD has decreased approximately 47 percent, or more than 8,300 students since 2003. Since the 2014–2015 school year, enrollment in the IUSD has decreased by nearly 1,700 students. Enrollment in the IUSD decreased by approximately 700 students in the 2016–2017 school year and by another 486 students in the 2017–2018 school year. The enrollment decline is expected to continue with enrollment dropping by approximately 500 students in the 2017–2018 school year and another 950 students expected to depart in the next two years.⁹¹

3.13.14 Adjusted Baseline Environmental Setting

Section 3.13, Public Services, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Accordingly, the changes to schools associated with these developments within the HPSP area are considered as part of the Adjusted Baseline.

⁸⁸ Inglewood Unified School District, *2018–2023 Strategic Plan, The Inglewood Graduate: Read from Day One!* updated November 2018.

⁸⁹ California Department of Education website, *2017–2018 data*, Available: <https://www.cde.ca.gov/ds/sd/sd/filesenr.asp>. Accessed March 2019.

⁹⁰ California Department of Education website, *2017–2018 data*. Available: <https://www.cde.ca.gov/ds/sd/sd/filesenr.asp>. Accessed March 2019.

⁹¹ California School Information Services, Fiscal Crisis and Management Assistance Team, 2018. *Inglewood Unified School District Progress Report* page 361, July 2018.

As shown in **Table 3.13-6**, development associated with the HPSP Adjusted Baseline projects would generate approximately 125 elementary school students, 50 middle school students, and 50 high school students for a total increase of 225 additional students that would be attending schools within the IUSD. **Table 3.13-7** describes school facilities capacity and student enrollment under the Adjusted Baseline. The IUSD would have available capacity of 486 elementary school seats, 971 middle school seats, and 43 high school seats under Adjusted Baseline conditions.

**TABLE 3.13-6
 STUDENT GENERATION IN HPSP ADJUSTED BASELINE PROJECTS**

Land Use	Development	Units	Elementary School ^{a,b}	Middle School ^{a,b}	High School ^{a,b}	Total ^c
Proposed Uses						
70,000 Seat NFL Stadium ^d	2,700,000 ^e	sq. ft.	55	22	22	99
6,000 Seat Performance Venue ^d	153,913 ^f	sq. ft.	3	1	1	5
Retail and Restaurant ^d	518,077	sq. ft.	11	4	4	19
Office ^g	466,000	sq. ft.	15	6	6	27
Residential ^h	314	Units	41	17	17	75
Total Students			125	50	50	225

NOTES:

- ^a Calculated by multiplying each of the proposed uses by its respective student generation rates. Student generation rates are taken from the Inglewood Unified School District Commercial/Industrial Development School Fee Justification Study, Table 10, Average Student Generation Impacts per 1,000 Square Feet CID, page 21, prepared by Cooperative Strategies, dated May 17, 2018. Retail and Services per 1,000 sq. ft. = 0.0203 for elementary school; 0.0083 for middle school; and 0.0082 for high school. Office per 1,000 sq. ft. = 0.0317 for elementary school; 0.0129 for middle school; and 0.0128 for high school. Hospital per 1,000 sq. ft. = 0.0252 for elementary school; 0.0102 for middle school; 0.0102 for high school. Hotel/Motel per 1,000 square feet = 0.0103 for elementary; 0.0042 for middle school; and 0.0041 for high school.
- ^b Calculated by multiplying each of the proposed uses by its respective student generation rates. Student generation rates are taken from the Inglewood Unified School District Residential Development School Fee Justification Study, Table 5, Adjusted Student Generation Factors, page 11, prepared by Cooperative Strategies, dated May 17, 2018. Multi-family attached units = 0.1316 for elementary school; 0.0540 for middle school; and 0.0534 for high school.
- ^c Rounded to the nearest whole number.
- ^f Retail and services generation rates were used.
- ^d To find the square footage of a 70,000-seat NFL Stadium, comparable stadiums were researched. The Mercedes Benz Stadium in Atlanta, Georgia has a capacity of 71,000 seats and is 2,000,000 square feet.
- ^e To find the square footage of a 6,000 seat performance venue, comparable performance venues were researched. The Novo by Microsoft in Los Angeles, California has a capacity of 2,300 seats and is 59,000 square feet. 59,000 square feet/2,300 seats = approximately 25 square feet per seat. 6,000 seats X 25 square feet = 153,913 square feet. 3.13.15 Regulatory Setting

Federal

While public education is generally regulated at the State and local levels, the federal government is involved in providing funding for specialized programs (e.g., school meals, Title 1, Special Education, School to Work, and Goals 2000). However, these monies are not used for general educational purposes and are not applicable to the discussion herein.

State

California Education Code

Education services are subject to the rules and regulations of the California Education Code and governance of the State Board of Education. The State also provides funding through a combination of sales and income taxes. In addition, pursuant to Proposition 98, the State is also responsible for the allocation of educational funds that are acquired from property taxes. Further, the governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement against any construction within the boundaries of the district, for the purpose of funding the construction or reconstruction of school facilities.⁹²

The California Education Code authorizes the California Department of Education (“Department”) to develop site selection standards for school districts. These standards are found in the California Code of Regulations and require that districts select a site that conforms to certain net acreage requirements established in the Department's 2000 “School Site Analysis and Development” guidebook. The Guide includes the assumption that the land purchased for school sites would be in a ratio of approximately 2 to 1 between the developed grounds and the building

⁹² California Education Code Section 17620(a)(1).

area. For example, for a school that houses kindergarten through sixth grade and has an enrollment of 600 children, the recommended acreage is 9.2 acres.

The Department's 2000 Guide includes exceptions to its recommended site size that allow smaller school sites. Additionally, the Department has the policy that if the “availability of land is scarce and real estate prices are exorbitant” the site size may be reduced. It is the Department's policy that if a school site is less than the recommended acreage required, the district shall demonstrate how the students would be provided an adequate educational program including physical education as described in the district's adopted course of study. Through careful planning, a reduced project area school site could follow the recent trend of school downsizing and meet the Department's criteria.

California School Facility Program

The Leroy F. Greene School Facilities Act of 1998 (known as Senate Bill 50 or SB 50), enacted in 1998, is a program for funding school facilities largely based on matching funds. Proposition 1A was a school construction funding measure that was approved by the voters on the November 3, 1998 ballot. SB 50 created the School Facility Program enabling eligible school districts to obtain state bond funds. State funding requires matching local funds that generally come from developer fees. The passage of SB 50 eliminated the ability of cities and counties to require other forms of mitigation of school overcrowding impacts and provided for school districts to assess fees in specified amounts to offset the costs associated with increasing school capacity as a result of new development. The old “Stirling” fees were incorporated into SB 50 and are referred to as Level 1 fees. SB 50 permits the IUSD to levy a fee, charge, dedication, or other requirement against any development (i.e., residential and commercial/industrial) within its boundaries, for the purpose of funding the construction or reconstruction of school facilities.

The new construction grant provides funding on a 50/50 State and local match basis. The modernization grant provides funding on a 60/40 basis. Districts that are unable to provide some, or all, of the local match requirement and are able to meet the financial hardship provisions may be eligible for additional State funding.⁹³

SB 50 also set a maximum level of fees a developer may be required to pay. As of January 2012, the State Allocation Board (SAB) authorized an adjustment in the Statutory School Fee amounts (Level 1 fees) for unified school districts pursuant to Government Code section 65995(b)(3) to \$3.20 per square foot for new residential development and \$0.51 per square foot for commercial and industrial (non-residential) development. Districts meeting certain criteria may collect Level 2 fees as an alternative to Level 1 fees. Level 2 fees are calculated under a formula in SB 50. Level 3 fees are approximately double Level 2 fees and are implemented only when the State Allocation Board is not apportioning state bond funds. The passage of Proposition 51 on November 8, 2016 authorized an additional \$9 billion in general obligation bonds for the construction and modernization of schools across California. Although for purposes of CEQA SB 50 states that

⁹³ State of California, Office of Public School Construction, 2012. *School Facility Program Guide*, October 24, 2012.

payment of developer fees is “deemed to be complete and full mitigation” of the impacts of new development on school overcrowding, fees and state funding do not fully fund new school facilities. The IUSD receives Level 1 and Level 2 fees.⁹⁴ Pursuant to Government Code section 65996, the payment of these fees by a developer serves to mitigate potential impacts of increased enrollment that may result from implementation of a project to a less-than-significant level.⁹⁵

Local

City of Inglewood General Plan

The City of Inglewood General Plan, Land Use Element, adopted in 1980 and amended in 1986, 2009, and 2016, presents a long-range plan for the distribution and future use of land within the City. The Land Use Element analyzes population, existing and future land use requirements, and proposed implementation techniques. It provides a framework upon which the development of public and privately owned land can be based.⁹⁶

Neither the City of Inglewood General Plan Land Use Element, nor any of the other elements of the General Plan, contain goals, objectives, or policies regarding public schools.

Inglewood Unified School District

The IUSD serves students in 18 schools which consist of 10 elementary schools, one transitional K–8 school, three middle schools, three high schools, and one continuation school.⁹⁷ Numerous independent charter schools are also located in the district.⁹⁸

The IUSD provides education to enrolled students who live within the City, portions of the cities of Culver City, Hawthorne, and Los Angeles, and a portion of the unincorporated County of Los Angeles. IUSD rules also provide that people employed within the IUSD boundaries may request enrollment of their children in IUSD schools.

On September 14, 2012, the governor approved Senate Bill (SB) 533, Chapter 325, bringing the district under state receivership. Under state receivership, the State Superintendent of Public Instruction appoints a state administrator to act as both the governing board and superintendent of the IUSD. The IUSD’s five-member elected governing board serves in an advisory role. State receivership will continue until the IUSD shows adequate progress in the five operational areas, including finance, human resources, community relations and governance, facilities, and pupil achievement, and the State Superintendent of Public Instruction determines that the district has

AR 5117 Students – Inter-District Attendance Permits

In accordance with an agreement between the Board of Education and the board of another school district, a permit authorizing a student’s attendance outside his/her district of residence may be issued upon approval of both the district of residence and the district of proposed attendance. The Superintendent or designee may approve an inter-district attendance permit for a student for parent employment reasons.^{100,101} The IUSD accepts outgoing inter-district permit applications beginning April 1 and ending September 30 for the subsequent school year. Applicants are only allowed to apply for one school district per school year. If the outgoing inter-district permit is denied by the requested school, the project applicant will have used their one-time option for that school year and must wait until the next outgoing inter-district permit period to re-apply. Applications for incoming inter-district permits are due by February 1 for the subsequent school year. For the present school year, incoming permits are accepted until March 30. Parents submitting an incoming inter-district

⁹⁹ California School Information Services, Fiscal Crisis and Management Assistance Team, 2018. *Inglewood Unified School District Progress Report*, page 2, July 2018.

¹⁰⁰ Yadallittle Preciado, IUSD staff within the ADA Attendance Clerk’s Office, phone correspondence, January 7, 2018, at 3:45 PM.

permit application for a student in any grade must have a minimum of a 2.0 grade point average (GPA) along with excellent attendance and appropriate behavior.

A student's inter-district agreement may be denied or revoked because of poor scholastic achievement, unsatisfactory effort, absences, excessive tardiness, truancy, continued disruption of the education program, impacted programs, or falsification and/or omission of any enrollment documents. Once a student's permit is revoked, the family may not reapply for 12 months for that student. If a parent wants to appeal revocation of the permit, the appealing party must submit a written request to the Superintendent or designee specifying the reasons why the decision should be overruled. This written appeal must be received by the designee within 10 days from the last day of the school year.

The Superintendent or designee may deny initial requests for inter-district attendance permits due to limited district resources, overcrowding of school facilities at the relevant grade level, or other considerations that are not arbitrary. However, once a student is admitted, the district may transfer the student to another school in the district due to overcrowded facilities at the relevant grade level.

Within 30 days of a request for an inter-district permit, the Superintendent or designee shall notify the parents/guardians of a student who is denied inter-district attendance regarding the process for appeal to the County Board of Education as specified in Education Code 46601. An appeal process at the District level shall be utilized. Students who are under consideration for expulsion or who have been expelled may not appeal inter-district attendance denials for decisions while expulsion proceedings are pending, or during the term of the expulsion. Pending a decision by the two districts for an appeal by the County Board, the Superintendent or designee may provisionally admit a student who resides in another district for a period not to exceed two months.

Once a student is admitted to a school on a basis of an inter-district permit, he/she shall not be required to re-apply for an inter-district transfer and shall be allowed to continue to attend the school in which he/she is enrolled, unless reapplication standards are otherwise specified in the inter-district attendance agreement. Existing inter-district attendance permits shall not be rescinded for students entering grade 11 or 12 in the subsequent school year.¹⁰²

3.13.16 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to public schools. The following threshold of significance has been adapted from CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Result in substantial adverse physical impacts associated with the provision of or need for new or physically altered facilities for schools, the construction of which could cause

¹⁰² Inglewood USD, *AR 5117 Students, Inter-District Attendance Permits*. Available: <http://www.gamutonline.net/district/inglewoodusd/displayPolicy/1079451/1>. Accessed January 2019.

significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for schools.

Methodology and Assumptions

The analysis of enrollment effects on schools is based on the ability of the IUSD school facilities and services to accommodate the potential increase in students generated from development of the Proposed Project and other cumulative development. The analysis estimates the number of students that would be generated by the Proposed Project and other cumulative development by using IUSD student generation factors, and focuses on whether IUSD school facilities expected to serve the Proposed Project and other cumulative development would have sufficient available capacity to accommodate these students.

The IUSD student generation factors were provided by the Inglewood Unified School District Residential Development School Fee Justification Study, Table 5, Adjusted Student Generation Factors, dated May 17, 2018, prepared by Cooperative Strategies, and the Inglewood Unified School District Commercial/Industrial Development School Fee Justification Study, Table 10, Average Student Generation Impacts per 1,000 Square Feet CID, dated May 17, 2018, prepared by Cooperative Strategies.

Current and projected enrollment/capacities use the 2017–2018 school year as representative of existing conditions. The student enrollments were obtained from the California Department of Education. As described above, projected student enrollment from the HPSP Adjusted Baseline projects is added to existing conditions to create the Adjusted Baseline, which is used as the baseline for impact analysis.

The analysis addresses all levels of education facilities operated by the IUSD (i.e., elementary schools, middle schools, and high schools), and focuses on the schools that would serve the Project Site and other cumulative development. It also addresses state regulations, e.g., SB 50, and cumulative development fees as a mechanism for providing new school facilities and addressing school impacts of the Proposed Project and other cumulative development. A determination is then made as to whether the IUSD would require new or physically altered facilities for schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives for schools.

Impacts and Mitigation Measures

Impact 3.13-11: Construction and operation of the Proposed Project could result in substantial adverse physical impacts associated with the need for or provision of new or physically altered schools, the construction of which could cause significant environmental impacts. (Less than Significant)

Construction

The nearest schools to the Proposed Project are the Worthington Elementary School at 11101 Yukon Avenue, located approximately 0.80 miles southeast of the Project Site; Woodworth (Clyde) Elementary School at 3200 West 104th Street, located approximately 0.83 miles southeast of

Project Site; Monroe (Albert F.) Middle School at 10711 10th Avenue, located 0.90 miles southwest of the Project Site; and Morningside High School at 10500 South Yukon Avenue, located 0.50 miles southeast of Project Site.¹⁰³ Project-related construction vehicles would primarily use designated truck routes in the vicinity of the Project Site including, but not limited to, Manchester Avenue, West Century Boulevard, Hawthorne Boulevard, South Prairie Avenue, West 102nd Street between South Prairie and Yukon Avenues, and Crenshaw Boulevard. None of the nearby schools are located on these designated truck routes, and thus any construction truck use of streets adjacent to these schools would be intermittent and infrequent. Project-related construction traffic, lane closures, and construction-related activities, including delivery of construction materials, would not affect school access or student pick-up/drop-off. As such, construction of the Proposed Project would not adversely affect the schools resulting in physical effects.

Construction of the Proposed Project would require the participation of a large number of construction employees who would be hired from a mobile regional construction work force that moves from project to project. Proposed Project construction workers with various skills work on the Proposed Project on an intermittent basis as their particular trades are required. As described in Chapter 2, Project Description, Table 2-5, construction phases at the Project Site would range from a few weeks to approximately 18 months, and would involve construction worker teams ranging from a couple dozen to several hundred depending on phase (see Chapter 2, Project Description, Section 2.5 Project Elements).

Given the mobility and limited durations of work on the Project Site, and a large construction labor pool that can be drawn upon from throughout the Los Angeles region, it is not reasonably expected that construction employees would relocate their place of residence or the schools in which their children are enrolled within this region or from other regions as a result of their work on the Proposed Project. Accordingly, construction of the Proposed Project would not result in an increase in the resident population or generate new students needing to attend local schools. Thus, construction of the Proposed Project would not create a need for new or physically altered schools, the construction of which would result in substantial adverse environmental impacts. Therefore, the impact of the construction of the Proposed Project on schools would be **less than significant**.

Operation

The Proposed Project would not involve the development of residential uses that could generate new student enrollment. Also, the Proposed Project would not remove existing residential uses or a school site, and therefore would not reduce the student population or availability of school facilities.

The Proposed Project would employ a total of 1087 existing and future permanent employees. The number of event-related employees required, and the types of services provided, for an event hosted at the Arena Structure would vary depending on the type and size of event. The highest number of event-related employees would be required to support an LA Clippers home basketball

¹⁰³ Distances are measured from the center of the Arena Site.

game, approximately 1,320 employees, which includes approximately 120 LA Clippers business operations support employees who would also work at LA Clippers games.

It is possible that a small number of permanent or event-related employees associated with the Proposed Project would request that their children be enrolled into an IUSD school near the Project Site. As discussed above, the Superintendent or designee may approve an inter-district attendance permit for a student for parent employment reasons.

Table 3.13-9 presents the estimated number of students generated by the Proposed Project. As shown in Table 3.13-9, the Proposed Project is expected to generate approximately 27 elementary school students, 10 middle school students, and 13 high school students for a total net increase of 50 students attending schools within IUSD service boundaries over existing conditions. Furthermore, a portion of the Proposed Project's generated school-aged children may attend private, charter, or magnet schools, which would reduce attendance at IUSD schools. For these reasons, the above analysis is considered conservative and likely overestimates the Proposed Project's actual potential to generate new students.

As described above in Table 3.13-7, under the Adjusted Baseline the IUSD has capacity to accommodate up to 472 elementary students, 966 middle school students, and 37 high school students. As shown below in **Table 3.13-10**, under the Adjusted Baseline, there is sufficient capacity to accommodate all students within existing capacities at each school level. As such, implementation of the Proposed Project would not result in overcrowding at any school level, and thus there would be no need for the construction of new school facilities to meet the demands of enrollment associated with the Proposed Project.

The Proposed Project would be required to pay fees in accordance with SB 50 (California Government Code section 65995 et seq.). Payment of such fees is intended for the general purpose of addressing the construction of new or improved school facilities, irrespective of whether schools serving the Proposed Project in question are at capacity. Pursuant to sections 65995(h) and 65996(b), payment of such fees is deemed to be full mitigation of a project's impacts related to overcrowding and enrollments at school facilities under CEQA.¹⁰⁴

¹⁰⁴ Government Code section 65995(h) states in part: "The payment or satisfaction of a fee ... in the amount specified in section 65995.5 or 65995.7 are hereby deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property ... on the provision of adequate school facilities." Government Code section 65996(b) states that "[t]he provisions of [SB 50] are hereby deemed to provide full and complete school facilities mitigation and, notwithstanding ... Division 13 (commencing with section 21000) of the Public Resources Code, or any other provision of state or local law, a state or local agency may not deny or refuse to approve a legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property ... on the basis that school facilities are inadequate."

NOTES:

- ^a Calculated by multiplying each of the proposed uses by its respective student generation rates. Student generation rates are taken from the Inglewood Unified School District Commercial/Industrial Development School Fee Justification Study, Table 10, Average Student Generation Impacts per 1,000 Square Feet CID, page 21, prepared by Cooperative Strategies, dated May 17, 2018. Retail and Services per 1,000 sq. ft. = 0.0203 for elementary school; 0.0083 for middle school; and 0.0082 for high school. Office per 1,000 sq. ft. = 0.0317 for elementary school; 0.0129 for middle school; and 0.0128 for high school. Hospital per 1,000 sq. ft. = 0.0252 for elementary school; 0.0102 for middle school; 0.0102 for high school. Hotel/Motel per 1,000 square feet = 0.0103 for elementary; 0.0042 for middle school; and 0.0041 for high school.
- ^b Rounded to the nearest whole number.
- ^c Retail and services generation rates were used.
- ^d Office generation rates were used.
- ^e Hospital generation rates were used.
- ^f Hotel/motel generation rates were used.
- ^g The Proposed Project would include a hotel with up to 150 guest rooms. According to *USA Today*, the average hotel room is approximately 330 square feet including a full bathroom. Source: <https://www.usatoday.com/story/travel/roadwarriorvoices/2015/11/04/hotel-rooms-20-years-ago-were-twice-as-large-as-some-of-todays-offerings/83847338/>, accessed January 2019. 150 hotel rooms X 330 square feet = 49,500 square feet of hotel uses.

**TABLE 3.13-10
 ADJUSTED BASELINE ENVIRONMENTAL SETTING SCHOOL FACILITIES CAPACITY AND STUDENT ENROLLMENT
 WITH PROJECT**

IUSD School Level	2017–2018 Facilities Capacity ^{a,b}	2017–2018 Adjusted Baseline Student Enrollment ^c	2017–2018 Adjusted Baseline Capacity (Shortage)	Project-Generated Students	Projected Student Enrollment for 2017–2018 Adjusted Baseline With Project	Projected Capacity/ (Shortage) for 2017–2018 Adjusted Baseline With Project
Elementary School (Grades K–5)	5,247	4,761	472	27	4,788	445
Middle School (Grades 6–8)	2,873	1,902	966	10	1,912	951
High School (Grades 9–12)	2,079	2,036	37	13	2,049	24

NOTES:

- ^a 2017–2018 is the most recent school year information available.
- ^b Capacity based on classroom utilization information provided by the IUSD in the Inglewood Unified School District Commercial/Industrial Development School Fee Justification Study.
- ^c 2017–2018 student enrollment provided by the California Department of Education.

SOURCES: Inglewood Unified School District, *Commercial/Industrial Development School Fee Justification Study*, May 17, 2018; and California Department of Education, 2017–2018 data, <https://www.cde.ca.gov/ds/sd/files/enr.asp>, accessed March 2019.

Overall, operation of the Proposed Project would not create a demand for schools that would result in the need for new or physically altered school facilities, the construction of which would result in substantial adverse environmental impacts, in order to maintain acceptable service ratios or other performance objectives. Therefore, impact of the operation of the Proposed Project on schools would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic context for analysis for cumulative impacts related to schools includes those past, present, and reasonably foreseeable cumulative projects located within the boundaries of the IUSD. Of the 145 cumulative projects on the cumulative projects list presented in Section 3.0, Introduction to the Analysis, Table 3.0-2, Cumulative Projects List, a total of 33 (Cumulative Projects 42-52, 54-74, and 118) are located within the attendance boundaries of the IUSD. The development of these 33 cumulative projects is anticipated to result in construction of 3,091 residential units, 443,059 sf of commercial and industrial uses, 451,923 sf of retail uses, 1,640 sf of restaurant uses, 3,567,314 sf of office uses, 304 hotel rooms, 30,000 sf of civic center uses, and approximately 13 acres of open space.

These cumulative projects located within the IUSD boundaries are included in **Table 3.13-11**.

Self-Storage per 1,000 square feet = 0.0006 for elementary; 0.0002 for middle school; and 0.0002 for high school.
- ^d Rounded to the nearest whole number.

SOURCES:

Inglewood Unified School District, *Residential Development School Fee Justification Study*, May 17, 2018; and Inglewood Unified School District, *Commercial/Industrial Development School Fee Justification Study*, May 17, 2018; and ESA 2019.

Impact 3.13-12: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could contribute to cumulative substantial adverse physical impacts associated with the need for or provision of new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools. (Less than Significant)

Construction

As described under Impact 3.13-11, schools in the vicinity of the Project Site are not located on City of Inglewood designated truck routes. As with the Proposed Project, construction vehicles for cumulative projects would primarily use designated truck routes including, but not limited to, Manchester Avenue, West Century Boulevard, Hawthorne Boulevard, South Prairie Avenue, West 102nd Street between South Prairie and Yukon Avenues, and Crenshaw Boulevard. None of the nearby schools are located on these designated truck routes, and thus any construction truck use of streets adjacent to these schools would be intermittent and infrequent. Construction

activities associated with the 33 cumulative projects located within the IUSD boundaries would not adversely affect IUSD schools resulting in physical effects. Project-related construction traffic, lane closures, and construction-related activities, including delivery of construction materials, would not affect school access or student pick-up/drop-off.

As described above under Impact 3.13-11, construction activities are not expected to result in an increase in the resident population or generate students needing to attend local schools. The construction of the Proposed Project in conjunction with construction of the HPSP Adjusted Baseline projects and the 33 related cumulative development projects located within the IUSD boundaries would not generate a new material demand for schools that could require construction of new facilities that could adversely affect the environment. Therefore, this cumulative impact would be **less than significant**.

Operation

Operation of the Proposed Project, combined with the operations of past, present, and reasonable future projects, could increase the number of students seeking to enroll in IUSD schools. Of the 145 cumulative projects, 33 are located within the attendance boundaries of the IUSD.

Table 3.13-11 presents the estimated students that would be generated by the cumulative projects located within the IUSD. Similar to the Proposed Project, the number of students anticipated to be generated by the cumulative projects was estimated based on the type of development proposed.

As shown in **Table 3.13-12**, the cumulative projects are expected to generate approximately 525 elementary school students, 215 middle school students, and 213 high school students. With the addition of student enrollment that could be generated by the Proposed Project, cumulative student enrollment could therefore increase by 552 elementary school students, 225 middle school students, and 226 high school students. This analysis is conservative, as a portion of the Proposed Project's and cumulative projects' generated school-age children may attend public schools in other districts, charter, or private schools, which would reduce attendance at IUSD schools.

As shown in Table 3.13-12, under cumulative conditions, the IUSD would have sufficient capacity for middle school students, but would have a small shortfall in capacity for elementary school students (66) and a more material shortfall in spaces for high school students (183). In the event that these shortfalls materialize, they are relatively small in comparison to the design capacity of either an elementary or high school, and would most likely be addressed through school class size adjustments or the addition of portable classrooms on existing school properties, and would not involve significant environmental impacts that can be associated with new school construction.

As discussed above, in recent years the IUSD has experienced declining student enrollment, changing demographics, challenging socioeconomic conditions for families, a drop in school funding, and the expansion of charter schools. Overall, year-to-year annual student enrollment in the IUSD has steadily declined while enrollment in area charter schools has slightly increased. Over the last 4 school years, IUSD enrollment has decreased by nearly 1,700 students, and is projected to decline by another 950 students over the next two years. Should those expected

IUSD School Level	2017–2018 Facilities Capacity ^{a,b}	Adjusted Baseline Student Enrollment ^c	Adjusted Baseline Capacity (Shortage)	Project + Cumulative Generated Students	Projected Student Enrollment for Adjusted Baseline + Project + Cumulative	Projected Seating Capacity (Shortage) for Adjusted Baseline + Project + Cumulative
Elementary School (Grades K–5)	5,247	4,761	486	552	5,313	(66)
Middle School (Grades 6–8)	2,873	1,902	971	225	2,127	746
High School (Grades 9–12)	2,079	2,036	43	226	2,262	(183)

NOTES:

- ^a 2017–2018 is the most recent school year information available.
- ^b Capacity based on classroom utilization information provided by the IUSD in the Inglewood Unified School District Commercial/Industrial Development School Fee Justification Study.
- ^c 2017–2018 student enrollment provided by the California Department of Education.

SOURCES:

Inglewood Unified School District, Commercial/Industrial Development School Fee Justification Study, May 17, 2018; and California Department of Education website, 2017–2018 data, <https://www.cde.ca.gov/ds/sd/filesenr.asp>, accessed March 2019.

decreases in enrollment occur, there would be sufficient space available for all students that would be generated by the Proposed Project plus cumulative development.

As described previously, the Proposed Project and all cumulative projects would be required to pay IUSD fees in accordance with SB 50 (California Government Code section 65995 et seq.). Based on current fees, the cumulative development of 3,091 residential units, 443,059 sf of commercial uses, 451,923 sf of retail uses, 1,640 sf of restaurant uses, 3,567,314 sf of office uses, 304 hotel rooms would generate approximately \$2.6 million in fees to the IUSD. Payment of such fees is intended for the general purpose of addressing the construction of new school facilities, or expansion and/or improvement of existing schools. Pursuant to sections 65995(h) and 65996(b), payment of such fees is deemed to be full mitigation of a project’s impacts related to school facilities under CEQA.

For the reasons described above, operation of the Proposed Project, in conjunction with cumulative development within the boundaries of the IUSD would not result in the need for the construction of new, or expanded school facilities, the construction of which could cause significant environmental impacts, in order to maintain performance objectives. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

3.14 Transportation and Circulation

This section describes and evaluates potential impacts related to transportation and circulation that could result from implementation of the Proposed Project. The section includes relevant adjusted baseline information, including a description of the anticipated project travel characteristics and relevant local, regional, state, and federal regulations. Project impacts to the roadway, bicycle, pedestrian, and transit systems in the study area are analyzed for adjusted baseline and cumulative conditions. Potentially feasible mitigation measures (where applicable) are then identified to avoid or lessen the impacts.

Comments received in response to the NOP for the EIR regarding transportation and circulation can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to transportation and circulation as a result of implementation of the Proposed Project are analyzed within this section.

This section relies on a variety of data sources and/or publicly available information to support the technical analysis. This information includes, but is not limited, to:

- Data from the Cities of Inglewood, Hawthorne and Los Angeles, and the County of Los Angeles.
- Data from California Department of Transportation (Caltrans) and the Los Angeles County Metropolitan Transportation Authority (Metro).
- Online survey of NBA Los Angeles Clippers fans.

This section describes the information that was used to determine the days and hours that were included in the traffic analysis. Because the Proposed Project includes an arena, the analysis necessarily considered traffic levels that would occur before and after events, and on various days of the week. The analysis also considered the days and times when surrounding traffic would be at its peak, such that project-related traffic would be added to the road network at its most congested level. The analysis also considered impacts that would occur on days when no event occurred at the arena.

Section Overview

The analysis of Transportation and Circulation describes the Proposed Project's anticipated travel characteristics and presents the impacts of the Proposed Project on the roadway, bicycle, pedestrian and transit systems in the study area under Adjusted Baseline and Cumulative conditions. This Section Overview provides a summary of the topics addressed in Section 3.14. Please see Chapter S, Summary, for a summary of the Proposed Project and its impacts, including impacts pertaining to Transportation and Circulation.

Study Area: The Transportation and Circulation analysis evaluates a total of 114 study intersections and 28 neighborhood street segments within an approximately 20-square-mile study area, including the corridors connecting to the major freeways that would provide regional access

to the Proposed Project. The study area extends generally westerly to the Interstate 405 (I-405), southerly to the I-105, easterly to the I-110, and northerly to Centinela Avenue and Florence Avenue and several outlying intersections further north. The transportation analysis also evaluates 53 discrete freeway components, including mainline and collector/distributor segments, weave areas, and ramp merge/diverge areas. The analysis also included vehicular queuing at the ten freeway off-ramps anticipated to be used to a significant degree by project trips.

Time Periods Evaluated: The analysis includes comprehensive modeling designed to characterize traffic conditions during those periods when the Proposed Project would have the maximum impact on transportation and circulation, based on both existing and projected traffic levels, and on the characteristics of the Proposed Project, including the nature, timing, frequency and size of events that will occur there. The analysis evaluates transportation and circulation impacts during the following time periods:

- Weekday AM peak (7:00 – 9:00 AM)
- Weekday PM peak (4:00 – 6:00 PM)
- Weekday pre-event hour
- Weekday post-event hour
- Weekend pre-event hour

The analysis uses a conservative approach to identify the appropriate time periods for analysis. To provide one example, LA Clippers' weekday regular season home games typically start at 7:30 PM. The analysis assumes, however, a start time of 7:00 PM for such games. This approach is conservative because it means that more traffic will be generated close to the weekday PM peak hour and will thus occur against a backdrop of more congested traffic levels than would occur later in the evening.

The complete definitions of the time periods used in the transportation impact analysis are presented in **Table 3.14-1** below. For purposes of clarity, the analysis uses the terminology set forth in Table 3.14-1 when referring to a time of day or day of the week.

Scenarios Evaluated: The Transportation and Circulation analysis evaluated 65 different permutations of the type of event and non-event conditions that would occur at the Proposed Project, including 5 existing conditions. The following events and activities are evaluated:

- Ancillary Uses (daily operation of the Proposed Project without an event at the Arena)
- Daytime Events (corporate or other sporting/gathering events)
- Major Events (LA Clippers basketball games and highly attended concerts at the Arena)
- Concurrent Events (overlapping or concurrent events occurring at The Forum and/or the Hollywood Park NFL Stadium)

Details regarding the assumptions underlying these event and non-event conditions are presented in Table 2-3 of Chapter 2, Project Description. The analysis of each scenario focuses on the day of the week and the time period when the largest potential impacts could occur. The event or use scenarios are:

- *Ancillary uses:* Ancillary uses include the daily operation of the Proposed Project without an event in the Arena. Ancillary uses include office, medical clinic, community space, restaurant and retail uses at the Proposed Project. Traffic from these uses would occur daily and represent the most frequent traffic scenario generated by the Proposed Project.
- *Daytime events:* Daytime weekday events represent the next most frequent traffic scenario generated by the Proposed Project and could involve corporate/civic events and other sports or gathering events at the Proposed Project. The analysis assumes that corporate/civic events could be attended by up to 2,000 persons and could occur up to 100 times per year. Other sports or gathering events could be attended by up to 7,500 persons and are anticipated to occur up to 35 times per year.
- *Major events:* Major events at the Proposed Project would include LA Clippers basketball games and highly attended concerts. This analysis assumes that up to 62 major events would take place at the Proposed Project per year. Maximum attendance would be for a sold-out NBA basketball game (18,000 persons), and for a sold-out concert (18,500 persons).
- *Concurrent/overlapping events:* Given the Proposed Project's proximity to The Forum and the NFL Stadium located in the Hollywood Park area, it is possible that certain events at the Proposed Project may occur simultaneously or concurrently with events at The Forum and/or the NFL Stadium. Accordingly, the transportation analysis studies five concurrent or overlapping event scenarios, as follows:

Scenario 1 (Major Events at Proposed Project and The Forum) consists of sold-out evening concert at The Forum (17,500 attendees), overlapping with an evening Major Event at the Proposed Project. The analysis looks at both weekdays and weekends.

Scenario 2 (Major Event at Proposed Project and Football Game at NFL Stadium) consists of sold-out NFL afternoon football game at the NFL Stadium (70,240 attendees), overlapping with an evening Major Event at the Proposed Project. The analysis focuses on the weekend.

Scenario 3 (Major Event at Proposed Project and Midsize Event at NFL Stadium) consists of a mid-size evening event at the NFL Stadium (25,000 attendees), overlapping with an evening Major Event at the Proposed Project. The analysis focuses on a weeknight.

Scenario 4 (Major Events at Proposed Project and The Forum; Midsize Event at NFL Stadium) consists of the following concurrent events occurring on a weekday evening: a 25,000-person event at the NFL Stadium, a 17,500-person concert at The Forum, and a Major Event at the Proposed Project.

Scenario 5 (Major Events at Proposed Project and The Forum; Football Game at NFL Stadium) consists of a 70,240-person NFL afternoon football game at the NFL Stadium, a 17,500-person evening concert at The Forum, and an evening Major Event at the Proposed Project. The analysis focuses on the weekend.

Table 3.14-2 below provides an overview of event types, frequency and timing at the Proposed Project, at the NFL stadium, and at The Forum. Table 3.14-3 lists the specific scenarios analyzed.

Adjusted Baseline: The Transportation and Circulation analysis evaluates the Proposed Project's impacts using an "Adjusted Baseline." Ordinarily, under CEQA, the baseline condition against which a project's potential impacts are measured consists of the environmental setting at the time the lead agency commences the environmental review process. In this instance, however, the City has determined that using such a baseline would be misleading. The Proposed Project is expected to be complete and operational in mid-2024, in time for the 2024-2025 NBA season. By that time, the environmental setting, as it exists today, will have changed in specific and predictable ways. In particular, the City has issued building permits for, and construction has commenced on, portions of the Hollywood Park Specific Plan (HPSP) located immediately north of the Project Site. In addition, the Metro Crenshaw/LAX light rail line is currently under construction and is scheduled to commence operations in 2020. Finally, certain road improvements in the vicinity are approved, funded, under construction, and scheduled for completion prior to 2024. The analysis assumes that this development, and these improvements to transit and roadways, will be completed by the time the Proposed Project commences operations. Additional information regarding the Adjusted Baseline transportation assumptions is provided in Section 3.14.2.

Cumulative Conditions: The City has consulted with surrounding jurisdictions and has assembled a list of past, present, and reasonably foreseeable cumulative land use development projects in the vicinity of the Project Site. The City has also identified improvements to the road and transit networks that have been proposed, and that are considered reasonably foreseeable. The development and transportation improvements are described below. The analysis considers whether the Proposed Project's impacts are considerable against the backdrop of these cumulative conditions.

Organization of Chapter 3.14: The Transportation and Circulation analysis presented in Chapter 3.14 is organized into the following five (5) subsections:

Section 3.14.1 describes the environmental setting, including the existing condition of the roadway network, bicycle facilities, pedestrian facilities, and public transit networks.

Section 3.14.2 describes the Adjusted Baseline Environmental Setting that was developed to evaluate the Proposed Project's impacts against the baseline environmental conditions (including land use and transportation systems assumptions) anticipated to exist when the Proposed Project would be constructed and opened for operations.

Section 3.14.3 provides a discussion of the relevant federal, state and local regulations pertaining to transportation and circulation that may be applicable to the Proposed Project.

Section 3.14.4 discusses the transportation and circulation impacts of the Proposed Project under the Adjusted Baseline conditions followed by Cumulative conditions for

each of the following scenarios: Ancillary Uses; Daytime Events; and Major Events. Under each of these three scenarios (and under both Adjusted Baseline and Cumulative conditions), the following impacts are evaluated: intersections; neighborhood streets; freeway facilities; vehicle miles traveled (VMT); public transit operations; existing or planned bicycle facilities; existing or planned pedestrian facilities; emergency access; and circulation during construction.

Section 3.14.5 discusses the Proposed Project under Adjusted Baseline and Cumulative conditions assuming one or more concurrent or overlapping events at The Forum and/or NFL Stadium. As described above, the analysis studies five concurrent or overlapping event scenarios under both Adjusted Baseline conditions followed by Cumulative conditions.

Identification of Analysis Scenarios and Study Periods

Although it is atypical for a Transportation and Circulation section to present project activities and travel characteristics prior to the Environmental Setting, the unique nature of the Proposed Project and its surrounding environment necessitated that an overview of its activities be provided here. This is because these conditions directly influence the selection of study days and time periods. Without this background knowledge, readers would not understand why certain peak hours are being studied under existing conditions.

**TABLE 3.14-1
 DEFINITIONS OF TIME PERIODS USED IN TRANSPORTATION IMPACT ANALYSIS**

Term	Definition
Weekday AM Peak Hour	Busiest hour of travel from 7 to 9 AM on a weekday
Weekday PM Peak Hour	Busiest hour of travel from 4 to 6 PM on a weekday
Weekday Pre-Event Peak Hour ^a	Occurs from 6 to 7 PM on a weekday
Weekday Post-Event Peak Hour ^a	Occurs from 9:30 to 10:30 PM on a weekday
Weekend Pre-Event Peak Hour ^a	Occurs from either 5 to 6 PM or 6 to 7 PM on a weekend ^b

NOTE:

^a In this context, an event is defined as consisting of an 18,000-person NBA Game or an 18,500-person concert. A variety of different event types may occur at Proposed Project, as described in the section below.

^b As described on the following pages, the types of nearby overlapping events assumed for a given scenario affect which hour is selected for analysis.

SOURCE: Fehr & Peers, 2019.

A variety of different types of events would be expected to occur at the Proposed Project. These events may occur simultaneously with events at the new NFL Stadium and The Forum, both of which are located within 1 mile of the project. This section discusses the extent to which events at the NFL Stadium and The Forum may occur concurrently with events at the Proposed Project. The potential for these events to overlap, and the temporal characteristics of these events, drive the selection of peak hours of study and development of analysis scenarios to cover such overlapping events.

Table 3.14-2 provides an overview of common event types including their general frequency and timing, and expected attendance. This does not represent a comprehensive list of all activities and events that would occur, but rather a selected list of the larger, more common events that would warrant detailed analysis. Refer to Table 2-3 in Chapter 2, Project Description, for a complete list of all annual activities anticipated for the Proposed Project.

As shown, programming for the Proposed Project would allow for up to 131 events per year (not including potential NBA playoff games) with attendance levels of at least 7,500 persons. Up to an additional 100 smaller events (2,000 persons or less) may also occur. The most frequent large event (18,000 persons) would be NBA Clippers regular season basketball games, which occur from late October through April. During that time, the Clippers would play 41 regular season home games (along with five lesser attended pre-season games and potentially playoff games in April, May, and June). Of the 23 total concerts expected during a typical year, 5 would be anticipated to attract up to 18,500 guests.

Table 3.14-3 presents the scenarios studied in the transportation analysis. The following discussion describes how these scenarios were selected.

NFL Stadium. The NFL Stadium would host the home games for the NFL Rams and Chargers. They would each play eight home games and two preseason games. Playoff games could also occur. In addition to football games, this facility would also host other events, such as concerts or non-football sporting events. Data from other outdoor stadiums in the Los Angeles region indicates that other events at such facilities are relatively infrequent. This analysis assumes that the NFL Stadium would host up to eight mid-sized events (25,000 persons) each year, which is consistent with analysis of the Hollywood Park Stadium Alternative Project prepared in 2015. The NFL Stadium also includes a performance venue that can accommodate up to 6,000 persons. As shown in Table 3.14-3, the analysis is conservatively analyzing a concurrent weekday evening condition in which a major event (i.e., NBA Basketball Game or Large Concert) would occur at the Proposed Project and a 25,000-person event occurs at the NFL Stadium. This is a more conservative scenario than alternatively assuming a 6,000-attendee event at the NFL Stadium performance venue. Thus, the impacts associated with a 25,000-person mid-sized event at the NFL Stadium operating concurrently with a major event at the Proposed Project also covers a less-crowded scenario in which the 6,000-seat performance venue is used instead of the NFL Stadium. A scenario in which both events at the NFL Stadium (resulting in 31,000 total persons on that site) also coincided with a major event at the Proposed Project was also considered but would not warrant a separate model run. Such a scenario would not alter the Proposed Project's relative impacts because its travel characteristics would not materially change. Thus, Proposed Project impacts under this scenario would be similar and the same mitigation measures would apply. This analysis is conservative, in that it assumes a greater level of activity at the NFL Stadium than has occurred at other, large outdoor stadiums in the Los Angeles region in recent years.¹

¹ ESA Memorandum, Weekday Events at Southern California Stadiums, February 19, 2019.

**TABLE 3.14-2
OVERVIEW OF COMMON EVENT TYPES, FREQUENCY, AND TIMING AT PROJECT, NFL STADIUM, AND THE FORUM**

Location	Common Event Types ^a	Event Characteristics				
		Time of Year	Day of Week	Frequency (per Year)	Approx. Start/End Time	Attendance ^b
Project	Clippers NBA Basketball Games (Regular)	Oct–April	Any	41 Regular Season	Typically Evening ^c	18,000
	Clippers NBA Basketball Games (Pre & Post)	Oct & May/June	Any	Approx. 5 Pre-Season & 3 Post-Season	Typically Evening ^c	18,000 ^d
	Concerts (Large)	Throughout	Fri/Sat more likely	Approx. 5	Evening	18,500
	Concerts (Medium)	Throughout	Fri/Sat more likely	Approx. 8	Evening	14,500
	Concerts (Small)	Throughout	Fri/Sat more likely	Approx. 10	Evening	9,500
	Family Shows ^e	Throughout	Any	Approx. 20	Varies	8,500
	Corporate/Community Events ^f	Throughout	Any	Approx. 100	8 AM–5 PM	2,000
	Other Event ^g	Throughout	Any	Approx. 35	Varies	7,500
NFL Stadium	Plaza Events ^h	Throughout	Any	Approx. 16	Varies	4,000
	NFL Football Games (Regular)	Sept–Dec	Mon, Thurs, Sat, and Sun	16 Regular Season	Mon & Thurs: 5:20 PM Sat: 5:20 PM Sun: 1:05, 1:25, or 5:20 PM	70,240
	NFL Football Games (Pre & Post)	Aug & Jan	Sat & Sun	4 Pre-Season & up to 4 Post-Season	Varies	70,240 ^d
	Midsized Event	Throughout	Any	Up to 8	Typically Evening	25,000 ⁱ
The Forum	Performance Venue	Throughout	Any	Approx. 75	Typically Evening	6,000
	Concerts	Throughout	Any	75 ^j	Evening	17,500

NOTES:

- ^a Refer to Table 2-3 in Chapter 2, Project Description, for a complete list of project activities.
- ^b Attendance values shown represent maximum unless specified otherwise.
- ^c Weekend games (especially Sunday) may start at 12:30 PM, 3 PM, 6 PM or 7 PM.
- ^d Pre-season games typically do not reach maximum attendance.
- ^e Examples of event types include Disney on Ice, Harlem Globetrotters, etc.
- ^f Examples of event types include small conventions, conferences, cultural/civic events.
- ^g Could include college basketball, boxing, professional wrestling, graduations, speaking events, etc.
- ^h Examples of plaza events include outdoor exhibitions or festivals, fan appreciation days, holiday celebrations, etc.
- ⁱ Because analysis of the Hollywood Park Stadium Alternative Project (February 2015) projected that the stadium would hold "events with attendance between 10,000 and 25,000 patrons, the upper end of this range was selected to provide a reasonably conservative basis for analysis of concurrent events that are no professional football games.
- ^j Based on events at The Forum in 2016–2018 (source: <https://www.songkick.com/venues/16272-forum/gigography?page=1>).

SOURCE: Fehr & Peers, 2019.

**TABLE 3.14-3
 PROPOSED PROJECT TRANSPORTATION IMPACT ANALYSIS SCENARIOS**

Scenario	Specific Condition ^a	Weekday				Weekend
		AM Peak Hour ^b	PM Peak Hour ^c	Pre-Event Peak Hour (6–7 PM)	Post-Event Peak Hour (9:30–10:30 PM)	5–6 PM (Unless Otherwise Noted)
Existing	No Event at NFL Stadium or Forum	x	x	x	x	x
Adjusted Baseline	No Project (No Event at NFL Stadium or Forum)	x	x	x	x	x
	Plus Project (Non-Event Day)^d	x	x			
	Plus Project (Day-Time Corporate/Community Event w/ 2,000 persons)	x				
	Plus Project (Other Sporting Event or Gathering w/ 7,500 persons)		x			
	Plus Project Major Event (18,000-person NBA Game starting on a weekday at 7 PM and on a weekend at 6 PM; post-event peak hour is an 18,500-person concert)			x	x	x
	No Project with NFL game (1:25 PM start time with 70,240 persons)					x
	with NFL game (1:25 PM start time with 70,240 persons) Plus Project Major Event (18,500-person concert starting on a weekend at 7 PM)					x (6–7 PM)
	No Project with Midsize Event at NFL Stadium (25,000 persons starting at 7 PM)			x	x	
	with Midsize Event (25,000 persons starting on a weekday at 7 PM) at NFL Stadium Plus Project Major Event (18,000-person NBA Game starting on a weekday at 7 PM; post-event peak hour is an 18,500-person concert)			x	x	
	No Project with Concert at Forum (17,500 persons starting at 7 PM)			x	x	x
	with Concert at Forum (17,500 persons starting at 7 PM) Plus Project Major Event (18,000-person NBA Game starting on a weekday at 7 PM and on a weekend at 6 PM; post-event peak hour is an 18,500-person concert)			x	x	x
	No Project with Midsize Event (25,000 persons starting at 7 PM) at NFL Stadium and with Concert at Forum (17,500 persons starting at 7 PM)			x	x	
	with Midsize Event (25,000 persons starting at 7 PM) at NFL Stadium and with Concert at Forum (17,500 persons starting at 7 PM) Plus Project Major Event (18,000-person NBA Game starting on a weekday at 7 PM; post-event peak hour is an 18,500-person concert)			x	x	
No Project with NFL game (1:25 PM start time with 70,240 persons) and with Concert at Forum (17,500 persons that starts at 7 PM)					x	
with NFL game (1:25 PM start time with 70,240 persons) and with Concert at Forum (17,500 persons that starts at 7 PM) Plus Project Major Event (18,500-person concert starting at 7 PM)					x (6–7 PM)	
Cumulative	Same scenarios as Adjusted Baseline					

NOTES:

- ^a All project special events scenarios also consider trips generated by project ancillary land uses.
- ^b Busiest hour of adjacent street travel from 7–9 AM.
- ^c Busiest hour of adjacent street travel from 4–6 PM.
- ^d Non-event day includes ancillary land uses only (team practice and training facility, team offices, sports medicine clinic, restaurant, retail and community space, outdoor civic plaza, hotel).

SOURCE: Fehr & Peers, 2019.

The degree of overlap of NFL Rams/Chargers and NBA Clippers games was studied for three seasons from 2016/17 through 2018/19. This study was performed in order to determine the frequency with which traffic from these two events would overlap. The analysis also considered when “peak” traffic occurs before or after such events. An NBA Clippers game overlapped with an NFL Rams/Chargers game once per season in 2016 and 2017, twice during the 2018 season. However, those overlapping events occurred at different venues that were not adjacent to one another. The following presents the degree of overlap of NFL Rams/Chargers and NBA Clippers games during the 2016-2018 seasons:

- In 2018/19, the NFL Rams/Chargers played a combined 12 home games on Sundays, one home game on a Saturday, one home game on a Monday, and one home game on a Thursday (one of the Chargers assigned home games was played at a neutral location). Two instances occurred where there were NFL and Clippers games on the same day: October 28th with a Rams game (NFL start time at 1:25 PM and Clippers start time at 6:30 PM), and Saturday, December 22nd Chargers game (NFL start time at 5:20 PM and Clippers start time at 2:00 PM). No other overlaps were identified.
- In 2017/18, the NFL Rams/Chargers played all 16 home games on Sundays. On Sunday, December 31st, both teams played home games starting at 1:25 PM (at different sites) while the Clippers had a home game at 4:00 PM. No other overlaps were identified.
- In 2016/17, the NFL Rams/Chargers played a combined 14 home games on Sundays, one home game on a Saturday, and one home game on a Thursday. The Sunday, December 4th Chargers game (played in San Diego at 1:25 PM) occurred on the same day as a home Clippers game, which started at 6:30 PM. No other overlaps were identified.

Furthermore, on May 16, 2019, NBA Game Schedule Management personnel submitted a letter to the LA Clippers organization regarding the NBA scheduling process. The letter provided an overview of the process NBA franchises can take to identify unavailable home dates (due to commitments for other events) or priority requests for certain dates. The letter states that three NBA franchises (Golden State Warriors, Philadelphia 76ers, and New Orleans Pelicans) currently play their home games in arenas close to NFL stadiums. The letter states that there have been no regular season NBA games scheduled on the same day as an NFL game played in these three markets over the last ten years. The letter concludes by stating that the NBA intends to continue using this scheduling process moving forward.

Based on this information, analysis of an NFL football game and Clippers game occurring on the same day is not warranted. Instead, the following realistic, overlapping scenarios would be analyzed:

- A 25,000-person event on a weeknight with the same start and end times as a major event at the Proposed Project.
- An NFL game that begins at 1:25 PM on a weekend followed by an 18,500-person concert that begins at 7 PM. The peak hour of travel associated with these overlapping events would occur from 6 to 7 PM.

The Forum. In order to determine whether, and to what extent, events at The Forum have the potential to overlap with those at the Proposed Project, the following information was obtained. Between 2016 and 2018, The Forum hosted an average of approximately 75 concerts per year. During peak concert season, there may be as many as 9 to 10 concerts a month. Therefore, a scenario in which both venues are hosting large events is included in Table 3.14-3. As shown, conditions are analyzed for weekday pre-event and post-event conditions with The Forum and Proposed Project hosting large events.

NFL Stadium Plus The Forum. The analysis also considered the extent to which an event at the Proposed Project may overlap with simultaneous events also being held at both the NFL Stadium and The Forum. The analysis serves to determine whether such events should be included as analysis scenarios in the transportation impact analysis. Based on this analysis, it is reasonable to expect that a Proposed Project major event could overlap on the same weekday with a mid-sized, 25,000-person (non-football) event at the NFL Stadium and with a concert hosting 17,500 persons at The Forum. Therefore, this scenario is also included in Table 3.14-3.

Based on review of the scheduling for all three venues during which there would be an NFL Rams/Chargers football game and considering the letter from NBA Game Schedule Management personnel cited previously, it is concluded that such an overlapping event would be extremely rare. However, to ensure that all potential Proposed Project impacts are identified, the following analysis scenarios are included in Table 3.14-3 and analyzed in this section:

- A 25,000-person event at the NFL Stadium, a concert at The Forum, and a major event at the Proposed Project starting and ending at the same times on a weeknight.
- An NFL game begins on a Sunday at 1:25 PM. A concert is held at the Proposed Project and at The Forum that same evening, both starting at 7 PM. Based on this, the peak hour of analysis is 6 to 7 PM. This hour would capture remaining outbound NFL Stadium football trips and inbound concert trips to both venues.

This latter scenario is highly conservative because it would occur very infrequently.

3.14.1 Environmental Setting

This section describes the environmental setting, including the existing condition of the roadway, bicycle, pedestrian, and transit networks.

Roadway Network

The roadway network includes local streets and intersections, plus State and federal highways and freeways.

Study Area

Given the magnitude of vehicle trips that could be generated under various concurrent event scenarios, a substantial study area was chosen. The study area, which is shown in **Figure 3.14-1**, includes 114 total study intersections within an approximate 20-square-mile area. The study area

extends westerly to I-405, southerly to I-105, and easterly to I-110. Its northern limits are generally at Centinela Avenue and Florence Avenue, but with several outlying intersections even further north. The study area includes the corridors connecting to the major freeways that would provide regional access to the Proposed Project and segments along these freeways. This study area was also used to analyze the various concurrent event scenarios set forth in Table 3.14-3.

The study area was scaled down to 43 study intersections for those scenarios that did not involve major events at the Arena Site or concurrent events at the NFL Stadium or The Forum. That is because significantly less traffic would be generated and, therefore, the geographic area in which potential impacts could occur would be smaller. These scenarios consist of ancillary project land uses and weekday daytime events (i.e., Corporate/Community Event with 2,000 persons and Other Sporting Event/Gathering with 7,500 persons) at the arena.

Freeway System

The following freeways would provide access to the Project Site:

- San Diego Freeway (I-405) – The San Diego Freeway runs north/south approximately 1.5 miles west of the Project Site. Access to the Project Site from I-405 is provided by interchanges at La Cienega Boulevard, West Century Boulevard, Manchester Boulevard, and Imperial Highway.
- Glenn Anderson (I-105) – The Glenn Anderson Freeway (also known as the West Century Freeway) runs east/west approximately 1 mile south of the Project Site. Access to the Project Site from I-105 is provided by interchanges at South Prairie Avenue and Crenshaw Boulevard.
- Harbor Freeway (I-110) – The Harbor Freeway runs north/south approximately 4 miles east of the Project Site. Access to the Project Site from the Harbor Freeway is provided by interchanges at West Century Boulevard and Manchester Boulevard.

Surface Street System

Figure 3.14-2 displays the existing roadway network in the study area (including number of travel lanes). The primary roadways that would provide access to the Project Site (and its parking facilities) are described below. Refer to *Technical Memorandum #1 – Supplemental Information Regarding Existing Conditions* in Appendix K.1 for a full list and description of study roadways.

- South Prairie Avenue is designated as a major arterial in the City of Inglewood General Plan that runs north/south along the project frontages. The street provides two travel lanes in each direction north of Manchester Boulevard, and three travel lanes in each direction to the south of Manchester Boulevard. Raised medians are present in some locations between Arbor Vitae Street and West Century Boulevard (but would be removed as part of the South Prairie Avenue Resurfacing Project expected to be completed by 2020). On-street parking is prohibited on both sides of the street in the project vicinity (though on-street parking is permitted on certain segments south of 106th Street). The posted speed limit is 40 miles per hour (mph).
- West Century Boulevard is designated as a major arterial in the City of Inglewood General Plan that runs east/west adjacent to the Project Site, providing three travel lanes in each direction with a center turn lane in the study area. Various segments of the street were under construction (both east and west of South Prairie Avenue) in 2019, which limited capacity to

two lanes in each direction. On-street parking is prohibited on both sides of the street in the project vicinity. The posted speed limit is 40 mph.

- La Brea Avenue is designated as a major arterial in the City of Inglewood General Plan that runs north/south to the west of the Project Site. The street provides two travel lanes in each direction north of Spruce Avenue and three travel lanes in each direction with a raised median south of Spruce Avenue. La Brea Avenue also provides left turn pockets at major intersections. Parking is available on most blocks within the study area for both sides of the street. The posted speed limit is 35 mph. South of West Century Boulevard, La Brea Avenue continues as Hawthorne Boulevard.
- Hawthorne Boulevard is designated as a major arterial in the City of Inglewood General Plan that runs north/south to the west of the Project Site and provides three travel lanes in each direction with a raised median, extending into the City of Hawthorne. Left turn pockets are provided at major intersections. Parallel parking is available on both sides of the street. The posted speed limit is 35 mph.
- Crenshaw Boulevard is designated as a major arterial in the City of Inglewood General Plan that runs north/south east of the Project Site and provides three travel lanes in each direction with left turn pockets at major intersections. Portions of Crenshaw Boulevard have raised medians. On street parking is provided both on frontage streets and on the main arterial. The posted speed limit is 40 mph.
- Manchester Boulevard is designated as a major arterial in the City of Inglewood General Plan. The street runs east/west north of the Project Site and provides two travel lanes in each direction west of South Prairie Avenue and three lanes in each direction east of South Prairie Avenue. There is a raised median on portions of the roadway. Parking is available on either side of the street west of Tamarack Avenue in the study area. The posted speed limit is 40 mph.

Several collector/local streets situated in the immediate project vicinity are also important to local circulation in the area and project access:

- West 101st Street is designated as a local street in the City of Inglewood General Plan that runs east/west through the Project Site from South Prairie Avenue to Hawthorne Boulevard. It consists of one travel lane in each direction, and has fronting residences. Parallel parking is available on both sides of the street.
- West 102nd Street is designated as a local street in the City of Inglewood General Plan that runs east/west through the Project Site from Yukon Avenue to just west of Hawthorne Boulevard. It consists of one travel lane in each direction, and has fronting residences west of South Prairie Avenue. Parallel parking is available on both sides of the street. The posted speed limit is 25 mph.
- West 103rd Street is designated as a local street in the City of Inglewood General Plan that runs east/west through the Project Site from South Prairie Avenue to Hawthorne Boulevard. It consists of one travel lane in each direction, and has fronting residences. Parallel parking is available on both sides of the street.

Figure 3.14-2
Existing Roadway Network

Note: Represents total number of travel lanes in both directions (excluding any medians or turn lanes). Surface streets shown in gray are two-lane facilities.

- West 104th Street is designated as a collector in the City of Inglewood General Plan that runs east/west south of the Project Site and provides one travel lane in each direction. It extends for nearly 5 miles between the I-405 and I-110 freeways. Residences front along the majority of this roadway, which also provides access to Morningside High School (located east of Yukon Avenue) and Dolores Huerta Elementary School (located west of South Prairie Avenue). Parallel parking is available on both sides of the street. The posted speed limit is 25 mph.
- Doty Avenue is designated as a collector in the City of Inglewood General Plan that runs north/south east of the Project Site. It consists of one lane in each direction and has fronting residences along it with a posted speed limit of 30 mph. It extends for about 1.2 miles, terminating just north of I-105. Parallel parking is available on both sides of the street. North of the West Century Boulevard, Doty Avenue becomes an entry/exit to the Hollywood Park Specific Plan area.
- Yukon Avenue is designated as a collector in the City of Inglewood General Plan that runs north/south east of the Project Site. It consists of two lanes in each direction between West Century Boulevard and West 102nd Street, one lane southbound and two lanes northbound between West 102nd Street and West 104th Street, and one lane in each direction south of West 104th Street and has a variety of adjacent land uses ranging from street-facing residential, a high school, and big box retail. It has a posted speed limit is 30 mph. It extends for about 1.4 miles, terminating just north of I-105. Parallel parking is available on portions, but not all of the street. North of the West Century Boulevard, Yukon Avenue becomes an entry/exit to the Hollywood Park Specific Plan area.

Data Collection

Existing peak hour turning movement counts, bicycle counts, and pedestrian counts were collected at the majority of study intersections in April and May of 2018 during five peak periods. Additional counts were obtained in November 2018 due to an expanded list of study intersections.

- Weekday AM peak period (7–9 AM)
- Weekday PM peak period (4–6 PM)
- Weekday pre-event peak hour (6–7 PM)
- Weekday post-event hour (9:30–10:30 PM)
- Weekend pre-event hour (5–6 PM)

Weekday AM and PM counts were conducted on a Thursday, weekday pre- and post-event counts were conducted on a Friday, and weekend pre-event counts were conducted on a Saturday. Before intersection counts were taken, spot counts between weekdays (Thursday and Friday) and weekend days (Saturday and Sunday) were collected. These spot counts were collected so that the appropriate days and hours could be selected for complete counts. The spot counts showed that the Friday pre-event and post-event volumes were busier than Thursday and that the Saturday volumes were busier than Sunday. Hence, use of Friday counts to represent the weekday pre-event and post-event study periods and use of Saturday counts from 5 to 6 PM to represent the weekend pre-event study period are considered conservative.

All existing conditions traffic counts were performed on days in which an event was not being held at The Forum. Counts were conducted when adjacent schools were in session, and during dry weather conditions. Thus, the counts were timed to capture normal, background traffic levels, during periods when traffic would not be artificially low due to school closures, weather conditions, or the like. The counts are therefore considered representative of existing traffic conditions during typical “peak” hours.

Intersection Operations

Study intersections are located within the Cities of Inglewood, Los Angeles, and Hawthorne, as well as within unincorporated Los Angeles County. Additionally, some intersections are located within Caltrans right-of-way. This study applies the intersection analysis methods preferred by each jurisdiction for intersections within that jurisdiction. As is noted later, several intersections are located on the boundary between two agencies. In those instances, multiple analysis methods were used with all sets of results reported. **Table 3.14-4** displays the intersection analysis methods selected for each jurisdiction.

**TABLE 3.14-4
 INTERSECTION ANALYSIS METHODS**

Jurisdiction	Peak Hour of Study	Analysis Method
City of Inglewood ^a	Weekday AM and PM Peak Hours	Intersection Capacity Utilization (ICU) method
	Weekday Pre-Event and Post-Event Peak Hours	Microsimulation using HCM methods ^b
	Weekend Pre-Event Peak Hour	
Los Angeles County and City of Hawthorne	All study periods	ICU method
City of Los Angeles	All study periods	Critical Movement Analysis (CMA) method
Caltrans	All study periods	HCM methods using Synchro software

NOTES:

^a The Florence Avenue/Centinel Avenue intersection was analyzed using HCM methods for all adjusted baseline and cumulative scenarios due to a new at-grade light rail crossing that would be pass through the intersection under these scenarios.

^b For intersections located outside of the limits of the microsimulation model area, analyses were performed using ICU method.

SOURCE: Fehr & Peers, 2019.

ICU/CMA Analysis Methodology

The Intersection Capacity Utilization (ICU) and Critical Movement Analysis (CMA) methods are deterministic models that evaluate the critical movements at signalized intersection and then calculate the total ‘per lane’ critical movement volume, which is compared to the intersection capacity to yield a volume-to-capacity (V/C) ratio. The level of service (LOS) is then determined based on the V/C ratio ranges shown in **Table 3.14-5**. LOS categories range from nearly free-flow traffic at LOS A to overloaded, stop-and-go conditions at LOS F. The ICU and CMA methods differ in certain ways, and so results are typically similar, but not necessarily identical.

TABLE 3.14-5
INTERSECTION LEVEL OF SERVICE DEFINITIONS USING ICU/CMA METHODS

Level of Service	Volume/Capacity (V/C) Ratio
A	< 0.60 V/C
B	0.60–0.70 V/C
C	0.701–0.80 V/C
D	0.801–0.90 V/C
E	0.901–1.00 V/C
F	> 1.00 V/C

NOTES:
 Applies only to signalized intersections.
 SOURCE: Fehr & Peers, 2019.

HCM Analysis Methodology

The latest edition of the *Highway Capacity Manual (HCM)*, 6th Edition² provides guidance for analyzing both signalized and unsignalized intersections. Because CMA/ICU methods can only analyze signalized intersections, all unsignalized (stop-control) intersections are analyzed using HCM methods.

The HCM methods calculate average vehicle delay for vehicles traveling through the intersection. Refer to **Table 3.14-6** for the delay range associated with each LOS category for signalized and unsignalized intersections. For signalized intersections and at all-way stop intersections, the reported delay is the weighted average of all vehicles passing through the intersection. At side-street stop-control intersections, the reported delay is the delay at the worst approach.

TABLE 3.14-6
INTERSECTION LEVEL OF SERVICE DEFINITIONS USING HCM METHODS

Level of Service	Signalized Intersections	Unsignalized Intersections
A	0–10.0 secs/veh	0–10.0 secs/veh
B	10.1–20.0 secs/veh	10.1–15.0 secs/veh
C	20.1–35.0 secs/veh	15.1–25.0 secs/veh
D	35.1–55.0 secs/veh	25.1–35.0 secs/veh
E	55.1–80.0 secs/veh	35.1–50.0 secs/veh
F	> 80.0 secs/veh	> 50.0 secs/veh

NOTES:
 Control delay includes initial deceleration delay, queue move-up time, stopped delay, and acceleration delay.
 SOURCE: Transportation Research Board, 6th Edition, 2016.

For signalized intersections, the intersection location and study period determines whether microsimulation (outlined in Chapter 7 of the *HCM 6th Edition*) or the deterministic analysis method (outlined in Chapter 19 of the *HCM 6th Edition*) are used. The deterministic analysis

² Transportation Research Board, 2016. *Highway Capacity Manual (HCM)*, 6th Edition: A Guide for Multimodal Mobility Analysis. Washington, D.C.

method (conducted using the Synchro software program) is used at all Caltrans ramp terminal intersections per their standard practice. Microsimulation (conducted using the SimTraffic software program) is used for the pre-event and post-event peak hours along the West Century Boulevard and South Prairie Avenue study corridors (with 65 total intersections included within the model during the existing scenario, and 66 intersections during the adjusted baseline and cumulative scenarios, due to the signalization of Buckthorn Street/South Prairie Avenue with the buildout of Hollywood Park). As is described in the following paragraph, microsimulation is particularly appropriate for these peak hours and for this portion of the study area. The geographic scope of the model was determined based on access to the Project Site and regional access using the I-105 and I-405 freeways. The remaining signalized intersections located outside of the SimTraffic model extents were analyzed using the deterministic CMA/ICU methodology or HCM (deterministic method) methods at Caltrans ramp terminal intersections.

Microsimulation models can study the effects of coordinated signal timing plans, closely spaced intersections, queue spillbacks, lane blockages, and other considerations. They also account for the effects of queue spillbacks on upstream intersection operations. Because these types of conditions may be present along portions of study corridors during the pre-event and post-event conditions with a major event at the Proposed Project, those facilities are studied using microsimulation. Inputs into SimTraffic included the volume of traffic traveling through the intersection, the lane geometries, the signal phasing, and pedestrian volumes and interactions at the street crosswalks. Per standard practice, reported results are based on an average of 10 runs.

Refer to *Technical Memorandum #1 – Supplemental Information Regarding Existing Conditions* (in Appendix K.1) for a more detailed description of these intersection analysis methods. That memorandum also includes an extensive description of the microsimulation model validation process (performed so that the existing conditions model is calibrated to closely match observed conditions, both in terms of recurring vehicle queuing, average travel time, and number of vehicles served per hour).

Appendix K.2 reports the traffic volumes at all study intersections for weekday AM and PM peak hour conditions, as well as for existing weekday pre-event and post-event peak hour traffic conditions.

Table 3.14-7 displays the LOS and average delay or V/C ratio at the 43 intersections selected for analysis under weekday AM and PM peak hour conditions (see Appendix K.3 for technical calculations). As shown in the table, five of the 43 study intersections are currently operating at poor levels of service (i.e., LOS E or F) during at least one of the analyzed peak hours:

- 14. South Prairie Avenue/Manchester Boulevard
- 19. South Prairie Avenue/Kelso Street/Pincay Drive
- 34. La Cienega Boulevard/West Century Boulevard
- 37. Inglewood Boulevard/West Century Boulevard
- 78. South Prairie Avenue/Imperial Highway

NOTES:

- ^a Analysis methods vary by jurisdiction (refer to previous pages for description).
- ^b Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods.
- ^c N/A = Not Applicable because South Prairie Avenue/Buckthorn Street intersection is currently unsignalized (and not analyzed for existing conditions), but included in the adjusted baseline and cumulative scenarios as a signalized intersection because signalization is expected as part of the Hollywood Park Specific Plan and would be constructed prior to the Proposed Project opening.

SOURCE: Fehr & Peers, 2019.

During the weekday post-event peak hour, all study intersections operate at LOS D or better.
During the weekend pre-event peak hour, the following intersection operates at LOS E:

108. La Cienega Boulevard/Centinel Avenue

All other study intersections operate at LOS D or better.

It is important to note that some of the intersections listed above as operating at LOS E or F on a weekday from 6–7 PM (i.e., pre-event peak hour) are reported in Table 3.14-7 as operating at

LOS D or better during the weekday PM peak hour, which occurs between 4 and 6 PM. This stems from the use of agency-preferred ICU/CMA analysis methods for the weekday PM peak hour, but use of HCM (and in particular microsimulation) during the pre-event peak hour. The two methods (ICU/CMA vs. HCM) are fundamentally different (e.g., ICU/CMA reports LOS on an hourly basis whereas HCM reports LOS for the peak 15 minutes); differences in how LOS is reported are to be expected.

Freeways

Mainline freeway segment analyses were conducted for the locations where the project is expected to add the most substantial traffic volumes. The selection of study locations includes what was requested by Caltrans in its comment letter on the NOP, as well as other locations. The six two-way segments listed below are located within 1 to 4 miles of the Project Site and would be used to a greater degree by project trips than other freeways.

- I-405: Between La Tijera Boulevard and I-105
- I-105: Between Vermont Avenue and I-405
- I-110: Between 76th Street and I-105

Freeway systems are comprised of several distinct parts or components. A freeway on-ramp is known as a merge movement, while a freeway off-ramp is known as a diverge movement. Where an on-ramp is connected to a successive off-ramp by an auxiliary (weave) lane, the entire segment of freeway between the two ramps is known as a weaving section. A stretch of freeway with no on- or off-ramps and no weaving lanes is known as a mainline basic section. Some of the study freeways have more complicated geometric designs due to the presence of collector-distributor roads, from which on/off ramps movements are accommodated (versus occurring directly from the freeway). In summary, the components of a freeway system consist of: ramp merges, ramp diverges, weave sections, and basic mainline sections. In total, the freeway study area consists of 53 such components.

Freeway mainline volume and speed data was obtained from Caltrans' Performance Measurement System (PeMS) archived traffic data for April 2018 for the AM (7–9 AM) and PM (4–6 PM) peak periods for Tuesdays, Wednesdays, and Thursdays, for the weekday pre-event hour (Fridays 5–7 PM), weekday post-event hour (Fridays 9–11 PM) and weekend pre-event hour (Saturdays 5–6 PM). For freeway study locations that did not have quality PeMS data available or PeMS monitoring locations, the Southern California Association of Governments (SCAG) travel demand model was used to identify segment volumes. The model data was normalized with available PeMS data for consistency. Existing counts were used at ramp locations that were analyzed in this study.

The freeway level of service methodology described in the *HCM 6th Edition* (2016) was used to determine the vehicle density on each analyzed segment (passenger cars equivalents per mile per lane per hour) by direction and the corresponding LOS. However, in some instances, the calculated LOS did not match field-observed conditions due to the effect of downstream

bottlenecks causing congestion/slowing in upstream segments. In these instances, average peak hour travel speeds on these segments were collected from PeMS to determine whether speeds were 35 mph or less, which is a definition of recurrent congestion in the HCM. Where such conditions were found to exist, the HCM-derived result was replaced by a LOS F condition.

Table 3.14-9 shows the existing LOS on freeway mainline segments (see Appendix K.3 for technical calculations). As shown, many of the study freeway facilities experience considerable congestion and directional LOS E or F operations during weekday AM and PM peak hours. Congested conditions on certain segments extend to the weekday pre-event and post-event peak hours, and also occur on weekend pre-event peak hour conditions.

NOTES:

- ^a Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions.
- ^b LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM resulted would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

Table 3.14-10 shows the existing weekday AM and PM peak hour 95th percentile vehicle queues at freeway off-ramps anticipated to be used to a significant degree by project trips. By definition,

the 95th percentile queue represents a queue length value for which the actual queue would have a 5 percent or less probability of exceeding. It is a statistical measure commonly used in the transportation engineering industry. Refer to footnotes in the table for methods applied in the analysis. As shown, the 95th percentile vehicle queues at each off-ramp during each peak hour do not exceed their available storage.

**TABLE 3.14-10
 FREEWAY OFF-RAMP QUEUING ANALYSIS – EXISTING WEEKDAY AM AND PM PEAK HOURS CONDITIONS**

Off-Ramp ^a	Ramp Capacity Threshold ^b	95th Percentile Queue (ft.) ^c		Queue Exceeds Available Storage ^d	
		AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
I-405 SB Off-Ramp at La Cienega Blvd (north of West Century Boulevard)	3,085	436	858	No	No
I-405 NB Off-Ramp at West Century Boulevard	3,600	1,862	965	No	No
I-405 SB Off-Ramp at La Cienega Blvd (south of West Century Boulevard)	1,265	54	236	No	No
I-105 EB/WB Off-Ramp at South Prairie Avenue	8,720	589	1,566	No	No

NOTES:

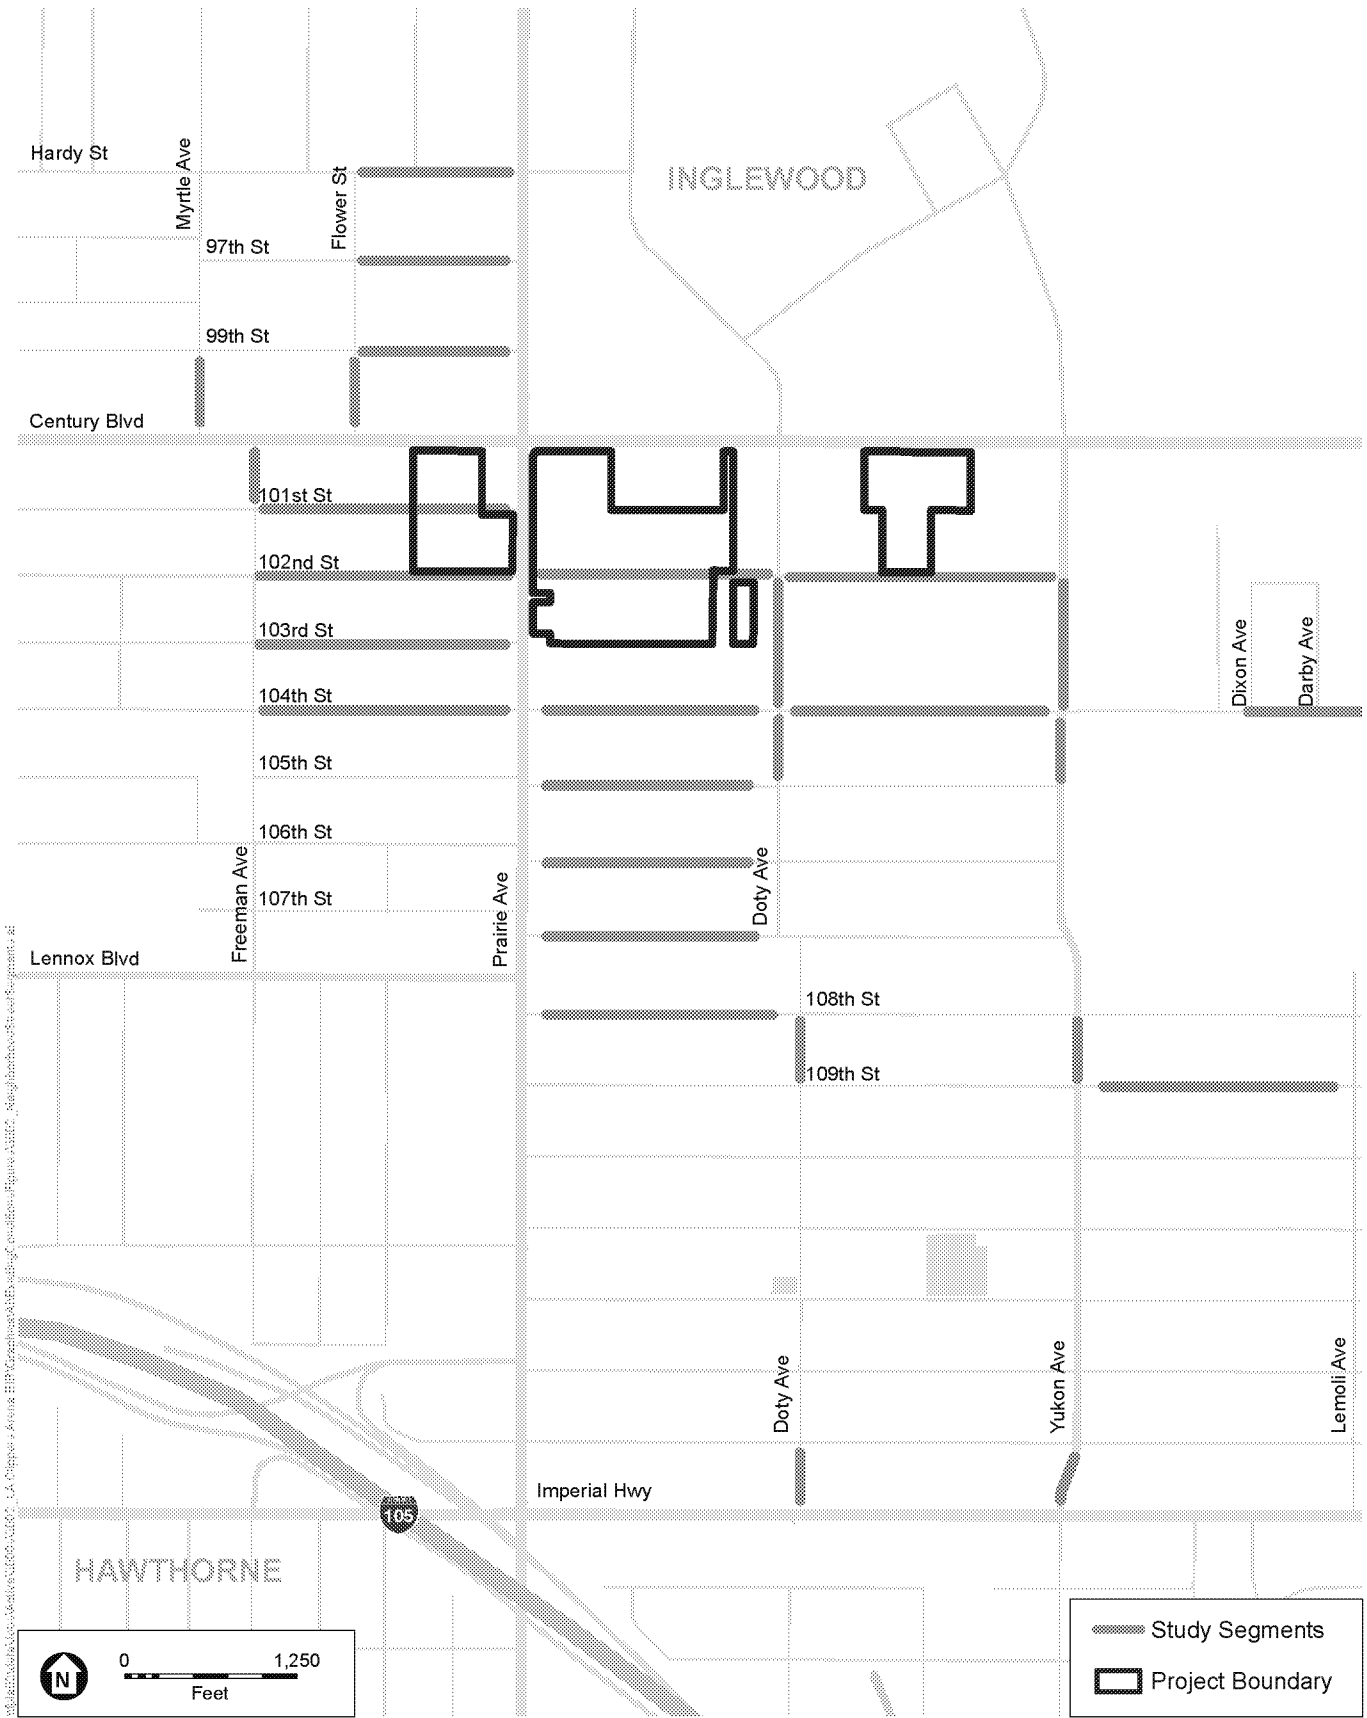

- ^a Auxiliary lanes are present at each of these off-ramps.
- ^b Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.
- ^c 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue would be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.
- ^d If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Table 3.14-11 shows the existing weekday and weekend pre-event peak hour 95th percentile vehicle queues at freeway off-ramps anticipated to be used to a significant degree during major events. This table indicates that a larger set of freeway off-ramps is being studied for major events (versus weekday AM and PM peak hour scenarios) due to the greater number of vehicle trips expected to be generated by such events. Vehicle queuing is not analyzed for weekday post-event conditions because major events would add very little traffic to off-ramps during such periods. As shown, the 95th percentile vehicle queues at each off-ramp during each peak hour do not exceed their available storage.

Neighborhood Streets

The City of Inglewood collected weekday and weekend 24-hour counts on 28 neighborhood street segments near the Project Site. These neighborhood street segments were selected given their proximity to the Project Site and potential for use by Proposed Project trips. The Average Daily Traffic (ADT) volumes reported for these streets are an indication of the degree of neighborhood traffic intrusion that exists or could occur, but do not correspond to a given level of service or street performance measure. The neighborhood street segments are shown on **Figure 3.14-3**. **Table 3.14-12** displays these counts.

Transit Network

Transit service in the immediate project vicinity consists primarily of fixed-route bus service operated by Metro. Additionally, the Metro Green Line light rail service operates in a generally east-west direction between the Cities of Redondo Beach and Norwalk. The Hawthorne/Lennox Station is the closest station (1.3 miles) to the Arena Site.

Fixed-Route Bus Service

Metro operates the following bus routes that stop at the South Prairie Avenue/West Century Boulevard intersection (see **Figure 3.14-4**):

- Metro Line 117 – is an east/west line that runs along West Century Boulevard between the LAX City Bus Center and Lakewood Boulevard Green Line Rail Station in Downey. The line has approximately 15-20 minute headways (i.e., time between successive buses) on weekdays between 6 AM and 6:30 PM. Bus stops (including shelters) are located in both directions of West Century Boulevard directly east of South Prairie Avenue and directly west of Doty Avenue.
- Metro Line 211– is a north/south line that runs along South Prairie Avenue from the Redondo Beach Green Line Rail Station to downtown Inglewood. The line has 30- to 40-minute headways during the AM peak period, 30- to 35-minute headways during the PM peak period and no midday or weekend service. Bus stops (including shelters) are located in both directions of South Prairie Avenue directly south of West Century Boulevard. The last evening run occurs at 7 PM.
- Metro Line 212/312 – is a north/south line that runs between Hollywood & Vine and the Hawthorne/Lennox Station. The line has 10- to 15-minute headways during the AM peak period, 25- to 30-minute headways during the PM peak period and 25- to 30-minute headways during the evening on weekends. Within the project vicinity, the line operates on South Prairie Avenue and stops directly south of West Century Boulevard. The last evening run occurs at approximately 1 AM.
- The Link Lennox – Lennox Shuttle/Microbus travels a loop route that starts and ends at Lennox/Firmona Station. Lennox Microbus runs primarily along Hawthorne Boulevard, Yukon Avenue, West Century Boulevard and West 104th Street within the study area. The line has 30-minute headways during the AM peak period, 30-minute headways during the PM peak period and 30-minute headways during evening on Saturday. No service is available on Sunday and holidays. The route includes stops on West Century Boulevard at Yukon Avenue, Doty Avenue, and South Prairie Avenue.

A number of other Metro bus routes operate on north-south and east-west parallel arterials to South Prairie Avenue and West Century Boulevard. Refer to *Technical Memorandum #1 – Supplemental Information Regarding Existing Conditions* (in Appendix K.1) for a list and description of those lines. The bus routes along Hawthorne Boulevard (40, 442, and 740) would require a 0.5-mile walk. Lines operating along Crenshaw Boulevard and Manchester Boulevard would require a 1-mile walk.

Metro provided ridership data for Lines 117, 211, and 212, which represent averages for April 2018. Both rail and bus ridership are reflective of the service levels in effect in the first half of 2018. Metro typically makes minor adjustments (“shake ups”) to their bus service in July and December, so the ridership is reflective of the December 2017 “shake up”. Bus data for weekdays includes average daily boardings (i.e., “ons”), alightings (i.e., “offs”), and counted passenger load per bus run approaching each stop.

SOURCE: Fehr and Peers, 2019

Inglewood Basketball and Entertainment Center

Figure 3.14-4
Existing Transit Services and Facilities

* Only bus stops adjacent to the project site are shown

The peak hour for ridership and bus load is 5–6 PM on a weekday for Lines 117, 211 and 212. Line 117 stops at West Century/South Prairie and averages 373 weekday boardings and alightings and 259 weekend boardings and alightings. The peak hour bi-directional boardings and alightings is 128 with an average bus load of 24 passengers per trip in the eastbound direction. The average weekday boardings and alightings for Line 211 and Line 212 are 43 and 299, respectively. The peak hour bi-directional boarding and alightings is 18 for Line 211 and 79 for Line 212, and an average bus load of 5 passengers for 211 and 14 passengers for 212 in the northbound direction.

Technical Memorandum #1 – Supplemental Information Regarding Existing Conditions (in Appendix K.1) provides tabulated ridership information for these lines as well as estimates for their capacity, and their resultant reserve capacity (to accommodate more riders). In summary, peak hour ridership levels on each of these routes represents less than 50 percent of the directional capacity of each line. Therefore, these routes have reserve capacity to accommodate more riders.

Light-Rail Service

The Metro Green Line light rail line operates in a generally east-west direction between the Cities of Redondo Beach and Norwalk. The Hawthorne/Lennox Station is the closest station (1.3 miles) to the Arena Site. The Green Line Crenshaw Station is 2.3 miles from the Arena Site. Transit riders may transfer from the Green Line to the Blue Line at the Willowbrook/Rosa Parks Station, which is five stops away from the Hawthorne/Lennox Station. The Blue Line extends southerly to the City of Long Beach and northerly into Downtown Los Angeles.

The Metro Green Line operates on weekdays, Saturdays, Sundays, and holidays from approximately 4 AM until midnight. On weekdays, the line has 5- to 10-minute headways in the AM and PM (up until 7:30 PM) peak periods. On weekday late evenings (i.e., from 9 PM to midnight), it operates on 20-minute headways. On weekends, it operates on 15-minute headways most of the day, and 20-minute headways after 8:30 PM.

Metro provided rail ridership for fiscal year 2018 (July 2017 to June 2018), which includes average hourly rail ridership for the Green Line. The data includes average station boardings, alightings, and average train car passenger load. The Hawthorne/Lennox station averages 6,450 weekday combined boardings and alightings, while boardings and alightings decrease to 3,370 on Saturday and 2,700 on Sunday. The peak hour for ridership and train load at the Hawthorne/Lennox station is 5–6 PM on a weekday, with 660 bi-directional boardings and alightings, and an average train load of 138 passengers eastbound and 13 passengers westbound. In the busier eastbound direction, this transit load corresponds to 58 percent of the total capacity (including both seated and standing) of the line currently being utilized. Refer to *Technical Memorandum #1 – Supplemental Information Regarding Existing Conditions* (in Appendix K.1) for more detailed ridership and capacity data for the Green Line.

The Crenshaw/LAX Line is currently under construction. When completed, it will connect with the Aviation/LAX station on the Green Line and the Expo/Crenshaw Station on the Expo Line. It

will feature a new station in Downtown Inglewood, approximately 2 miles from the Project Site. This new light rail extension represents an important piece of connectivity to rail transit in the region, providing quicker and more direct access into Downtown Los Angeles and cities/communities to the west such as Santa Monica and Culver City. This light rail project is scheduled to be open and operational in mid-2020, four years prior to the opening of the proposed arena.

Pedestrian Network

The Project Site is served by a robust pedestrian network. All of the streets immediately bordering the Project Site and most streets in the study area include sidewalks, facilitating pedestrian movement. Most sidewalks in the study area are in good condition. Marked crosswalks are present at most intersections in the study area. Pedestrian walk phases at signalized intersections are either automatically provided at the intersections or are actuated by pedestrian push-buttons. Below is a description of the pedestrian facilities on streets near the Project Site.

Figure 3.14-5 displays the pedestrian network near the project site.

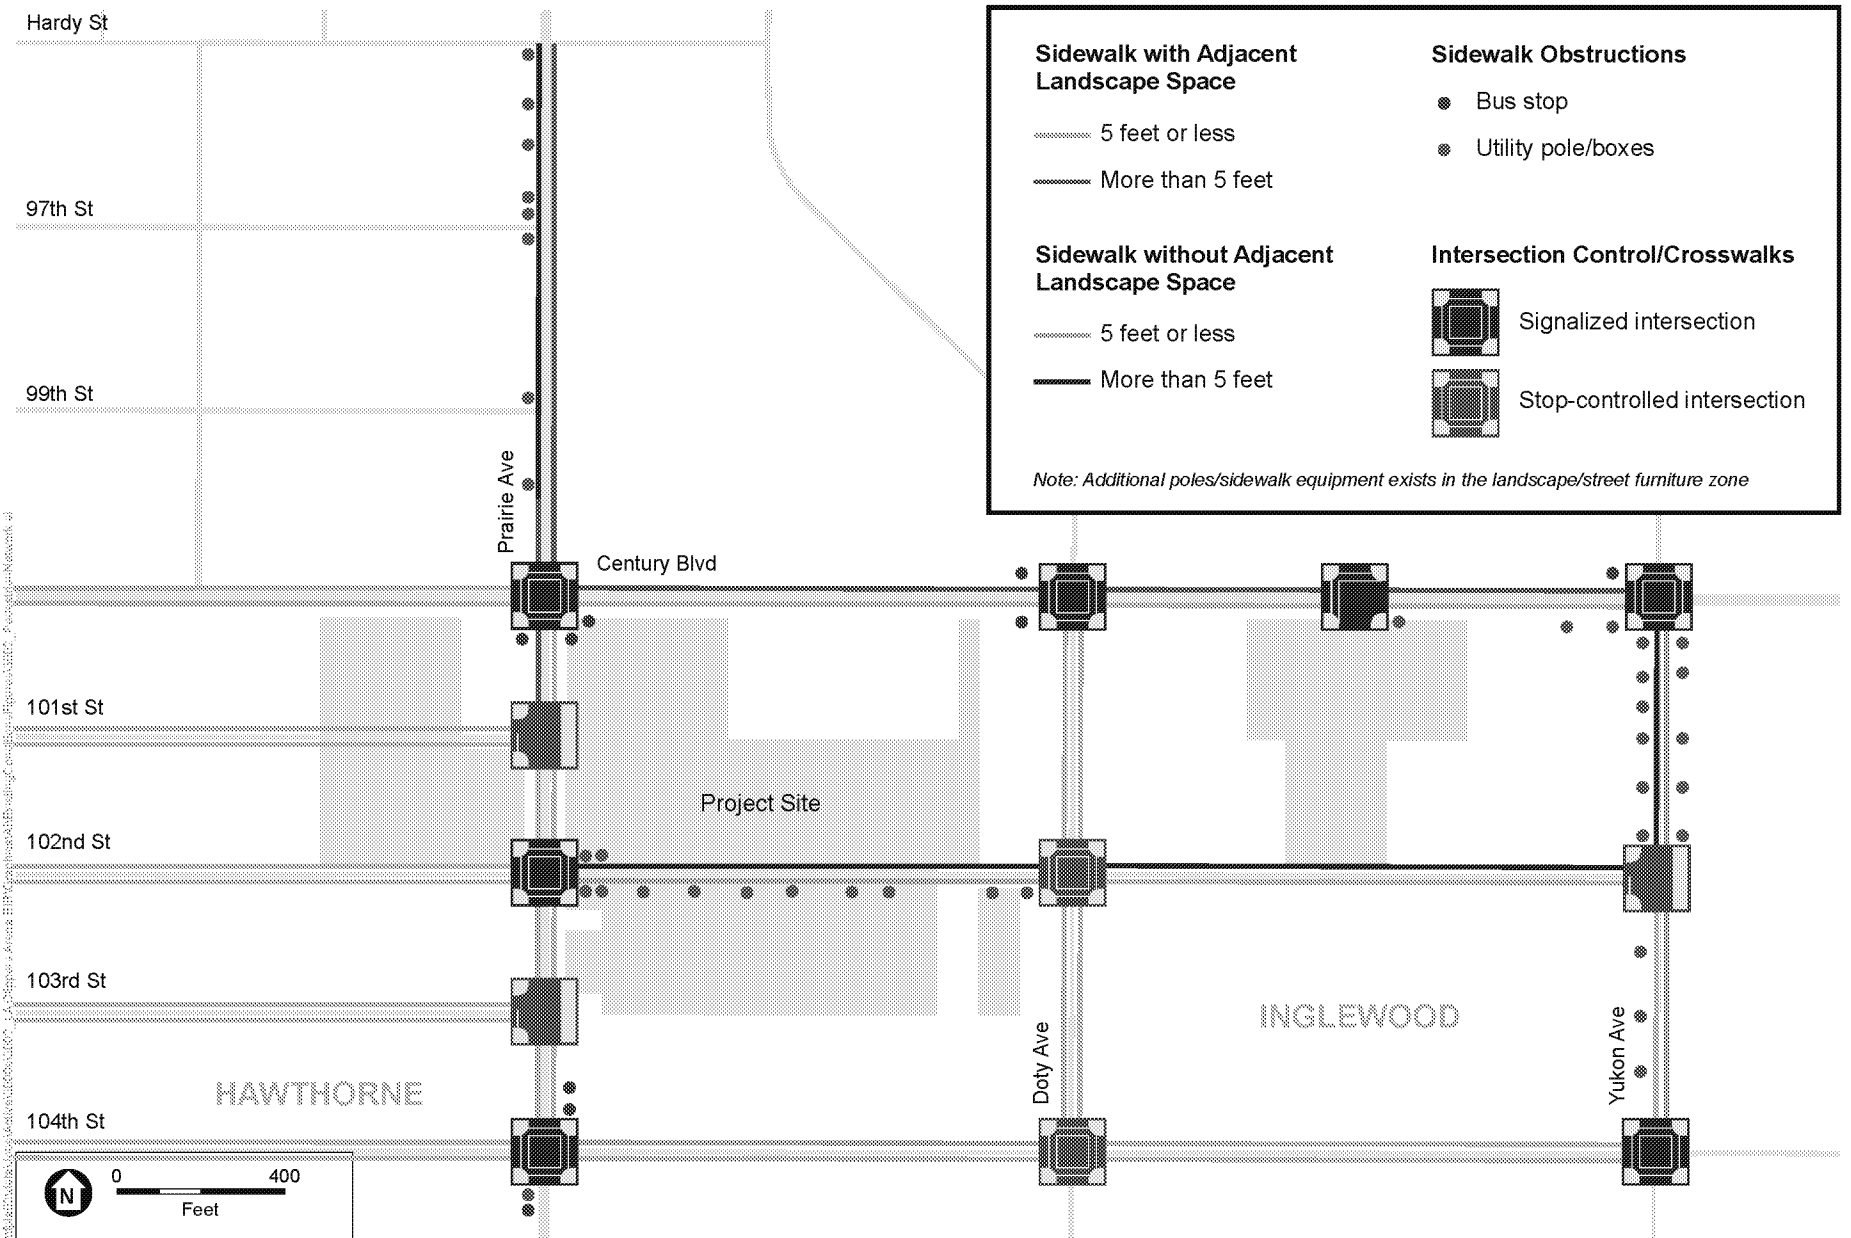

- South Prairie Avenue – In the vicinity of the project, the street has continuous sidewalks with widths varying from about 5 to 13 feet. Sidewalks immediately adjacent to the Project Site are less than 5 feet, and adjacent to an 8-foot landscaped area that also contains signage and utilities. Striped crosswalks are provided at signalized intersections, and most curb ramps do not have truncated domes.
- West Century Boulevard – Continuous sidewalks are provided on West Century Boulevard, although widths vary between 5 and 11 feet in the vicinity of the Project Site. Sidewalks immediately adjacent to the Project Site are 5 feet or less, with an 8-foot landscaped area that also contains signage and utilities.
- West 101st Street – The street features five-foot sidewalks on each side of the street adjacent to an eight foot landscaped area that also contains signage and utilities.
- West 102nd Street – Sidewalks on West 102nd Street near the Project Site range from 5 to 7 feet. Signage and utilities obstruct the pedestrian path of travel in several locations.

Bicycle Network

There is limited dedicated bicycle infrastructure within the study area. Class II bike lanes (on-street lanes with appropriate striping and signage) exist in parts of Downtown Inglewood, and on Hawthorne Boulevard between of West 104th Street and 111th Street. Florence Avenue has Class II and Class III (bike routes) on portions of the street within the study area. Bicycle lanes do not exist on portions of either West Century Boulevard or South Prairie Avenue in the vicinity of the Proposed Project.

Other Travel Modes

In addition to the modes of travel listed above, the study area is served by taxis and transportation network companies (TNCs) such as Uber and Lyft. These services provide point-to-point travel within and outside of the study area. Paratransit, a form of on-demand transportation, is also available. These modes of travel are evaluated under ‘plus project’ conditions.

SOURCE: Fehr and Peers, 2019

Inglewood Basketball and Entertainment Center

Figure 3.14-5
Existing Pedestrian Facilities

On-Street Parking

This section describes current signage and programs in effect to regulate on-street parking in the project vicinity. The following describes on-street parking restrictions on key roadways in the project vicinity based on field reviews of current signage:

- On-street parking is prohibited on West Century Boulevard.
- On-street parking is prohibited on South Prairie Avenue.
- On-street parking is permitted on the west sides of Yukon Avenue and Doty Avenue with no time restrictions, with the exception of on Thursdays (Doty Avenue) and Fridays (Yukon Avenue) from 8 AM to 3 PM for street sweeping and trash collection. Parking is prohibited on the east side of each street.
- On-street parking on West 101st Street west of South Prairie Avenue (along portions with fronting residences) is prohibited every day from noon to 6 PM unless the vehicle has an appropriate permit. Parking is also prohibited on Thursdays (south side) and Fridays (north side) from 8 AM to 3 PM for street sweeping and trash collection.
- On-street parking is permitted on West 102nd Street between South Prairie Avenue and Freeman Avenue with no time restrictions, with the exception of on Thursdays (north side) and Fridays (south side) from 8 AM to 3 PM for street sweeping and trash collection. Between South Prairie Avenue and Yukon Avenue, parking is permitted on the south side of the street with the exception of Thursdays from 8 AM to 3 PM. The north side of the street prohibits on-street parking at all times with the exception of when parking on the south side of prohibited.
- On-street parking is permitted on West 103rd Street west of South Prairie Avenue with no time restrictions, with the exception of on Thursdays (north side) and Fridays (south side) from 8 AM to 3 PM for street sweeping and trash collection.

In summary, on-street parking is permitted on the majority of the residential and collector streets in the project vicinity. Depending on the size and timing of events at the Proposed Project, it is conceivable that some patrons may choose to park along these streets. The demand for this parking would be greatest during a major event, which would typically begin at 7 PM. By that time, much of the on-street parking in the area, which is utilized by residents, would be occupied. Therefore, a limited supply of available on-street parking spaces would be available on these streets to accommodate major events at the Proposed Project.

Parking is not considered a direct environmental impact under CEQA. In other words, providing (or not providing) a certain amount of parking does not directly translate into an impact. However, the indirect effects of providing a given supply of parking could indirectly cause potentially significant impacts, such as vehicles circulating to look for parking, conflicts with other modes of travel, etc. This section examines parking from the perspective of being a potentially significant secondary effect.

3.14.2 Adjusted Baseline Environmental Setting

As discussed in Section 3.0, Introduction to the Analysis, the Proposed Project is not anticipated to be constructed and begin operations until mid-2024 for the 2024-25 NBA basketball season.

Adjusted Baseline Land Use Assumptions

As discussed in Section 3.0, Introduction to the Analysis, the City has issued building permits for, and construction has commenced on, significant portions of the HPSP, including the construction of the 70,240-seat NFL Stadium, a 6,000-seat performance venue, 518,077 square feet of retail and restaurant uses, 466,000 square feet of office space, 314 residential units, and approximately 9,000 parking spaces for the stadium. Due to the certainty of these projects being constructed and in operation prior to opening of the Proposed Project, the City of Inglewood determined that it is appropriate to include these projects in an adjusted environmental setting for the Proposed Project. In addition, a number of mitigation measures or other improvements associated with this development (and located within the City of Inglewood) will be in place prior to the opening of the Proposed Project.

The Adjusted Baseline No Project scenario was developed by first estimating the number of external vehicle trips that would be generated by the retail, restaurant, office space, and residential units based on trip generation rates published in the *Trip Generation Manual*³ and with reasonable and supported estimates of internalization of trips and pass-by trips to the retail and restaurant uses. As shown in Appendix K.2, these uses are estimated to generate 2,041 new weekday AM peak hour trips, and 2,881 new weekday PM peak hour trips. These trips were assigned to the study intersections based on the projected distribution of trips from the SCAG travel demand model. Access to these uses would be provided via a signalized entrance on West Century Boulevard at Doty Avenue, and multiple access points along South Prairie Avenue. Trips from these uses were then added to existing volumes to yield the Adjusted Baseline No Project scenario. Section 3.14.4 presents the analysis of the Proposed Project (under a variety of time periods and overlapping scenarios) under the adjusted baseline condition.

Adjusted Baseline Transportation System Assumptions

Adjusted Baseline Transit Assumptions

The adjusted baseline conditions transit network would differ considerably from existing conditions due to completion of the Metro Crenshaw/LAX light rail line, which is currently under construction and scheduled to commence operations in mid-2020. With this completion and the potential for a future Green Line South Bay extension, Metro is evaluating multiple operating scenarios, which would affect the routing of the trains, number of train cars, and potential peak and off-peak headways. The Metro board has currently approved Alternative C-3 for a two-year pilot program as opposed to the staff recommended Alternative C-1.⁴ Therefore, ridership forecasts for Alternative C-3 for a 2025 condition were used to represent the Adjusted Baseline

³ Institute of Transportation Engineers, 2017. *Trip Generation Manual, 10th Edition*.

⁴ <https://boardagendas.metro.net/board-report/2018-0710/>.

condition. Alternative C-1 consists of an interline train between existing Norwalk Station (Green Line) and Expo/Crenshaw station, and a short line train between Redondo Beach Station (Green Line) and West Century/Aviation Station. Alternative C-3 recommends an interline train between existing Norwalk Station (Green Line) and Expo/Crenshaw, and a short line train between Willowbrook/Rosa Parks Station and Redondo Beach Station (Green Line).

Metro is also studying changes to its bus system through the NextGen Bus study. Through this study, Metro could implement changes to bus transit in the study area, such as modifying bus connections to better serve the Crenshaw/LAX transit corridor. Additionally, the City of Inglewood has been in discussions with municipal transit operators such as G Transit and Torrance Transit about the possibility of additional service linking Inglewood with other communities in the South Bay. These changes are not yet defined and so would be speculative to assume that these changes would be implemented as of 2025. Therefore, the adjusted baseline conditions analysis assumes the existing bus routes that serve the Project Site would remain in operation at opening year of the Proposed Project.

The transit system is analyzed in detail in Section 3.14.4 including bus and light rail capacity and expected ridership levels.

Adjusted Baseline Roadway Assumptions

The physical improvements listed in **Table 3.14-13**, which are mitigations and/or conditions of approval of the Hollywood Park Specific Plan, are related to the City’s ongoing West Century Boulevard Improvement Plan, or are associated with the Crenshaw/LAX light rail line project. These improvements either are under construction, or are approved and funded and scheduled; the improvements would be in place under all adjusted baseline condition scenarios.

**TABLE 3.14-13
 BACKGROUND ROADWAY NETWORK IMPROVEMENTS – ADJUSTED BASELINE CONDITIONS**

#	Intersection	Description
3	Hillcrest Blvd/ Florence Ave	Eastbound approach: through lane added, resulting in 3 through lanes and 1 right-turn lane
4	Centinela Ave/ Florence Ave	Eastbound approach: through and left-turn lanes added, resulting in 3 through lanes and 2 left-turn lanes Westbound approach: through lane added, resulting in 3 through lanes and 2 right-turn lanes Southbound approach: shared left/right lane added, resulting in 2 left-turn lanes, one right/left-turn lane, one right-turn lane
5	South Prairie Ave/Florence Ave	Eastbound approach: through lane added, resulting in 3 through lanes and 1 right-turn lane Westbound approach: through lane added, resulting in 3 through lanes and 1 left-turn lane
19	South Prairie Ave/Kelso Street/ Pincay Drive	Northbound approach: right-turn lane added, resulting in 1 left-turn lane, 3 through lanes, 1 right-turn lane
20	Kareem Court/ Pincay Drive	Eastbound approach: ongoing construction-related lane closures eliminated, resulting in 2 through lanes and 1 left-turn lane Westbound approach: ongoing construction-related lane closures eliminated, resulting in 2 through lanes Southbound approach: lanes reassigned, resulting in 1 right-turn lane and 2 left-turn lanes Northbound approach: removed

**TABLE 3.14-13
BACKGROUND ROADWAY NETWORK IMPROVEMENTS – ADJUSTED BASELINE CONDITIONS**

#	Intersection	Description
25	South Prairie Ave/Arbor Vitae	Westbound approach: reconstructed to consist of one left-turn lane, one through lane, and one right-turn lane
28	South Prairie Ave/Hardy Street	Westbound approach: reconstructed to consist of one left-turn lane, one through/left, and one right-turn lane (eastbound and westbound approaches operated with split phasing)
32	South Prairie Ave/97th Street	Westbound approach: reconstructed to consist of one left-turn lane, and one through/right lane
37	Inglewood Ave/ West Century Blvd	Eastbound and westbound approaches: converted to include protected/permitted left-turn signal phasing
38	Fir Ave/Firmona Ave/West Century Blvd	Eastbound and westbound approaches: converted to include protected/permitted left-turn signal phasing
39	Grevillea Ave & West Century Blvd	Eastbound and westbound approaches: converted to include protected/permitted left-turn signal phasing
40	Hawthorne Blvd/ La Brea Ave/ West Century Blvd	Eastbound approach: left-turn lane added, resulting in two left-turn lanes, and three through lanes Westbound approach: left-turn lane added, resulting in two left-turn lanes, and three through lanes
41	Myrtle Ave/West Century Blvd	Eastbound and westbound approaches: converted to include protected/permitted left-turn signal phasing
43	South Prairie Ave/West Century Blvd	Eastbound approach: left-turn lane added, resulting in two left-turn lanes, and three through lanes Westbound approach: left-turn lane added, resulting in two left-turn lanes, three through lanes, and one right-turn lane
44	Doty Ave/West Century Blvd	Eastbound approach: one left-turn lane added, resulting in one left-turn lane and three through lanes (east and west approaches operate with protected left-turn phasing) Northbound approach: modified lanes consisting of left-turn lane and one through/right lane Southbound approach: constructed with one left-turn lane, one left/through lane, one right-turn lane (northbound and southbound phases operate with split phasing)
45	Yukon Ave/West Century Blvd	Northbound approach: modified lane assignments consisting of one left turn, one left/through/right, one right-turn lane Southbound approach: widened/reconstructed to consist of one left turn, one through, one right-turn lane (northbound and southbound phases operate with split phasing)
49	5th Ave/West Century Blvd	Eastbound and westbound approaches: converted to include protected/permitted left-turn signal phasing
90	South Prairie Ave/Buckthorn Street	Eastbound approach: lane reassignment to consists of left/through/right shared lane Westbound approach: constructed with one left turn, one through, one right-turn lane (eastbound and westbound approaches operate with split phasing) Northbound approach: right-turn lane added, resulting in one left-turn lane, three through, one right-turn lane Southbound approach: left-turn lane added, resulting in one left-turn lane and three through lanes

NOTES:

In instances where a dedicated right-turn lane is not specified (but movement is permitted), a right turn is assumed to occur from the outside through lane.

SOURCE: Fehr & Peers, 2019.

Section 3.14.4 presents traffic volumes and operations analysis results associated with the Adjusted Baseline No Project scenario, which represents existing conditions plus the addition of

traffic generated by the HPSP projects described above and reflecting the transportation projects described above. This scenario represents the adjusted baseline condition upon which project-specific impacts will be measured. If the Proposed Project is approved and commences operations as scheduled, in fall 2024, then the Adjusted Baseline reflects transportation conditions that are expected to exist at that time. Because the HPSP projects and transportation projects listed above are all approved, funded, and/or under construction, it would be misleading to analyze the Proposed Project's transportation impacts without taking into account these changes.

3.14.3 Regulatory Setting

This section provides a discussion of relevant federal, state, and local regulations pertaining to transportation that may be applicable to the Proposed Project.

Federal

There are no applicable federal regulations that apply directly to the Proposed Project. However, federal regulations relating to the Americans with Disabilities Act, Title VI, and Environmental Justice relate to transit service.

State

Assembly Bill 987 (AB 987)

As discussed in Section 3.0, AB 987 was signed by Governor Jerry Brown on September 30, 2018. The bill added Section 21168.6.8 to the Public Resources Code (PRC Section 21168.6.8) and provides for expedited judicial review in the event that the certification of this EIR or the granting of project approvals are challenged, so long as certain requirements are met. In regards to transportation, in order to qualify for expedited judicial review under AB 987, the Proposed Project must implement a transportation demand management (TDM) program that will achieve a 15 percent reduction in vehicle trips and would not result in any net additional greenhouse gas emissions. Further, the Proposed Project must implement trip reduction measures including the following:

- Implementation of a TDM program that, upon full implementation, will achieve and maintain a 15-percent reduction in the number of vehicle trips, collectively, by attendees, employees, visitors, and customers as compared to operations absent the TDM program;
- To accelerate and maximize vehicle trip reduction, each measure in the TDM program shall be implemented as soon as feasible, so that no less than a 7.5-percent reduction in vehicle trips is achieved and maintained by the end of the first NBA season during which an NBA team has played at the arena;
- A 15-percent reduction in vehicle trips shall be achieved and maintained as soon as possible, but not later than January 1, 2030. The applicant shall verify achievement to the lead agency and the Office of Planning and Research; and
- If the applicant fails to verify achievement of the reduction require by clause (iii), the lead agency shall impose additional feasible measures to reduce vehicle trips by 17 percent, or, if

there is a rail transit line with a stop within 0.25 miles of the arena, 20 percent, by January 1, 2035.

Additional requirements not related to transportation are discussed in Section 3.0.

Senate Bill 743 (SB 743)

Senate Bill (SB) 743, passed in 2013, requires the California Governor's Office of Planning and Research (OPR) to develop new CEQA guidelines that address traffic metrics under CEQA. As stated in the legislation, upon adoption of the new guidelines, "automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any." In December 2018, OPR published final technical guidance for implementing SB 743.⁵ On December 28, 2018, the Resources Agency adopted CEQA Guidelines Section 15064.3. Under this guideline, VMT will be the primary metric used to identify transportation impacts. Using VMT is optional through June 30, 2020. As of July 1, 2020, the provisions of Section 15064.3 will become mandatory.

In response to SB 743, Caltrans issued interim guidance,⁶ which refocuses Caltrans Local Development-Intergovernmental Review program attention away from vehicle delay and to local development projects' VMT, appropriate transportation demand measures, and addressing multimodal operational issues. The City of Inglewood has not previously adopted a VMT threshold. Nevertheless, this section contains a comprehensive analysis of the project VMT in addition to LOS, and applies VMT thresholds of significance to analyze transportation impacts.

Regional

Congestion Management Plan for Los Angeles County

Metro administers the Congestion Management Program (CMP). The CMP is a State-mandated program designed to provide comprehensive long-range traffic planning on a regional basis. On October 28, 2010, the Metro Board adopted the 2010 CMP for Los Angeles County.⁷ The 2010 CMP summarizes the results of 18 years of CMP highway and transit monitoring and 15 years of monitoring local growth. CMP implementation guidelines for local jurisdictions are also contained in the 2010 CMP, and includes a hierarchy of highways and roadways with minimum level of service standards, transit standards, a trip reduction and travel demand management element, a program to analyze the impacts of local land use decisions on the regional transportation system, a seven-year capital improvement program, and a county wide computer model used to evaluate traffic congestion and recommend relief strategies and actions. The primary goal of the CMP is to reduce traffic congestion in order to enhance the economic vitality

⁵ State of California, Governor's Office of Planning and Research, Technical Advisory on Evaluating Transportation Impacts in CEQA, December 2018. Available: www.opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf. Accessed March 7, 2019.

⁶ California Department of Transportation, Local Development-Intergovernmental Review Program Interim Guidance, Revised November 9, 2016. Available: www.dot.ca.gov/hq/tpp/sb743.html. Accessed March 6, 2019.

⁷ Los Angeles County Metropolitan Transportation Authority, 2010 Congestion Management Program. Available: www.media.metro.net/projects_studies/cmp/images/CMP_Final_2010.pdf. Accessed March 6, 2019.

and quality of life for affected communities. CMP guidelines require the evaluation of freeway segments to which a project could add 150 or more trips in each direction during peak hours and require evaluation of designated CMP roadway intersections to which a project could add 50 or more trips during either the AM or PM peak hours. The guidelines also require evaluation of the public transit system serving the project area.

The CMP was one of the pioneering efforts to conduct performance-based planning. Because the CMP primarily uses LOS to assess congestion, however, it is inconsistent with the direction of SB 743 which requires use of VMT-related performance measures for determining CEQA impacts. SB 743 and other state laws that have been enacted over the last decade are intended to, among other things, address climate change and support infill development and sustainable transportation. Metro, like other lead agencies, is developing new ways to measure transportation system performance. These are among the reasons that Metro initiated a process that led to Los Angeles County opting out of the CMP, as permitted by Government Code section 65088.3 (part of the original legislation authorizing the preparation of the CMP). Metro initiated this process on June 20, 2018.⁸ Opting out required the approval of a majority of local jurisdictions within the County representing a majority of the County population. In response, the City of Inglewood adopted a resolution to opt out of the CMP on November 13, 2018.⁹ A majority of local jurisdictions within the County representing a majority of the County population adopted resolutions to opt out as of July 2019, and the Los Angeles County CMP is no longer in force. However, a CMP analysis was conducted for the Proposed Project and is presented in Appendix K.5 for informational purposes.

Southern California Association of Governments 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy

In April 2016, SCAG adopted the 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS).¹⁰ The 2016–2040 RTP/SCS presents a long-term vision for the regional transportation system through the year 2040 and identifies mobility, accessibility, sustainability, and high quality of life as the principles most critical to the future of the region. Furthermore, it balances the future mobility and housing needs of the region with economic, environmental, and public health goals. As stated in the 2016–2040 RTP/SCS, California SB 375 requires SCAG and other Metropolitan Planning Organizations throughout the state to develop a Sustainable Communities Strategy to reduce per capita GHG emissions through integrated transportation, land use, housing, and environmental planning. Within the 2016–2040 RTP/SCS, the overarching strategy includes plans for High Quality Transit Areas (HQTAs), Livable Corridors, and Neighborhood Mobility Areas as key features of a thoughtfully planned, maturing

⁸ Congestion Management Program Opt Out. Los Angeles County Metropolitan Transportation Authority, Planning and Programming Committee, Board Report, June 20, 2018. Available: www.media.metro.net/docs/cmp_optOut_2018-0620.pdf. Accessed March 6, 2019.

⁹ Resolution to Opt-Out of the Los Angeles County Metropolitan Transit Authority, Congestion Management Program, City of Inglewood, Council Staff Report. Available: www.cityofinglewood.org/AgendaCenter/ViewFile/Item/5549?fileID=3011. Accessed March 26, 2019.

¹⁰ Southern California Association of Governments, 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy, April 2016.

region in which people benefit from increased mobility, more active lifestyles, increased economic opportunity, and an overall higher quality of life. HQTAs are described as areas within 0.5 miles of a fixed guideway transit stop or a bus transit corridor with 15-minute or less service frequency during peak commute hours. Local jurisdictions are encouraged to focus housing and employment growth within HQTAs. The Project Site is consistent with the criteria to be located within an HQTA as designated by the 2016–2040 RTP/SCS.¹¹⁻¹²⁻¹³

The 2016-2040 RTP/SCS includes six specific goals that pertain to mobility, accessibility, travel safety, and productivity of the transportation system. These goals, which complement the transportation investments of the state and region, and security of the regional transportation system, are listed below.

Goal 2: Maximize mobility and accessibility for all people and goods in the region.

Goal 3: Ensure travel safety and reliability for all people and goods in the region.

Goal 4: Preserve and ensure a sustainable regional transportation system.

Goal 5: Maximize the productivity of our transportation system.

Goal 6: Protect the environment and health of our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking).

Goal 9: Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.

The project was found to be consistent with Goals 2 and 3 based on its multi-modal approach for special event planning, implementation of an Event Transportation Management Plan (TMP) to address potential modal conflicts, and location within the region that is served by multiple freeways, interchanges, and high-capacity surface streets. The proposed shuttle system that would deliver event attendees between the Project Site and existing/planned light rail stations is an example of how the project is contributing toward sustainable regional transportation solutions (Goal 4). Both project components (including a shuttle system to light rail stations) and mitigations (consisting of traffic signal retiming/optimization, and temporary traffic management to increase capacity where needed) are examples of how the project is maximizing the productivity of the transportation system in its vicinity (Goal 5). The project would provide dedicated on-site bike parking and pedestrian amenities within and along its frontages to encourage travel by active modes (Goal 6). Part of the Event TMP is a set of communications protocols with relevant agencies including public works departments, police, sheriff, and

¹³ Metro Line 117 on Century Boulevard provides 15-minute service frequencies during peak commute hours. Metro Lines 211, 212, and 312 on South Prairie Avenue together provide service frequencies of less than 15 minutes during peak commute hours.

California Highway Patrol to monitor transportation system performance, and implement real-time modifications to the plan as conditions change (Goal 9). In summary, review of the project against applicable mobility policies contained in the 2016–2040 RTP/SCS did not identify any inconsistencies.

Local

City of Inglewood General Plan Circulation Element

The Circulation Element of the City of Inglewood General Plan¹⁴ identifies the system of freeways, major and minor arterials, and collector streets needed to carry traffic within and through the community. The primary purpose of the Circulation Element as stated within the Circulation Element is to require that the provision of adequate street access and traffic capacity is considered for current and future land use needs. The Circulation Element also describes transit services within Inglewood, and designates truck routes and bicycle routes throughout the City.

The San Diego Freeway (I-405) travels through the western portion of the city and the Glenn Anderson/West Century Freeway (I-105) travels along the southern edge of the city. The Circulation Element defines the following classifications of streets:

- Major Arterials – Major arterials are the most important surface streets, functioning as primary intercity routes and collecting and distributing a large portion of local traffic. Major arterials are typically designed to carry over 30,000 vehicles per day with a minimum of two travel lanes in each direction and a separate median lane to accommodate left-turn movement.
- Minor Arterials – Minor arterials, also referred to as secondary arterials, are similar to major arterials except that they may be discontinuous within the City and may carry less traffic volume. Minor arterials are typically designed to carry 15,000 to 30,000 vehicles per day with a minimum of two travel lanes in each direction. A separate median lane to accommodate left-turn movement is desirable if there is sufficient roadway width.
- Collectors – Collectors are transitional streets between arterials and local streets, collecting vehicles from the local street system and transporting them to the arterial system. Collectors may also provide cross-city access. Collectors may be designed to carry up to 15,000 vehicles per day, although 3,000 to 10,000 vehicles is more typical. Collectors will have at least one travel lane in each direction, although two travel lanes may be utilized depending upon volume and function.

The map on page 17 of the Circulation Element and the text on page 21 of the Circulation Element would require amendment to reflect the street vacations proposed as part of the Proposed Project. The Project would not be inconsistent with the Circulation Element as amended.

¹⁴ City of Inglewood, 1992. *Circulation Element of the Inglewood General Plan*, adopted December 15, 1992.

City of Inglewood Municipal Code

The City of Inglewood Municipal Code¹⁵ includes a number of sections relevant to the Proposed Project. These include:

- Section 3-2.2/Authority of Officers and Designated Personnel – Section 3-2.2 authorizes peace officers and persons designated by the Chief of Police to direct traffic in conformance with traffic laws after passing a traffic regulation training program. This is relevant to the use of traffic control officers (TCOs) as part of the Proposed Project event transportation management plan.
- Section 3-63/Off-Street Parking – Section 3-63 permits any property within the City to be used for off-street parking purposes and requires that a permit for such purpose be issued by the City Permits and Licenses Committee. The section requires that the permits be issued only when there is an extensive parking need requiring the issuance of such permits to reduce traffic congestion or hazards, when such facilities are made available for public parking and a fee is charged. Section 3-63.1 provides further requirements for the operation of such facilities. This is relevant to the potential use of off-site parking facilities by attendees of events at the Proposed Project.
- Sections 3-80 and 3-81/Permit Parking Districts – Section 3-81 defines the boundaries of various permit parking districts within the City and Section 3-80 describes the restrictions in place within each district. District 3 encompasses the area generally bounded by Arbor Vitae Street from Myrtle Avenue to South Prairie Avenue, South Prairie Avenue from Arbor Vitae Street to West Century Boulevard, West Century Boulevard from South Prairie Avenue to Yukon Avenue, Yukon Avenue from West Century Boulevard to West 104th Street, West 104th Street from Yukon Avenue to Freeman Avenue, Freeman Avenue from West 104th Street to West Century Boulevard, West Century Boulevard from Freeman Avenue to Myrtle Avenue, and Myrtle Avenue from West Century Boulevard to Arbor Vitae Street. As such the district surrounds the Proposed Project Site. Within this district, unless a parking permit has been issued and properly displayed, it is unlawful for any person to park any vehicle during either any period between the hours of 12 noon and 6 PM Monday through Sunday inclusive (seven days) or any period between the hours of 7 PM and 10 PM Monday through Sunday inclusive (seven days). However, although the district is formally defined in the Municipal Code, some of the streets within the district are not currently posted with signs indicating the parking restrictions in accordance with the posting requirements in Section 3-77.

3.14.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of project-specific and cumulatively considerable impacts to the transportation and circulation system. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. The following describes the significance criteria used to identify project-specific and cumulatively considerable impacts to the transportation and circulation system for the Proposed Project.

¹⁵ City of Inglewood Municipal Code. Available: www.qcode.us/codes/inglewood/. Accessed March 25, 2019.

Intersections

Impacts would be significant if:

- A project would have a significant impact during the weekday AM or PM peak hours on intersection capacity (in the City of Inglewood or City of Los Angeles) at a signalized intersection analyzed using the CMA/ICU methodology operating at LOS C, D, or E/F after the addition of project traffic if the project traffic causes an increase in the V/C ratio as follows:
 - V/C ratio increase ≥ 0.040 if LOS is C
 - V/C ratio increase ≥ 0.020 if LOS is D
 - V/C ratio increase ≥ 0.010 if LOS is E or F
- A project would have a significant impact during the weekday AM or PM peak hours on intersection capacity (in the County of Los Angeles or City of Hawthorne) at a signalized intersection analyzed using the ICU methodology operating at LOS C, D, or E/F prior to the addition of project traffic if the project traffic causes an increase in the V/C ratio as follows:
 - V/C ratio increase ≥ 0.040 if LOS is C
 - V/C ratio increase ≥ 0.020 if LOS is D
 - V/C ratio increase ≥ 0.010 if LOS is E or F
- The traffic generated by the project during the weekday AM or PM peak hours causes an increase in the average delay by more than 5 seconds at a signalized intersection analyzed using the HCM methodology operating at LOS D or worse after the addition of project traffic.
- A project would have a significant impact during the pre-event or post-event peak hours on intersection capacity (in the City of Inglewood or City of Los Angeles) at a signalized intersection analyzed using the CMA/ICU methodology operating at LOS E or F after the addition of project traffic if the project traffic causes an increase in the V/C ratio of 0.01 or greater.
- A project would have a significant impact during the pre-event or post-event peak hours on intersection capacity (in the County of Los Angeles or City of Hawthorne) at a signalized intersection analyzed using the ICU methodology operating at LOS E or F prior to the addition of project traffic if the project traffic causes an increase in the V/C ratio of 0.01 or greater.
- The traffic generated by the project during the pre-event or post-event peak hours causes an increase in the average delay by more than 5 seconds at a signalized intersection analyzed using the HCM methodology operating at an unacceptable LOS (LOS E or F) after the addition of project traffic.
- A project would have a significant impact at an unsignalized intersection if project-related traffic causes the level of service at the worst approach to deteriorate from LOS D or better to LOS E or LOS F and peak hour signal warrants would be met, or would cause peak hour signal warrants to be met when the worst approach is already operating at LOS E or LOS F.

Freeway Facilities

Impacts to the freeway system would be significant if:

- Impacts to freeway mainline segments for weekday AM and PM peak hour conditions are considered significant if the traffic generated by a project: (a) causes a freeway mainline segment LOS to worsen from LOS C to D, or worsen from LOS D to E, or worsen from LOS E to F; or (b) when a segment is already at LOS F, causes an increase in volume of greater than 1 percent.
- Impacts to freeway mainline segments for pre-event and post-event (major event) peak hour conditions are considered significant if the traffic generated by a project: (a) causes a freeway mainline segment to worsen from LOS D or better to LOS E, or worsen from LOS E to F; or (b) when a segment is already at LOS F, causes an increase in volume of greater than 1 percent.
- Impacts to off-ramps are considered significant if the traffic generated by a project causes or worsens an off-ramp queue that: (a) exceeds 85 percent of the off-ramp storage capacity; or (b) when an auxiliary lane is present, exceeds the lesser of one-half the length of the auxiliary lane or 1,000 feet.

Residential Street Segments

Impacts to residential streets would be significant if:

- A project would have a significant impact if, after the addition of project trips, there is projected to be more than 3,000 vehicles per day on a local street or more than 10,000 vehicles per day on a collector street (unless the project causes a net reduction in trips relative to 'no project' conditions).

Vehicle Miles Traveled

Impacts related to VMT would be considered significant if:

- The office components of the project generate work VMT exceeding (i.e., higher than) a level of 15 percent below existing regional daily work VMT per employee.
- The retail components of the project that are not local serving cause a net increase in daily VMT.
- The hotel component of the project causes a net increase in daily VMT.
- The event component of the project causes a net increase in daily VMT.

Transit

Impacts to the transit system are considered significant if a project would:

- Adversely affect public transit operations; or
- Fail to adequately provide access to transit.

Bicycle Facilities

Impacts to bicycle facilities are considered significant if a project would:

- Adversely affect existing or planned bicycle facilities; or
- Fail to adequately provide for access by bicycle.

Pedestrian Circulation

Impacts to pedestrian circulation are considered significant if a project would:

- Adversely affect existing or planned pedestrian facilities; or
- Fail to adequately provide for access by pedestrians.

Emergency Access

Impacts to emergency access are considered significant if a project would result in inadequate emergency access.

Construction-Related Traffic Impacts

A project would have a significant impact during construction if it were to substantially affect circulation for a substantial duration, considering the following factors:

Temporary Traffic Impacts:

- The length of time of temporary street closures or closures of traffic lanes;
- The classification of the street (major arterial, state highway) affected;
- The existing traffic levels and LOS on the affected street segments and intersections;
- Whether the affected street directly leads to a freeway on- or off-ramp or other state highway;
- Potential safety issues involved with street or lane closures; and
- The presence of emergency services (fire, hospital, etc.) located nearby that regularly use the affected street.

Temporary Loss of Access:

- The length of time of any loss of vehicular or pedestrian access to a parcel fronting the construction area;
- The availability of alternative vehicular or pedestrian access; and
- The type of land uses affected, and related safety, convenience, and/or economic issues.

Temporary Loss of Bus Stops or Rerouting of Bus Lines:

- The length of time that an existing bus stop would be unavailable or that existing service would be interrupted;
- The availability of a nearby location to which the bus stop or route can be temporarily relocated;
- The existence of other bus stops or routes with similar routes/destinations; and

- Whether the interruption would occur on a weekday, weekend or holiday, and whether the existing bus route typically provides service that/those day(s).

Temporary Loss of On-Street Parking:

- The current utilization of existing on-street parking;
- The availability of alternative parking locations or public transit options (e.g., bus, train); and
- The length of time that existing parking spaces would be unavailable.

Methodology and Assumptions

This subsection presents the analysis methods and assumptions used to evaluate the significance of project impacts under adjusted baseline and cumulative conditions. Analysis scenarios presented here follow the general ordering of scenarios shown in Table 3.14-3. Specifically, the analysis of project-only scenarios (for both adjusted baseline and cumulative) are presented first followed by various concurrent scenarios involving events at The Forum and NFL Stadium. Refer to *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC*, which is contained in Appendix K.1, for a detailed analysis of the Proposed Project travel characteristics for each of the scenarios/activities described in Table 3.14-3. The discussion that follows presents a summary of those results.

Due to the size of the study area and number of analysis scenarios, all adjusted baseline and cumulative peak hour turning movement volumes are provided in Appendix K.2, rather than in figures contained in this section.

Proposed Project Vacated Streets

The Proposed Project would result in localized changes to the existing traffic patterns due to the following actions:

- Removal of a 1,200-foot section of West 102nd Street between South Prairie Avenue and Doty Avenue to facilitate arena construction.
- Removal of a 340-foot section of West 101st Street between residential uses and retail uses (directly west of South Prairie Avenue) to facilitate the West Parking Garage Site.
- Removal of an existing traffic signal on South Prairie Avenue at West 102nd Street, turn prohibitions (via a raised median, channelization, or signing/stripping) from South Prairie Avenue onto westbound West 102nd Street, and restriction of eastbound turns on West 102nd Street at South Prairie Avenue to right-turns only (controlled by a stop sign).
- A new privately-owned but publicly-accessible alley would be constructed to the west of the West Parking Garage Site, connecting West Century Boulevard to West 101st and West 102nd streets.

According to Table 3.14-12, West 101st Street west of South Prairie Avenue currently carries 1,137 and 966 daily trips on weekdays and weekends, respectively, while West 102nd Street east of South Prairie Avenue currently carries 5,661 and 4,099 daily trips on weekdays and weekends, respectively. The above mentioned street closures would cause existing traffic to shift to other

roadways. The traffic analysis assumes that this traffic would shift to the closest convenient alternative route, following the closure of these segments of West 101st and West 102nd streets. Specifically, the analysis assumes that vehicles traveling on West 102nd Street east of South Prairie Avenue would shift to West Century Boulevard and West 104th Street, while vehicles on West 102nd Street west of South Prairie Avenue would shift onto either West Century Boulevard, West 104th Street or Freeman Avenue (depending on their travel routes). Vehicles on West 101st Street west of South Prairie Avenue would shift to West Century Boulevard, West 102nd Street, and West 104th Street. These vehicle volume shifts are applied for all project scenarios.

Proposed Project Land Uses, Parking Supply, and Access Provisions

Chapter 2, Project Description, presents the Proposed Project site plan and detailed land use quantities for the Proposed Project. As described in that chapter, the majority of the ancillary land uses would be located within the Arena Site. The exception is the hotel, which is part of the East Transportation and Hotel Site located on the south side of West Century Boulevard between Doty Avenue and Yukon Avenue.

The Proposed Project would construct the following three parking garages:

- West Parking Garage: 3,110 parking spaces on six floors located west of South Prairie Avenue and south of West Century Boulevard.
- South Parking Garage: 650 parking spaces located east of South Prairie Avenue, immediately south of the arena.
- East Parking Garage: located south of West Century Boulevard between Doty Avenue and Yukon Avenue and consisting of 3 floors. The top two floors would consist of 365 parking spaces, while the bottom floor would serve as a transportation hub, dedicated exclusively to pick-up/drop-offs by TNCs, such as Uber and Lyft, and to parking for charter buses.

In total, these three garages would provide 4,125 parking spaces (excluding TNC pick-up/drop-offs and charter bus parking). Vehicular access provisions to these garages are described below:

Access to West Parking Garage

The West Parking Garage would be accessible from South Prairie Avenue and from West Century Boulevard. Direct access would not be provided from West 102nd Street, the remaining portion of West 101st Street (directly west of South Prairie Avenue), or the new alley/fire lane extending from West 102nd Street to West Century Boulevard. The following describes the two points of access to this structure:

- Signalized Driveway on West Century Boulevard – would be located approximately 475 feet west of South Prairie Avenue (measured from centerline to centerline). This driveway would be operational on event days and closed on non-event days. It would consist of three reversible travel lanes that provide ground floor access and direct ramps to the upper floors. Motorists would not be permitted to turn left into the garage driveway from westbound West Century Boulevard. Motorists would access this driveway by turning right from eastbound West Century Boulevard.

- **Signalized Driveway on South Prairie Avenue** – would be located approximately 575 feet south of West Century Boulevard. This driveway would be operational at all times. It would consist of four reversible travel lanes that provide access to the first floor and direct ramps to the upper floors. Under non-event conditions, exclusive northbound left-turn and southbound right-turn lanes would be provided on South Prairie Avenue, and exclusive eastbound (outbound) left and right-turn lanes would be provided on the driveway. For major events, special lane assignments would be implemented as described in the Adjusted Baseline Plus Project Conditions subsection.

A pedestrian bridge would connect the West Parking Garage and the Arena plaza. A crosswalk would be constructed on the south leg of the West Parking Garage signalized driveway on South Prairie Avenue.

Access to South Parking Garage

The South Parking Garage would be accessed from a right-turn only driveway on South Prairie Avenue between West 102nd Street and West 103rd Street. The driveway would therefore be accessible by those traveling northbound on South Prairie Avenue. Movements would be restricted to inbound and outbound right-turns at all times. The South Parking Garage would also be accessible from the east via West 102nd Street and Doty Avenue. Persons parking in this structure would have direct access to the Arena.

Access to East Parking Garage/Transportation Hub

Charter buses and TNCs would enter and exit the East Parking Garage via a new fourth (south) leg of the West Century Boulevard/Hollywood Park Casino Driveway signalized intersection. Regular parking would be provided on the second and third floors, which would be accessible exclusively from a full-access driveway on West 102nd Street. Persons parking in this structure would walk along West Century Boulevard to reach the Arena plaza. The driveway on West Century Boulevard would have three outbound lanes and multiple inbound lanes to accommodate buses. The driveway on West 102nd Street would have two reversible lanes.

The first floor would be the Transportation Hub and consist of 28 distinct spaces for TNCs to pick-up or drop-off passengers. It would also include twelve queuing lanes, which could provide storage for 154 vehicles to simultaneously stage to pick-up passengers after events conclude. This system is intended to be operated on a first-in, first-out type design (similar to a taxi stand) versus the more traditional system in which drivers and passengers meet at a defined numbered/lettered location. Assuming an average loading time of two minutes per vehicle, this design could accommodate up to 840 vehicles per hour. The first floor would also provide parking for 20 charter buses and 23 micro-transit vehicles.

Adjusted Baseline Conditions

This subsection presents the impacts of the Proposed Project for the various adjusted baseline scenarios described in Table 3.14-3. Additional information regarding the assumptions underlying these event and non-event conditions are presented in Table 2-3 of Chapter 2, Project Description.

Adjusted Baseline Plus Project (Ancillary Land Uses) Conditions

The vehicle trip generation estimates for most of the ancillary uses (office, medical clinic, community space, restaurant, and retail) are based on the square footage of the proposed site plan using trip generation data from the *Trip Generation Manual*.¹⁶ For the practice facility, trip generation is based on the number of staff, as this land use does not have a comparable land use code in the *Trip Generation Manual* that factors in the unique nature of the project. The medical clinic is expected to specialize in sports medicine and would be open to the public on weekdays during normal business hours. Mode split data, internalization rates, and pass-by adjustments were made to the project gross vehicle trips. Refer to *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC*, which is contained in Appendix K.1, for methods used to estimate internal trips, pass-by trips, and external non-auto trips. Trip generation estimates for the existing restaurant, motel and manufacturing uses now on the Project Site (and to be removed) were also based on their square footage and trip generation data from *Trip Generation Manual*.

All parking for the ancillary land uses would occur in one of the three garages. However, the hotel would be located on a separate site, immediately east of the East Parking Garage, and would provide its own parking in compliance with the City of Inglewood Municipal Code.

Table 3.14-14 displays the AM peak hour, PM peak hour, and daily vehicle trip generation on a typical weekday for the project ancillary land uses. This table applies to a day in which an event is not being held at the project. As shown, the ancillary land uses would generate approximately 4,706 net new daily vehicle trips, with 294 occurring during the AM peak hour and 409 occurring during the PM peak hour.

**TABLE 3.14-14
 PROJECT ANCILLARY LAND USES TRIP GENERATION**

Ancillary Land Uses	Vehicle Trips								
	Daily			AM Peak Hour			PM Peak Hour		
	In	Out	Total	In	Out	Total	In	Out	Total
Gross Vehicle Trips	3,449	3,449	6,898	314	108	422	261	349	610
Internal Trips	-148	-148	-296	-27	-11	-38	-35	-38	-73
Pass-by Trips	-474	-474	-948	-12	-9	-21	-31	-24	-55
Existing Trips to be Removed	-311	-311	-622	-32	-20	-52	-23	-26	-49
Transit/Bike/Walk	-163	-163	-326	-12	-5	-17	-11	-13	-24
Net New Vehicle Trips	2,353	2,353	4,706	231	63	294	161	248	409

NOTES:

Applies to conditions in which an event is not being held at the Project Site.
 Trip generation estimates based on rates contained in *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017) except as noted in text above.
 See *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC* in Appendix K.1 regarding how internal trips, pass-by trips, and external non-auto trips were estimated.

SOURCE: Fehr & Peers, 2019.

¹⁶ Institute of Transportation Engineers, 2017. *Trip Generation Manual, 10th Edition*.

Trip distribution for ancillary land uses was developed using data from SCAG travel demand model. Model outputs were adjusted based on observed intersection operational characteristics to develop the project assignment. Project trips were added to the Adjusted Baseline No Project volumes to yield Adjusted Baseline Plus Project Conditions. **Figure 3.14-6** displays the distribution of trips generated by the ancillary land uses.

Table 3.14-15 displays the weekday AM and PM peak hour LOS and average delay or V/C ratio at the 43 study intersections under Adjusted Baseline No Project and Adjusted Baseline Plus Project (Ancillary Land Uses) conditions (see Appendix K.3 for technical calculations). As shown in the table, the project would cause significant impacts at several study intersections during one or both peak hours.

Table 3.14-16 displays the average weekday and weekend daily traffic volumes on the neighborhood street study segments under adjusted baseline Conditions for No Project and Plus Project (Ancillary Land Uses) conditions. As shown in the table, the project would add trips to one facility whose daily volume of traffic would exceed the applicable threshold for the facility type.

Table 3.14-17 shows the Adjusted Baseline LOS on freeway mainline segments for weekday AM and PM peak hours, without and with trips generated by the ancillary land uses (see Appendix K.2 for additional data supporting the freeway impact conclusions and Appendix K.3 for technical calculations). **Table 3.14-18** shows the existing weekday AM and PM peak hour 95th percentile vehicle queues at freeway off-ramps for these scenarios. The Ancillary Land Uses would not cause freeway mainline segment impacts during the AM or PM peak hours. No ramp queues exceed the applicable storage.

Adjusted Baseline Plus Project (Daytime Event) Conditions

The daytime event scenario analyzes the following two different types of events that may occur at the Proposed Project on weekdays:

- Corporate/Community Event with 2,000 people attending, beginning in the weekday AM peak hour.
- Other Sporting Event or Gathering with 7,500 people attending, ending in the weekday PM peak hour.

Technical Memorandum #2 – Project Travel Demand Estimates for IBEC, which is contained in Appendix K.1, describes the expected Proposed Project travel characteristics for daytime events including how mode split was estimated, average vehicle occupancy, peak hours of arriving and departing traffic, employee mode split, and many other important travel behaviors. This section presents a summary of the results of that work. For these event types, shuttle service to nearby light rail stations is not assumed to be provided.

NOTES:

Shaded cells identify significant impacts.

^a Analysis methods vary by jurisdiction (refer to previous pages for description).

^b Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

^c Applies to conditions in which an event is not occurring at the Project Site.

^d Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

NOTES:

- ^a Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions.
- ^b LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

**TABLE 3.14-18
 FREEWAY OFF-RAMP QUEUING ANALYSIS – ADJUSTED BASELINE PLUS PROJECT (ANCILLARY LAND USES)
 CONDITIONS**

Off-Ramp ^a	Ramp Capacity Threshold ^b	Adjusted Baseline No Project				Adjusted Baseline Plus Project			
		95th Percentile Queue (ft.) ^c		Queue Exceeds Available Storage ^d		95th Percentile Queue (ft.) ^c		Queue Exceeds Available Storage ^d	
		AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
I-405 SB Off-Ramp at La Cienega Blvd (north of West Century Blvd)	3,085	436	858	No	No	438	862	No	No
I-405 NB Off-Ramp at West Century Blvd	3,600	1,944	1,049	No	No	1,963	1,062	No	No
I-405 SB Off-Ramp at La Cienega Blvd (south of West Century Blvd)	1,265	94	270	No	No	100	276	No	No
I-105 EB/WB Off-Ramp at South Prairie Ave	8,720	695	1,692	No	No	740	1,736	No	No

NOTES:

- ^a Auxiliary lanes are present at each of these off-ramps.
- ^b Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.
- ^c 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue would be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.
- ^d If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Table 3.14-19 indicates that a Corporate/Community Event with 2,000 people would generate 1,347 vehicle trips during the AM peak hour. **Table 3.14-20** indicates that a Sporting Event or Gathering with 7,500 people would generate 3,616 vehicle trips during the PM peak hour. **Table 3.14-21** displays the average daily vehicle trip generation for each of these event types. On a daily basis, the Corporate/Community Event with 2,000 people would generate 3,406 vehicle trips, while the Sporting Event or Gathering with 7,500 people would generate 8,318 vehicle trips. These trip totals exclude trips generated by the ancillary land uses. Thus, total trips from the Proposed Project would consist of those generated by the ancillary land uses, plus those generated by these events.

Vehicle distribution for these events is based on mobile source data from events at The Forum. For typical daytime events, it is expected that the South parking garage would be open for use by arena staff (office, basketball facilities, medical center employees), and that event attendees would be parked in the West Parking Garage.

Table 3.14-22A displays the weekday AM peak hour LOS and average delay or V/C ratio at the 43 study intersections under Adjusted Baseline No Project and Adjusted Baseline Plus Project (Daytime Event) conditions. As shown in the table, these activities would cause a number of significant degradations in intersection LOS.

Table 3.14-22B displays the weekday PM peak hour LOS and average delay or V/C ratio at the 116 study intersections under Adjusted Baseline No Project and Adjusted Baseline Plus Project (Daytime Event) conditions. As shown in the table, these activities would cause a number of significant degradations in intersection LOS. Because the Adjusted Baseline Plus Project (Daytime Event) conditions caused degraded LOS at many of the intersections at the edge of the 43-intersection study area, the study was expanded to evaluate LOS at all 116 intersections.

Table 3.14-23 displays the average weekday and weekend daily traffic volumes on the neighborhood street study segments under Adjusted Baseline Conditions for No Project and Plus Project (Daytime Events) conditions. As shown in the table, the project would add trips to two facilities whose daily volume of traffic would exceed the applicable threshold for the facility type.

Table 3.14-24 shows the Adjusted Baseline LOS on freeway mainline segments for weekday AM and PM peak hours, without and with trips generated by the daytime events. **Table 3.14-25** shows the weekday AM and PM peak hour 95th percentile vehicle queues at freeway off-ramps for these scenarios. As shown, the daytime events would cause degraded operations at several facilities, some of which are considered significant. Daytime events would not cause a freeway off-ramp to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

^a Analysis methods vary by jurisdiction (refer to previous pages for description).

^b Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is at E or F and the peak hour signal warrant is met.

^c For AM peak hour conditions, event is a 2,000-person Corporate/Community event. For PM peak hour conditions, event is a 7,500-person Other Sports/Gathering Event.

^d Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes) Per the HCM, delay estimates in over-saturated conditions are unreliable.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

^a Analysis methods vary by jurisdiction (refer to previous pages for description).

^b Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is at E or F and the peak hour signal warrant is met.

^c For AM peak hour conditions, event is a 2,000-person Corporate/Community event. For PM peak hour conditions, event is a 7,500-person Other Sports/Gathering Event.

^d Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes) Per the HCM, delay estimates in over-saturated conditions are unreliable.

NOTES:

Shaded cells identify significant impacts.

^a Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from C to D, from D to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

^b LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

I-105 EB/WB Off-Ramp at South Prairie Ave	8,720	695	1,692	No	No	780	1,810	No	No

NOTES:

- ^a Auxiliary lanes are present at each of these off-ramps.
- ^b Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.
- ^c 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.
- ^d If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Adjusted Baseline Plus Project (Major Event) Conditions

As shown in Table 3.14-3, the Proposed Project is analyzed for weekday and weekend pre-event peak hour conditions assuming a sold-out (18,000 persons) NBA basketball game. The weekday post-event condition is analyzed for a concert attended by 18,500 persons. To estimate the Proposed Project pre-event and post-event peak hour vehicle trip generation for these scenarios, it was necessary to estimate the mode split, average vehicle occupancy (AVO), and percent of arrivals/departures within each peak hour for attendees and employees.

The following summarizes how these estimates were derived. Refer to *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC*, which is contained in Appendix K.1, for a discussion of why the above scenarios were selected (i.e., greatest number of trips generated and potential for impacts) and a comprehensive analysis of their travel behaviors.

Mode Split

The mode split for basketball game attendees was derived (but not applied directly) from a 2018 online survey of Los Angeles Clippers fans who attended basketball games at Staples Center in downtown Los Angeles. The survey found that light rail transit was used by 9 percent of Clippers game attendees on weekdays and 10 percent of Clippers game attendees on weekends to access

the venue, and another 2 percent of Clippers game attendees use bus transit on both weekdays and weekends. Those mode splits cannot be applied directly to the Proposed Project because it would be located in a different geographic setting (including different transit accessibility) when compared to Staples Center. It was necessary to develop a transit mode share logit model using the survey results, the cost of travel, and other factors (e.g., parking cost, transfer times, trip origins/destinations, etc.) to estimate attendee transit use to the Proposed Project. This model predicted 5 percent light rail transit use on weekdays and 6 percent light rail transit use on weekends to the Proposed Project. An additional 1 percent would travel by bus.

During major events, the Proposed Project would operate shuttles that transport attendees between the site and the Hawthorne Green Line Station and planned Metro Crenshaw/LAX Line station in Downtown Inglewood. Shuttles are not assumed to operate during daytime events. More information on the survey and the transit mode share model is included in *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC*, which is contained in Appendix K.1.

Attendee TNC mode share was based on data from the Clippers game attendee survey and the *Final Golden 1 Center Year One Travel Monitoring Report*¹⁷ (the Sacramento Kings' arena in downtown Sacramento). The survey showed only 4 percent of attendees using TNCs to travel to/from Clippers games. In contrast, data from the Golden 1 Center showed 9 percent of attendees attending a Sacramento Kings basketball game using TNCs. The analysis conservatively estimates that TNC use would continue to grow in the Los Angeles region, and would account for 10 percent of attendee trips in 2024 when the Proposed Project would open. This is conservative because each TNC trip creates both an inbound and outbound trip whereas a private vehicle trip generates just one.

In general, NBA games are expected to have slightly higher levels of transit usage than concerts due to the percentage of attendees that are season (or multi-game) ticketholders and therefore more familiar with available travel options. Additionally, concert attendees often consider such events a special occasion (i.e., date night, dress-up, dinner prior, etc.) which could discourage the use of transit by some attendees. Employee mode share would skew more toward private vehicle travel (versus TNCs) than for attendees due to the cost of travel by TNC and the recurring costs that would come from using a TNC for travel to the venue. The mode split for those who bike or walk to the venue is below 1 percent due to attendees' lengthy trip origins/destinations, which are generally not conducive to these shorter trip modes.

Table 3.14-26 displays the Proposed Project weekday and weekend pre-event peak hour mode split for attendees to an NBA game, and the weekday post-event peak hour mode split for attendees leaving a concert.

Average Vehicle Occupancy

Attendee AVO was developed for the pre-event scenarios based on results of the NBA Clippers game attendee survey. Attendee responses were weighted based on their ticket type (season ticket

¹⁷ City of Sacramento, 2017. *Final Golden 1 Center Year One Travel Monitoring Report*. Prepared by Fehr & Peers.

holder, half-season ticket holder, and individual game ticket holder) to match the percentage of each group for the 2017-2018 NBA season and yielded an AVO of 2.27. This value is very similar to the result of 2.32 persons per vehicle from the *Final Golden 1 Center Year One Travel Monitoring Report*.¹⁸ For the post-event concert major event, the attendee AVO of 2.18 was estimated from observations at four concerts at The Forum in December 2018. Employee AVO was estimated at 1.18, based on the 2017 National Household Travel Survey for commute trips. Refer to *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC*, which is contained in Appendix K.1, for technical details.

Arrival and Departure Patterns

Attendee arrival and departure patterns for NBA games are based on the NBA Clippers game attendee survey, in which attendees were asked what time they arrived prior to the game start. Approximately 68 percent of attendees indicated they arrived within one hour of the game starting. Attendee arrival and departure patterns for concerts are based on data collected at four concerts at The Forum in December 2018. About 83 percent of attendees departed in the one hour immediately after the concert concluded. Staff arrival and departure patterns are based on data from applicant-provided *Anticipated Annual Event Characteristics* from September 2018.

Trip Generation

Tables 3.14-27, 3.14-28, and 3.14-29 display the Proposed Project expected trip generation for the weekday pre-event, weekday post-event, and weekend pre-event peak hours, respectively. As shown, a major event at the Proposed Project would generate 5,777, 8,156, and 5,728 trips during the weekday pre-event, weekday post-event, and weekend pre-event peak hours, respectively.

Table 3.14-30 displays the Proposed Project daily vehicle trip generation for NBA games and concerts held on weekdays and weekends. This table indicates that the daily trip generation of these events is relatively similar, ranging from about 18,840 to 19,960 trips.

Total ³	18,980	18,840	19,964	19,814

NOTES:

¹ Assumes 4 pre-event and 4 post-event employee shuttle drop-offs and pick-ups in addition of shuttling of attendees.

² Includes vendors, security, etc.

³ Does not include trip generation associated with ancillary land uses. Only applies to scenario in which major event does not coincide with our nearby venue events.

⁴ Assumes 1 percent shift in driving to transit from weekday to weekend concerts consistent with estimate for weekday versus weekend NBA game.

SOURCE: Fehr & Peers, 2019.

The estimates in these tables do not include trips that would also be generated by the ancillary land uses. While it is expected that much of the travel to/from the retail/restaurant component of the ancillary land uses would be associated with event attendees (based on surveys of Clippers game attendee surveys at Staples Center and observations from other venues), some new trips associated with ancillary land uses are nonetheless expected. *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC* in Appendix K.1 discusses the methods used to estimate the external vehicle trips generated by the proposed ancillary land uses during the pre-event and post-event peak hours.

Parking Demand

Based on Table 3.14-27, a weekday basketball game would generate a parking demand by attendees and employees of approximately 7,700 spaces. Based on Table 3.14-28, a concert would result in a parking demand of approximately 8,100 spaces. These totals exclude additional parking required for players, officials, and charter buses, service/delivery vehicles, etc. For events held at the Proposed Project when there is no overlapping event at the NFL Stadium, vehicles would be expected to be parked at the following off-street locations in the following quantities (based on their proposed supply):

- 3,110 vehicles would be parked in the West Parking Garage.
- 365 vehicles would be parked in the East Parking Garage.
- 650 vehicles would be parked in the South Parking Garage (with 100 of those spaces being reserved for players and key team employees).
- Between 3,700 and 4,100 vehicles would be parked in parking lots or structures within the Hollywood Park Specific Plan including new parking lots or structures to be constructed for the NFL stadium and the Hollywood Park Casino garage (located north of West Century Boulevard and east of South Prairie Avenue).

A modest amount of on-street parking would occur on residential and collector streets in the project vicinity. The City of Inglewood is planning to expand residential parking districts within the City near the Proposed Project and NFL Stadium, in order to prevent attendees from parking on residential streets near these new venues. However, such a program is not assumed under adjusted baseline conditions because it is unknown whether the City would expand such districts or, if they are expanded, what the geographic scope of those districts might be.

Hollywood Park and the Hollywood Park Casino are the most convenient off-site locations to accommodate the parking needs of attendees and employees to the Proposed Project. Hollywood Park and the Hollywood Park Casino would offer the easiest pedestrian connections to the Proposed Project, given their close proximity. Further, the large supply of parking at these locations would ensure that parking is available, as compared to smaller lots which may fill up. Based on information from the Hollywood Park Casino owners and City of Inglewood staff, 575 spaces would be available for use by Proposed Project attendees for a typical major event. About 9,000 spaces at the NFL Stadium within Hollywood Park would be available for use by Proposed Project attendees on typical days when there is not an overlapping event in the stadium.

The majority of off-street parking to be constructed in conjunction with the Proposed Project would be pre-paid during major events, particularly the South Parking Garage, and often the West Parking Garage. The types and size of activities would dictate when parking would be paid versus first-come, first-served. The east parking garage may offer both pre-paid and first-come, first-served parking. All three parking garages are being designed to include entry lanes and associated technologies that minimize the likelihood of inbound traffic spilling back onto public streets. It is anticipated that attendees would arrive consistently to all available parking locations (i.e., versus filling all on-site spaces first and then directing drivers to off-site spaces).

The supply of parking in the three parking garages and at Hollywood Park and the Hollywood Park Casino is more than adequate to accommodate attendee and employee parking demands during major events at the Proposed Project (so long as an overlapping event at the NFL Stadium is not occurring). Parking on adjacent neighborhood streets would primarily be due to attendees searching for free and/or closer parking, and not the result of inadequate overall off-street supply. The overlapping events subsection presented later describes how the Proposed Project parking demands would geographically change when a major event is held concurrently at the NFL Stadium.

Trip Distribution and Assignment

The trip distribution for NBA games for the pre-event peak hour was developed based on anonymous mobile source data (“big data”) records that show origins and destinations of fans attending Clippers games at Staples Center. The data is comprised of approximately 20,000 one-way trips to and from 12 Clippers games during the 2017–2018 NBA season. To avoid capturing travel to the project vicinity associated with non-basketball activities, the data includes only dates when there were no other events happening at the Staples Center, LA Live, or the Convention Center.

The trip distribution for concerts (post-event period analysis) was developed based on anonymous mobile source data from 44 dates when events were held at The Forum between October 2017 and April 2018, along with an additional four events in December 2018. This dataset is comprised of approximately 59,000 one-way trips. Concert trip distribution also considered intersection vehicle counts collected in Fall/Winter 2018 at nine intersections near The Forum during dates that had concerts and dates when The Forum was not in use. The difference in volumes between ‘no event’ and ‘with concert’ was used to inform distribution to and from The Forum.

Although Clippers ticket purchase data by zip code was also available, this data was considered less accurate than the mobile source data for various reasons, which are described in *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC* contained in Appendix K.1.

Figure 3.14-7 displays the spatial distribution for weekday trips to The Forum and NBA Clippers games across the nine sub-area planning regions in Los Angeles County (as defined by Metro) as well as bordering counties. The percentage of trips originating from each subarea for concerts at The Forum and Clippers games at Staples Center are relatively similar. However, differences do

SOURCE: Fehr and Peers, 2019

Inglewood Basketball and Entertainment Center

Figure 3.14-7
Spatial Distribution of Major Event Attendees

exist in Central Los Angeles (where NBA attendees make up a greater share of attendees by 7 percent) and the Gateway Cities (where concert attendees make up a greater share of attendees by 6 percent). These differences are likely due to a number of factors such as frequency of attending events (i.e., most NBA game attendees are season ticket holders who attend multiple games each year and would be less likely to travel long distances for frequent games). In contrast, concert attendees are purchasing tickets for individual shows, and may be more willing to travel longer distances to attend a single show for an artist or band.

Figures 3.14-8 and 3.14-9 display expected trip distribution percentages for pre-event inbound and post-event outbound travel, respectively. These percentages consider not only the origin and destination of each trip, but also traffic management techniques (described in the following subsection) for each peak hour and permitted garage ingress/egress movements. Figure 3.14-8 indicates that 35 percent of project trips are expected on northbound South Prairie Avenue approaching the Proposed Project. Another 24 percent originate from west (i.e., travel eastbound) along West Century Boulevard. The direction of outbound travel after events is generally similar.

Trips were assigned to parking lots/garages in a manner that considers that most motorists would park in a location prior to reaching the site, but that some motorists would pass the site en route to either premium parking (i.e., in the south or west garage) or other reserved parking. Additionally, given the relative proportion of arriving traffic in each direction versus parking supply locations, some trips would necessarily have to pass through the West Century Boulevard/South Prairie Avenue intersection to access parking. For instance, the total parking supply in the West and South garages would not be sufficient to accommodate all motorists traveling northbound on South Prairie Avenue. Some of these motorists would travel through the West Century Boulevard/South Prairie Avenue intersection to access parking in Hollywood Park.

For pre-event conditions, it is expected that some attendees traveling to the venue via a TNC would request to be dropped off near the plaza, versus in the designated East Parking Transportation Hub, or would exit their vehicle at other locations along the curb once the vehicle encounters heavy congestion. For analysis purposes, it is assumed that one-third of pre-event peak hour TNC drop-offs occur along a public street curb (i.e., along South Prairie Avenue or West Century Boulevard) while two-thirds (i.e., most traveling from the east) are dropped off in the East Transportation Hub. This approach is consistent with observations from other urban arenas, in which TNC drop-offs tend to occur adjacent to the venue unless precluded by physical barriers and/or enforcement. For post-event conditions, the arena is assumed to be placed within a 'geofenced area' in which attendees requesting a TNC are directed to meet the vehicle at the East Parking Garage. Thus, all post-event TNC pick-up activity would occur in this garage (or at a location further from the Proposed Project that would require a longer walk). The use of a geofence has been shown to be an effective means of controlling the location where TNC pick-ups can occur; for example, a geofence is used at the LAX central terminal and at numerous other sporting/entertainment centers (e.g., Seattle Center, Levi's Stadium, etc.).

NOTE: Distribution percentages apply for conditions in which there is not an overlapping event at The Forum or NFL Stadium

Inglewood Basketball and Entertainment Center
Figure 3.14-9
 Outbound Trip Distribution for Major Event

The analysis that follows is based on the premise that the regional distribution of NBA Clippers game attendees traveling to the Proposed Project is the same as the distribution of game attendees observed to currently travel to Staples Center. While it is conceivable that changes in fan base and thus distribution patterns may occur, it would be speculative to estimate the type and magnitude of such a shift. The distribution of trips to the Proposed Project for concerts is based on the distribution from concerts at The Forum, which is reasonable given their proximity.

Parking Garage Access and Traffic Management during Major Events

Figure 3.14-10 shows the permitted movements and lane configurations planned during the pre-event peak hour at the West and South Parking Garages for a major event. This figure also displays other traffic management elements (e.g., lane closures) assumed during the pre-event peak hour. **Figure 3.14-11** shows similar information for the post-event peak hour.

Lanes along South Prairie Avenue would be temporarily modified to enable simultaneous dual left-turns and dual right-turns to enter the West Parking Garage driveway on South Prairie Avenue. Traffic Control Officers (TCOs) would be stationed at specific locations to monitor conditions and in some instances, assign right-of-way.

The permitted turning movements at the West Parking Garage driveways are intended to empty that garage as quickly as possible while minimizing cross flows (i.e., motorists are pushed away from the arena toward streets that otherwise have capacity). To accomplish this, the following egress is planned for post-event conditions (see Figure 3.14-11):

- The West Parking Garage driveway on West Century Boulevard would consist of three exiting lanes, all of which would turn left onto westbound West Century Boulevard. This signalized intersection would operate with special traffic signal timings such that operations along West Century Boulevard at South Prairie Avenue and the garage driveway are coordinated.
- The West Parking Garage driveway on South Prairie Avenue would be configured so that two lanes turn right onto southbound South Prairie Avenue. By virtue of lane closures upstream on South Prairie Avenue, these exiting lanes would be fed directly into the outside and middle southbound travel lanes on South Prairie Avenue. One continuous southbound travel lane would be provided from West Century Boulevard through the West Parking Garage driveway intersection.

For analysis purposes, TCOs were assumed to be positioned at several key intersections in the project vicinity including along West Century Boulevard at the west garage entry, South Prairie Avenue, Doty Avenue, the Hollywood Park Casino/east garage entry, and Yukon Avenue. TCOs would be situated on South Prairie Avenue at the west garage entry.

The South Parking Garage would permit right-turns only at its driveway on South Prairie Avenue before and after events. Access onto West 102nd Street via Doty Avenue would also be provided.

Note:
 - Exhibit does not display required advance signage to alert motorists of lane closures and transitions.
 - This exhibit only depicts placement of equipment and TCOs within immediate vicinity of IBEC. Additional equipment and TCOs are also required at select locations further from site.

Intersection, Neighborhood Street, and Freeway Evaluation

Table 3.14-31 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Adjusted Baseline No Project and Adjusted Baseline Plus Project (Major Event) conditions for the three event-related peak hours (see Appendix K.3 for technical calculations). A number of intersections would be significantly impacted during each peak hour. Extensive vehicle queue spillbacks would occur on portions of eastbound West Century Boulevard and northbound South Prairie Avenue heading toward the Project Site. Under this and other intersection LOS tables that display Proposed Project impacts during major events, certain unsignalized intersections may be reported as operating at LOS F with the Proposed Project, but impacts are not identified as significant because the applicable traffic signal warrant (which is part of the significance criteria) is not met.

Table 3.14-32 displays the average weekday and weekend daily traffic volumes on the neighborhood street study segments under Adjusted Baseline Conditions for No Project and Plus Project (Major Event) conditions.

Table 3.14-33 shows the Adjusted Baseline LOS on freeway mainline segments for the three event-related peak hours, without and with trips generated by a major event (see Appendix K.2 for additional data supporting the freeway impact conclusions and Appendix K.3 for technical calculations). **Table 3.14-34** shows the 95th percentile vehicle queues at freeway off-ramps for these scenarios. A major event would cause degraded operations at several facilities, some of which are considered significant. A major event would also cause three freeway off-ramps during the weekday pre-event peak hour and two freeway off-ramps during the weekend pre-event peak hour to experience queuing that exceeds the applicable threshold.

Key findings from the tables referenced above include the following:

- With respect to intersections:
 - Proposed Project impacts on intersections are more frequent during the weekday pre-event peak hour (40 impacted intersections) than during the other two event study periods (11 during the weekday post-event hour and 26 during the weekend pre-event hour).
- With respect to freeway facilities:
 - Proposed Project impacts on freeway segments are generally more extensive during the weekday pre-event peak hour than during the other two event study periods.
- With respect to freeway off-ramp queuing:
 - Proposed Project impacts on freeway off-ramp queuing are significant at three off-ramps during weekday pre-event peak hour two one off-ramp during the weekend pre-event peak hour.

				Weekend Pre-Event			N / A	N / A
116	South Prairie Ave/West Structure Driveway	HCM	Inglewood	Weekday Pre-Event			55.5	E
				Weekday Post-Event	Does Not Exist		N / A	N / A
				Weekend Pre-Event			26.1	C

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is at E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

Shaded cells identify significant impacts.

¹ ADT represents average daily traffic (total volume in both directions).

Above results are applicable for both major events consisting of an NBA basketball game and a concert based on their very similar levels of usage of neighborhood streets. Total traffic levels on these streets are within 1 percent of each other.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

I-110 NB Off-Ramp at Manchester Blvd	3,655	1,285	1,351	No	No	1,285	1,351	No	No

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Transit System Evaluation

The Proposed Project ancillary land uses are expected to generate a modest number of new bus riders. According to Table 3.14-14, the external vehicle trips were reduced by 17 in the AM peak hour and 24 in the PM peak hour to reflect trips made by walking, bicycling, or riding the bus. Those that choose to ride the bus would be dispersed over three different lines (Metro Line 117 on West Century Boulevard and Lines 211 and 212 on South Prairie Avenue) that operate in all directions with headways every 15 to 30 minutes during peak periods. Given that there is reserve

capacity on these lines, the Proposed Project ancillary land uses would not cause ridership on any of these bus lines to exceed their load capacity.

Based on the data presented in Table 3.14-19, a 2,000-person weekday Daytime Event at the Proposed Project would generate 21 bus riders during the AM peak hour. Based on the data presented in Table 3.14-20, a 7,500-person weekday Daytime Event would generate 99 bus riders during the PM peak hour. According to *Technical Memorandum #1 – Supplemental Information Regarding Existing Conditions* (in Appendix K.1), Metro Lines 117, 211, and 212 experience existing peak hour ridership levels that represent less than 50 percent of the directional capacity of each line. Therefore, these routes have reserve capacity (to accommodate up to 700 additional riders). Thus, a weekday Daytime Event at the Proposed Project would not cause ridership on any of these bus lines to exceed its load capacity.

Light rail ridership under adjusted baseline conditions is expected to increase over current conditions due to the opening of the Crenshaw/LAX light rail line. Because the Crenshaw/LAX Line is not yet operational, ridership data is unavailable. Accordingly, to analyze ridership and reserve capacity on this line, 2025 ridership forecasts were obtained from Metro, and specifically the forecasts associated with the Metro board recommended Alternative C-3.¹⁹ This alternative consists of an interline train between existing Norwalk Station (Green Line) and Expo/Crenshaw, and a short line train between Willowbrook/Rosa Parks Station and Redondo Beach Station (Green Line). To convert to a peak hour estimate of ridership on the Crenshaw/LAX Line, the analysis used the ratio of AM peak hour riders (which was provided by Metro) to peak period riders from the 2025 ridership data provided by Metro at the Hawthorne/Lennox and Downtown Inglewood Stations. This ratio, 17 percent, was used as it represents conditions at the stations closest to the Project Site, to convert from peak period ridership to PM peak hour ridership. Metro has not prepared weekend forecasts for the Crenshaw/LAX Line. To estimate weekend ridership, the analysis was based on the ratio of existing weekday peak hour load and weekend peak hour load, which is 21 percent on the Green Line. To estimate hourly load, the boardings and alightings were added and subtracted at each station, to calculate the remaining hourly on-vehicle load.

The transit mode share model (see *Technical Memorandum #2 – Project Travel Demand Estimates for IBEC* in Appendix K.1) was used to estimate the directionality of Proposed Project light rail riders and their relative use of the Downtown Inglewood station along the Crenshaw/LAX Line or the Hawthorne/Lennox Station along the Green Line. **Table 3.14-35** displays the expected usage of various light rail lines and stations for each of the peak hours being studied. As shown, the majority of riders are expected to board/alight to/from the north (toward the Expo Line) at the Downtown Inglewood Station, or board/alight to/from the east (on the Green Line) at the Hawthorne/Lennox Station.

¹⁹ <https://boardagendas.metro.net/board-report/2018-0710/>.

TABLE 3.14-35
DIRECTIONALITY OF LIGHT RAIL RIDERS – ADJUSTED BASELINE PLUS PROJECT (MAJOR EVENT) CONDITIONS

Line	Station	Direction	Weekday		Weekend
			Pre-Event Peak Hour	Post-Event Peak Hour	Pre-Event Peak Hour
Crenshaw/LAX	Downtown Inglewood	North	0%	51%	0%
		South	51%	0%	51%
Green Line	Hawthorne/Lennox Station	East	6%	43%	6%
		West	43%	6%	43%

SOURCE: Fehr & Peers, 2019.

Table 3.14-36 presents the Adjusted Baseline pre-event peak hour (for both weekdays and weekends) passenger load and capacity approaching the Downtown Inglewood and Hawthorne/Lennox Stations. These particular light rail stations are selected because each station is the closest and most convenient to the Proposed Project on the Crenshaw/LAX and Green lines, respectively, and would be the stations most likely to be used by attendees of events at the Proposed Project (with proposed connecting shuttle service for major events). This table shows that there would be sufficient rail transit capacity to accommodate the Proposed Project demands during the weekday and weekend pre-event peak hours.

TABLE 3.14-36
ADJUSTED BASELINE PLUS PROJECT (MAJOR EVENT) LIGHT-RAIL TRANSIT LOAD – PRE-EVENT PEAK HOUR CONDITIONS

Line	Station	Direction	Peak Hour Capacity ¹	Weekday			Weekend			
				No Project Peak Hour Load	Project Load ²	Plus Project Load (% Capacity)	No Project Peak Hour Load	Project Load ⁴	Plus Project Load (% Capacity)	
Crenshaw/LAX	Downtown Inglewood	North	2,380	569	0	569 (24%)	850	120	0	120 (14%)
		South	2,380	1,098	317	1,415 (59%)	850	267	379	646 (76%)
Green Line	Hawthorne/Lennox	East	2,380	1,385	34	1,419 (60%)	680	255	44	299 (44%)
		West	2,380	167	265	432 (18%)	680	106	319	425 (63%)

NOTES:

- ¹ Based on ten two-car trains each having a capacity of 238 passengers (inclusive of seated and standing passengers) during peak hours.
- ² Project peak hour light rail riders calculated from Table 3.14-25 as follows: 1,080 pre-event attendees use transit with 68 percent arriving during pre-event peak hour of which five-sixths arrive via light rail (1,080 x 68% x 83% = 611) riders. Similarly, 66 employees arrive via transit with 10 percent occurring during pre-event peak hour and four-fifths using light rail (66 x 10% x 80% = 5 riders). Total ridership is thus 616.
- ³ Based on five two-car trains each having a capacity of 170 passengers (inclusive of seated and standing passengers) during off-peak peak hours.
- ⁴ Project peak hour light rail riders calculated from Table 3.14-27 as follows: 1,260 pre-event attendees use transit with 68 percent arriving during pre-event peak hour of which six-sevenths arrive via light rail (1,260 x 68% x 86% = 737) riders. Similarly, 66 employees arrive via transit with 10 percent occurring during pre-event peak hour and four-fifths using light rail (66 x 10% x 80% = 5 riders). Total ridership is thus 742.

SOURCE: Fehr & Peers, 2019.

Table 3.14-37 shows this same information for Adjusted Baseline weekday post-event conditions. This table indicates that a major event at the Proposed Project could cause ridership in light rail trains traveling in the eastbound direction on the Green Line (i.e., leaving the Hawthorne/Lennox Station) to exceed their capacity.

**TABLE 3.14-37
 ADJUSTED BASELINE PLUS PROJECT (MAJOR EVENT) LIGHT RAIL TRANSIT LOAD – WEEKDAY POST-EVENT
 PEAK HOUR CONDITIONS**

Line	Station	Direction	Peak Hour Capacity ¹	No Project Peak Hour Load ²	Project Load ³	Plus Project Load (% Capacity)
Crenshaw/LAX	Downtown Inglewood	North	850	256	355	611 (72%)
		South	850	488	0	488 (57%)
Green Line	Hawthorne/Lennox	East	850	622	297	919 (108%)
		West	850	70	38	108 (13%)

NOTES:

- ¹ Post-event train capacity is much lower than pre-event due to fewer trains per hour and lower 'standing room only' thresholds adopted by Metro.
- ² Applied the ratio of existing PM peak hour two-way train load versus 9 to 10 PM two-way train load (i.e., calculated as 45 percent on the Green Line at Hawthorne/Lennox Station) to the Adjusted Baseline PM peak hour train load to obtain post-event peak hour riders.
- ³ Project peak hour light rail riders calculated from Table 3.14-26 as follows: 925 post-event attendees use transit with 83 percent departing during post-event peak hour of which four-fifths depart via light rail ($925 \times 83\% \times 80\% = 614$) riders. Similarly, 56 employees depart via transit with 79 percent occurring during post-event peak hour and four-fifths using light rail ($56 \times 79\% \times 80\% = 35$ riders). Total ridership is thus 737.

SOURCE: Fehr & Peers, 2019.

Bus riders are expected to use various Metro bus routes (including 117, 211, and 212) that stop in the project vicinity. These lines would have ample reserve capacity to accommodate pre-event riders. Under post-event conditions, Route 117 operates one bus in each direction during the post-event hour, with a load capacity of 44 riders per direction per hour. Route 211 ends operations before the post-event hour. Route 212 operates two buses in each direction during the post-event hour, with a load capacity of 96 riders per direction per hour. With 162 post-event peak hour bus riders, bus capacity (for routes that stop in the immediate vicinity of the Arena Site) could be exceeded during a major event at the Proposed Project.

The Governor’s Office of Planning and Research has issued a technical advisory concerning the analysis of transportation impacts under CEQA. The advisory provides the following guidance concerning analyzing a project’s potential impact on transit:

When evaluating impacts to multimodal transportation networks, lead agencies generally should not treat the addition of new transit users as an adverse impact. An infill development may add riders to transit systems and the additional boarding and alighting may slow transit vehicles, but it also adds destinations, improving proximity and accessibility. Such development also improves regional vehicle flow by adding less vehicle travel onto the regional network.²⁰

²⁰ Governor’s Office of Planning and Research, Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018), p. 19.

This analysis has been prepared in accordance with OPR's guidance. The extent to which the project may interfere with transit operations is discussed. In addition, the analysis discloses the extent to which existing transit capacity is adequate to accommodate transit demand generated by the Proposed Project; such transit demand is not, however, considered an impact of the Proposed Project under CEQA. Rather, the information is provided for information purposes.

Pedestrian System Evaluation

The pedestrian system evaluation focuses on the adequacy of existing and planned facilities to accommodate surges in pedestrians associated with events at the Proposed Project. Chapter 16 of the *Highway Capacity Manual, 6th Edition*²¹ presents a detailed methodology for calculating the pedestrian LOS for a given street segment. In determining the overall LOS, this methodology considers a variety of factors such as block length, pedestrian wait times at intersections, route directness, sidewalk width, presence of lateral obstructions, midblock crossing opportunities, curb presence, width of outside through lane or bike lane, proportion of on-street parking that is occupied, buffer width to the street, etc. These factors play a role in how a pedestrian perceives the quality of the pedestrian system. However, these factors are not as important when considering surges in pedestrian flows associated with large events. In such instances, the evaluation typically focuses on whether crosswalks and sidewalks are of sufficient width to accommodate projected pedestrian flows during peak periods. If pedestrian flows become excessive, pedestrians may overflow onto streets, which can cause conflicts with moving vehicles and other forms of travel.

Crosswalks and sidewalks are analyzed using average pedestrian space as the threshold for determining facility adequacy. Average pedestrian space reflects the level of crowding on a crosswalk or sidewalk. It represents the average amount of sidewalk area available to each pedestrian walking along the segment. According to Page 4-31 of the HCM, average pedestrian space, which is represented in square-feet per person (i.e., ft²/ped) depends on the pedestrian flow rate, which is expressed as the number of pedestrians per minute per foot of effective sidewalk space. Additionally, the average walk speed (typically assumed to be 4 feet per second, or 2.7 mph) influences average pedestrian space. Consistent with HCM guidance, a 0.85 peak hour factor is applied to represent a moderate surge in pedestrian travel during the busiest 15 minutes of the peak hour.

For sidewalks, 13 ft²/ped of pedestrian space has been set as the lowest acceptable threshold per the HCM. This value is near the LOS E/F threshold for facilities with cross-flows. For crosswalks, a value of 11 ft²/ped is used, which represents an LOS E/ F threshold under platooned (i.e., walking together in a group) flow conditions. For crosswalks, an additional step is required that considers the amount of walk time provided for the crosswalk (while also considering the intersection cycle length). According to Chapter 16 of the HCM, pedestrian flow rates remain relatively stable when the average space per pedestrian drops into the range of 5 to 9 ft²/ped. But when pedestrian space is reduced to below 5 ft²/ped, the flow rate declines precipitously.

²¹ Transportation Research Board, 2016. *Highway Capacity Manual (HCM), 6th Edition: A Guide for Multimodal Mobility Analysis*. Washington, D.C.

Accordingly, the thresholds applied in this study are more restrictive (and therefore more conservative) than the absolute capacity of the facility.

Tables 3.14-38 and 3.14-39 present an analysis of sidewalks and crosswalks, respectively, that would be used to the greatest degree under Adjusted Baseline Plus Project post-event peak hour conditions for an 18,500-person concert (see Appendix K.3 for technical calculations). The analysis focuses on an 18,500-person concert because that is the event that would generate the largest number of pedestrians. In addition, the analysis focuses on post-event conditions because hourly pedestrian volumes are higher after an event rather than before the event (i.e., flows are more concentrated after the event, when attendees tend to leave en masse when the event concludes; before an event, by contrast, attendees arrive more gradually, over a longer period of time). Volumes would be slightly lower for the post-event peak hour for an NBA basketball game due to slightly lower venue capacity. Figure 3.14-12 graphically displays the pedestrian flows and associated LOS on these facilities. The selected sidewalks are those that are most proximate to the arena, and provide access between the arena and transit and parking facilities in the vicinity.

**TABLE 3.14-38
 SIDEWALK FACILITY ANALYSIS – BASELINE PLUS PROJECT POST-EVENT PEAK HOUR
 (18,500-PERSON CONCERT)**

Facility	Segment	Side	Width ^a (ft.)	Pedestrians During Post- Event Peak Hour	Average Pedestrian Space	LOS
West Century Boulevard	South Prairie Ave to Doty Ave	North	8	555	132	A
	South Prairie Ave to Plaza Opening ^b	South	20	—	—	B
	East of Arena Plaza to Doty Ave	South	8	5,360	14	E
	Doty Ave to Casino Access	North	8	2,220	33	C
	Doty Ave to East Garage Access	South	8	3,695	20	D
	Casino Access to Yukon Ave	North	8	2,289	32	C
	East Garage Access to Yukon Ave	South	8	371	198	A
South Prairie Avenue	West Century Blvd. to Hardy Ave	East	8	2,892	25	C
	Plaza Opening to West Century Blvd ^b	East	20	—	—	B
Pedestrian Bridge Over South Prairie Avenue to West Parking Garage			25	5,627	50	B

NOTES:

Analysis performed for post-event peak hour condition associated with a sold-out (18,500-person) concert because this activity would have a greater pedestrian flow demand than an NBA basketball game.

^a Average pedestrian space takes into consideration effective sidewalk width including obstructions and shy distances (e.g., areas near edge of sidewalk and building face where walking may feel uncomfortable).

^b According to the Proposed Project site plan, sidewalks along the project frontage on South Prairie Avenue south of West Century Boulevard and on West Century Boulevard east of South Prairie Avenue would each be 20 feet wide. These facilities would be expected to accommodate a combined 3,500 persons during the post-event peak hour, in anticipation of accessing the east leg crosswalk at the South Prairie Avenue/West Century Boulevard intersection. Although the precise number of pedestrians using each route is not known at this time (due to details relating the plaza wayfinding, specific arena doors to be opened during post-event egress, etc.), analyses indicate that each sidewalk could accommodate up to 100 percent of this demand while still operating at LOS B.

^a Average pedestrian space takes into consideration signal timing (total cycle length and walk interval) for crosswalk.

SOURCE: Fehr & Peers, 2019.

The pedestrian flows shown in these tables and on Figure 3.14-12 are based on the following anticipated pedestrian travel behaviors, which have been observed and measured at other venues such as Golden 1 Center in Sacramento and Key Arena in Seattle:

1. Pedestrian flows will tend to reach an equilibrium state in which alternate routes eventually achieve similar levels of perceived travel time.
2. Pedestrians tend to initially walk in the general direction of their destination (versus initially veering off-course even if that route has a comparable travel time).

These assumptions were used to estimate the distribution of pedestrians among alternative routes available to them to reach their destinations around the arena. Among pedestrians walking to the east lots within Hollywood Park (including the Hollywood Park Casino garage), 15 percent are assumed to use the east leg crosswalk at the West Century Boulevard/South Prairie Avenue intersection, with the remaining 85 percent walking east along the south side of West Century Boulevard toward Doty Avenue. From there, they would cross at one of four crosswalks to reach the north side of the street. The 15 percent/85 percent split results in both this east leg crosswalk and south side of West Century Boulevard operating at LOS E (i.e., hence the equilibrium state).

If the east leg crosswalk at the West Century Boulevard/South Prairie Avenue intersection were to instead be used by 33 percent of those attendees destined for parking on the east side of Hollywood Park, the total pedestrian volume in the crosswalk would increase from approximately 3,450 to 4,100 pedestrians. This would cause the average pedestrian space to decrease from 12 to 10 ft²/ped, dropping its performance below the 11 ft²/ped threshold for crosswalks. Conversely, if

none of these pedestrians used the east leg crosswalk, this would cause the average pedestrian space on the south side of West Century Boulevard west of Doty Avenue to decrease from 14 to 12 ft²/ped, dropping its performance below the 13 ft²/ped threshold for sidewalks. It is worth noting that the north side of West Century Boulevard between South Prairie Avenue and Doty Avenue would carry 550 pedestrians and operate at LOS A. Mitigation measures pertaining to pedestrian facilities consider the sensitivity of how pedestrian routing can affect their operations.

Vehicle Miles of Travel Evaluation

This section describes the methodologies used to estimate the VMT associated with various project activities and scenarios. Refer to *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for further detail regarding the methodology and supporting calculations. VMT is often expressed on a ‘per capita’ or ‘per employee’ basis to understand the relative efficiency of a project. By definition, one VMT occurs when one vehicle is driven one mile. A given daily VMT value represents VMT for entire weekday or weekend day. Lastly, VMT values in this analysis represent the full length of a given trip, and are not truncated at city, county, or region boundaries.

For the purpose of determining the significance of impacts of the Proposed Project on VMT, VMT estimates were prepared for daytime events and major events at the Proposed Project as well as for the ancillary uses. The analysis included estimates for events at the Proposed Project as well as for similar existing events venues elsewhere in the region which could potentially move to the Proposed Project. The VMT estimates include vehicle trips by private vehicles, TNCs (e.g., Uber, Lyft), employees, shuttles, and miscellaneous.

Table 3.14-40 displays the weekday daily VMT associated with the ancillary land uses (refer to *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for technical calculations). These estimates were developed using trip generation estimates from Table 3.14-14 and trip length data from the SCAG travel demand model for the traffic analysis zone in which the Proposed Project is located (13.4 miles for home-based work attractions, 9.3 miles for home-based other attractions, 7.5 miles for non-home-based attractions, and 5.9 miles for non-home-based productions). These values represent the VMT generated by these uses. The three office-related components would have a combined 379 employees, which translate to 15.0 daily work VMT per employee.

Table 3.14-41 displays the VMT associated with the two Daytime Events being studied (refer to *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for technical calculations). These estimates were developed starting with the disaggregated daily trip generation of each event (Table 3.14-21). The number of attendee vehicle trips was then multiplied by an average attendee trip length of 20.3 miles, obtained from the Forum attendee origin-destination mobile source data described previously given the proximity of The Forum to the Project Site. Average trip lengths for employees were derived from the SCAG travel demand model.

**TABLE 3.14-40
WEEKDAY VMT GENERATED BY ANCILLARY LAND USES**

Land Use	VMT ¹	Notes
Office ²	5,694	VMT shown only for primary work trip. ³
Retail	6,998	Includes all vehicle travel.
Full-Service Restaurant	9,171	Includes all vehicle travel.
Quick Service Restaurant	5,113	Includes all vehicle travel.
Coffee Shop	3,641	Includes all vehicle travel.
Community Space	2,794	Includes all vehicle travel.
Business Hotel	5,144 ⁴	Includes all vehicle travel.

NOTES:

¹ Applies on a day in which an event is not occurring at Arena Site.

² Includes 71,000 square-foot office space, 25,000 square-foot sports medicine clinic, and 54 employees associated with practice facility.

³ VMT associated with mid-day employee trips (e.g., to lunch) not included. Calculation per significance criterion for office use.

⁴ A net increase of 4,057 over the 1,087 VMT generated by the existing hotel on the Project Site.

SOURCE: Fehr & Peers, 2019.

**TABLE 3.14-41
VMT GENERATED BY DAYTIME EVENTS**

Event Type	Day	VMT per Event	Notes
2,000-Person Corporate/Community Event	Weekday	68,645	Represents all vehicle travel and does not subtract VMT from a potentially relocated event.
	Weekend	68,645	
7,500-Person Other Sporting Event or Gathering	Weekday	163,209	
	Weekend	163,209	

SOURCE: Fehr & Peers, 2019.

Table 3.14-42 displays the estimated VMT per event and VMT per attendee associated with the two major events being studied (refer to *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for technical calculations). These estimates were developed starting with the disaggregated daily trip generation of each event (Table 3.14-30). For the NBA game, the number of attendee vehicle trips was then multiplied by an average attendee trip length of 22.2 miles. This trip length was obtained from the Staples Center attendee origin-destination mobile source data described previously, recalculated to reflect the difference in trip lengths between travel to Staples Center and travel to the Project Site and conservatively assuming no shift in fan base. For the concert, the number of attendee vehicle trips was then multiplied by an average trip length of 20.3 miles for concerts at the Proposed Project, obtained from the Forum attendee origin-destination mobile source data described previously. Average trip lengths for employees were derived from the SCAG travel demand model.

TABLE 3.14-42
VMT GENERATED BY MAJOR EVENTS

Event Type	Day	VMT per Event	VMT per Attendee	Notes
18,000-Person NBA Basketball Game	Weekday	398,447	22.1	Represents all vehicle travel and does not subtract VMT from a potentially relocated event.
	Weekend	394,985	21.9	
18,500-Person Concert	Weekday	389,598	21.1	
	Weekend	386,237	20.9	

SOURCE: Fehr & Peers, 2019.

Table 3.14-43 illustrates how the two major events would affect regional VMT if they were replacing events otherwise being held at venues elsewhere in the region (refer to *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for technical calculations). All NBA Basketball games would replace games at Staples Center. A sold-out NBA basketball game at Staples Center was assumed to have 19,079 attendees (obtained from an internet search of Staples Center capacity²²) with an average attendee trip length from the mobile source data of 18.7 miles and mode splits based on the 2018 online survey of Los Angeles Clippers fans at Staples Center described previously. As shown in the table, the Proposed Project would result in approximately 79,000 to 89,000 added VMT for a major event consisting of an NBA Basketball game replacing an NBA Basketball game at Staples Center, with the net increase stemming from Staples Center having a higher non-auto mode split and shorter trip lengths when compared to the Proposed Project.

TABLE 3.14-43
NET CHANGE IN VMT CAUSED BY PROPOSED PROJECT MAJOR EVENTS

Event Type	Day	Added VMT per Event	Subtracted VMT per Event	Net Change in VMT per Event	Net Change in VMT per Attendee
18,000-Person NBA Basketball Game Replacing Sold-Out NBA Game at Staples Center	Weekday	398,447	-309,600 ¹	+88,847	+4.9
	Weekend	394,985	-315,882 ¹	+79,103	+4.4
18,500-Person Concert Replacing Sold-Out Concert Elsewhere in the Region	Weekday	389,598	-291,277 ²	+98,321	+5.3
	Weekend	386,237	-297,229 ²	+89,008	+4.8

NOTES:

¹ Subtracted VMT is based on a sold-out 19,079-person NBA Basketball Game that would otherwise occur at Staples Center in Downtown Los Angeles (see *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for calculations).

² Subtracted VMT is based on a sold-out 17,500-person Concert that would otherwise occur at concert venue elsewhere in the region (see *Technical Memorandum #3 – Vehicle Miles Traveled Analysis for IBEC* in Appendix K.1 for calculations).

SOURCE: Fehr & Peers, 2019.

²² Staples Center, A-Z Guide, Seating Capacity. Available: <https://www.staplescenter.com/guest-services/a-z>. Accessed May 9, 2019.

A sold-out concert at a similar-sized concert venue elsewhere in the region was assumed to have 17,500 attendees (based on sell-out capacities of 17,500 for The Forum and the Hollywood Bowl and up to 20,000 for Staples Center), with an average attendee trip length of 18.6 miles. The Proposed Project would result in up to approximately 98,000 added VMT for a major event consisting of a concert replacing a concert at a venue elsewhere in the region; this increase in VMT is due to the larger sell-out capacity of the Proposed Project when compared to many other venues in the region. Based on data from the Stone Planning report, *Inglewood Basketball and Entertainment Center – Analysis of Future Events*,²³ 20 percent (5) of the anticipated 23 annual concerts at the Proposed Project may be new to the market versus transferred from another venue elsewhere in the region.

Cumulative Conditions

This subsection presents the impacts of the Proposed Project for the various cumulative scenarios described in Table 3.14-3.

Cumulative Land Use Assumptions

As discussed in Section 3.0.6, Cumulative Assumptions, the City, in consultation with other surrounding jurisdictions, has assembled a list of 144 known past, present, and reasonably foreseeable cumulative land use development projects in the vicinity of the Project Site. The projects on this list consist of development projects within the City or other identified surrounding jurisdictions which have a pending development applications, are approved, or are under construction. Notable among these related projects is the full buildout of the former Hollywood Park site which, when combined with the baseline development there will total 890,000 square feet of retail space, 2,500 dwelling units, a 300-room hotel and over 4,000,000 square feet of office space. In addition, substantial growth in landside traffic at LAX is forecast as passenger activity increases from approximately 74.9 million annual passengers in 2015 to approximately 91 million annual passengers in 2030.²⁴ Forecasts of projected growth in LAX-related trips included in the EIR for the Landside Access Modernization Program were used as the basis for estimating this element of future traffic growth. The Cumulative Base is the combination of trips generated by the Adjusted Baseline development described in Section 3.14.2 plus trips generated by the related development projects and area-wide ambient growth to Year 2030. Ambient traffic volumes in the vicinity of the study area are assumed to increase at a compounded rate of 0.23 percent per year, based on data in the Congestion Management Program for Los Angeles County²⁵ for the South Bay/LAX Regional Statistical Area in which Inglewood is located. Therefore, over the 12-year planning horizon an increase in total ambient growth of 2.76 percent is used.

²³ Stone Planning, *Inglewood Basketball and Entertainment Center – Analysis of Future Events*, July 2019.

²⁴ Off-Airport Traffic Study (Appendix O), LAX Landside Access Modernization Program Draft EIR, September 2016, p. 141.

²⁵ Los Angeles County Metropolitan Transportation Authority, 2010. *Congestion Management Program*. Prepared by Long Range Planning and Coordination.

The Cumulative No Project scenario was developed by first estimating the number of vehicle trips that would be generated for each related land use development project based on data in environmental clearance documents, data provided by LADOT, and trip generation rates published in the *Trip Generation Manual*.²⁶ As shown in Appendix K.2, these uses would generate a combined total of approximately 18,800 AM peak hour trips and 26,600 PM peak hour trips. Trip generation estimates for these related projects are conservative in that they do not in every case account for either the existing uses to be removed or the possible use of non-motorized travel modes (transit, walking, etc.).

The geographic distribution of the traffic generated by the cumulative projects is dependent on several factors. These factors include the type and density of the proposed land uses, the geographic distribution of population from which the employees and potential patrons of the proposed developments are drawn, and the location of the employment and commercial centers to which residents of residential projects would be drawn, and the location of the projects in relation to the surrounding street system. If available, trip distribution from a cumulative project traffic study was used in this analysis. When trip distribution was not available for a cumulative project, it was estimated based on the factors described above.

Cumulative Transportation System Assumptions

Inglewood Transit Connector

The Inglewood Transit Connector (ITC) is a proposed transit enhancement that would operate in a generally north-south direction along South Prairie Avenue. It would be an elevated transit facility (functionally like the Monorail at Seattle Center, the grade-separated transit connection between Oakland International Airport, and the Bay Area Rapid Transit system, or the automated people mover under construction at LAX). The City of Inglewood studied multiple potential alignments for the ITC and, in July 2018, selected an alignment as the “locally preferred alternative” for further review. The City also issued a NOP commencing the environmental review process for the ITC. The northern terminus of the preferred alignment would be the future Crenshaw/LAX Downtown Inglewood light rail station. From there, it would extend generally south and include stops at The Forum, the NFL Stadium, and, at the southern terminus of the system, the Proposed Project. As currently proposed, the southern station would be located in the northeast quadrant of the South Prairie Avenue/West Century Boulevard intersection.

The cumulative analysis does not consider the ITC when determining the modes of travel for attendees to the Proposed Project, The Forum, or the NFL Stadium, nor does it consider changes in vehicle trip generation generated by the Hollywood Park Specific Plan land uses (which would be situated in close proximity to the ITC). The mode split implications of the ITC were not considered due to the uncertainty of how it would be operated (i.e., hours of operation, headways, etc.).

The ITC would require construction of a series of columns along South Prairie Avenue. Preliminary designs indicate that columns would be placed within the South Prairie Avenue right-

²⁶ Institute of Transportation Engineers, 2017. *Trip Generation Manual, 10th Edition*.

of-way, which may require shifting of travel lanes. Specifically, columns would be placed directly south of West Century Boulevard, which would require widening of South Prairie Avenue to accommodate relocated through lanes. The site plan for the Proposed Project provides sufficient space for this widening, should it be required, and the ITC is not expected to materially affect the operation of the South Prairie Avenue/West Century Boulevard intersection.

South Prairie Avenue Reversible Lane System

Hollywood Park, located on the north side of West Century Boulevard across from the Proposed Project Site, was formerly operated as a horse racetrack. Attendance there reached 40,000 a few times each year. South Prairie Avenue served as a primary route for those entering or exiting the racetrack. In order to improve access for race attendees, the City instituted a “reversible lane” program along South Prairie Avenue. Under this program, the direction of traffic lanes could be reversed by the City before and after events so that an increased level of traffic flow in the inbound or outbound direction could be accommodated. This program was also available to accommodate traffic associated with events at The Forum. In the 1990s, attendance at the racetrack declined, and the Lakers departed The Forum. As a result, the City ceased this program. The City is now evaluating whether to resume this program to improve access to the NFL Stadium before and after major events there. For example, prior to major events at the NFL Stadium, an additional lane of northbound traffic could be provided on South Prairie Avenue between I-105 and West Century Boulevard. By increasing the capacity of South Prairie Avenue during such periods, the program could result in greater capacity along South Prairie Avenue, one of the primary means of accessing the NFL Stadium. If implemented, the program would use the existing lanes along South Prairie Avenue, and would not require widening the road. The program would use gantries and other signage to provide drivers with guidance regarding the availability of lanes. The program would thus provide the City with an additional tool for managing traffic to and from the NFL Stadium. Based on the City’s experience with this program when the racetrack was in operation, the effect of this program on traffic congestion would be beneficial because it would increase capacity along South Prairie Avenue in the peak direction of traffic, thereby increasing the amount of traffic that can approach or depart from the Project Site on South Prairie Avenue, and decreasing the amount of traffic that would approach or depart the Project Site on other streets in the vicinity. The reversible lane program, if resumed for events at the NFL Stadium, could later be expanded to accommodate traffic during major events at The Forum or the Proposed Project. At this time, it is unknown whether or when such a program would be resumed for major events at the NFL Stadium. Nor is it known whether such a program would later be expanded to manage traffic during major events at The Forum or the Proposed Project. Due to these uncertainties, the effects of a reversible lane program, though likely beneficial, have not been incorporated into the transportation analysis.

I-105 Express Lanes

The I-105 Express Lanes project is proposed to enhance traffic flow, improve trip reliability and travel times on I-105 between I-405 and I-605. The project would convert the existing high-occupancy vehicle (HOV) lanes on I-105 to electronically-tolled lanes that allow use by single-occupant vehicles as well as HOVs. An EIR for the project is being prepared by Metro and

Caltrans and is planned for release in late 2019. In addition to the No Build Alternative, the two action alternatives under study are to convert the existing HOV lane in each direction to an express lane, and to convert the existing HOV lane and add a second express lane with non-standard lane widths. This project was not assumed to be in place in the cumulative analysis because the environmental review process is ongoing, full funding has not been established, and it would be speculative at this time to know which alternative would be pursued.

LAX Landside Access Modernization Program

The LAX Landside Modernization Program, currently under construction, is a new ground transportation network comprised of four major elements. Together they are planned to improve ground access to LAX. The major elements are: a 2.25-mile-long automated people mover; two intermodal transportation facilities with parking structures and areas for passenger loading and transfer from personal vehicles, buses, taxis, shuttles and shared ride services; a consolidated rental car facility; and a series of roadway improvements to relieve congestion in and around airport facilities. This system will also connect LAX with the 96th Street station on the Metro Crenshaw/LAX light rail line currently under construction. Phase 1 of the project, including the automated people mover, consolidated rental car facility, intermodal transportation facilities and some roadway improvements is planned for completion by 2024. Phase 2, mainly consisting of remaining roadway improvements, would be constructed from 2024 to 2035. As described in the following section, these improvements are assumed under Cumulative conditions.

Physical Roadway Improvements

The physical roadway improvements listed below are mitigations and/or conditions of approval for the LAX Landside Access Modernization Program or are among the transportation improvements included in the City of Inglewood Capital Improvement Program. These improvements either are under construction or are approved, funded, and scheduled. The roadway improvements are assumed to be in place under all cumulative condition scenarios and are included in the analysis of cumulative conditions.

10. La Cienega Boulevard/Manchester Boulevard

- Southbound approach: reconfigure to provide 2 left-turn lanes, 1 through lane and 1 shared through/right-turn lane
- Northbound approach: reconfigure to provide 2 left-turn lanes, 1 through lane, 1 shared through/right-turn lane and 1 right-turn lane

21. La Cienega Boulevard/Arbor Vitae Street

- Eastbound approach: widen the eastbound approach to provide 1 left-turn lane, 2 through lanes and 1 free-flow right-turn lane

31. La Cienega Boulevard/SB I-405 Ramps (north of West Century Boulevard/98th Street)

- Eastbound approach: construct the west leg of this intersection (98th Street) with 2 left-turn lanes, 2 through lanes and 1 right-turn lane

- Westbound approach: improve to provide 2 left-turn lanes, 1 through lane and 1 shared through/right-turn lane
- Southbound approach: improve to provide 2 left-turn lanes, 3 through lanes and 1 right-turn lane
- Northbound approach: improve to provide 2 left-turn lanes, 1 through lane, 1 shared through/right-turn lane and 1 right-turn lane

34. La Cienega Boulevard/West Century Boulevard

- Westbound approach: reconfigure to provide 1 left-turn lane, 3 through lanes, 1 right-turn lane
- Southbound approach: reconfigure to provide 2 left-turn lanes, 2 through lanes, 1 right-turn lane
- Northbound approach: reconfigure to provide 2 left-turn lanes, 2 through lanes, 2 right-turn lanes

53. La Cienega Boulevard/I-405 Ramps (south of West Century Boulevard)

- Northbound approach: reconfigure to provide 2 through lanes, 1 shared through/right-turn lane

57. La Cienega Boulevard/West 104th Street

- Northbound approach: reconfigure to provide 1 left-turn lane, 2 through lanes, 1 shared through/right-turn lane

87. La Cienega Boulevard/Lennox Boulevard

- Northbound approach: reconfigure to provide 2 through lanes, 1 shared through/right-turn lane

107. La Brea Avenue/Centinela Avenue

- Eastbound and westbound approaches: convert to include protected/permitted left-turn signal phasing

Cumulative Plus Project (Ancillary Land Uses) Conditions

The expected travel characteristics for the Proposed Project ancillary land uses under adjusted baseline conditions were also assumed for cumulative conditions. These trips were added to the Cumulative No Project volumes to develop the Cumulative Plus Project (Ancillary Land Uses) scenario.

Table 3.14-44 displays the weekday AM and PM peak hour LOS and average delay or V/C ratio at the 43 study intersections under Cumulative No Project and Cumulative Plus Project (Ancillary Land Uses) conditions. As shown in the table, these uses would cause several significant degradations in intersection LOS. **Table 3.14-45** displays the average weekday and weekend daily traffic volumes on the neighborhood street study segments under Cumulative Conditions for No Project and Plus Project (Ancillary Land Uses) conditions. As shown in the table, the project

would add trips to three facilities whose daily volume of traffic would exceed the applicable threshold for the facility type.

Table 3.14-46 shows the Adjusted Baseline LOS on freeway mainline segments for weekday AM and PM peak hours, without and with trips generated by the daytime events. **Table 3.14-47** shows the weekday AM and PM peak hour 95th percentile vehicle queues at freeway off-ramps for these scenarios. As shown, the daytime events would cause degraded operations at several facilities, some of which are considered significant. Daytime events would not cause a freeway off-ramp to experience queuing that exceeds the applicable threshold.

Cumulative Plus Project (Daytime Event) Conditions

The expected travel characteristics for the Proposed Project daytime events under Adjusted Baseline conditions were also assumed for cumulative conditions. These trips were added to the Cumulative No Project volumes to develop the Cumulative Plus Project (Daytime Events) scenario.

Table 3.14-48A displays the weekday AM peak hour LOS and average delay or V/C ratio at the 43 study intersections under Cumulative No Project and Cumulative Plus Project (Daytime Event) conditions. As shown in the table, these activities would cause a number of significant degradations in intersection LOS.

Table 3.14-48B displays the weekday PM peak hour LOS and average delay or V/C ratio at the 116 study intersections under Cumulative No Project and Cumulative Plus Project (Daytime Event) conditions. As shown in the table, these activities would cause a number of significant degradations in intersection LOS. Because the Cumulative Plus Project (Daytime Event) conditions caused degraded LOS at many of the intersections at the edge of the 43-intersection study area, the study was expanded to evaluate LOS at all 116 intersections.

Table 3.14-49 displays the average weekday and weekend daily traffic volumes on the neighborhood street study segments under Cumulative Conditions for No Project and Plus Project (Daytime Events) conditions. As shown in the table, the project would add trips to four facilities whose daily volume of traffic would exceed the applicable threshold for the facility type.

Table 3.14-50 shows the Cumulative LOS on freeway mainline segments for weekday AM and PM peak hours, without and with trips generated by the daytime events. **Table 3.14-51** shows the weekday AM and PM peak hour 95th percentile vehicle queues at freeway off-ramps for these scenarios. As shown, the daytime events would cause degraded operations at several facilities, some of which are considered significant. Daytime events would not cause a freeway off-ramp to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Applies to conditions in which an event is not occurring at the Project Site.

⁴ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

NOTES:

- ¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from C to D, from D to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).
- ² LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

**TABLE 3.14-47
FREEWAY OFF-RAMP QUEUING ANALYSIS – CUMULATIVE PLUS PROJECT
(ANCILLARY LAND USES) CONDITIONS**

Off-Ramp ¹	Ramp Capacity Threshold ²	Cumulative No Project				Cumulative Plus Project			
		95th Percentile Queue (ft.) ³		Queue Exceeds Available Storage ⁴		95th Percentile Queue (ft.) ³		Queue Exceeds Available Storage ⁴	
		AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
I-405 SB Off-Ramp at La Cienega Blvd (north of West Century Blvd)	3,085	626	1,112	No	No	628	1,116	No	No
I-405 NB Off-Ramp at West Century Blvd	3,600	2,275	1,371	No	No	2,291	1,384	No	No
I-405 SB Off-Ramp at La Cienega Blvd (south of West Century Blvd)	1,265	396	630	No	No	408	638	No	No
I-105 EB/WB Off-Ramp at South Prairie Ave	8,720	1,100	1,950	No	No	1,164	2,082	No	No

NOTES:

- ¹ Auxiliary lanes are present at each of these off-ramps.
- ² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.
- ³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.
- ⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is at E or F and the peak hour signal warrant is met.

³ For AM peak hour conditions, event is a 2,000-person Corporate/Community event. For PM peak hour conditions, event is a 7,500-person Other Sports/Gathering Event.

⁴ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

NOTES:

Shaded cells identify significant impacts.

^a Analysis methods vary by jurisdiction (refer to previous pages for description).

^b Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is at E or F and the peak hour signal warrant is met.

^c For AM peak hour conditions, event is a 2,000-person Corporate/Community event. For PM peak hour conditions, event is a 7,500-person Other Sports/Gathering Event.

^d Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes) Per the HCM, delay estimates in over-saturated conditions are unreliable.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from C to D, from D to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

**TABLE 3.14-51
 FREEWAY OFF-RAMP QUEUING ANALYSIS – CUMULATIVE PLUS PROJECT (DAYTIME EVENT) CONDITIONS**

Off-Ramp ¹	Ramp Capacity Threshold ²	Cumulative Baseline No Project				Cumulative Plus Project			
		95th Percentile Queue (ft.) ³		Queue Exceeds Available Storage ⁴		95th Percentile Queue (ft.) ³		Queue Exceeds Available Storage ⁴	
		AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
I-405 SB Off-Ramp at La Cienega Blvd (north of West Century Blvd)	3,085	626	1,112	No	No	786	1,114	No	No
I-405 NB Off-Ramp at West Century Blvd	3,600	2,275	1,371	No	No	2,477	1,387	No	No
I-405 SB Off-Ramp at La Cienega Blvd (south of West Century Blvd)	1,265	396	630	No	No	410	716	No	No
I-105 EB/WB Off-Ramp at South Prairie Ave	8,720	1,100	1,950	No	No	1,214	2,190	No	No

NOTES:

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue would be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

Cumulative Plus Project (Major Event) Conditions

Intersection, Neighborhood Street, and Freeway Evaluation

The expected travel characteristics for major events at the Proposed Project are expected to be very similar between Adjusted Baseline and cumulative conditions. Major event trips were added to the Cumulative No Project volumes to develop the Cumulative Plus Project (Major Events) scenario.

Table 3.14-52 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Cumulative No Project and Cumulative Plus Project (Major Event) conditions for the three event-related peak hours (see Appendix K.3 for technical calculations). A number of intersections would be significantly impacted during each peak hour. Extensive vehicle queue spillbacks would occur on portions of eastbound West Century Boulevard and northbound South Prairie Avenue heading toward the Project Site. In some instances, it was not possible for the entire hourly travel demand to be served within that hour, which indicates that ‘peak hour spreading’ (i.e., multiple hours of congestion) is likely. Under this and other intersection LOS tables that display Proposed Project impacts during major events, certain unsignalized intersections may be reported as operating at LOS F with the Proposed Project, but impacts are not identified as significant because the applicable traffic signal warrant (which is part of the significance criteria) is not met.

Table 3.14-53 displays the average weekday and weekend daily traffic volumes on the neighborhood street study segments under Cumulative Conditions for No Project and Plus Project (Major Event) conditions. As shown in the table, the project would cause a net increase in trips on four facilities whose daily volume of traffic would exceed the applicable threshold for the facility type.

Table 3.14-54 shows the Cumulative LOS on freeway mainline segments for weekday AM and PM peak hours, without and with trips generated by the major events (see Appendix K.2 for additional data supporting the freeway impact conclusions and Appendix K.3 for technical calculations). **Table 3.14-55** shows the weekday AM and PM peak hour 95th percentile vehicle queues at freeway off-ramps for these scenarios. As shown, major events would cause degraded operations at several facilities, some of which are considered significant. Major events would cause three freeway off-ramps to experience queuing that exceeds the applicable threshold during both the weekday and weekend pre-event peak hours.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

Shaded cells identify significant impacts.

¹ ADT represents average daily traffic (total volume in both directions).

Above results are applicable for both major events consisting of an NBA basketball game and a concert based on their very similar levels of usage of neighborhood streets. Total traffic levels on these streets are within 0.01 percent of each other.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this component based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Key findings from the tables above include the following:

- With respect to intersections:
 - Under weekday pre-event peak hour cumulative conditions, the Proposed Project would contribute to significant impacts at more than half (60) of the study intersections.
 - When compared to Adjusted Baseline impacts, Proposed Project impacts under cumulative conditions are more frequent regardless of which peak hour or background condition is being studied. This is due to increased background traffic, which increases the potential for Proposed Project vehicle trips to exacerbate unacceptable conditions.

- The overall operation of the street system is generally projected to be worse under cumulative conditions than under adjusted baseline conditions due to increased background traffic.
- With respect to freeway facilities:
 - Cumulative freeway impacts due to the Proposed Project are nearly identical to those identified under Adjusted Baseline conditions. This is likely due to many facilities being at or near capacity and being unable to accommodate much more growth in trips during the peak hour. As a result, project impacts would be similar under each time period.
- With respect to freeway off-ramp queuing:
 - Proposed Project impacts on freeway off-ramp queuing are significant at same three off-ramps during the weekday and weekend pre-event peak hours.

Transit System Evaluation

Light rail ridership under Cumulative conditions is expected to increase over current conditions due to the opening of the Crenshaw/LAX light rail line and future growth in ridership. Because the Crenshaw/LAX Line is not yet operational, ridership data is unavailable. To estimate 2030 conditions for the Metro Board adopted operating plan (Alternative C-3), growth rates calculated from a different operation plan (Alternative C-1) were applied to the Alternative C-3 2025 forecast, because Metro prepared both 2025 and 2030 forecasts for the Alternative C-1, whereas only 2025 forecasts were prepared for Alternative C-3. Additionally, the Cumulative trip generation scenario for the Hollywood Park development was used. Otherwise, the methodology and assumptions used to calculate Cumulative Baseline ridership loads, were consistent with the approach detailed above for Adjusted Baseline.

The transit mode share model (see *Technical Memorandum #2 – Project Travel Demands for IBEC* in Appendix K.1) was used to estimate the directionality of Proposed Project light rail riders and their relative use of the Downtown Inglewood station along the Crenshaw/LAX Line or the Hawthorne/Lennox Station along the Green Line. **Table 3.14-56** displays the expected usage of various light rail lines and stations for each of the peak hours being studied. As shown, the majority of riders are expected to board/alight to/from the north (toward the Expo Line) at the Downtown Inglewood Station, or board/alight to/from the east (on the Green Line) at the Hawthorne/Lennox Station.

Table 3.14-57 presents the Cumulative pre-event peak hour (for both weekdays and weekends) passenger load and capacity approaching the Downtown Inglewood and Hawthorne/Lennox Stations. These particular light rail stations are selected because each station is the closest and most convenient to the Proposed Project on the Crenshaw/LAX and Green lines, respectively and would be the stations most likely to be used by attendees of events at the Proposed Project (with proposed connecting shuttle service for major events). This table shows that there would be sufficient rail transit capacity to accommodate the Proposed Project demands during the weekday and weekend pre-event peak hours.

TABLE 3.14-56
DIRECTIONALITY OF LIGHT RAIL RIDERS – CUMULATIVE PLUS PROJECT (MAJOR EVENT) CONDITIONS

Line	Station	Direction	Weekday		Weekend
			Pre-Event Peak Hour	Post-Event Peak Hour	Pre-Event Peak Hour
Crenshaw/LAX	Downtown Inglewood	North	0%	51%	0%
		South	51%	0%	51%
Green Line	Hawthorne/Lennox Station	East	6%	43%	6%
		West	43%	6%	43%

NOTES:

See *Technical Memorandum #2 – Project Travel Demands for IBEC* in Appendix K.1 for methodologies used to develop these estimates.

NOTES:

¹ Based on ten two-car trains each having a capacity of 238 passengers (inclusive of seated and standing passengers) during peak hours.

² Project peak hour light rail riders calculated from Table 3.14-25 as follows: 1,080 pre-event attendees use transit with 68 percent arriving during pre-event peak hour of which five-sixths arrive via light rail (1,080 x 68% x 83% = 611) riders. Similarly, 66 employees arrive via transit with 10 percent occurring during pre-event peak hour and four-fifths using light rail (66 x 10% x 80% = 5 riders). Total ridership is thus 616.

³ Based on five two-car trains each having a capacity of 170 passengers (inclusive of seated and standing passengers) during off-peak peak hours.

⁴ Project peak hour light rail riders calculated from Table 3.14-27 as follows: 1,260 pre-event attendees use transit with 68 percent arriving during pre-event peak hour of which six-sevenths arrive via light rail (1,260 x 68% x 86% = 737) riders. Similarly, 66 employees arrive via transit with 10 percent occurring during pre-event peak hour and four-fifths using light rail (66 x 10% x 80% = 5 riders). Total ridership is thus 742.

SOURCE: Fehr & Peers, 2019.

Table 3.14-58 shows this same information for the Cumulative weekday post-event conditions. This table indicates that a major event at the Proposed Project could cause ridership in light rail trains traveling in the eastbound direction on the Green Line (i.e., leaving the Hawthorne/Lennox Station) to exceed their capacity.

**TABLE 3.14-58
 CUMULATIVE PLUS PROJECT (MAJOR EVENT) LIGHT RAIL TRANSIT LOAD – WEEKDAY POST-EVENT PEAK
 HOUR CONDITIONS**

Line	Station	Direction	Peak Hour Capacity ¹	No Project Peak Hour Load ²	Project Load ³	Plus Project Load (% Capacity)
Crenshaw/ LAX	Downtown Inglewood	North	850	256	355	611 (72%)
		South	850	493	0	493 (58%)
Green Line	Hawthorne/ Lennox	East	850	656	297	953 (112%)
		West	850	192	38	230 (27%)

NOTES:

- ¹ Post-event train capacity is much lower than pre-event due to fewer trains per hour and lower 'standing room only' thresholds adopted by Metro.
- ² Applied the ratio of existing PM peak hour two-way train load versus 9 to 10 PM two-way train load (i.e., calculated as 45 percent on the Green Line at Hawthorne/Lennox Station) to the Adjusted Baseline PM peak hour train load to obtain post-event peak hour riders.
- ³ Project peak hour light rail riders calculated from Table 3.14-26 as follows: 925 post-event attendees use transit with 83 percent departing during post-event peak hour of which four-fifths depart via light rail (925 x 83% x 80% = 614) riders. Similarly, 56 employees depart via transit with 79 percent occurring during post-event peak hour and four-fifths using light rail (56 x 79% x 80% = 35 riders). Total ridership is thus 737.

SOURCE: Fehr & Peers, 2019.

Bus riders are expected to use various Metro bus routes (including 117, 211, and 212) that stop in the project vicinity. These lines would have ample reserve capacity to accommodate pre-event riders. Under post-event conditions, Route 117 operates one bus in each direction during the post-event hour, with a load capacity of 44 riders per direction per hour. Route 211 ends operations before the post-event hour. Route 212 operates two buses in each direction during the post-event hour, with a load capacity of 96 riders per direction per hour. With 162 post-event peak hour bus riders, bus capacity (for routes that stop in the immediate vicinity of the Arena Site) could be exceeded during a major event at the Proposed Project.

Consistent with OPR guidance, an increase in transit demand is not considered an impact for CEQA purposes. Information on the increase in transit demand is instead provided for information purposes.

Project-Specific Impacts and Mitigation Measures

Organization of Impacts and Mitigation Measures

The subsections below include analysis of impacts and applicable mitigation measures for the Proposed Project under Adjusted Baseline conditions, followed by analysis of impacts and applicable mitigation measures for Cumulative conditions for each of the following scenarios: Ancillary uses (daily operation of the Proposed Project without an event at the Arena); Daytime Events (corporate or other sporting/gathering events); and major events (LA Clippers basketball games and highly-attended concerts at the Arena).

The analyzed impacts fall within the following categories: intersections; neighborhood streets; freeway facilities; VMT; public transit operations; existing or planned bicycle facilities; existing or planned pedestrian facilities; emergency access; and circulation during construction.

Section 3.14.5 presents impact statements for the various concurrent scenarios that were analyzed.

Approach to Mitigation

Mitigation measures are recommended for project-specific and cumulatively considerable significant project impacts. The effectiveness of these mitigation measures is then tested for the following scenarios:

- Adjusted Baseline Plus Project Ancillary Land Uses
- Adjusted Baseline Plus Project Daytime Events
- Adjusted Baseline Plus Project Major Events
- Cumulative Plus Project Ancillary Land Uses
- Cumulative Plus Project Daytime Events
- Cumulative Plus Project Major Events
- Adjusted Baseline (with The Forum) Plus Project Major Events (in Section 3.14.5)
- Cumulative (with The Forum) Plus Project Major Events (in Section 3.14.5)

Concurrent event Scenario 1 (i.e., Proposed Project Major Event and 17,500-person Concert at The Forum) was selected as the most appropriate concurrent event to mitigate for several reasons. First, this scenario may occur with some regularity given how often events at each venue may overlap. Second, analyses indicate that the Proposed Project would generate substantially more impacts under this scenario versus if an event were not occurring at The Forum. This scenario generates more impacts than a concurrent scenario featuring a mid-sized event at the NFL Stadium because that scenario requires a considerable proportion of Proposed Project attendees to park off-site, thereby dispersing traffic and reducing impacts. The Proposed Project and Forum concurrent event generates comparable levels of surface street impacts to the very rare condition in which all three venues are hosting concurrent events.

Range of Mitigation Measures

This subsection contains a variety of mitigation measures, each of which falls into one of the following four categories:

- Physical Improvements – The majority of the study area is built out, which limits the locations, magnitude, and type of physical improvements that could be constructed on surface streets. The following describes the range of physical improvements that may be possible at intersections:
 - Capacity Enhancements through Added Lanes: In some instances, restriping, converting medians to turn lanes, and widening (particularly on freeway off-ramps) is possible and can add capacity to a given intersection. Where such improvements are being proposed, the mitigation measure discusses the extent to which additional right-of-way may be necessary and the agency responsible for approving the physical improvement.

- Operational Enhancements: Examples of these types of improvements include modifying the signal phasing to become more efficient, or adding a right-turn overlap phase. They are considered physical because they may require some modifications to the traffic signal system.
- Signal Timing Improvements – Some, but not all, of the signalized intersections along study corridors currently feature coordinated operations that enable large platoons of vehicles to progress from one intersection to the next with minimal stopping. Further, few, if any, signals operate with special event signal timings, which provide increased green time to high-volume movements. Through analysis of signal improvements using microsimulation, their effectiveness can be quantified. The preferred means for accomplishing signal timing improvements is through the Citywide Intelligent Transportation Systems (ITS) program versus an isolated, intersection by intersection approach. The City’s ITS program is described in detail later in this subsection.
- TDM Strategies – Another form of mitigation is to implement a comprehensive TDM program that includes strategies to reduce vehicle trips and encourage other modes of travel.
- Event TMP – An Event TMP is often developed and implemented for major event venues such as the Proposed Project. The TMP implements a series of temporary transportation management strategies to better accommodate all modes of travel. It includes specific elements for vehicles (both private and TNCs), transit/shuttles, pedestrians, bicyclists, paratransit, parking, etc. It also considers emergency access and neighborhood traffic intrusion.

In most instances, physical improvements were considered among the potential mitigation measures for significant project impacts. But at many locations, they were found either to be ineffective or infeasible due to right-of-way acquisition. This section does not present this type of evaluation for all impacted intersections because the detailed nature of such evaluations, combined with the large number of impacted locations, would have substantially further increased the length and complexity of the section. However, for particularly critical intersections under certain scenarios, this section describes potential physical improvements that were considered but found either to be ineffective or infeasible.

Impact 3.14-1: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under Adjusted Baseline conditions. (Significant and Unavoidable)

As presented in Table 3.14-15 and based on the significance criteria, the following three intersections would experience significant impacts:

AM Peak Hour

None

PM Peak Hour

- South Prairie Avenue/West Century Boulevard (City of Inglewood)
- Crenshaw Boulevard/West Century Boulevard (City of Inglewood)

- South Prairie Avenue/West 104th Street (City of Inglewood)

These impacts are considered **significant**.

Mitigation Measure 3.14-1(a)

The project applicant shall implement elements of the Transportation Demand Management (TDM) Program described in Mitigation Measure 3.14-2(b) including strategies, incentives and tools to provide opportunities for daytime and non-event employees to reduce single-occupancy vehicle trips and use other modes besides automobile to travel to and from the Project Site. These elements include:

- a) *TDM 1/Encourage Alternative Modes of Transportation (Rail, Public Bus, and Vanpool) – The Project shall encourage alternative modes of transportation use by providing monetary incentives and bus stop improvements near the Project Site such as:*
 - *Bus stop facilities improvements: The Project would provide on-site and/or off-site improvements such as lighting, new benches and overhead canopies, added bench capacity if needed, and real-time arrival information for an improved user experience for bus stops that are relocated as a result of the Project.*
 - *Transit and/or Multi-Modal Subsidy: The Project would provide pre-tax commuter benefits for employees.*
 - *Vanpool Subsidy: This would provide pre-tax commuter benefits for employees.*
 - *Marketing and outreach campaign for transit usage.*
- b) *TDM 3/Encourage Carpools and Zero-Emission Vehicles – The Project shall provide several incentives that would encourage carpooling and zero-emission vehicles as a means for sharing access to and from the Project Site including the following:*
 - *Provide incentives for carpools or zero-emission vehicles, including preferential parking with the number of parking spots in excess of applicable requirements, reduced parking costs, or other discounts/benefits.*
- c) *TDM 4/Encourage Active Transportation – The Project shall include features which enhance access for bicyclists and pedestrians including the following:*
 - *Bicycle parking: provide bicycle parking in excess of applicable code requirements. The Project Site would provide 60 employee bike parking spaces and 23 attendee bike parking spaces.*
 - *Provide showers and lockers for employees.*
 - *Bicycle fix-it station: provide a bicycle repair station where bicycle maintenance tools and supplies are readily available on a permanent basis and offered in good condition.*
 - *Sidewalks or other designated pathways following safe routes from the pedestrian circulation to the bicycle parking facilities and throughout the development.*
- d) *TDM 5/Employee Vanpool Program – The Project shall provide an employee vanpool program that would accommodate up to 66 employees utilizing the vanpool*

service. Each vanpool is assumed to have a capacity of 15 persons per vehicle. The vanpool program would be in conjunction with a vanpool subsidy providing pre-tax commuter benefits for employees as indicated in TDM 1.

- e) *TDM 7/Information Services – The Project shall provide services to inform employees about transportation options including the following:*
- *Welcome packets for new employees and ongoing marketing.*
 - *Information kiosk or bulletin board providing information about public transportation options.*

Mitigation Measure 3.14-1(b)

Implement Mitigation Measure 3.14-3(f) (Northbound Exclusive Right-turn Lane and Overlap Phase on South Prairie Avenue at West Century Boulevard).

Mitigation Measure 3.14-1(c)

Implement Mitigation Measure 3.14-3(l) (Implement protected or protected/permissive left-turn phasing on South Prairie Avenue at West 104th Street).

Level of Significance After Mitigation: Since the majority of trips generated by the ancillary uses are generated by patrons of the commercial uses and not employees, these measures would reduce the severity of, but not eliminate, these impacts. No feasible mitigation measures are available at the Crenshaw Boulevard/West Century Boulevard intersection. These impacts are considered **significant and unavoidable**.

Impact 3.14-2: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions. (Significant and Unavoidable)

AM Peak Hour

Significant impacts were identified for a 2,000-person weekday morning event based on the results in Table 3.14-22A and the significance criteria. The following nine intersections would be significantly impacted by a 2,000-person weekday morning event:

- La Cienega Boulevard/I-405 Ramps North (Cities of Inglewood and Los Angeles)
- La Cienega Boulevard/West Century Boulevard (Cities of Inglewood and Los Angeles)
- South Prairie Avenue/West Century Boulevard (City of Inglewood)
- South Prairie Avenue/West 104th Street (City of Inglewood)
- Yukon Avenue/West 104th Street (City of Inglewood)
- Crenshaw Boulevard/West 104th Street (City of Inglewood)
- South Prairie Avenue/Lennox Boulevard (City of Inglewood)
- South Prairie Avenue/108th Street (City of Inglewood)
- South Prairie Avenue/Imperial Highway (Cities of Hawthorne and Inglewood)

PM Peak Hour

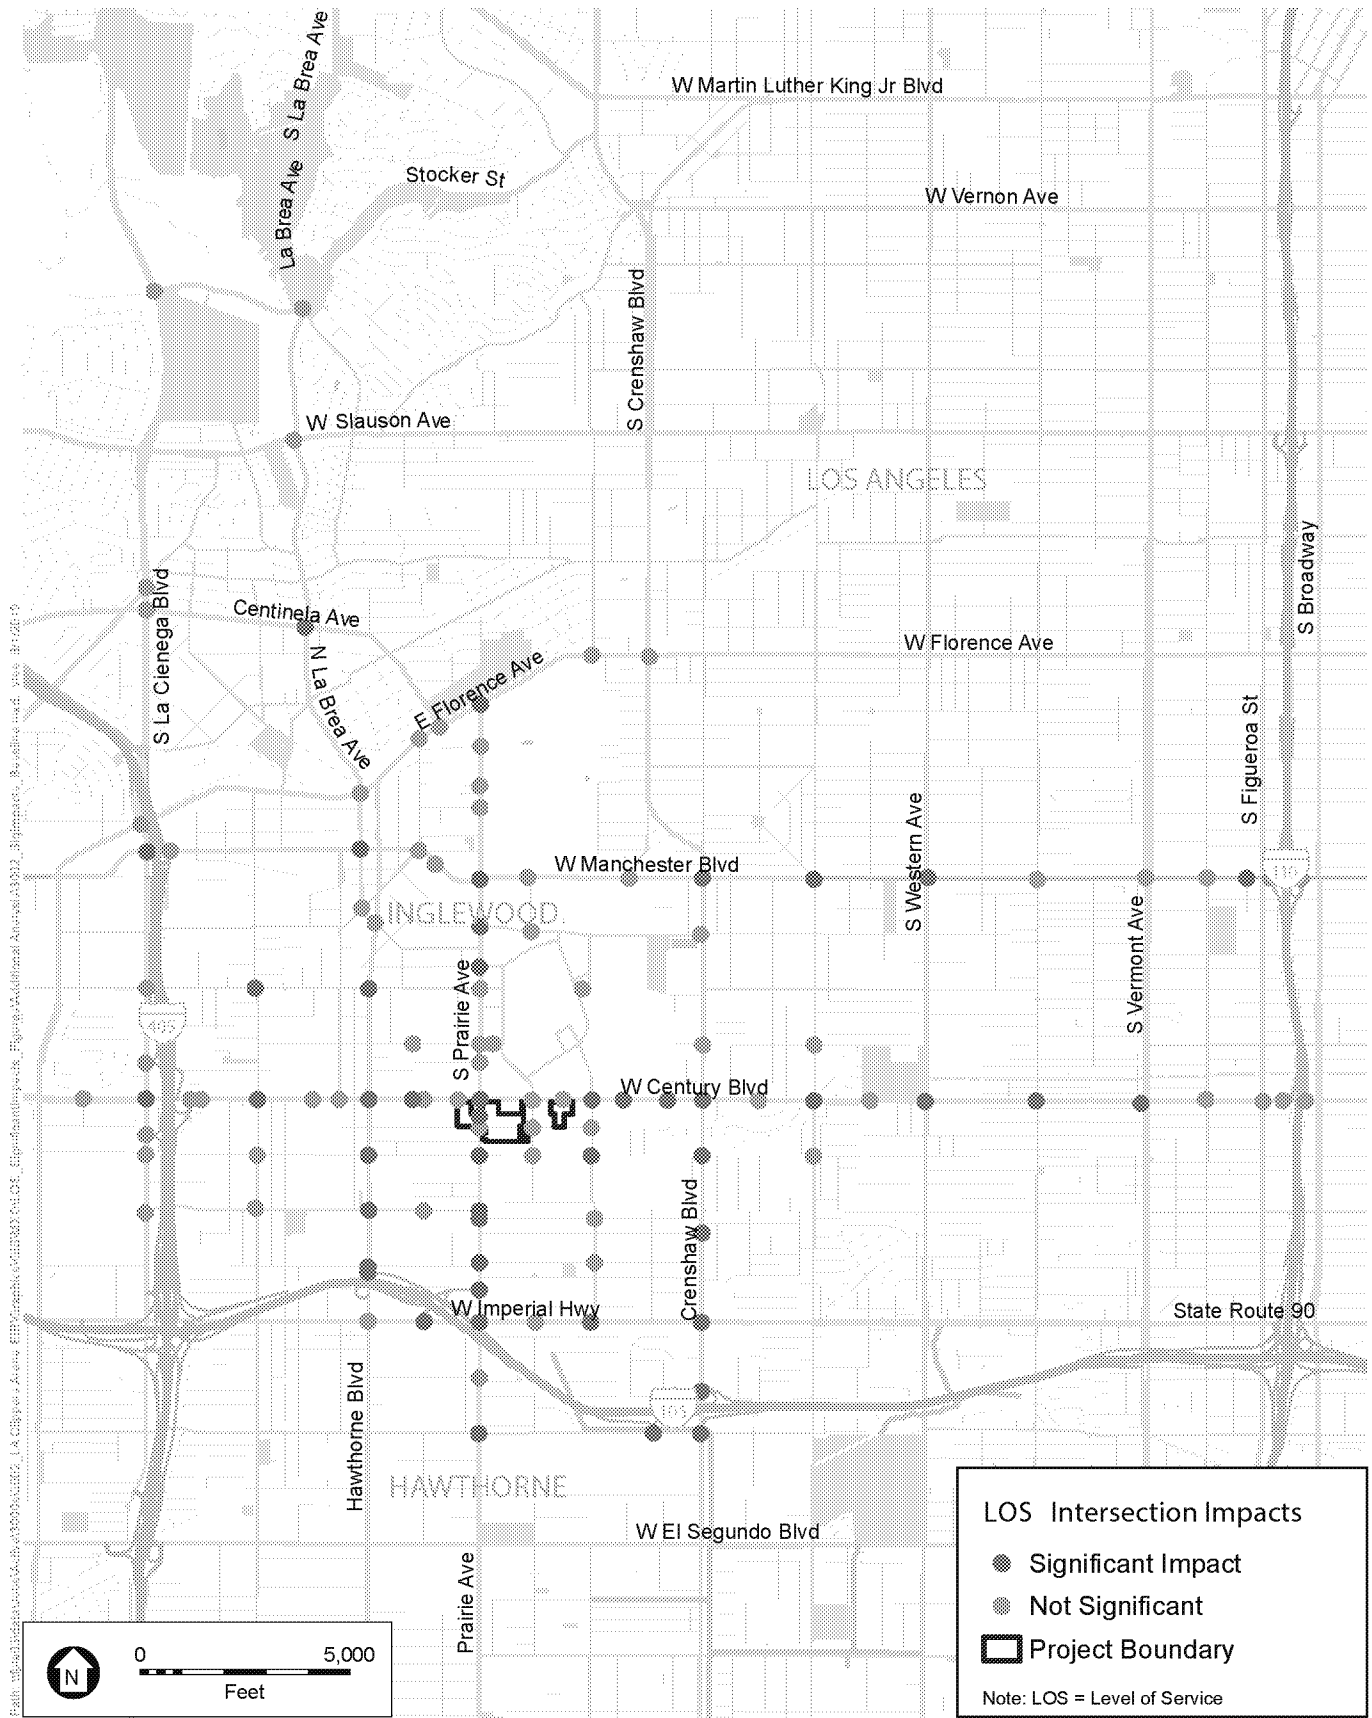

Significant impacts were identified for a 7,500-person weekday afternoon event based on the results in Table 3.14-22B and the significance criteria. **Figure 3.14-13** displays intersections that would be significantly impacted by a 7,500-person weekday afternoon event during the weekday PM peak hour (46 intersections).

These impacts are considered **significant**.

Mitigation Measure 3.14-2(a)

The project applicant shall prepare and implement an Event Transportation Management Plan (TMP). The Event TMP shall address the issues set forth below, and shall achieve the identified standards for each of these issues:

- a) *Vehicle Queuing on City Streets: Through added intersection capacity and/or traffic management, traffic does not queue back to the upstream locations listed below during more than five percent of a pre-event peak hour (assuming no other concurrent events):*
 - *Northbound South Prairie Avenue: vehicle queues do not spill back from the project vicinity to I-105, causing vehicle queues on the South Prairie Avenue off-ramp to exceed their available storage.*
 - *Southbound South Prairie Avenue: vehicle queues do not spill back from the project vicinity to beyond Manchester Boulevard.*
 - *Eastbound West Century Boulevard: vehicle queues do not spill back from the project vicinity to I-405, causing vehicle queues on the West Century Boulevard off-ramps to exceed their available storage.*
 - *Westbound West Century Boulevard: vehicle queues do not spill back from the project vicinity to beyond Crenshaw Boulevard.*
- b) *Pedestrian Flows: Through pedestrian flow management, pedestrians do not spill out of sidewalks onto streets with moving vehicles, particularly along portions of West Century Boulevard and South Prairie Avenue adjacent to the Project.*
- c) *Vehicular Parking: A comprehensive parking plan is implemented to minimize unnecessary vehicular circulation (while looking for parking) within and adjacent to the Project. The Plan could include strategies such as a reservation system, smartphone parking app, directional signage, and real-time parking garage occupancy.*
- d) *Bicycle Parking: Signage is clearly visible to direct bicyclists to on-site event bicycle parking. The on-site bicycle parking shall have an adequate supply to accommodate a typical major event. If monitoring shows that there is demand for on-site bicycle parking that is not being met, then additional supply (such as a bicycle valet) shall be identified.*
- e) *Shuttle Bus Loading: An adequate amount of curb space (accompanied by appropriate traffic management strategies) is provided along South Prairie Avenue to efficiently accommodate shuttle buses that transport attendees to/from light rail stations.*

SOURCE: Fehr and Peers, 2019

Inglewood Basketball and Entertainment Center

Figure 3.14-13

Impacted Intersections:

Baseline Plus Daytime Event Weekday PM Peak Hour

Note: LOS = Level of Service

- f) *Shuttle Bus Capacity and Wait Times: An adequate supply of shuttle buses is provided such that peak wait times for attendees before and after major events do not exceed 15 minutes.*
- g) *Paratransit: Specific suitable locations are provided to accommodate paratransit vehicle stops.*
- h) *Ridehailing: Traffic management strategies (including active enforcement, wayfinding, signage, etc.) are implemented to minimize pre-event passenger drop-offs in travel lanes or at curbs along the project frontage, and to provide orderly vehicle staging, passenger loading, and traffic flow of ridehailing vehicles after events. For post-event conditions, the arena is placed within a 'geofenced area' in which attendees requesting a TNC are directed to meet the TNC vehicle at the East Parking Garage. If monitoring shows that ridehailing vehicles are using travel lanes or curbs along the project frontage to drop off passengers during the pre-event period, then TCOs and/or barricades shall be stationed at locations where unauthorized drop-offs are occurring.*
- i) *Neighborhood Streets: Reduce traffic volumes on local and collector street segments identified in the Draft EIR as having a significant impact without causing a significant impact on other local and collector street segments. Discourage and reduce event-related cut-through traffic while maintaining access for residents and their guests.*
- j) *Truck Staging: Large trucks associated with concerts or other special events do not park or idle along South Prairie Avenue, West Century Boulevard, or any local/collector street in the project vicinity, with the exception of Doty Avenue between West Century Boulevard and West 102nd Street.*
- k) *Parking Garage/Lot Operations: Through effective garage/lot operations, vehicles do not spill back onto public streets and adversely affect the roadway network prior to events while waiting to enter garages/lots.*

The Event TMP shall be subject to review and approval by the City Traffic Engineer. The City Traffic Engineer shall, in performing this review, confirm that the Event TMP meets these standards.

The Event TMP would be a dynamic document that would be revised and refined as monitoring is performed, experience is gained, additional information is obtained regarding the Proposed Project transportation characteristics, and advances in technology or infrastructure become available. Any changes to the Event TMP shall be subject to review and approval by the City Traffic Engineer. In reviewing any proposed changes to the Event TMP, the City Traffic Engineer shall ensure that the Event TMP, as revised, is equally or more effective in addressing the issues set forth above.

Mitigation Measure 3.14-2(b)

The project applicant shall implement a Transportation Demand Management Program (TDM Program). The TDM Program shall include strategies, incentives, and tools to provide opportunities for non-event employees and patrons as well as event attendees and employees to reduce single-occupancy vehicle trips and to use other modes of transportation besides automobile to travel to basketball games and other events hosted at the Project. The TDM Program shall include:

- a) *TDM 1/Encourage Alternative Modes of Transportation (Rail, Public Bus, and Vanpool) – The Project shall encourage alternative modes of transportation use by providing monetary incentives and bus stop improvements near the Project Site such as:*
- *Integrated event and transit ticketing to enable seamless connections and provide event-day travel updates.*
 - *Discounted event tickets with the purchase of a transit pass or providing proof of a registered TAP card (the regional fare payment method).*
 - *Giveaways for transit users (goods for attendees, free tickets for employees, etc.).*
 - *Rewards/gamification opportunities for fans to compete for prizes or points based on their transportation choices.*
 - *Bus stop facilities improvements: The Project shall provide on-site and/or off-site improvements such as lighting, new benches and overhead canopies, added bench capacity if needed, and real-time arrival information for an improved user experience for bus stops that are relocated as a result of the Project.*
 - *Transit and/or Multi-Modal Subsidy: The Project would provide pre-tax commuter benefits for employees.*
 - *Vanpool Subsidy: This would provide pre-tax commuter benefits for employees.*
 - *Marketing and outreach campaign for transit usage.*
- b) *TDM 2/Event-day Dedicated Shuttle Services – The Project shall provide connectivity to the existing and future Metro Rail Stations and would take advantage of the transportation resources in the area. The Project shall ensure that enough shuttles would be provided for successful and convenient connectivity with short wait times. The following shall be provided:*
- *The Project shall provide dedicated shuttle service from the Green Line at Hawthorne Station, Crenshaw/LAX Line at AMC/96th Station, and Crenshaw/LAX Line at Downtown Inglewood station for arena events. This shuttle service shall be a dedicated event-day shuttle service from the venue for employees and attendees.*
 - *The Project shall provide an estimated 27 shuttles with a capacity of 45 persons per shuttle to accommodate employees and attendees traveling to and from the Project Site. Due to the arrival and departure of employees prior to the attendees, the same shuttles would be utilized for the employees. It is anticipated that the shuttle service would begin two hours before the game and extend to 30 minutes after the start. After the game, shuttle service would begin 30 minutes before the end, and continues one hour after.*
 - *The Project shall provide a convenient and safe location on-site for shuttle pick-up and drop-off on the east side of South Prairie Avenue, approximately 250 feet south of West Century Boulevard. The drop-off location shall be adjacent to the arena so that shuttle users would not need to cross South Prairie Avenue to arrive at the arena.*

- *The project applicant shall monitor the number of people using shuttles to travel between the above light rail stations and the Project. If the monitoring shows that peak wait times before or after major events exceeds 15 minutes, then the project applicant shall add sufficient additional shuttle capacity to reduce wait times to meet this target. The aim is to require increased shuttle runs as necessary to make sure that demand is accommodated within a reasonable amount of time and to encourage use of transit.*
- c) *TDM 3/Encourage Carpools and Zero-Emission Vehicles – The Project shall provide several incentives that would encourage carpooling and zero-emission vehicles as a means for sharing access to and from the Project Site including the following:*
- *Provide incentives for carpools or zero-emission vehicles, including preferential parking with the number of parking spots in excess of applicable requirements, reduced parking costs, discounted rides (or other similar benefits) for those sharing transportation network company (TNC) rides to or from the event, or other discounts/benefits.*
 - *Provide variable parking price based on car occupancy – structured to encourage carpooling.*
 - *The Project would provide 8 percent of parking spaces with electrical vehicle charging stations in excess of the minimum requirement of 6 percent.*
- d) *TDM 4/Encourage Active Transportation – The Project shall include features which enhance access for bicyclists and pedestrians including the following:*
- *Bicycle parking: Provide bicycle parking in excess of applicable code requirements. The Project Site would provide 60 employee bike parking spaces and 23 attendee bike parking spaces.*
 - *Provide showers and lockers for employees.*
 - *A bike valet service would be implemented if needed to accommodate bike parking space needs.*
 - *Bicycle fix-it station: Provide a bicycle repair station where bicycle maintenance tools and supplies are readily available on a permanent basis and offered in good condition.*
 - *Coordinate bike pools and walk pools.*
 - *Sidewalks or other designated pathways following safe routes from the pedestrian circulation to the bicycle parking facilities and throughout the development.*
- e) *TDM 5/Employee Vanpool Program – The Project shall provide an employee vanpool program that would accommodate up to 66 employees utilizing the vanpool service. Each vanpool is assumed to have a capacity of 15 persons per vehicle. The vanpool program would be in conjunction with a vanpool subsidy providing pre-tax commuter benefits for employees as indicated in TDM 1.*
- f) *TDM 6/Park-n-Ride Program – The Project shall provide a regional park-n-ride program that would utilize charter coach buses with a capacity of up to 45 persons per bus to accommodate up to 1,980 attendees. Parking lot locations would*

correspond to zip code ticket purchase data, and the site circulation would be designed to account for the charter coaches. The operation of this park-n-ride would be similar to the currently operating park-n-ride program from the Hollywood Bowl venue located in the Hollywood Hills within the County of Los Angeles.

- g) *TDM 7/Information Services – The Project shall provide information services to inform the public about activities at the Project including the following:*
- *Strategic multi-modal signage/wayfinding.*
 - *Real-time travel information; changeable message sign (CMS) and social media.*
 - *Welcome packets for new employees and ongoing marketing.*
 - *Commercials/advertisement – television, website, social media, radio, etc.*
 - *Information kiosk or bulletin board providing information about public transportation options.*
- h) *TDM 8/Reduce On-Site Parking Demand – The Project shall include features that reduce on-site parking demand such as:*
- *Provide coach bus/minibus/microtransit staging and parking areas: The Project is designed to accommodate 20 minibus/microtransit/paratransit parking spaces and 23 charter coach bus spaces. The capacity for minibus/microtransit/paratransit is 10 persons per vehicle and 45 persons per bus for the charter coach bus.*
 - *Allocated sufficient TNC staging spaces: The Project is designed to accommodate approximately 160 spaces for TNC staging.*
- i) *TDM 9/Event-Day Local Microtransit Service – The Project shall provide a local minibus/microtransit service for all event days with a service range of approximately 6 miles surrounding the Project Site. Each minibus is assumed to have a capacity of 10 persons per vehicle, and the service would accommodate up to 66 employees and up to 180 attendees on all event days.*
- j) *Monitoring – The TDM Program shall include an ongoing program to monitor each of the TDM Program elements listed above. The monitoring program shall collect data on the implementation of each specific TDM strategy, and shall assess the extent to which the TDM Program is meeting demand for alternative forms of transportation, and reducing vehicle trips and reliance on private automobiles. The information obtained through this monitoring program shall be provided to the City Traffic Engineer on an annual basis.*

A monitoring report shall be prepared not less than once each year. The report shall evaluate the extent to which the TDM Program encourages employees to reduce single-occupancy vehicle trips and to use other modes of transportation besides automobile to travel to basketball games and other events hosted at the Project. The monitoring report shall be provided to the City Traffic Engineer (ongoing) and the State of California Office of Planning and Research (through 2030).

The TDM Program shall be a dynamic document that is expected to be revised and refined as monitoring is performed, experience is gained, additional information is

obtained regarding the Project transportation characteristics, and advances in technology or infrastructure become available. Any changes to the TDM Program shall be subject to review and approval by the City Traffic Engineer. In reviewing any proposed changes to the TDM Program, the City Traffic Engineer shall ensure that the TDM Program, as revised, is equally or more effective in addressing the issues set forth above.

Mitigation Measure 3.14-2(c)

The project applicant shall work with the City of Inglewood and the City of Los Angeles to implement capacity-increasing improvements at the West Century Boulevard/La Cienega Boulevard intersection. Recommended improvements include two elements:

- a) Restripe the westbound approach to convert the outside through/right lane to a dedicated right-turn lane and operate it with an overlap phase. This is consistent with the LAX Landside Modernization Program improvements planned for this location.*
- b) Remove median island on the west leg and restripe the eastbound and westbound approaches to add second left-turn lanes in each direction.*

Mitigation Measure 3.14-2(d)

The project applicant shall construct (via restriping and conversion of median) second left-turn lanes on the northbound and southbound approaches to the West Century Boulevard/Hawthorne Boulevard/La Brea Boulevard intersection and operate the northbound right-turn with an overlap phase.

Mitigation Measure 3.14-2(e)

Implement Mitigation Measure 3.14-3(f) (Implement northbound exclusive right-turn lane and overlap phase on South Prairie Avenue at West Century Boulevard).

Mitigation Measure 3.14-2(f)

The project applicant shall restripe the westbound West 104th Street approach to Yukon Avenue from consisting of a shared left/through/right lane to consist of a left/through lane and a dedicated right-turn lane.

Mitigation Measure 3.14-2(g)

The project applicant shall work with the City of Inglewood and Caltrans to widen the I-105 off-ramp approach to South Prairie Avenue to consist of two lefts, a shared left/through/right, and a dedicated right-turn lane. This would require complying with the Caltrans project development process as a local agency-sponsored project. Depending on the complexity and cost of the improvement, this could include (but is not limited to) a cooperative agreement, permit engineering evaluation report, project study report, project report, environmental and engineering studies, project design, construction, etc.

Mitigation Measure 3.14-2(h)

The project applicant shall restripe the eastbound approach of Manchester Boulevard at La Brea Avenue to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes and one right-turn lane.

Mitigation Measure 3.14-2(i)

The project applicant shall restripe the westbound approach of Manchester Boulevard at Crenshaw Boulevard to provide a second left-turn lane, resulting in two left-turn lanes, one through lane and one shared through/right-turn lane.

Mitigation Measure 3.14-2(j)

The project applicant shall work with the City of Inglewood, the City of Hawthorne, and Caltrans to widen the I-105 westbound off-ramp at Crenshaw Boulevard to consist of one left, one left/through, and two right-turn lanes. This would require complying with the Caltrans project development process as a local agency-sponsored project. Depending on the complexity and cost of the improvement, this could include (but is not limited to) a cooperative agreement, permit engineering evaluation report, project study report, project report, environmental and engineering studies, project design, construction, etc.

Mitigation Measure 3.14-2(k)

The project applicant shall work with the City of Hawthorne to remove the median island and restripe the southbound approach of South Prairie Avenue at 120th Street to provide a second left-turn lane, resulting in two left-turn lanes, two through lanes and one shared through/right-turn lane.

Mitigation Measure 3.14-2(l)

The project applicant shall work with the City of Hawthorne to implement a southbound right-turn overlap signal phase at the intersection of Crenshaw Boulevard and 120th Street.

Mitigation Measure 3.14-2(m)

Provide TCOs on Crenshaw Boulevard at 120th Street during post-event period as part of Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-2(n)

The project applicant shall construct a second left-turn lane on southbound La Brea Avenue at Centinela Avenue and implement protected left turns for the northbound and southbound approaches.

Mitigation Measure 3.14-2(o)

The project applicant shall make a funding contribution to the City of Inglewood Public Works Traffic Division to help fund and implement Intelligent Transportation Systems (ITS) improvements at intersections in which the Project causes a significant impact for which a specific mitigation that would reduce this impact to less than significant could not be identified.

Level of Significance After Mitigation: A draft of the Event TMP described under Mitigation Measure 3.14-2(a) is included as Appendix K.4. The measures described in Mitigation Measure 3.14-2(b) included in the TDM Program, which was peer reviewed by Fehr & Peers and the City during preparation of the EIR and are considered objective and appropriate for inclusion in this Draft EIR.

Mitigation Measures 3.14-2(c) through 3.14-2(n) on the previous two pages identify physical mitigation measures that could reduce the impacts at the specific impacted intersections listed in these mitigation measures. No feasible physical mitigation was identified that would reduce impacts at the remaining impacted intersections. However, the combined effects of the Event TMP, coordinated/special event signal timings, and the physical mitigations below, would have synergistic effects to improve operations at other intersections without requiring physical improvements at them.

Mitigation Measure 3.14-2(c), if implemented, would improve operations at the West Century Boulevard/La Cienega Boulevard intersection from LOS F (with project) to E (with project and mitigation) during the weekday AM peak hour and from LOS D (with project) to C (with project and mitigation) during the weekday PM peak hour, thereby resulting in a less-than-significant impact. Since the improvement involves another jurisdiction in addition to the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-2(d) would improve operations at the West Century Boulevard/Hawthorne Boulevard/La Brea Boulevard intersection from LOS D (with project) to C (with project and mitigation) during the weekday AM peak hour and from LOS F (with project) to E (with project and mitigation) during the weekday PM peak hour. The impact would be **significant and unavoidable** during the PM peak hour because operations would not be restored to 'no project' conditions.

The impact at the South Prairie Avenue/West Century Boulevard intersection would be **significant and unavoidable** because the improvement under Mitigation Measure 3.14-2(e) does not mitigate the Daytime Event impact during the PM peak hour.

Mitigation Measure 3.14-2(f) would improve operations at the West 104th Street/Yukon Avenue intersection from LOS C (with project) to A (with project and mitigation) during the weekday AM peak hour and maintain LOS D conditions during the weekday PM peak hour. The impact would be **significant and unavoidable** during the PM peak hour because operations would not be restored to 'no project' conditions.

Although it is not yet designed, it is possible that implementation of Mitigation Measure 3.14-2(g) would result in the creation of a new off-ramp lane to the south of the existing southernmost off-ramp lane at Prairie Avenue. The construction of this new off-ramp lane would move noise-generating traffic approximately 10-12 feet closer to residences at 11207 South Prairie Avenue (on the west side, between West 112th and West 113th Streets). These residences are currently approximately 60 feet from the closest travel lane; with implementation of Mitigation Measure 3.14-2(g), the distance would be reduced to approximately 48 feet. The reduction of the distance could increase noise levels at these residences. Because the homes are not protected by a soundwall, it is possible that the incremental increase in noise could be significant.

The addition of a new off-ramp lane would move vehicles that are the source of criteria pollutant and toxic air contaminant emissions approximately 12 feet closer to the residences than under existing conditions. It is unlikely that the addition of the new off-ramp lane would result in significant concentrations of these air pollutants.

In addition, construction of Mitigation Measure 3.14-2(g) would remove an indeterminate amount of roadway shoulder landscaping, including potentially some landscape trees that

are planted on the south side of current off-ramp lanes. Further, as described for the Proposed Project, although the site of this mitigation measure is highly disturbed by past road construction, it remains possible that unknown archaeological resources could be discovered, or that previously unknown contaminants from roadway runoff could be encountered.

Mitigation Measure 3.14-2(g) would occur within right-of-way that is under the jurisdiction of Caltrans, and prior to implementation Caltrans would undertake environmental review pursuant to CEQA that would identify and mitigate to the extent feasible any reasonably anticipated environmental impacts of this measure.

Mitigation Measure 3.14-2(g), if implemented, would improve operations at the I-105 off-ramp/South Prairie Avenue intersection from LOS C (with project) to B (with project and mitigation) during the weekday AM peak hour and from LOS F (with project) to E (with project and mitigation) during the weekday PM peak hour, although the impact would be significant during the PM peak hour since the Adjusted Baseline No Project LOS is D during this period. Since the improvement involves another jurisdiction in addition to the City of Inglewood, and would require independent CEQA review by Caltrans prior to implementation, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-2(h) would mitigate the Daytime Event impact at the Manchester Boulevard/La Brea Avenue intersection during the PM peak hour to a **less-than-significant level**.

Mitigation Measure 3.14-2(i) would mitigate the Daytime Event impact at the Manchester Boulevard/Crenshaw Boulevard intersection during the PM peak hour to a **less-than-significant level**.

Although it is not yet designed, it is possible that implementation of Mitigation Measure 3.14-2(j) would result in the creation of a new off-ramp lane to the north of the existing northernmost westbound off-ramp lane at Crenshaw Boulevard. The construction of this new off-ramp lane would move noise-generating traffic approximately 10-12 feet closer to residences at the corner of 119th Street and Crenshaw Boulevard, and at 119th Street and Atkinson Avenue. These residences are currently approximately 100-110 feet from the closest off-ramp lane; with implementation of Mitigation Measure 3.14-3(j), the distance would be reduced to 90-100 feet. The reduction of the distance could increase noise levels at these residences. However, because the homes are already protected by a soundwall that runs on the south side of 119th Street, it is unlikely that the incremental increase in noise would be significant.

The addition of a new off-ramp lane would move vehicles that are the source of criteria pollutant and toxic air contaminant emissions approximately 12 feet closer to the residences than under existing conditions. It is unlikely that the addition of the new off-ramp lane would result in significant concentrations of these air pollutants.

In addition, construction of Mitigation Measure 3.14-2(j) would remove an indeterminate amount of ruderal grassland and potentially some landscape trees that are planted on the south side of the soundwall. Further, as described for the Proposed Project, although the site of this mitigation measure is highly disturbed by past road construction, it remains

possible that unknown archaeological resources could be discovered, or that previously unknown contaminants from roadway runoff could be encountered.

Mitigation Measure 3.14-2(j) would occur within right-of-way that is under the jurisdiction of Caltrans, and prior to implementation Caltrans would undertake environmental review pursuant to CEQA that would identify and mitigate any reasonably anticipated environmental impacts of this measure.

Mitigation Measure 3.14-2(j) reduces the Daytime Event impact at the I-105 westbound off-ramp/Crenshaw Boulevard intersection during the PM peak hour but not to less than significant. Since the improvement involves other jurisdictions beyond the City of Inglewood, and would require independent CEQA review by Caltrans prior to implementation, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-2(k) would mitigate the Daytime Event impact at the South Prairie Avenue/120th Street intersection during the PM peak hour to a level of less than significant. Since the improvement involves another jurisdiction in addition to the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

If implemented and in conjunction with Mitigation Measure 3.14-2(m), the modifications under Mitigation Measure 3.14-2(l) would improve operations at the Crenshaw Boulevard/120th Street intersection from LOS F (with project) to C (with project and mitigation) during the weekday post-event peak hour. Although the impact would still be significant per the impact criteria, this would be a substantial improvement in operations. Since the improvement involves another jurisdiction beyond the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

The Event TMP could benefit operations at the Crenshaw Boulevard/120th Street intersection under Mitigation Measure 3.14-2(m). The TMP includes placement of a TCO and traffic cones to permit the southbound approach to function with two right-turn lanes at this intersection during the post-event period to better facilitate traffic flow. If implemented, the modifications would improve operations from LOS F (with project) to C (with project and mitigation) during the weekday post-event peak hour. Although the impact would still be significant per the impact criteria, this would be a substantial improvement in operations.

Deployment of electronic changeable message signs (CMS) and/or blank-out signs (depending on location and the nature of the message) could be considered at the 120th Street/Crenshaw Boulevard intersection in lieu of TCOs. Experience from other venues has determined that it is preferable to evaluate the effectiveness of TCOs and special event staff deployment before deciding whether permanent electronic signs would be effective and economical.

Since this improvement involves another jurisdiction beyond the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-2(n), which would consist primarily of restriping and not require right-of-way acquisition, would mitigate and restore operations at the La Brea Avenue/Centinela Avenue intersection to better than the ‘no project’ condition, thereby mitigating this impact to **less than significant**.

The City of Inglewood is implementing a city-wide ITS program on key corridors including but not limited to West Century Boulevard, South Prairie Avenue, Manchester Boulevard, Florence Avenue, Centinela Avenue, Crenshaw Boulevard, Imperial Highway, La Brea Avenue, La Cienega Boulevard, Arbor Vitae Street, and Pincay Drive. The program is to enable intersections to operate as part of a coordinated system, to allow for remote intersection monitoring from the City’s Traffic Management Center, and to provide flexibility to remotely change signal timings from the Traffic Management Center in response to changes in traffic flows or incidents. ITS will provide a fully responsive traffic signal system based on real time traffic conditions that can provide instantaneous traffic information and predictive time information to users along access corridors. Additionally, this would enable the City to better accommodate event-related traffic. Intersection improvements designed to address the significant impacts of the Project consist of financial contribution toward the design, construction, and integration of ITS improvements, which include but are not limited to: vehicles detection, computer hardware and networking, fiber-optic communication system upgrades, closed circuit TV cameras, changeable message signs, blank-out signs, equipment and networking management, traffic signal modifications, Traffic Management Center and Decision Support System integration, software licensing, high resolution data, connected vehicle technology, upgrading outdated software and equipment, ATC controllers and cabinets, lane control management, and other improvements to the ITS network. The ITS improvements focus on intersections on certain key corridors potentially affected by the Proposed Project. Under Mitigation Measure 3.14-2(o), funding contributions may focus on ITS improvements along these corridors, in addition to at identified intersections. The financial contribution shall be available for ITS improvements at the following intersections and to the corridors where these intersections are located. The list below comprises intersections impacted under either Adjusted Baseline and/or cumulative conditions). Impact 3.14-28 in Section 3.14.5 lists five additional intersections that are significantly impacted by the Proposed Project under a concurrent event at The Forum.

- La Cienega Boulevard / Florence Avenue
- Centinela Avenue / Florence Avenue
- South Prairie Avenue / Florence Avenue
- West Boulevard / Florence Avenue
- South Prairie Avenue / Grace Avenue
- South Prairie Avenue / East Carondelet Way
- South Prairie Avenue / East Regent Street
- La Cienega Boulevard / Manchester Boulevard
- La Brea Avenue / Manchester Boulevard
- Hillcrest Boulevard / Manchester Boulevard
- Spruce Avenue / Manchester Boulevard
- South Prairie Avenue / Manchester Boulevard

- Kareem Court / Manchester Boulevard
- Crenshaw Boulevard / Manchester Boulevard
- South Prairie Avenue / Kelso Street / Pincay Drive
- La Cienega Boulevard / Arbor Vitae Street
- Inglewood Avenue / Arbor Vitae Street
- Myrtle Avenue / Arbor Vitae Street
- South Prairie Avenue / Arbor Vitae Street
- La Brea Avenue / Hardy Street
- South Prairie Avenue / Hardy Street
- Crenshaw Boulevard / Hardy Street
- Felton Avenue / West Century Boulevard
- Inglewood Avenue / West Century Boulevard
- Fir Avenue / Firmona Avenue / West Century Boulevard
- Grevillia Avenue / West Century Boulevard
- Hawthorne Boulevard / La Brea Boulevard / West Century Boulevard
- Myrtle Avenue / West Century Boulevard
- Freeman Avenue / West Century Boulevard
- South Prairie Avenue / West Century Boulevard
- Doty Avenue / West Century Boulevard
- Yukon Avenue / West Century Boulevard
- Club Drive / West Century Boulevard
- 11th Avenue / Village Avenue / West Century Boulevard
- Crenshaw Boulevard / West Century Boulevard
- 5th Avenue / West Century Boulevard
- Yukon Avenue / West 102nd Street
- Hawthorne Boulevard / West 104th Street
- South Prairie Avenue / West 104th Street
- Yukon Avenue / West 104th Street
- Crenshaw Boulevard / West 104th Street
- South Prairie Avenue / Lennox Boulevard
- South Prairie Avenue / 108th Street
- South Prairie Avenue / 111th Street
- South Prairie Avenue / Imperial Highway
- Doty Avenue / Imperial Highway
- Crenshaw Boulevard / Imperial Highway

- Crenshaw Boulevard / 120th Street
- Hollywood Park Casino Driveway / West Century Boulevard
- South Prairie Avenue / Buckthorn Street
- Van Ness Avenue / Manchester Boulevard
- Crenshaw Boulevard / Pincay Drive

The Adjusted Baseline Plus Project (Daytime Event) scenario included a number of intersections that were also significantly impacted with a major event (see Impact 3.14-3). However, some of the mitigation measures for impacts during a major event were not considered for a Daytime Event because they would not be effective from the perspective of showing improved operations. This stems from the use of different intersection analysis methods between the two scenarios. An example of this is the Prairie Avenue/Pincay Street intersection.

The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-59**. Of the nine significant intersection impacts identified during the weekday AM peak hour, the above mitigation measures would cause two to become less than significant. Of the 46 significant intersection impacts identified during the weekday PM peak hour, the above mitigation measures would cause five to become less than significant. The precise degree of effectiveness of proposed TDM strategies to shift the mode split away from driving and reduce the project's vehicular trip generation is not known. Therefore, mitigation measure testing did not explicitly account for a certain amount of reduced vehicle travel due to TDM strategies. However, the above list of mitigation measures would reduce vehicle travel demand, accommodate the remaining travel demand in a more efficient manner, and provide physical improvements, where feasible, to add capacity to the roadway system. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies. Further, there are no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

NOTES:

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections in which mitigation was either not required or not feasible.

SOURCE: Fehr & Peers, 2019.

Impact 3.14-3: Major events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions. (Significant and Unavoidable)

Significant impacts were identified based on the results in Table 3.14-31 and the significance criteria. **Figures 3.14-14, 3.14-15, and 3.14-16** are study area maps displaying intersections that would be significantly impacted during the weekday pre-event (42 intersections), weekday post-event (11 intersections), and weekend pre-event (26 intersections) peak hours, respectively.

These impacts are considered **significant**.

Figure 3.14-17 displays the project-specific mitigation measures associated with the Adjusted Baseline with Major Event conditions. Specific mitigation measures are presented below.

Mitigation Measure 3.14-3(a)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-3(b)

Implement Mitigation Measure 3.14-2(b) (Implement TDM Program).

Mitigation Measure 3.14-3(c)

The project applicant shall work with the City of Inglewood and Caltrans to restripe the center lane on the I-405 NB Off-Ramp at West Century Boulevard to permit both left and right-turn movements. This would require complying with the Caltrans project development process as a local agency-sponsored project. This could include (but is not limited to) a cooperative agreement, permit engineering evaluation report, encroachment permit, project design, construction, etc.

Mitigation Measure 3.14-3(d)

Implement Mitigation Measure 3.14-2(d) (West Century Boulevard/Hawthorne Boulevard/La Brea Boulevard Improvements).

Mitigation Measure 3.14-3(e)

The project applicant shall convert the signal control system at the intersection of South Prairie Avenue and Pincay Drive to provide protected or protected-permissive westbound and eastbound left-turn phasing.

Mitigation Measure 3.14-3(f)

The project applicant shall widen the east side of South Prairie Avenue to extend the proposed shuttle bus pull-out on the east side of South Prairie Avenue to the intersection to serve as an exclusive right-turn lane. Additionally, implement a northbound right-turn signal overlap phase. During pre-event and post-event periods, TCOs shall be positioned at this location as part of the Event TMP to manage the interaction of northbound right-turning traffic and pedestrians in the east leg crosswalk and to permit the lane to also operate as a bus queue jumper for shuttle buses departing the shuttle bus pull-out and traveling north through the intersection.

Baseline Plus Major Event Weekday Post-Event Peak Hour

SOURCE: Fehr and Peers, 2019

Inglewood Basketball and Entertainment Center

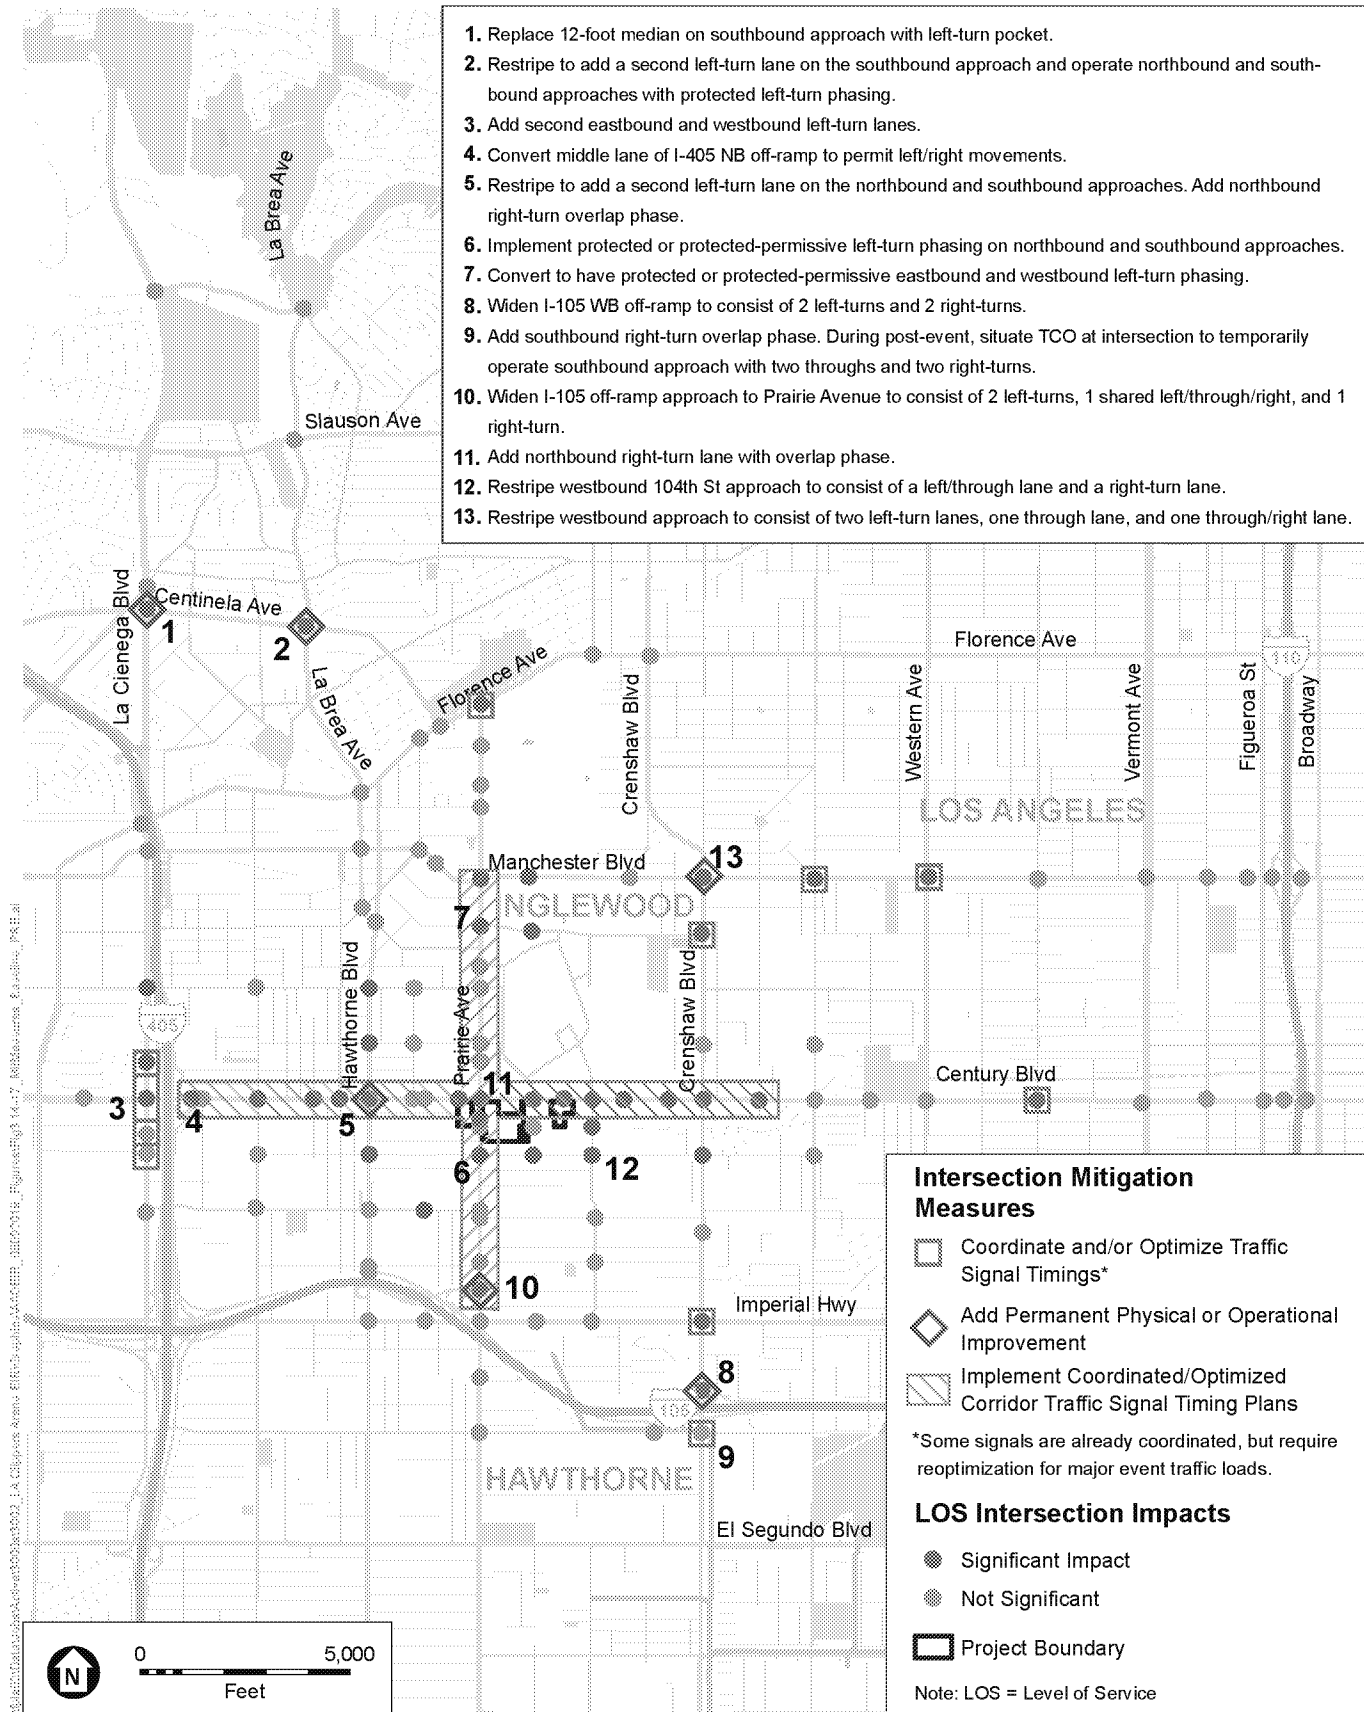

Figure 3.14-16

Impacted Intersections:

Baseline Plus Major Event Weekend Pre-Event Peak Hour

1. Replace 12-foot median on southbound approach with left-turn pocket.
2. Restripe to add a second left-turn lane on the southbound approach and operate northbound and southbound approaches with protected left-turn phasing.
3. Add second eastbound and westbound left-turn lanes.
4. Convert middle lane of I-405 NB off-ramp to permit left/right movements.
5. Restripe to add a second left-turn lane on the northbound and southbound approaches. Add northbound right-turn overlap phase.
6. Implement protected or protected-permissive left-turn phasing on northbound and southbound approaches.
7. Convert to have protected or protected-permissive eastbound and westbound left-turn phasing.
8. Widen I-105 WB off-ramp to consist of 2 left-turns and 2 right-turns.
9. Add southbound right-turn overlap phase. During post-event, situate TCO at intersection to temporarily operate southbound approach with two throughs and two right-turns.
10. Widen I-105 off-ramp approach to Prairie Avenue to consist of 2 left-turns, 1 shared left/through/right, and 1 right-turn.
11. Add northbound right-turn lane with overlap phase.
12. Restripe westbound 104th St approach to consist of a left/through lane and a right-turn lane.
13. Restripe westbound approach to consist of two left-turn lanes, one through lane, and one through/right lane.

Intersection Mitigation Measures

- Coordinate and/or Optimize Traffic Signal Timings*
- Add Permanent Physical or Operational Improvement
- Implement Coordinated/Optimized Corridor Traffic Signal Timing Plans

*Some signals are already coordinated, but require reoptimization for major event traffic loads.

LOS Intersection Impacts

- Significant Impact
- Not Significant
- Project Boundary

Note: LOS = Level of Service

SOURCE: Fehr and Peers, 2019

Inglewood Basketball and Entertainment Center

Figure 3.14-17
Intersection Mitigation Measures - Adjusted Baseline Plus Project Major Event Weekday Conditions

Mitigation Measure 3.14-3(g)

Implement Mitigation Measure 3.14-2(g) (I-105 Off-Ramp Widening at South Prairie Avenue).

Mitigation Measure 3.14-3(h)

Implement Mitigation Measure 3.14-2(j) (I-105 Westbound Off-Ramp Widening at Crenshaw Boulevard).

Mitigation Measure 3.14-3(i)

Implement Mitigation Measure 3.14-2(l) (Crenshaw Boulevard/120th Street Improvements).

Mitigation Measure 3.14-3(j)

The project applicant shall work with the City of Inglewood and the City of Los Angeles to remove the median island on the north leg and construct a second left-turn lane on southbound La Cienega Boulevard at Centinela Avenue.

Mitigation Measure 3.14-3(k)

Implement Mitigation Measure 3.14-2(n) (La Brea Avenue/Centinela Avenue Improvements).

Mitigation Measure 3.14-3(l)

The project applicant shall implement protected or protected/permissive left-turn phasing on northbound and southbound South Prairie Avenue at West 104th Street.

Mitigation Measure 3.14-3(m)

Implement Mitigation Measure 3.14-2(e) (Restripe the westbound West 104th Street approach to Yukon Avenue to consist of a left/through lane and a dedicated right-turn lane).

Mitigation Measure 3.14-3(n)

Implement Mitigation Measure 3.14-2(i) (Manchester Boulevard/Crenshaw Boulevard Improvements).

Mitigation Measure 3.14-3(o)

The project applicant shall work with the City of Inglewood to coordinate traffic signals and optimize traffic signal timings to accommodate major event traffic flows (see Figure 3.14-17 for locations).

Mitigation Measure 3.14-3(p)

Implement Mitigation Measure 3.14-2(o) (Financial Contribution to City ITS program).

Level of Significance After Mitigation: Mitigation Measures 3.14-3(c) through 3.14-3(n) above identify physical mitigation measures that could reduce the impacts at the specific impacted intersections listed in these mitigation measures. No feasible physical mitigation was identified that would reduce impacts at the remaining impacted

intersections. However, the combined effects of the Event TMP, coordinated/special event signal timings, and the physical mitigations below, would have synergistic effects to improve operations at other intersections without requiring physical improvements to them.

If Mitigation Measure 3.14-3(c) is implemented, the modification to the center lane on the I-405 NB Off-Ramp at West Century Boulevard would improve operations from LOS F (with project) to C (with project and mitigation) during the weekend pre-event peak hour but would not improve upon the 'no project' LOS F condition during the weekday pre-event peak hour. Since the improvement involves another jurisdiction in addition to the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

The modifications under Mitigation Measure 3.14-2(d) would maintain LOS F conditions at the West Century Boulevard/Hawthorne Boulevard/La Brea Boulevard intersection during the weekday and weekend pre-event peak hour conditions and improve weekday post-event peak hour conditions from LOS F to E. The impact would be **significant and unavoidable** because an acceptable LOS D would not be achieved.

The modification under Mitigation Measure 3.14-3(e) would improve operations at the South Prairie Avenue/Pincay Drive intersection from LOS E (with project) to C (with project and mitigation) during the weekday pre-event peak hour, thereby mitigating this impact to **less than significant**.

The Proposed Project site plan would provide sufficient area to allow for widening Prairie Avenue to provide a northbound right-turn lane. However, it would cause the sidewalk along the east side of Prairie Avenue between the plaza entry/exit and Century Boulevard to be reduced from 20 to 8 feet in width. This is considered a potentially significant secondary impact because it could cause post-event pedestrian flows to exceed the sidewalk capacity (thereby resulting in walking in the street). In response to this potential condition, the Event TMP (Mitigation Measure 3.14-2(a)) includes post-event pedestrian wayfinding guidance, which if followed, would result in the majority of post-event attendees using the primary plaza exit to access the east leg crosswalk at the Prairie Avenue/Century Boulevard intersection, thereby limiting flows on this sidewalk to match its available width. With Mitigation Measure 3.14-3(f) in place, operations at the Prairie Avenue/Century Boulevard intersection would remain at LOS F (with similar delay levels to 'without mitigation') conditions. The impact would be **significant and unavoidable** because an acceptable LOS D would not be achieved. Other mitigation measures, such as adding a second northbound and southbound left-turn lane were also considered, but found not to be feasible due to lack of roadway width and developed or developing properties on all quadrants of the intersection.

Mitigation Measure 3.14-3(g), if implemented, would improve operations at the I-105 Off-Ramp/South Prairie Avenue intersection from LOS F (with project) to D (with project and mitigation) during the weekday post-event peak hour, thereby mitigating this portion of the impact to less than significant. However, operations would not be restored to an acceptable LOS during the weekday pre-event peak hour. Since the improvement involves another jurisdiction in addition to the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-3(h), if implemented, would improve operations at the I-105 Westbound Off-Ramp/Crenshaw Boulevard intersection from LOS E (with project) to D (with project and mitigation) during the weekday and weekend pre-event peak hours, thereby mitigating this impact to less than significant. Since the improvement involves other jurisdictions beyond the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-3(i), if implemented and in conjunction with Mitigation Measure 3.14-3(a), would improve operations at the Crenshaw Boulevard/120th Street intersection from LOS F (with project) to B (with project and mitigation) during the weekday post-event peak hour, thereby mitigating this impact to less than significant. Since the improvement involves another jurisdiction beyond the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-3(j), if implemented, would improve operations at the La Cienega Boulevard/Centinela Avenue intersection under with project conditions to a V/C ratio the same as or better than the no project condition under during all three analysis periods, thereby mitigating the impact to less than significant. Since the improvement involves another jurisdiction in addition to the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**.

Mitigation Measure 3.14-3(k), which would consist primarily of restriping and not require right-of-way acquisition, would improve operations at the La Brea Avenue/Centinela Avenue intersection from LOS E (with project) to D (with project and mitigation) during the weekday pre-event peak hour, thereby mitigating this impact to **less than significant**.

Mitigation Measure 3.14-3(l) would reduce the severity of LOS F operations at South Prairie Avenue at West 104th Street compared to with project conditions for weekday and weekend pre-event conditions, but maintain LOS F during both periods. Operations would remain at LOS E during the weekday post-event peak hour. The impact would be **significant and unavoidable** during the weekday pre-event, weekday post-event, and weekend pre-event peak hours because operations would not improve to an acceptable LOS D or better.

Mitigation Measure 3.14-3(m) would reduce the severity of LOS F operations at the West 104th Street/Yukon Avenue intersection compared to with project conditions during the weekday pre-event peak hour, though operations would remain at LOS F. The impact would be **significant and unavoidable** during the weekday pre-event peak hour.

Mitigation Measure 3.14-3(n) would improve operations at Manchester Boulevard/Crenshaw Boulevard from LOS F (with project) to E (with project and mitigation) during the weekday pre-event peak hour, thereby mitigating this impact to less than significant (because operations would be at LOS F under no project conditions). This modification improves operations from LOS E (with project) to C (with project and mitigation) during the weekend pre-event peak hour, thereby mitigating this impact to **less than significant**.

Mitigation Measure 3.14-3(o) would reduce impacts or the severity of impacts at intersections along key corridors throughout the study area, including in some cases

intersections near the Proposed Project. However, in some cases improving traffic flow at one or more intersections may degrade operations at others by relieving an upstream bottleneck, thus permitting more traffic to flow through downstream intersections. This, in turn, would contribute to secondary significant impacts described below.

Under Mitigation Measure 3.14-3(p), the ITS improvements focus on intersections on certain key corridors potentially affected by the Proposed Project. Figure 3.14-17 and the Event TMP (see Appendix K.4) indicate that there are several ‘arterial-to-arterial’ impacted intersections that do not have a recommended physical improvement nor an active traffic management component. Two examples are the Manchester Boulevard/South Prairie Avenue and Crenshaw Boulevard/West Century Boulevard intersections. At the Manchester Boulevard/South Prairie Avenue intersection, operation of the intersection with officers along with a modified set of lane assignments (to facilitate travel toward the Proposed Project) was tested using microsimulation, but found not to be effective. Hence, it is not included as part of the coordinated/optimized South Prairie Avenue corridor signal timing plan. At the Crenshaw Boulevard/West Century Boulevard intersection, the recently constructed improvements were reviewed and no further capacity increases were deemed feasible. Similar reviews were conducted of other intersections featuring significant impacts.

The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-60**. Based on network-level microsimulation analysis, under major event conditions, the mitigations at major bottlenecks often result in increased traffic flow at adjacent and/or downstream intersections. Improving the flow at major bottleneck locations, although desirable, can cause secondary, significant impacts. The following describes their effectiveness during each peak hour.

Weekday Pre-Event Peak Hour

Of the 42 significant intersection impacts, the above mitigation measures would cause 15 to become less than significant. In some cases, these mitigation measures improved traffic flow at one or more intersections, which resulted in degraded operations at others by relieving an upstream bottleneck or causing queues to spillback to a nearby intersection, worsening its operations. This occurred at six such intersections. Those locations are identified in Table 3.14-60 showing their results being shaded for the ‘with mitigation’ scenario, but not shaded for the ‘plus project’ scenario. Opportunities for physical or further operational/signal timing improvements at these locations were investigated, but no feasible mitigations were identified. The average percent demand served at the 68 intersections analyzed using microsimulation increased from 85 percent (without mitigation) to 90 percent with the recommended mitigation measures in place.²⁷

²⁷ “Average percent demand served” by the entire simulation network is a metric which quantifies the extent to which the entire hourly travel demand for a given intersection is able to be served within that hour. Under congested conditions, bottlenecks form in the system which can cause traffic not to be able to reach downstream intersections, or can cause blockages of upstream intersections by queued vehicles at the bottleneck. When the percent demand served falls well below 100 percent (e.g., to 75 to 85 percent for a large network such as this), the likelihood of ‘peak hour spreading’ (i.e., multiple hours of congestion) increases.

NOTES:

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes) Per the HCM, delay estimates in over-saturated conditions are unreliable.

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections in which mitigation was either not required or not feasible.

Intersections analyzed using HCM may show "with mitigation" LOS results despite the particular intersection not being impacted because microsimulation analysis of mitigations reveals effects on nearby intersections.

SOURCE: Fehr & Peers, 2019.

Weekday Post-Event Peak Hour

Of the 11 significant intersection impacts, the above mitigation measures would cause five to become less than significant. These mitigation measures would cause an additional two intersections to become new secondary, significantly impacted locations. The average percent demand served at the 68 intersections analyzed using microsimulation increased from 94 percent (Adjusted Baseline Plus Project without mitigation) to 95 percent with the recommended mitigation measures in place.

Weekend Pre-Event Peak Hour

Of the 26 significant intersection impacts identified during the weekend pre-event peak hour, the above mitigation measures would cause 11 to become less than significant. These mitigation measures would cause an additional one intersection to become a new secondary, significantly impacted location. The average percent demand served at the 68 intersections analyzed using microsimulation increased from 91 percent (Adjusted Baseline Plus Project without mitigation) to 95 percent with the recommended mitigation measures in place.

The precise degree of effectiveness of proposed TDM strategies to shift the mode split away from driving and reduce the project's vehicular trip generation is not known. Therefore, mitigation measure testing did not explicitly account for a certain amount of reduced vehicle travel due to TDM strategies. The above list of mitigation measures would reduce vehicle travel demand, accommodate the remaining travel demand in a more efficient manner, and provide physical improvements, where feasible, to add capacity to the roadway system. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies, and there are no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

Impact 3.14-4: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under Adjusted Baseline conditions. (Significant and Unavoidable)

As presented in Table 3.14-16 and based on the significance criteria, the following neighborhood street segments would be significantly impacted:

- The collector street segment of Yukon Avenue south of West 102nd Street would experience an increase in weekday daily traffic from 13,059 vehicles under Adjusted Baseline No Project conditions to 13,863 vehicles under Adjusted Baseline Plus Project (Ancillary Land Uses) conditions.

This impact is considered **significant**.

Mitigation Measure 3.14-4(a)

Implement Neighborhood Traffic Management Plan component of Event TMP, which is contained in Mitigation Measure 3.14-2(a).

Mitigation Measure 3.14-4(b)

Implement Mitigation Measure 3.14-2(b) (Implement TDM Program).

Level of Significance After Mitigation: The Event TMP, which can be found in Appendix K.4, includes a chapter on neighborhood traffic protection including the need for the project applicant to develop and implement a Neighborhood Traffic Management Plan (NTMP). The NTMP would cover the area bounded by Hawthorne Boulevard, Hardy Boulevard, Crenshaw Boulevard, and Imperial Highway (excluding the Hollywood Park Specific Plan area). It outlines the process by which the applicant and City would engage neighborhood groups, businesses, and stakeholders to develop a plan that has broad consensus and protects the neighborhood from unwanted traffic intrusion during events at the Proposed Project. It was not possible for the Draft EIR to identify a solution with broad consensus among stakeholders that would fully address and mitigate the traffic levels expected on the impacted streets. Such an effort would require extensive public outreach, as well as detailed study of how various measures could be implemented to reduce volumes on street segments identified as having significant street impacts without causing additional impacts on nearby streets. The NTMP lays out the process to be undertaken to complete this assessment.

At this time, the effectiveness of the NTMP toward reducing traffic levels on impacted neighborhood streets to acceptable thresholds cannot be guaranteed. Although implementation of the TDM Program may reduce vehicle trips, the precise degree of trip reduction cannot be precisely quantified to determine whether an impact could be avoided at any potentially impacted neighborhood street. Therefore, this impact is considered **significant and unavoidable**. However, the Event TMP includes a performance standard that requires reducing traffic volumes on local and collector street segments identified in the Draft EIR as having a significant impact without causing a significant impact on other local and collector street segments and discouraging and reducing event-related cut-through traffic while maintaining access for residents and their guests.

Impact 3.14-5: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions. (Significant and Unavoidable)

As presented in Table 3.14-23 and based on the significance criteria, the following neighborhood street segments would be significantly impacted:

- The collector street segment of Yukon Avenue south of West 102nd Street would experience an increase in weekday daily traffic from 13,059 vehicles under Adjusted Baseline No Project conditions to 13,866 vehicles with a 2,000-person corporate/community event and 14,171 vehicles with a 7,500-person sports/gathering event.
- The local street segment of 109th Street between Yukon Avenue and Lemoli Avenue would experience an increase in weekday daily traffic from 2,898 vehicles under Adjusted Baseline No Project conditions to 3,087 vehicles with a 2,000-person corporate/community event and 3,128 vehicles with a 7,500-person sports/gathering event.

These impacts are considered **significant**.

Although a 7,500-person sports/gathering event would result in the local street segment of West 102nd between Doty Avenue and Yukon Avenue carrying 3,107 vehicles per day, the project impact on this segment is not considered significant because it would otherwise be carrying over 4,600 vehicles per day if the project was not constructed (i.e., because it would not be discontinuous east of South Prairie Avenue).

Mitigation Measure 3.14-5

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Level of Significance After Mitigation: The Event TMP, which can be found in Appendix K.4, includes a chapter on neighborhood traffic protection including the need for the project applicant to develop and implement a NTMP. At this time, the effectiveness of the NTMP element of the TMP toward reducing traffic levels on impacted neighborhood streets to acceptable thresholds cannot be guaranteed. Therefore, this impact is considered **significant and unavoidable**. However, the Event TMP includes a performance standard that requires reducing traffic volumes on local and collector street segments identified in the EIR as having a significant impact without causing a significant impact on other local and collector street segments and discouraging and reducing event-related cut-through traffic while maintaining access for residents and their guests.

Impact 3.14-6: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions. (Significant and Unavoidable)

As presented in Table 3.14-32 and based on the significance criteria, the following neighborhood street segments would be significantly impacted:

- The collector street segment of Yukon Avenue south of West 102nd Street would experience an increase in weekday daily traffic from 13,059 vehicles under Adjusted Baseline No Project conditions to 14,982 vehicles with a major event. On a weekend day, this segment would experience an increase in daily traffic from 11,600 vehicles under Adjusted Baseline No Project conditions to 13,442 vehicles with a major event.
- The collector street segment of West 104th Street between South Prairie Avenue and Doty Avenue would experience an increase in weekday daily traffic from 5,967 vehicles under Adjusted Baseline No Project conditions to 10,050 vehicles with a major event.
- The collector street segment of West 104th Street between Doty Avenue and Crenshaw Boulevard would experience an increase in weekday daily traffic from 9,001 vehicles under Adjusted Baseline No Project conditions to 10,232 vehicles with a major event.
- The local street segment of 109th Street between Yukon Avenue and Lemoli Avenue would experience an increase in weekday daily traffic from 2,898 vehicles under Adjusted Baseline No Project conditions to 3,158 vehicles with a major event.

These impacts are considered **significant**.

It should be noted that although a major event would result in the local street segment of West 102nd Street between Doty Avenue and Yukon Avenue carrying 3,549 vehicles per day, the project impact on this segment is not considered significant because it would otherwise be carrying over 4,600 vehicles per day if the project was not constructed.

Mitigation Measure 3.14-6

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Level of Significance After Mitigation: The Event TMP, which can be found in Appendix K.4, includes a chapter on neighborhood traffic protection including the need for the project applicant to develop and implement a NTMP. At this time, the effectiveness of the NTMP element of the TMP toward reducing traffic levels on impacted neighborhood streets to acceptable thresholds cannot be guaranteed. Therefore, this impact is considered **significant and unavoidable**. However, the Event TMP includes a performance standard that requires reducing traffic volumes on local and collector street segments identified in the EIR as having a significant impact without causing a significant impact on other local and collector street segments and discouraging and reducing event-related cut-through traffic while maintaining access for residents and their guests.

Impact 3.14-7: Operation of the Proposed Project ancillary land uses could have the potential to cause significant impacts on freeway facilities under Adjusted Baseline conditions. (Less than Significant)

As presented in Table 3.14-17 and based on the significance criteria, the Proposed Project ancillary land uses would not result in significant impacts on study freeway components. According to Table 3.14-18 and the significance criteria, the Proposed Project ancillary land uses would not cause any freeway off-ramps to have queue lengths that exceed the applicable threshold.

These impacts are considered **less than significant**.

Mitigation Measures

None required.

Impact 3.14-8: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions. (Significant and Unavoidable)

Weekday AM Peak Hour

As presented in Table 3.14-24 and based on the significance criteria, a 2,000-person weekday event at the Proposed Project Arena would cause significant impacts on the following study freeway components (refer to table for specific components):

- One impacted component on Northbound I-405
- Three impacted components on Southbound I-405
- Seven impacted components on Westbound I-105

Weekday PM Peak Hour

As presented in Table 3.14-24 and based on the significance criteria, a 7,500-person weekday afternoon event at the Proposed Project Arena would cause significant impacts on the following study freeway components (refer to table for specific components):

- Two impacted components on Northbound I-405
- Three impacted components on Southbound I-405
- One impacted component on Westbound I-105
- Five impacted components on Eastbound I-105
- Two impacted components on Northbound I-110
- Two impacted components on Southbound I-110

These impacts are considered **significant**.

As presented in Table 3.14-25 and based on the significance criteria, daytime events at the Proposed Project Arena would not cause any freeway off-ramps to have queue lengths that exceed the applicable threshold. Therefore, freeway off-ramp queuing impacts are considered **less than significant**.

Mitigation Measure 3.14-8(a)

Implement the trip reduction measures included in the Project TDM Program described in Mitigation Measure 3.14-2(b).

Mitigation Measure 3.14-8(b)

The project applicant shall work with Caltrans to implement the following traffic management system improvements along the I-105 corridor:

- a) Changeable message sign (CMS) on the eastbound I-105 between the I-405 connector ramp and the eastbound South Prairie Avenue off-ramp.*
- b) CMS on the westbound I-105 between Vermont Avenue and the westbound Crenshaw Boulevard off-ramp.*

- c) *Closed circuit television cameras on the westbound Crenshaw Boulevard off-ramp, the South Prairie Avenue off-ramp, the westbound Hawthorne Boulevard off-ramp, and the eastbound 120th Street off-ramp to I-105.*

Level of Significance After Mitigation: The freeway component impacts are considered to be **significant and unavoidable** despite the presence of the above mitigation measures. Implementation of these measures would not guarantee that operations at each impacted component would be restored to ‘no project’ levels. Freeway off-ramp queuing under this scenario would be **less than significant** and require no mitigation.

Impact 3.14-9: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions. (Significant and Unavoidable)

As presented in Table 3.14-33 and based on the significance criteria, major events at the Proposed Project Arena would cause significant impacts on the following study freeway components (refer to table for specific components). According to Table 3.14-34 and the significance criteria, major events at the Proposed Project Arena would cause freeway off-ramps to have queue lengths that exceed the applicable threshold.

Weekday Pre-Event Peak Hour

- Three impacted components on Southbound I-405
- Two impacted components on Eastbound I-105
- One impacted component on Westbound I-105
- Project causes queues to exceed storage at three freeway off-ramps

Weekday Post-Event Peak Hour

- One impacted component on Northbound I-405
- One impacted component on Eastbound I-105
- One impacted component on Westbound I-105

Weekend Pre-Event Peak Hour

- Three impacted components on Southbound I-405
- Two impacted components on Eastbound I-105
- One impacted component on Westbound I-105
- Project causes queues to exceed storage at two freeway off-ramps

These impacts are considered **significant**.

Mitigation Measure 3.14-9(a)

Implement mitigation measure 3.14-3(h) ((I-105 Westbound Off-ramp Widening at Crenshaw Boulevard).

Mitigation Measure 3.14-9(b)

Implement Mitigation Measure 3.14-3(c) (Restripe I-405 NB Off-Ramp at West Century Boulevard).

Mitigation Measure 3.14-9(c)

Implement Mitigation Measure 3.14-3(o) (Retime and optimize traffic signals on Inglewood streets).

Mitigation Measure 3.14-9(d)

Implement Mitigation Measure 3.14-3(g) (I-105 Off-ramp Widening at South Prairie Avenue).

Mitigation Measure 3.14-9(e)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-9(f)

Implement the trip reduction measures included in the Project TDM Program described in Mitigation Measure 3.14-2(b).

Mitigation Measure 3.14-9(g)

Implement Mitigation Measure 3.14-8(b) (Work with Caltrans to implement traffic management system improvements along the I-105 corridor).

Level of Significance After Mitigation: The combined effect of the above mitigation measures would be improved operations of streets in the vicinity of the Proposed Project, which would result in less overall delay and vehicle queuing. Additionally, widening and/or lane reassignments on each of the impacted off-ramps would improve their capacity and ability to store vehicles. The following describes how impacted off-ramps would be improved (for the more critical weekday pre-event peak hour):

- At the I-405 Northbound off-ramp at West Century Boulevard, the maximum vehicle queue would be reduced from an estimated 4,075 feet (without mitigation) to 2,325 feet with mitigation, which is less than the applicable 3,600-foot storage. Thus, storage would be adequate with mitigation.
- At the I-105 Westbound off-ramp at Crenshaw Boulevard, the maximum vehicle queue would be reduced from an estimated 5,465 feet (without mitigation) to 3,194 feet with mitigation, which is less than the applicable 4,065-foot storage. Thus, storage would be adequate with mitigation.
- The surface street improvements and traffic management strategies would result in a small decrease in the maximum queue at the I-405 southbound off-ramps onto La Cienega Boulevard. However, the more southerly ramp (south of West Century Boulevard) would continue to exceed the applicable storage threshold.

If implemented, these measures would reduce the off-ramp queues to within the applicable ramp storage threshold at two of the three impacted off-ramps during the weekday and weekend pre-event peak hours. However, the maximum queue at the I-405

southbound off-ramp onto La Cienega (south of West Century Boulevard) would continue to exceed the applicable storage threshold. Since these improvements involve another jurisdiction in addition to the City of Inglewood, however, their implementation cannot be guaranteed. The freeway component impacts are considered to be **significant and unavoidable**.

Impact 3.14-10: Certain components of the Proposed Project would generate VMT in excess of applicable thresholds. (Significant and Unavoidable)

Table 3.14-40 presented the weekday daily VMT estimates associated with the ancillary land uses. The impact on VMT of the office, practice facility, and sports medicine clinic components of the Proposed Project would be considered **less than significant** as the daily work VMT per employee is estimated at 15.0, less than the 15.8 threshold (15 percent less than the regional daily work VMT value of 18.6²⁸).

The retail component impact on VMT would be considered **significant** as it is considered to be regional-serving (i.e., a team store not catering to the local area) and it would generate a net increase in daily VMT.

The restaurant uses could be considered both local- and regional-serving in that they would attract local patronage on non-event days and regional patronage associated with the event on event days. Since the regional patronage associated with events is considered as part of the event VMT impacts, the restaurant uses' impact on VMT by themselves are considered to be **less than significant**.

The hotel component impact on VMT would be considered **significant** as it would generate a net increase in daily VMT.

Tables 3.14-41, 3.14-42, and 3.14-43 display the estimated VMT generated by daytime events, VMT generated by major events, and the net change in daily VMT generated by each analyzed event type at the Proposed Project for new events and for events transferred from other venues in the region. Additionally, other events that would be hosted within the event component of the Proposed Project (e.g., medium and small concerts, daytime family shows, corporate events, and other sporting or entertainment events) also would generate VMT, and a corresponding net increase in VMT per event and per attendee as seen for major events. The event component of the Proposed Project would generate a net increase in VMT and would therefore be considered **significant**.

The Proposed Project impact on VMT under Cumulative conditions and concurrent event conditions would effectively be the same as those under Adjusted Baseline conditions, as the Proposed Project would generate the same levels of VMT. In the concurrent event scenario, with

²⁸ Southern California Association of Governments 2016 RTP/SCS regional travel demand model, as run by Fehr & Peers.

Proposed Project attendees parking further from the Proposed Project, the VMT levels would likely be slightly lower.

Mitigation Measure 3.14-10(a)

Implement the trip reduction measures included in the Project TDM Program described in Mitigation Measure 3.14-2(b).

Mitigation Measure 3.14-10(b)

The project applicant shall operate a shuttle to transport hotel guests between the hotel and Los Angeles International Airport, if warranted by demand.

Level of Significance After Mitigation: As the significance thresholds for events, the hotel, and the regional retail use is any net increase in VMT, these measures would reduce the magnitude of the impacts on VMT but would not reduce them to less than significant. The Proposed Project impacts on VMT would be **significant and unavoidable**.

Impact 3.14-11: Operation of the Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions. (Significant and Unavoidable)

The Proposed Project is not expected to require any temporary bus route detours or temporary stop locations, and therefore would not affect route length. However, project vehicular traffic has the potential to affect on-time performance for buses operating in the study area (particularly along South Prairie Avenue and West Century Boulevard) because of congestion associated with event arrival and departure traffic, as documented in Impact 3.14-2 and Impact 3.14-3. This impact is considered **significant**.

Project-related vehicular traffic is not expected to affect Green Line and Crenshaw/LAX transit corridor run time, as the Green Line is fully grade separated, and the Crenshaw/LAX transit corridor is grade separated at most major arterial crossings. However, increased ridership demand associated with the Proposed Project, especially at the Downtown Inglewood and Hawthorne/Lennox Stations, would increase station dwell time compared with non-event days. As there would be no other impacts to run time, this extra station dwell time should be able to be made up along the routes, and therefore no adverse impact to rail transit operations is expected for either line. Consistent with OPR guidance, an increase in transit demand is not considered an impact for CEQA purposes. This impact is considered to be **less than significant**.

During major events, the Proposed Project would operate shuttles that transport attendees between the site and the Hawthorne Green Line Station and planned Metro Crenshaw/LAX Line station in Downtown Inglewood. The Proposed Project site plan indicates a 120-foot bus pull-out would be provided along South Prairie Avenue. According to Table 3.14-27 and 3.14-28, a major event at the Proposed Project would generate 16 pre-event peak hour shuttle buses that would use

this turnout. During the post-event peak hour, 20 shuttles would need to arrive and depart in less than one hour as attendees exit the event and wait for the shuttle bus to be transported to a light rail station. The 120-foot turn bay would enable no more than two buses to simultaneously load/unload passengers. Observations at other major events suggest that it may take up to five minutes of elapsed time for a bus to arrive, load passengers, and then depart, suggesting a capacity to accommodate no more than 24 shuttles per hour. However, to the extent congestion on South Prairie Avenue blocks ingress or egress from the turnout, an even longer shuttle bus service period may be required. To the extent that congestion on South Prairie Avenue during the pre-event and post-event hours caused by the addition of event traffic blocks ingress or egress from the proposed shuttle bus pull-out turnout adjacent to the Project Site along South Prairie Avenue, the proposed 120-foot length of the pull-out may be inadequate. As such, the Proposed Project's incorporation of a 120-foot bus pull-out to accommodate shuttle buses on South Prairie Avenue would fail to provide adequate access to transit due to potential delays in shuttle service, which is considered a **significant impact**.

The following mitigation measures have been identified that could reduce the impacts regarding adequate access to transit.

Mitigation Measure 3.14-11(a)

Implement Mitigation Measures 3.14-2(a) (Event Transportation Management Plan), 3.14-2(b) (TDM Program), and the entirety of intersection improvements identified in Mitigation Measures 3.14-2 and 3.14-3.

Mitigation Measure 3.14-11(b)

Implement Mitigation Measure 3.14-3(f), to extend the proposed shuttle bus pull-out on the east side of South Prairie Avenue to the South Prairie Avenue/West Century Boulevard intersection.

Level of Significance After Mitigation: Implementation of Mitigation Measure 3.14-11(a) is expected to improve traffic operations in the study area surrounding the Proposed Project, which would thereby reduce congestion on South Prairie Avenue and West Century Boulevard affecting public bus operations and congestion on South Prairie Avenue that could block ingress or egress from the turnout. Moreover, implementation of the Event TMP would require that the Arena operator to provide sufficient shuttles to ensure that there is successful and convenient connectivity with short wait times to light rail stations such that peak wait times before or after major events does not exceed 15 minutes. As such, implementation of Mitigation Measure 3.14-11(a), the Event TMP, would reduce transit impacts associated with public bus operations and attendees using shuttles to access light rail.

Mitigation Measure 3.14-11(b) would provide additional load/unload area for shuttles and would also allow for the lane to serve as a bus queue jumper (operated by traffic control officers) at the South Prairie Avenue/West Century Boulevard intersection during the pre-event and post-event period.

Since these mitigation measures would reduce but not eliminate project impacts on traffic operational conditions, the impacts on public bus operations are considered **significant**

and unavoidable. Implementation of Mitigation Measure 3.14-11(b), when paired with implementation of Mitigation Measure 3.14-11(a) the Event TMP, would reduce transit impacts associated with attendees using shuttles to access light rail to **less than significant**.

Impact 3.14-12: The Proposed Project could have the potential to adversely affect existing or planned bicycle facilities; or fail to adequately provide for access by bicycle. (Less than Significant)

There are no existing bicycle facilities in the immediate vicinity of the Proposed Project. The City of Inglewood Circulation Element indicates that there are Class I bike paths along West Century Boulevard on the south side of the Hollywood Park site and along South Prairie Avenue on the west side of the Hollywood Park site. However, those facilities are no longer present. The Circulation Element also indicates that there are Class III facilities on Yukon Avenue south of West Century Boulevard and on West 104th Street east of Yukon Avenue and a potential route on West 104th Street between South Prairie Avenue and Yukon Avenue. However, there are no signs or pavement markings designating these facilities. No bike facilities are planned by the City of Inglewood on streets adjacent to the Project Site.

The Proposed Project includes 23 spectator and 60 employee on-site bike parking spaces, which exceeds the City's bicycle parking code.²⁹ The spectator bike parking spaces would be located within the West Parking Garage, and would be accessed via West Century Boulevard or South Prairie Avenue. Employee bike parking would be located on the Project Site to the east of the arena and would be accessed via the driveway on West 102nd Street west of Doty Avenue.

As there are no existing or planned bicycle facilities adjacent to the Proposed Project, no bicycle facilities would be adversely affected by construction of the Proposed Project. Although new curb cuts would be created by the Proposed Project, they would not be on streets with existing or planned bicycle facilities. The Proposed Project would provide amenities and facilities to accommodate bicyclists and would not adversely affect any existing or planned bicycle facilities. Therefore, project impacts on the bicycle facilities are considered **less than significant**, and no mitigation measures are required.

Cumulative impacts are also considered less than significant as the growth in cumulative traffic volumes related to reasonably foreseeable cumulative projects (including any planned transportation improvements and buildout of Hollywood Park Specific Plan Phase 2), would also not adversely affect any existing or planned bicycle facilities in the vicinity of the Proposed Project. Impacts under a concurrent event scenario, with major events at the Proposed Project

²⁹ Inglewood Municipal Code Section 12-42.1(C)(3) states: "Bicycle racks, bicycle lockers or other secure bicycle parking shall be provided to accommodate four bicycles per the first fifty thousand square feet of nonresidential building area and one additional bicycle per each additional fifty thousand square feet of nonresidential building area. Calculations that result in a fraction of 0.5 or higher shall be rounded to the next higher whole number." Based on a project size of approximately 1,179,000 square feet, as described in the project description, the Municipal Code requires that the Proposed Project provide 27 bicycle spaces.

occurring concurrently or overlapping with events at The Forum and the NFL Stadium, are also considered less than significant as those impacts would not combine to adversely affect existing or planned bicycle facilities in the vicinity of the Proposed Project or fail to adequately provide for access by bicycle.

Mitigation Measures

None required.

Impact 3.14-13: The Proposed Project could have the potential to adversely affect existing or planned pedestrian facilities, or fail to adequately provide for access by pedestrians. (Less than Significant with Mitigation)

The east leg crosswalk across West Century Boulevard at South Prairie Avenue would operate very near unacceptable pedestrian densities during peak event periods given the heavy volume of pedestrians crossing to walk between the Proposed Project and parking areas at Hollywood Park. This impact is considered **significant**.

The following physical mitigation measure was identified that could reduce impacts to pedestrian facilities.

Mitigation Measure 3.14-13

The project applicant shall widen the east leg crosswalk across West Century Boulevard at South Prairie Avenue to 20 feet.

Level of Significance After Mitigation: The widened crosswalk would provide sufficient capacity for the anticipated pedestrian flows. The impact would be mitigated to **less than significant**.

The widened crosswalk may also encourage more pedestrians destined to/from the parking areas in the northeast part of Hollywood Park to use the north sidewalk along West Century Boulevard rather than the south sidewalk, which would improve conditions for pedestrians using the south sidewalk to walk to/from the East Transportation Center and Garage.

This mitigation measure would not be required if the West Century Boulevard Pedestrian Bridge Project Variant is constructed. Under this condition, pedestrian travel in this crosswalk should be prohibited during the pre-event and post-event peak periods.

Cumulative impacts are also considered less than significant as the cumulative projects would not add a significant number of pedestrians to the analyzed sidewalk and crosswalk facilities near the Proposed Project. Mitigation Measure 3.14-13 would ensure that any cumulative pedestrian impacts would also be less than significant with mitigation.

Impacts under a concurrent event scenario, with major events at the Proposed Project occurring concurrently or overlapping with events at The Forum and/or the NFL

Stadium, are also considered less than significant as the anticipated pedestrian flows would not add a significant number of pedestrians (beyond conditions analyzed under the Adjusted Baseline Plus Project Major Event Scenario) to the analyzed sidewalk and crosswalk facilities near the Proposed Project analyzed during the pre-event and post-event peak hours. It is anticipated that events at The Forum would generate relatively few added pedestrians near the Proposed Project given their physical distance from one another and availability of parking on-site at The Forum. It is anticipated that pedestrians attending events at the NFL Stadium would primarily utilize the HPSP internal pedestrian network if they park on-site. Alternately, they would utilize pedestrian facilities beyond the limits of the pedestrian study area for the Proposed Project if they parked off-site and relied on shuttles to access the NFL Stadium. As such, under a concurrent event scenario, those impacts would not combine to adversely affect existing or planned pedestrian facilities near the Proposed Project or fail to adequately provide for pedestrian access; heavier volumes of traffic on concurrent event days would not result in inadequate pedestrian access in the vicinity of the Proposed Project.

Impact 3.14-14: The Proposed Project could have the potential to result in inadequate emergency access under Adjusted Baseline conditions. (Less than Significant with Mitigation)

Project Site Access

The Proposed Project site plan (see Figure 2-7) indicates that emergency vehicles would be able to access the Project Site from all perimeter roads (i.e., West Century Boulevard, South Prairie Avenue, and West 102nd Street). Los Angeles County Fire Department Stations 18 and 170 are located to the southwest and southeast of the project, approximately 1 mile and 1.4 miles by road from the Project Site, respectively. The Inglewood Police Department is located next to City Hall, west of La Brea Avenue north of Manchester Boulevard, approximately 1.7 miles by road from the Project Site. As described in Section 3.13, Public Services, the HPSP Adjusted Baseline projects include construction of an Inglewood PD substation to be located inside one of the HPSP parking structures. The substation will be equipped with offices, an interview room, and work area for use by Inglewood PD officers and personnel. The emergency room at the Centinela Hospital Medical Center (CHMC), one of the top 10 busiest privately-run emergency rooms in Los Angeles County,³⁰ is located on Myrtle Avenue approximately 0.6 miles by road northwest of the Project Site.

Event-related traffic conditions on local streets in the vicinity have affected access for emergency vehicles and other vehicles traveling to CHMC for many years. Hollywood Park racetrack hosted events with attendance in excess of 30,000 for decades before it closed in 2013, and was already present on South Prairie Avenue when CHMC was opened in 1960. The Forum has hosted events of 17,500 or more persons for over 50 years. The location of these event facilities is approximately one-half mile north of the Project Site, and thus the locations of congestion from events at these facilities may be somewhat further to the north compared to that described for the Proposed Project.

³⁰ <https://www.centinelamed.com/Services/Emergency-Services.aspx>, accessed July 24, 2019.

Figure 2-7 shows emergency vehicle access routes wrapping around the arena building from West Century Boulevard to South Prairie Avenue with an additional connection to West 102nd Street, along the west side of the West Parking Garage from West Century Boulevard to West 102nd Street, along the east side of the West Parking Garage from West Century Boulevard, and along the west side of the East Parking Garage from West Century Boulevard. During certain specific events, medical personnel would be present on-site along with an ambulance. During larger events, traffic control officers would be present to control crowds and facilitate emergency vehicle access onto the Project Site, if needed.

Street Vacations

The proposed closure of West 101st Street through the Project Site west of South Prairie Avenue would not substantially affect emergency access to land uses along West 101st Street to the west of the Project Site since access to West 101st Street would remain available from Freeman Avenue and Hawthorne Boulevard as well as from West Century Boulevard and West 102nd Street via the new public access roadway to be constructed along the west side of the West Parking Garage. The closure of West 102nd Street through the Project Site east of South Prairie Avenue would not substantially affect emergency access to land uses along West 102nd Street to the east of the Project Site since access to West 102nd Street would remain available from Doty Avenue and Yukon Avenue.

Congestion Effects

As presented in Table 3.14-15, on non-event days increased traffic generated by the Proposed Project would not result in substantial increases in vehicle delay for emergency vehicles or other persons accessing the emergency room at CHMC in their personal vehicles. On days with larger daytime events and major events, congestion associated with event arrival and departure traffic would significantly impact intersection operating conditions at numerous intersections in the vicinity of the site, as documented in Impact 3.14-2 and Impact 3.14-3.

At peak pre-event and post-event times, the levels of congestion on multiple travel corridors connecting parts of Inglewood and adjacent communities to CHMC could result in slower travel times and potentially the need to reroute emergency vehicles and other vehicles traveling to the hospital. Drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using their sirens to clear a path of travel, driving in the lanes of opposing traffic, and bypassing signals and stopped traffic. Furthermore, during larger events, traffic control officers would be present at key intersections to control traffic and facilitate emergency vehicle access if needed, and TCOs could move temporary barriers to allow emergency vehicles to pass. The predicted level of congestion could, however, substantially affect the ability of other persons to access the emergency room at the CHMC in their personal vehicles. For this reason, the impact on emergency access is considered **significant**.

Mitigation Measure 3.14-14

The project applicant shall work with the City and the Centinela Hospital Medical Center (CHMC) to develop and implement a Local Hospital Access Plan that would maintain

reasonable access to the hospital by emergency and private vehicles accessing the CHMC emergency room. Measures to be included in the plan could include, but may not be limited to, the following:

- a) *Development of a wayfinding program that consists of the following:*

Placement of signage (e.g., blank-out signs, changeable message signs, permanent hospital alternate route signs, etc.) on key arterials that may provide fixed alternate route guidance as well as real-time information regarding major events. This program would benefit from the project financial contribution to the City's ITS program (see Mitigation Measure 3.14-2(o)) by including cameras, vehicle queue spillback detection loops on eastbound West Century Boulevard, and other technologies which, if implemented, could enable the wayfinding signs to be automatically illuminated when necessary.

- b) *Coordination with CHMC regarding updates to their website and any mobile apps so that employees, visitors, and patients visiting those sites are provided with advanced information of when events are scheduled.*
- c) *Provide direction to TCOs regarding best practices for accommodating emergency vehicles present in congested conditions during pre-event and post-event conditions.*

The Local Hospital Access Plan shall consider, develop, and implement solutions to address potential access restrictions caused by construction activity at the Project (see Impact 3.14-15). The Plan shall have a monitoring and coordination component including observations of accessibility to the Emergency Department during periods when events are and are not being held at the Project. Coordination would include participation by the project applicant in quarterly working group meetings with hospital administrators to identify and address circulation concerns.

The Local Hospital Access Plan shall be reviewed by the City, the Police Department, Los Angeles County Fire Department, and approved by the City prior to the first event at the Project arena.

Level of Significance After Mitigation: The implementation of the above mitigation measure would reduce this impact to **less than significant**.

Impact 3.14-15: The Proposed Project would substantially affect circulation for a substantial duration of construction under Adjusted Baseline conditions. (Significant and Unavoidable)

Construction of the Arena Site is expected to take approximately 36 months. Construction of the West Parking Garage Site is expected to take approximately 20 months. Construction of the East Transportation and Hotel Site is expected to take approximately 13 months. The construction periods would overlap, and the overall construction period for the entirety of the Proposed Project would be 40 months.

Construction of the project would involve large amounts of grading, earthwork, and construction activities over an extended period of time. Large numbers of trucks and employee trips would enter and exit the area during construction. The potential for temporary impacts on traffic, access, public transit, and parking was assessed against the significance criteria presented in Section 3.14.4.

Temporary Traffic Impacts

During construction of the Arena Site, the easternmost travel lane of northbound South Prairie Avenue would be fenced and closed to travel from West 103rd Street to West Century Boulevard. The southernmost lane on eastbound West Century Boulevard would also be closed to traffic from South Prairie Avenue to approximately 450 feet east, in front of the Airport Park View Hotel. The southernmost lane on eastbound West Century Boulevard adjacent to the West Parking Garage Site would be closed during the construction of the West Parking Garage Site. South Prairie Avenue and West Century Boulevard are both designated as major arterials in the City of Inglewood General Plan.

The temporary but prolonged elimination of the third travel lane in the northbound and eastbound approaches through the South Prairie Avenue/West Century Boulevard intersection would reduce the intersection's capacity. During the weekday AM peak hour, operations would remain at LOS C, though the v/c ratio would increase from 0.704 (existing) to 0.782. During the weekday PM peak hour, operations would worsen from LOS D (v/c ratio = 0.839) to LOS F (v/c ratio = 1.058). This level of degraded operations would remain during the vast majority of the approximate three-year construction period. The number of employees and trucks traveling to/from the site would vary throughout the construction period. To the extent these vehicles travel through the South Prairie Avenue/West Century Boulevard during these peak hours to park near the site, deliver materials, etc., operations would be further degraded.

Construction of the pedestrian bridge spanning South Prairie Avenue would require the full closure of South Prairie Avenue for three nights and the closure of select lanes on South Prairie Avenue for three to four nights. There are no police or fire stations located near to these locations. However, there is an emergency room located at CHMC located approximately 0.4 miles northwest of the intersection of South Prairie Avenue and West Century Boulevard. These impacts are considered **significant**.

Temporary Loss of Access

The sidewalks along the South Prairie Avenue frontage and the West Century Boulevard frontage would be closed to pedestrians, requiring that pedestrians be routed to the opposite side of the street. Driveway access to the residences at 10204 South Prairie Avenue and 10226 South Prairie Avenue would be maintained for the duration of project construction. These impacts are considered **less than significant** because crosswalks are present along both corridors and the overall amount of diverted walking is not considerable.

Temporary Loss of Bus Stops or Rerouting of Bus Lines

Two existing bus stops at the southeast corner of West Century Boulevard and South Prairie Avenue would be removed and relocated as part of the Project. The bus stop that serves Metro line 117, east of South Prairie Avenue, for eastbound traffic on West Century Boulevard would be temporarily relocated to the west side of the intersection during Project construction, then permanently relocated back to the east side of the intersection directly in front of the proposed plaza. The bus stop that serves Metro lines 212/312, south of West Century Boulevard, for northbound traffic on South Prairie Avenue would be permanently relocated to the northeast corner of the intersection. No other bus stops would be affected. These impacts are considered **less than significant** because bus service would not be interrupted during construction.

Temporary Loss of On-Street Parking

No on-street parking is provided on South Prairie Avenue or West Century Boulevard in the vicinity of the Project Site; thus closure of traffic lanes on these streets would not create a loss of on-street parking. On-street parking could potentially be temporarily affected along the north side of West 102nd Street along its frontages adjacent to the West Parking Garage site and the East Transportation Center site. Parking is not considered a direct environmental impact under CEQA, parking is available on other sections of West 102nd Street and on other streets in the area, and public transit is available within walking distance. These impacts are therefore considered **less than significant**.

Mitigation Measure 3.14-15

Before issuance of grading permits for any phase of the Project, the project applicant shall prepare a detailed Construction Traffic Management Plan that will be subject to review and approval by the City Department of Public Works, in consultation with affected transit providers and local emergency service providers. The plan shall ensure that acceptable operating conditions on local roadways are maintained. At a minimum, the plan shall include:

- a) Identification of haul routes and truck circulation patterns; not permitting trucks to travel on residential streets.*
- b) Time of day of arrival and departure of trucks.*
- c) Limitations on the size and type of trucks; provision of a staging area with a limitation on the number of trucks that can be waiting; not permitting trucks to park or stage on residential streets.*
- d) Preparation of worksite traffic control plan(s) for lane and/or sidewalk closures.*
- e) Identification of detour routes and signing plan for street/lane closures.*
- f) Provision of driveway access plan so that safe vehicular, pedestrian, and bicycle movements are maintained (e.g., steel plates, minimum distances of open trenches, and private vehicle pick up and drop off areas).*
- g) Maintain safe and efficient access routes for emergency vehicles and transit.*
- h) Manual traffic control when necessary.*

- i) *Provisions for pedestrian and bicycle safety.*
- j) *Identification of locations for construction worker parking; not permitting construction worker parking on residential streets.*
- k) *Strategies to reduce the proportion of employee and delivery trips made during weekday AM and PM peak hours through employee shift and construction material delivery scheduling.*
- l) *Strategies to be undertaken (e.g., alternate routing/parking of employees and deliveries, etc.) to reduce the adverse effects during events at The Forum or NFL Stadium of construction-related closures of travel lanes along the project frontage.*

A copy of the construction traffic management plan shall be submitted to local emergency response agencies and transit providers, and these agencies shall be notified at least 30 days before the commencement of construction that would partially or fully obstruct roadways.

Level of Significance after Mitigation: The implementation of the above mitigation measure would reduce the significance of this impact, but not to a less-than-significant level. Lane closures at the South Prairie Avenue/West Century Boulevard intersection would cause temporary, but noticeable worsening of traffic conditions throughout construction. This impact is considered **significant and unavoidable**.

Cumulative Project Impacts and Mitigation Measures

Impact 3.14-16: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under cumulative conditions. (Significant and Unavoidable)

As presented in Table 3.14-44 and based on the significance criteria, the following four intersections would be significantly impacted by the Proposed Project ancillary land uses under cumulative conditions:

AM Peak Hour

- South Prairie Avenue/West Century Boulevard (City of Inglewood)

PM Peak Hour

- South Prairie Avenue/West Century Boulevard (City of Inglewood)
- South Prairie Avenue/West 104th Street (City of Inglewood)
- South Prairie Avenue/112th Street/I-105 Off Ramp (City of Inglewood and Caltrans)
- South Prairie Avenue/Imperial Highway (Cities of Hawthorne and Inglewood)

These impacts are considered **significant**.

Mitigation Measure 3.14-16(a)

Implement Mitigation Measure 3.14-1(a) (Elements of the TDM Program for daytime and non-event employees).

Mitigation Measure 3.14-16(b)

Implement Mitigation Measure 3.14-3(f) (Implement northbound exclusive right-turn lane and overlap phase on South Prairie Avenue at West Century Boulevard).

Mitigation Measure 3.14-16(c)

Implement Mitigation Measure 3.14-2(g) (I-105 Off-Ramp Widening at South Prairie Avenue).

Level of Significance After Mitigation: The modification at the South Prairie Avenue/I-105 off-ramp/112th Street intersection, if implemented, would improve operations from LOS E (with project) to D (with project and mitigation) during the weekday PM peak hour, thereby mitigating this impact to less than significant. Since the improvement involves another jurisdiction in addition to the City of Inglewood, however, its implementation cannot be guaranteed and the impact is considered to be **significant and unavoidable**. The addition of a northbound left-turn lane at the South Prairie Avenue/West Century Boulevard intersection does not improve its operation during this time period, but does benefit operations during other time periods and scenarios.

The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-61**. Of the four significant intersection impacts identified, the above mitigation measures would cause one to become less than significant. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies. Further, there are no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

TABLE 3.14-61
INTERSECTION OPERATIONS – CUMULATIVE PLUS PROJECT (ANCILLARY) WITH MITIGATION CONDITIONS

#	Intersection	Methodology ^{1,2}	Jurisdiction ¹	Peak Hour	Cumulative No Project		Cumulative Plus Project		Cumulative Plus Project With Mitigation

NOTES:

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections in which mitigation was either not required or not feasible.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized.

SOURCE: Fehr & Peers, 2019.

Impact 3.14-17: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions. (Significant and Unavoidable)

AM Peak Hour

Significant cumulative impacts were identified for a 2,000-person weekday morning event based on the results in Table 3.14-58A and the significance criteria. The following 17 intersections would be significantly impacted by a 2,000-person weekday morning event under cumulative conditions:

- La Cienega Boulevard/I-405 Ramps North (Cities of Inglewood and Los Angeles)
- La Cienega Boulevard/West Century Boulevard (Cities of Inglewood and Los Angeles)
- Felton Ave/West Century Blvd (City of Inglewood)
- South Prairie Avenue/West Century Boulevard (City of Inglewood)
- Doty Ave/West Century Blvd (City of Inglewood)
- Yukon Ave/West Century Blvd (City of Inglewood)
- Club Drive/West Century Boulevard (City of Inglewood)
- 11th Avenue/Village Avenue/West Century Boulevard (City of Inglewood)
- Crenshaw Boulevard/West Century Boulevard (City of Inglewood)
- Van Ness Avenue/West Century Boulevard (Cities of Los Angeles and Inglewood)
- South Prairie Avenue/West 104th Street (City of Inglewood)
- Yukon Avenue/West 104th Street (City of Inglewood)
- Crenshaw Boulevard/West 104th Street (City of Inglewood)
- South Prairie Avenue/Lennox Boulevard (City of Inglewood)
- South Prairie Avenue/108th Street (City of Inglewood)
- South Prairie Ave/112th St/I-105 On Ramp (City of Inglewood and Caltrans)
- South Prairie Avenue/Imperial Highway (Cities of Hawthorne and Inglewood)

PM Peak Hour

Significant cumulative impacts were identified for a 7,500-person weekday afternoon event based on the results in Table 3.14-48B and the significance criteria. **Figure 3.14-18** displays intersections that would be significantly impacted by a 7,500-person weekday afternoon event during the weekday PM peak hour under cumulative conditions (59 intersections).

These impacts are considered **significant**.

Mitigation Measure 3.14-17(a)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-17(o)

Implement Mitigation Measure 3.14-2(o) (Financial Contribution to City ITS Program).

Mitigation Measure 3.14-17(p)

Implement Mitigation Measure 3.14-3(c) (I-405 NB Off-Ramp Restripe at West Century Boulevard).

Mitigation Measure 3.14-17(q)

The project applicant shall restripe the northbound approach of Felton Avenue at West Century Boulevard from a single left-through-right lane to one left/through lane and one right-turn lane.

Level of Significance After Mitigation: The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-62**. Of the 17 significant intersection impacts identified during the weekday AM peak hour, the above mitigation measures would cause four to become less than significant. Of the 59 significant intersection impacts identified during the weekday PM peak hour, the above mitigation measures would cause five to become less than significant. The precise degree of effectiveness of proposed TDM strategies to shift the mode split away from driving and reduce the project's vehicular trip generation is not known. Therefore, mitigation measure testing did not explicitly account for a certain amount of reduced vehicle travel due to TDM strategies. Mitigation measure testing also did not account for the beneficial effects of the TMP because the static intersection analysis methods do not allow for those operational benefits to be quantified. The Event TMP includes placement of TCOs on South Prairie Avenue at the intersection with the West Garage driveway to better facilitate traffic flow. TCOs would facilitate right-turning traffic from West 102nd Street onto South Prairie Avenue. However, the above list of mitigation measures would reduce vehicle travel demand, accommodate the remaining travel demand in a more efficient manner, and provide physical improvements, where feasible, to add capacity to the roadway system. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies. Further, there are no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

NOTES:

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections in which mitigation was either not required or not feasible.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes. Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

SOURCE: Fehr & Peers, 2019.

Impact 3.14-18: Major events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions. (Significant and Unavoidable)

Significant impacts were identified based on the results in Table 3.14-52 and the significance criteria. **Figures 3.14-19, 3.14-20, and 3.14-21** are study area maps displaying those intersections that are significantly impacted during the weekday pre-event, weekday post-event, and weekend pre-event peak hours, respectively, under cumulative conditions. These impacts are considered **significant**.

Figure 3.14-22 displays the project-specific mitigation measures associated with the Cumulative with Major Event condition.

Mitigation Measure 3.14-18(a)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-18(b)

Implement Mitigation Measure 3.14-2(b) (Implement TDM Program).

Mitigation Measure 3.14-18(c)

Implement Mitigation Measure 3.14-3(c) (I-405 NB Off-Ramp Restripe at West Century Boulevard).

Mitigation Measure 3.14-18(d)

Implement Mitigation Measure 3.14-2(d) (West Century Boulevard/Hawthorne Boulevard/La Brea Boulevard Improvements).

Mitigation Measure 3.14-18(e)

Implement Mitigation Measure 3.14-3(e) (Protected or protected/permissive eastbound/westbound left turns at South Prairie Avenue/Pincay Drive).

Mitigation Measure 3.14-18(f)

Implement Mitigation Measure 3.14-3(f) (Northbound Exclusive Right-turn Lane and TCO support at South Prairie Avenue/West Century Boulevard).

Mitigation Measure 3.14-18(g)

Implement Mitigation Measure 3.14-2(g) (I-105 Off-Ramp Widening at South Prairie Avenue).

Mitigation Measure 3.14-18(h)

Implement Mitigation Measure 3.14-2(j) (I-105 Off-ramp Widening at Crenshaw Boulevard).

Mitigation Measure 3.14-18(i)

Implement Mitigation Measure 3.14-2(l) (Crenshaw Boulevard/120th Street Improvements).

Mitigation Measure 3.14-18(j)

Implement Mitigation Measure 3.14-3(j) (La Cienega Boulevard/Centinela Avenue Improvements).

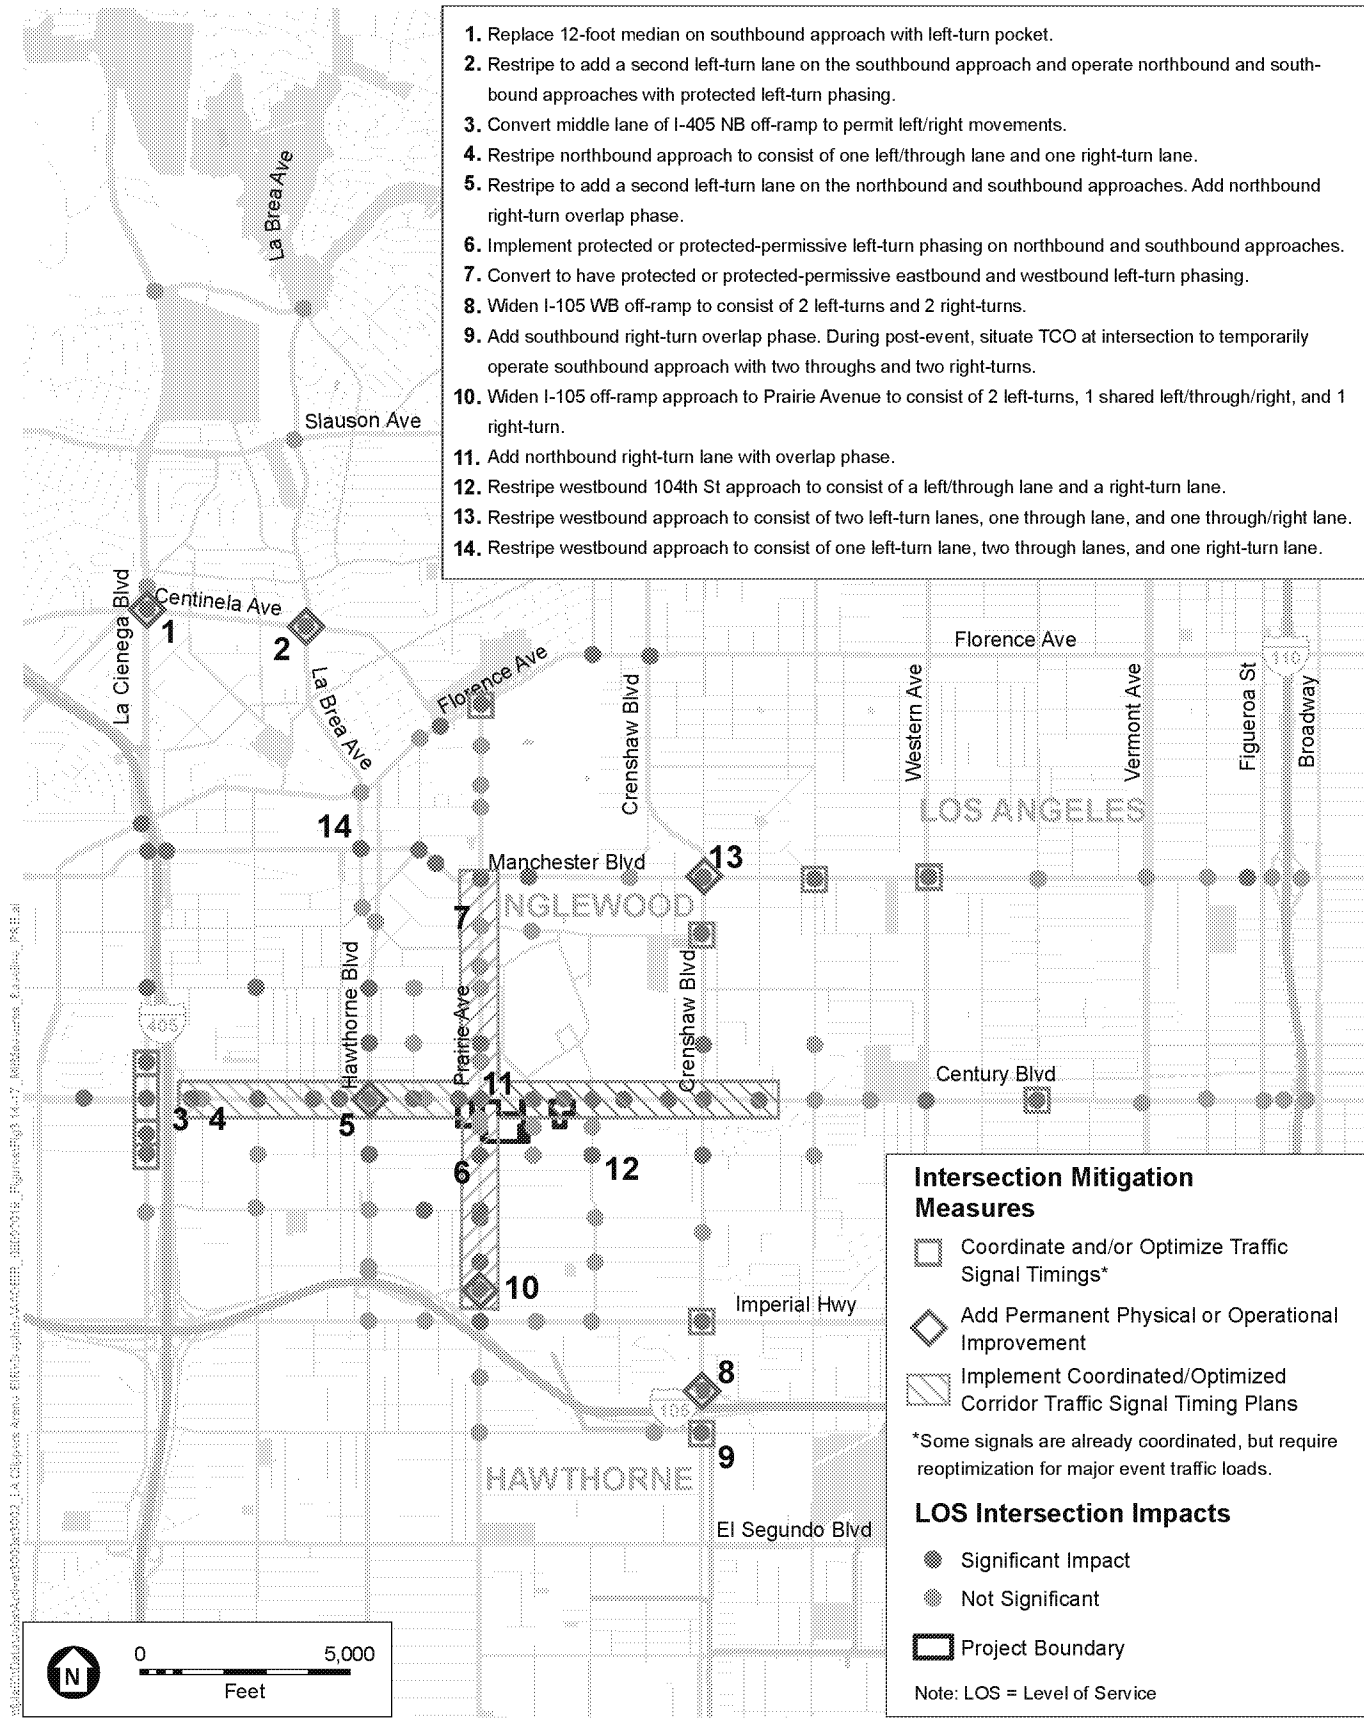

Figure 3.14-21

Impacted Intersections:

Cumulative Plus Major Event Weekend Pre-Event Peak Hour

1. Replace 12-foot median on southbound approach with left-turn pocket.
2. Restripe to add a second left-turn lane on the southbound approach and operate northbound and southbound approaches with protected left-turn phasing.
3. Convert middle lane of I-405 NB off-ramp to permit left/right movements.
4. Restripe northbound approach to consist of one left/through lane and one right-turn lane.
5. Restripe to add a second left-turn lane on the northbound and southbound approaches. Add northbound right-turn overlap phase.
6. Implement protected or protected-permissive left-turn phasing on northbound and southbound approaches.
7. Convert to have protected or protected-permissive eastbound and westbound left-turn phasing.
8. Widen I-105 WB off-ramp to consist of 2 left-turns and 2 right-turns.
9. Add southbound right-turn overlap phase. During post-event, situate TCO at intersection to temporarily operate southbound approach with two throughs and two right-turns.
10. Widen I-105 off-ramp approach to Prairie Avenue to consist of 2 left-turns, 1 shared left/through/right, and 1 right-turn.
11. Add northbound right-turn lane with overlap phase.
12. Restripe westbound 104th St approach to consist of a left/through lane and a right-turn lane.
13. Restripe westbound approach to consist of two left-turn lanes, one through lane, and one through/right lane.
14. Restripe westbound approach to consist of one left-turn lane, two through lanes, and one right-turn lane.

Mitigation Measure 3.14-18(l)

Implement Mitigation Measure 3.14-3(l) (South Prairie Avenue/West 104th Street Improvements).

Mitigation Measure 3.14-18(m)

Implement Mitigation Measure 3.14-2(e) (West 104th Street/Yukon Avenue Improvements).

Mitigation Measure 3.14-18(n)

Implement Mitigation Measure 3.14-2(i) (Manchester Boulevard/Crenshaw Boulevard Improvements).

Mitigation Measure 3.14-18(o)

Implement Mitigation Measure 3.14-3(o) (Coordinate and Optimize Traffic Signals).

Mitigation Measure 3.14-18(p)

Implement Mitigation Measure 3.14-2(o) (Financial Contribution to City ITS program).

Mitigation Measure 3.14-18(q)

Implement Mitigation Measure 3.14-17(q) (Felton Avenue/West Century Boulevard Improvements).

Mitigation Measure 3.14-18(r)

Implement Mitigation Measure 3.14-2(h) (Manchester Boulevard La Brea Avenue Improvements).

Level of Significance After Mitigation: The following subsection describes specifically how the Event TMP under Mitigation Measure 3.14-18(a) would modify lanes and operations under Cumulative conditions at the West Century Boulevard/I-405 northbound on-ramp and Hawthorne Boulevard/West Century Boulevard intersection. The Event TMP includes placement of TCOs and temporary lane changes through the use of cones during post-event conditions at West Century Boulevard at the I-405 northbound on-ramp from two through lanes and one shared through-right turn lane to two through lanes and one dedicated right turn lane. The Event TMP includes placement of TCOs and temporary lane changes through the use of cones during pre-event conditions at the northbound approach of Hawthorne Boulevard to West Century Boulevard to 2 through lanes and 2 dedicated right-turn lanes.

Deployment of electronic CMS and/or blank-out signs (depending on location and the nature of the message) could be considered at these locations in lieu of TCOs. Experience from other venues has determined that it is preferable to evaluate the effectiveness of TCOs and special event staff deployment before deciding, in consultation with the City Traffic Engineer, whether permanent electronic signs would be effective and economical.

The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-63**. Based on network-level microsimulation analysis, under major event

conditions, the mitigations at major bottlenecks often result in increased traffic flow at adjacent and/or downstream intersections. Improving the flow at major bottleneck locations, although desirable, can cause secondary, significant impacts. The following describes their combined effectiveness during each peak hour.

Weekday Pre-Event Peak Hour

Of the 61 significant intersection impacts, the above mitigation measures would cause ten to become **less than significant**. In some cases, these mitigation measures improved traffic flow at one or more intersections, which resulted in degraded operations at others by relieving an upstream bottleneck or causing queues to spillback to a nearby intersection, worsening its operations. This occurred at eight such intersections. Opportunities for physical or further operational/signal timing improvements at these locations were investigated, but no feasible mitigations were identified. The inability of the mitigation measures to materially improve traffic flow under Cumulative Plus Project conditions is evidenced by the percent demand served (averaged across all intersections) in the microsimulation remaining at 78 percent, without and with the recommended mitigations. The mitigation measures are less effective than under adjusted baseline conditions due to background traffic growth.

Weekday Post-Event Peak Hour

Of the 21 significant intersection impacts, the above mitigation measures would cause 13 to become **less than significant**. No intersections would experience a secondary, significant impact due to these mitigation measures. The average percent demand served at the intersections analyzed using microsimulation increased from 92 percent (Adjusted Baseline Plus Project without mitigation) to 98 percent with the recommended mitigation measures in place. The post-event mitigation measures proved much more effective than the pre-event mitigation measures because background traffic levels (upon which project trips would be added) are much lower after events versus prior to events.

Weekend Pre-Event Peak Hour

Of the 40 significant intersection impacts identified during the weekend pre-event peak hour, the above mitigation measures would cause six to become **less than significant**. These mitigation measures would cause an additional six intersections to become new secondary, significantly impacted locations. The average percent demand served at the intersections analyzed using microsimulation increased from 84 percent (Adjusted Baseline Plus Project without mitigation) to 87 percent with the recommended mitigation measures in place.

Mitigation measure testing did not consider the effect of TDM strategies on travel demand due to the uncertainty of precisely quantifying their beneficial effect during special events. However, the above list of mitigation measures would reduce vehicle travel demand, accommodate the remaining travel demand in a more efficient manner, and provide physical improvements, where feasible, to add capacity to the roadway system. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies. Further, there are no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

NOTES:

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections in which mitigation was either not required or not feasible.

Intersections analyzed using HCM may show "with mitigation" LOS results despite the particular intersection not being impacted because microsimulation analysis of mitigations reveals effects on nearby intersections.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes. Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

SOURCE: Fehr & Peers, 2019.

Impact 3.14-19: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under cumulative conditions. (Significant and Unavoidable)

As presented in Table 3.14-45 and based on the significance criteria, the following three neighborhood street segments would be significantly impacted by the Proposed Project ancillary land uses under cumulative conditions:

- The collector street segment of Yukon Avenue south of West 102nd Street would experience an increase in weekday daily traffic from 14,033 vehicles under Cumulative No Project conditions to 14,891 vehicles under Cumulative Plus Project (Ancillary Land Uses) conditions.
- The collector street segment of Yukon Avenue south of West 104th Street would experience an increase in weekday daily traffic from 10,092 vehicles under Cumulative No Project conditions to 10,110 vehicles under Cumulative Plus Project (Ancillary Land Uses) conditions.
- The local street segment of 109th Street between Yukon Avenue and Lemoli Avenue would experience an increase in weekday daily traffic from 2,898 vehicles under Cumulative No Project conditions to 3,048 vehicles with the Proposed Project ancillary land uses.

These impacts are considered **significant**.

Mitigation Measure 3.14-19(a)

Implement Neighborhood Traffic Management Plan component of Event TMP, which is contained in Mitigation Measure 3.14-2(a).

The Event TMP, which can be found in Appendix K.4, includes a chapter on neighborhood traffic protection including the need for the project applicant to develop and implement a NTMP. The NTMP would cover the area bounded by Hawthorne Boulevard, Hardy Boulevard, Crenshaw Boulevard, and Imperial Highway (excluding the Hollywood Park Specific Plan area). It outlines the process by which the applicant and City would engage neighborhood groups, businesses, and stakeholders to develop a plan that has broad consensus and protects the neighborhood from unwanted traffic intrusion during events at the Project. It was not possible for the Draft EIR to identify a solution with broad consensus among stakeholders that would fully address and mitigate the traffic levels expected on the impacted streets. Such an effort would require extensive public outreach, as well as detailed study of how various measures could be implemented to reduce volumes on street segments identified as having significant street impacts without causing additional impacts on nearby streets. The NTMP lays out the process to be undertaken to complete this assessment.

Mitigation Measure 3.14-19(b)

Implement Mitigation Measure 3.14-2(b) (Implement TDM Program).

Level of Significance After Mitigation: At this time, the effectiveness of the NTMP toward reducing traffic levels on impacted neighborhood streets to acceptable thresholds cannot be guaranteed. Therefore, this impact is considered **significant and unavoidable**.

However, the Event TMP includes a performance standard that requires reducing traffic volumes on local and collector street segments identified in the EIR as having a significant impact without causing a significant impact on other local and collector street segments and discouraging and reducing event-related cut-through traffic while maintaining access for residents and their guests.

Impact 3.14-20: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions. (Significant and Unavoidable)

As presented in Table 3.14-49 and based on the significance criteria, the following neighborhood street segments would be significantly impacted by daytime events under cumulative conditions:

- The collector street segment of Yukon Avenue south of West 102nd Street would experience an increase in weekday daily traffic from 14,033 vehicles under Cumulative No Project conditions to 14,894 vehicles with a 2,000-person corporate/community event and 15,199 vehicles with a 7,500-person sports/gathering event.
- The collector street segment of Yukon Avenue south of West 104th Street would experience an increase in weekday daily traffic from 10,092 vehicles under Cumulative No Project conditions to 10,124 vehicles with a 2,000-person corporate/community event and 10,240 vehicles with a 7,500-person sports/gathering event.
- The local street segment of 109th Street between Yukon Avenue and Lemoli Avenue would experience an increase in weekday daily traffic from 2,978 vehicles under Cumulative No Project conditions to 3,167 vehicles with a 2,000-person corporate/community event and 3,208 vehicles with a 7,500-person sports/gathering event.

These impacts are considered **significant**.

It should be noted that although a 7,500-person sports/gathering event would result in the local street segment of West 102nd between Doty Avenue and Yukon Avenue carrying 3,184 vehicles per day, the project impact on this segment is not considered significant because it would otherwise be carrying 4,733 vehicles per day if the Proposed Project was not constructed because the Proposed Project would vacate the portion of West 102nd Street directly east of South Prairie Avenue.

Mitigation Measure 3.14-20

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Level of Significance After Mitigation: The Event TMP, which can be found in Appendix K.4, includes a chapter on neighborhood traffic protection including the need for the project applicant to develop and implement a NTMP. At this time, the effectiveness of the NTMP toward reducing traffic levels on impacted neighborhood streets to acceptable thresholds cannot be guaranteed. Therefore, this impact is considered **significant and unavoidable**. However, the Event TMP includes a

performance standard that requires reducing traffic volumes on local and collector street segments identified in the EIR as having a significant impact without causing a significant impact on other local and collector street segments and discouraging and reducing event-related cut-through traffic while maintaining access for residents and their guests.

Impact 3.14-21: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions. (Significant and Unavoidable)

As presented in Table 3.14-53 and based on the significance criteria, the following six neighborhood street segments would be significantly impacted by major events under cumulative conditions:

- The collector street segment of Yukon Avenue south of West 102nd Street would experience an increase in weekday daily traffic from 14,033 vehicles under Cumulative No Project conditions to 16,010 vehicles with a major event. On a weekend day, this segment would experience an increase in daily traffic from 12,235 vehicles under Cumulative No Project conditions to 14,112 vehicles with a major event.
- The collector street segment of Yukon Avenue south of West 104th Street would experience an increase in weekday daily traffic from 10,092 vehicles under Cumulative No Project conditions to 10,827 vehicles with a major event.
- The collector street segment of West 104th Street between South Prairie Avenue and Doty Street would experience an increase in weekday daily traffic from 6,132 vehicles under Cumulative No Project conditions to 10,298 vehicles with a major event.
- The collector street segment of West 104th Street east of Dixon Avenue would experience an increase in weekday daily traffic from 9,249 vehicles under Cumulative No Project conditions to 10,480 vehicles with a major event.
- The local street segment of 109th Street between Yukon Avenue and Lemoli Avenue would experience an increase in weekday daily traffic from 2,978 vehicles under Cumulative No Project conditions to 3,238 vehicles with a major event.
- The local street segment of Flower Street north of West Century Boulevard would experience an increase in weekday daily traffic from 2,848 vehicles under Cumulative No Project conditions to 3,026 vehicles with a major event.

These impacts are considered **significant**.

It should be noted that although a major event would result in the local street segment of West 102nd between Doty Avenue and Yukon Avenue carrying 3,626 vehicles per day, the project impact on this segment is not considered significant because it would otherwise be carrying 4,733 vehicles per day if the project was not constructed.

Mitigation Measure 3.14-21

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Level of Significance After Mitigation: The Event TMP, which can be found in Appendix K.4, includes a chapter on neighborhood traffic protection including the need for the project applicant to develop and implement a NTMP. At this time, the effectiveness of the NTMP toward reducing traffic levels on impacted neighborhood streets to acceptable thresholds cannot be guaranteed. Therefore, this impact is considered **significant and unavoidable**. However, the Event TMP includes a performance standard that requires reducing traffic volumes on local and collector street segments identified in the EIR as having a significant impact without causing a significant impact on other local and collector street segments and discouraging and reducing event-related cut-through traffic while maintaining access for residents and their guests.

Impact 3.14-22: Operation of the Proposed Project ancillary land uses could have the potential to cause significant impacts on freeway facilities under cumulative conditions. (Less than Significant)

As presented in Table 3.14-46 and based on the significance criteria, the Proposed Project ancillary land uses would not cause significant impacts on study freeway segments under cumulative conditions. According to Table 3.14-47 and the significance criteria, the Proposed Project ancillary land uses would not cause any freeway off-ramps to have queue lengths that exceed the applicable threshold.

These impacts are considered **less than significant**.

Mitigation Measures

None required.

Impact 3.14-23: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions. (Significant and Unavoidable)

As presented in Table 3.14-50 and based on the significance criteria, daytime events at the Proposed Project Arena would cause significant impacts on the following study freeway components under cumulative conditions (refer to table for specific components):

Weekday AM Peak Hour

- One impacted component on Northbound I-405
- Three impacted components on Southbound I-405
- Seven impacted components on Westbound I-105

Weekday PM Peak Hour

- One impacted component on Northbound I-405
- Three impacted components on Southbound I-405
- One impacted component on Westbound I-105
- Five impacted components on Eastbound I-105
- Three impacted components on Northbound I-110
- One impacted component on Southbound I-110

These freeway component impacts are considered **significant**.

As presented in Table 3.14-51 and based on the significance criteria, daytime events at the Proposed Project Arena would not cause any freeway off-ramps to have queue lengths that exceed the applicable threshold. Therefore, freeway off-ramp queuing impacts are considered **less than significant**.

Mitigation Measure 3.14-23(a)

Implement the trip reduction measures included in the Project TDM Program described in Mitigation Measure 3.14-2(b).

Mitigation Measure 3.14-23(b)

Implement Mitigation Measure 3.14-8(b) (Work with Caltrans to implement traffic management system improvements along the I-105 corridor).

Level of Significance After Mitigation: The freeway component impacts are considered to be **significant and unavoidable** despite the presence of the above mitigation measures. Implementation of these measures would not guarantee that operations at each impacted component would be restored to ‘no project’ levels. Freeway off-ramp queuing under this scenario would be **less than significant** and require no mitigation.

Impact 3.14-24: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions. (Significant and Unavoidable)

As presented in Table 3.14-54 and based on the significance criteria, major events at the Proposed Project Arena would cause significant impacts on the following study freeway components (refer to table for specific components) and, according to Table 3.14-55 and the significance criteria, major events at the Proposed Project Arena would cause freeway off-ramps to have queue lengths that exceed the applicable threshold:

Weekday Pre-Event Peak Hour

- Five impacted components on Southbound I-405
- Two impacted components on Eastbound I-105

- One impacted component on Westbound I-105
- Project causes queues to exceed storage at three freeway off-ramps

Weekday Post-Event Peak Hour

- One impacted component on Northbound I-405
- One impacted component on Eastbound I-105
- One impacted component on Westbound I-105

Weekend Pre-Event Peak Hour

- Three impacted components on Southbound I-405
- Two impacted components on Eastbound I-105
- Four impacted components on Westbound I-105
- Project causes queues to exceed storage at three freeway off-ramps

These freeway segment and ramp queuing impacts are considered **significant**.

Mitigation Measure 3.14-24(a)

Implement mitigation measure 3.14-3(h) (I-105 Westbound Off-ramp Widening at Crenshaw Boulevard).

Mitigation Measure 3.14-24(b)

Implement Mitigation Measure 3.14-3(c) (Restripe I-405 NB Off-Ramp at West Century Boulevard).

Mitigation Measure 3.14-24(c)

Implement Mitigation Measure 3.14-3(o) (Retime and optimize traffic signals on Inglewood streets).

Mitigation Measure 3.14-24(d)

Implement Mitigation Measure 3.14-3(g) (I-105 Off-ramp Widening at South Prairie Avenue).

Mitigation Measure 3.14-24(e)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-24(f)

Implement the trip reduction measures included in the Project TDM Program described in Mitigation Measure 3.14-2(b).

Mitigation Measure 3.14-24(g)

Implement Mitigation Measure 3.14-8(b) (Work with Caltrans to implement traffic management system improvements along the I-105 corridor).

Level of Significance After Mitigation: The combined effect of the above mitigation measures would be improved operations of streets in the vicinity of the Proposed Project, which would result in less overall delay and vehicle queuing. Additionally, widening and/or lane reassignments on each of the impacted off-ramps would improve their capacity and ability to store vehicles. The following describes how impacted off-ramps would be improved for the more critical weekday (versus weekend) pre-event peak hour:

- At the I-105 off-ramp at South Prairie Avenue, the maximum vehicle queue would be reduced from an estimated 9,150 feet (without mitigation) to 4,875 feet with mitigation, which is less than the applicable 8,720-foot storage. Thus, storage would be adequate with mitigation.
- At the I-105 Westbound off-ramp at Crenshaw Boulevard, the maximum vehicle queue would be reduced from an estimated 5,973 feet (without mitigation) to 3,671 feet with mitigation, which is less than the applicable 4,065-foot storage. Thus, storage would be adequate with mitigation.
- The surface street improvements and traffic management strategies would result in small decreases in the maximum queue at the I-405 northbound and southbound off-ramps at West Century Boulevard. However, the northbound off-ramp and the more southerly southbound off-ramp (south of West Century Boulevard) would continue to exceed the applicable storage threshold.

These mitigation measures, if implemented, would reduce two of the impacted off-ramp queues to within the available ramp storage during the weekday and weekend pre-event peak hours, thereby mitigating this impact to less than significant. However, the maximum queue at the I-405 northbound off-ramp onto West Century Boulevard and at the I-405 southbound off-ramp onto La Cienega (south of West Century Boulevard) would continue to exceed the applicable storage threshold. Since the improvements involve another jurisdiction in addition to the City of Inglewood, however, their implementation cannot be guaranteed and the impacts are considered to be **significant and unavoidable**. The freeway component impacts are considered **significant and unavoidable**.

Impact 3.14-25: The Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions. (Significant and Unavoidable)

The project vehicular traffic has the potential to affect on-time performance for buses operating in the study area because of congestion associated with event arrival and departure traffic under cumulative conditions, as documented in Impact 3.14-17 and Impact 3.14-18. This adverse impact to bus operations is considered **significant** and the project contribution would be considerable.

Project-related vehicular traffic is not expected to affect Green Line and Crenshaw/LAX transit corridor run time, as the Green Line is fully grade separated, and the Crenshaw/LAX transit corridor is grade separated at most major arterial crossings. However, increased ridership

generated by project events and cumulative development would increase station dwell time at the Downtown Inglewood and Hawthorne/Lennox Stations, compared with non-event days. As there would be no other impacts to run time, this extra station dwell time should be able to be made up along the routes, and therefore no adverse impact to rail transit operations is expected for either line. Consistent with OPR guidance, an increase in transit demand is not considered an impact for CEQA purposes. This impact is considered to be **less than significant**.

During major events, the Proposed Project would operate shuttles that transport attendees between the site and the Hawthorne Green Line Station and planned Metro Crenshaw/LAX Line station in Downtown Inglewood. The Proposed Project site plan indicates a 120-foot bus pull-out would be provided along South Prairie Avenue. To the extent that congestion on South Prairie Avenue during the pre-event and post-event hours caused by the combination of event traffic and cumulative traffic growth blocks ingress or egress from the proposed shuttle bus pull-out turnout adjacent to the Project Site along South Prairie Avenue, the proposed 120-foot length of the pull-out may be inadequate. Thus, the Proposed Project's plan for accommodating shuttle buses on South Prairie Avenue would fail to provide adequate access to transit, which is considered a **significant impact**.

The following mitigation measures have been identified that could reduce the impacts regarding adequate access to transit.

Mitigation Measure 3.14-25(a)

The project applicant shall implement Mitigation Measures 3.14-2(a) (Event Transportation Management Plan), 3.14-2(b) (TDM Program), and the entirety of the intersection improvements in Mitigation Measures 3.14-2 and 3.14-3.

Mitigation Measure 3.14-25(b)

The project applicant shall implement Mitigation Measures 3.14-11(b) to lengthen the proposed shuttle pull-out.

Level of Significance After Mitigation: Implementation of Mitigation Measure 3.14-25(a) is expected to improve traffic operations in the study area surrounding the Proposed Project, which would thereby reduce congestion on South Prairie Avenue and West Century Boulevard affecting public bus operations and would reduce congestion on South Prairie Avenue that could block ingress or egress from the turnout. Moreover, implementation of the Event TMP would require that the Arena operator to provide sufficient shuttles to ensure that there is successful and convenient connectivity with short wait times to light rail stations such that peak wait times before or after major events does not exceed 15 minutes. As such, implementation of Mitigation Measure 3.14-25(a) would reduce transit impacts associated with public bus operations and attendees using shuttles to access light rail.

Since these measures would reduce but not eliminate cumulative project impacts on traffic operational conditions, the impacts on public bus operations are considered **significant and unavoidable**. Mitigation measure 3.14-25(a) and 25(b) would reduce

transit impacts associated with attendees using shuttles to access light rail under cumulative conditions to **less than significant**.

Impact 3.14-26: The Proposed Project could have the potential to result in inadequate emergency access under cumulative conditions. (Less than Significant with Mitigation)

As presented in Table 3.14-44, on non-event days increased traffic generated by the Proposed Project and cumulative traffic growth would not result in substantial increases in vehicle delay for emergency vehicles or other persons accessing the emergency room at CHMC in their personal vehicles. On days with larger daytime events and major events, congestion associated with event arrival and departure traffic and with cumulative traffic growth (particularly buildout of HPSP Phase 2) would significantly impact intersection operating conditions at numerous intersections in the vicinity of the Project Site, as documented in **Impact 3.14-17** and **Impact 3.14-18**.

At peak pre-event and post-event times, the levels of congestion on multiple travel corridors connecting parts of Inglewood and adjacent communities to Centinela Hospital, could result in incrementally slower travel times and potentially greater need to reroute emergency vehicles and other vehicles travelling to the hospital than under the Proposed Project scenario. As described above under Impact 3.14-14, drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using their sirens to clear a path of travel, driving in the lanes of opposing traffic, and bypassing signals and stopped traffic. Furthermore, during larger events, traffic control officers would be present at key intersections to control traffic and facilitate emergency vehicle access if needed, and TCOs could move temporary barriers to allow emergency vehicles to pass. The predicted level of congestion could, however, substantially affect the ability of other persons to access the emergency room at CHMC in their personal vehicles to a greater degree than under Proposed Project conditions.

For the reasons discussed above, the impact on emergency access is considered **potentially significant**. The project contribution would be cumulatively considerable, and, thus, the cumulative impact is **potentially significant**.

Mitigation Measure 3.14-26

Implement Mitigation Measure 3.14-14 (Local Hospital Access Plan).

Level of Significance After Mitigation: The implementation of the above mitigation measure would reduce this impact to **less than significant**.

Impact 3.14-27: The Proposed Project would substantially affect circulation for a substantial duration of construction under cumulative conditions. (Significant and Unavoidable)

The cumulative context for construction impacts would be other projects in the immediate vicinity that would be constructed concurrently with the Proposed Project. The only known related projects in the immediate vicinity of the Proposed Project that could have construction occurring concurrently with the construction of the Proposed Project would be construction of elements of the Hollywood Park Specific Plan Phase 1 that are not completed prior to commencement of construction of the Proposed Project and construction at the hotel renovation project at 3900 West Century Boulevard adjacent to the Project Site if it is not completed prior to commencement of construction of the Proposed Project.³¹ Construction of these HPSP elements, however, would not be expected to materially affect traffic conditions on the streets surrounding the HPSP Phase 1 area (South Prairie Avenue, West Century Boulevard), since improvements to these streets and the sidewalks fronting the HPSP Phase 1 site have already been completed and continued construction of the HPSP Phase 1 project would be within the HPSP Phase 1 Project Site and off-street. Construction at the hotel renovation project at 3900 West Century Boulevard could potentially require closure of the curb traffic lane on West Century Boulevard along the 3900 West Century Boulevard frontage; however, if this were to occur, it would effectively be a continuation of the lane closure anticipated as part of the Proposed Project along the Project Site frontage and the combined effects of the two would not be materially different than anticipated for the Proposed Project. Cumulative construction impacts on traffic, access, bus stops, and on-street parking would therefore be similar to those identified in **Impact 3.14-15** for the Proposed Project itself. In that section, construction impacts on traffic were determined to be **significant** in the vicinity of the South Prairie Avenue/West Century Boulevard intersection due to temporary, but prolonged lane closures along the Project frontage, which would result in degraded operations throughout the duration of Proposed Project construction. The Proposed Project contribution to cumulative construction impacts would be considerable. This impact would be considerable on days in which events are hosted at The Forum and the NFL Stadium, during which times there would be reductions in intersection capacity and degraded operations, which contributes to the significance of this cumulative impact. Temporary impacts on access, bus stops and on-street parking would be **less than significant**.

Mitigation Measure 3.14-27

The project applicant shall implement Mitigation Measure 3.14-15, Construction Traffic Management Plan.

Level of Significance after Mitigation: The implementation of the above mitigation measure would reduce the significance of this impact, but not to a less-than-significant level. Lane closures at the South Prairie Avenue/West Century Boulevard intersection

³¹ The next four nearest related projects are located between 0.6 and 1.2 miles from the Project Site and are each small residential projects of between three and five dwelling units.

would cause temporary, but noticeable worsening of traffic conditions throughout construction. This impact is considered **significant and unavoidable**.

3.14.5 Analysis, Impacts and Mitigation with Concurrent Events

Given the Proposed Project's proximity to The Forum and the NFL Stadium located in the Hollywood Park Specific Plan, it is possible that certain events at the Proposed Project may occur simultaneously with events at The Forum and/or the NFL Stadium. Accordingly, this transportation analysis studies five concurrent or overlapping event scenarios, further described below. These five concurrent or overlapping event scenarios are studied in this section under both Adjusted Baseline (project-specific) and Cumulative conditions.

Approach to Mitigation

A variety of mitigation measures have been identified for impacts occurring under the concurrent event scenarios. The effectiveness of these mitigation measures is then tested for the following scenarios:

- Adjusted Baseline (with Event at The Forum) Plus Project Major Events
- Cumulative (with Event at The Forum) Plus Project Major Events

For purposes of this analysis, identified mitigation measures were tested against concurrent event Scenario 1 (i.e., Proposed Project Major Event and 17,500-person Concert at The Forum) under both Adjusted Baseline and Cumulative conditions. For several reasons, concurrent event Scenario 1 was selected as the most appropriate concurrent event scenario to present an analysis of the impacts "with mitigation". First, this scenario would likely occur with some regularity given how often events at each venue may overlap. Second, analyses indicate that the Proposed Project would generate substantially more impacts under this scenario versus if an event were not occurring at The Forum. In addition, Scenario 1 would yield greater Project impacts than Scenario 2 (Proposed Project Major Event and Football Game at NFL Stadium) because most NFL Stadium-related traffic would have dispersed before the attendees for the Proposed Project Major Event would be arriving at Proposed Project. Scenario 1 would also generate more impacts than a concurrent scenario featuring a mid-sized event at the NFL Stadium (Scenario 3) because that scenario requires a considerable proportion of Proposed Project attendees to park at remote lots (i.e., not in HPSP lots), thereby dispersing traffic and reducing impacts. Scenarios 4 and 5, consisting of events at all three venues, were determined not to be appropriate for identifying and testing mitigation measures, particularly physical and permanent improvements, given the rarity with which those scenarios would occur. Any mitigation identified for Scenario 1 would also reduce the magnitude of impacts associated with Scenarios 2, 3, 4, and 5.

Adjusted Baseline Plus Project (Overlapping Major Events) Conditions

This subsection analyzes the Proposed Project under Adjusted Baseline conditions assuming one or more overlapping events at the nearby NFL Stadium and The Forum. As described in Table 3.14-3, the following five overlapping major events scenarios are analyzed:

- Scenario 1 (Major Events at Proposed Project and The Forum) – would consist of an 17,500-person concert at The Forum that begins on a weekday at 7 PM and ends at 9:15 PM, overlapping with a Major Event at Proposed Project (18,000-person NBA game for pre-event peak hour and 18,500-person concert for post-event analysis). Additionally, a weekend scenario is studied for a 5–6 PM peak hour in which the Forum event begins at 7 PM and the basketball game begins at 6 PM.
- Scenario 2 (Major Event at Proposed Project and Football Game at NFL Stadium) – would consist of a 70,240-person NFL football game at the NFL Stadium that begins on a weekend at 1:25 PM and ends at about 4:30 PM, overlapping with a Major Event at Proposed Project (18,500-person concert that begins at 7 PM). This scenario is studied for the 6 to 7 PM peak hour.
- Scenario 3 (Major Event at Proposed Project and Midsize Event at NFL Stadium) – would consist of a 25,000-person event at the NFL Stadium that begins on a weekday at 7 PM and ends at 9:15 PM, overlapping with a Major Event at Proposed Project (18,000-person NBA game for pre-event peak hour and 18,500-person concert for post-event analysis).
- Scenario 4 (Major Events at Proposed Project and The Forum, and Midsize Event at NFL Stadium) – would consist of a weekday 17,500-person concert at The Forum that begins on a weekday at 7 PM and ends at 9:15 PM, a 25,000-person event at the NFL Stadium that begins at 7 PM and ends at 9:15 PM, and a Major Event at Proposed Project (18,000-person NBA game for pre-event peak hour and 18,500-person concert for post-event analysis).
- Scenario 5 (Major Events at Proposed Project and The Forum, and Football Game at NFL Stadium) – would consist of a weekend 70,240-person NFL football game at the NFL Stadium that begins at 1:25 PM and ends at about 4:30 PM, an 17,500-person event at The Forum that begins at 7 PM, and a Major Event at Proposed Project (18,500-person concert that begins at 7 PM). This scenario is studied for the 6 to 7 PM peak hour.

The analyses that follow present intersection LOS, freeway operations, and off-ramp queuing results for each scenario and their applicable hours of study. Analyses of neighborhood traffic volumes are not performed for these concurrent scenarios. The mid-sized and major events at the NFL Stadium will be supported by a stadium transportation management and operations plan. However, the number of hours it would be implemented during a major event has not been finalized. Moreover, NFL Stadium events would result in fewer Proposed Project attendees parking in close proximity to the Proposed Project, as more Proposed Project parking would occur at remote lots; thus, it is likely that concurrent events at the Proposed Project and NFL Stadium would have similar, if not slightly reduced levels of neighborhood street traffic, as compared to a Proposed Project-only scenario. Accordingly, it would be speculative for the above reasons to quantify how much usage neighborhood streets would experience of with concurrent events at the Proposed Project and NFL Stadium over the course of a day. Neighborhood streets that could potentially be used by concert attendees at The Forum are farther north in the vicinity

of The Forum, not in the vicinity of the Project, and therefore the Proposed Project impacts on neighborhood streets would be similar in concurrent event scenarios involving The Forum.

Scenario 1 (Major Events at Proposed Project and The Forum)

This scenario is analyzed for the weekday pre-event and post-event peak hours and the weekend pre-event peak hour. Travel characteristics for the Proposed Project under this scenario are consistent with data reported in the Adjusted Baseline Plus Project (Major Event) Conditions subsection.

Trip generation estimates for a 17,500-person concert at The Forum were developed based on mode split and arrival/departure patterns derived from observations conducted at concerts at The Forum in December 2018³² and are presented in Appendix K.2. On a weekday, a 17,500-person event at The Forum is estimated to generate 4,739 pre-event peak hour vehicle trips and 7,992 post-event peak hour vehicle trips. On a weekend day, a 17,500-person event at The Forum would generate 2,551 vehicle trips during the weekend 5–6 PM study period (the hour beginning two hours prior to the concert start, for this scenario) and 4,477 vehicle trips during the weekend 6–7 PM study period (the hour beginning one hour prior to the concert start, for concurrent event scenario 5).

Traffic forecasts were developed for Adjusted Baseline (with The Forum) No Project conditions by adding The Forum concert trips to the Adjusted Baseline No Project forecasts. Trips associated with the Proposed Project were then added to those volumes to yield the Adjusted Baseline (with The Forum) Plus Project (Major Event) conditions.

Table 3.14-64 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Adjusted Baseline (with The Forum) No Project and Adjusted Baseline (with The Forum) Plus Project (Major Event) conditions for the three event-related peak hours. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

Table 3.14-65 displays the freeway LOS results under Adjusted Baseline (with The Forum) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in **Table 3.14-66**, a major event (assuming a concurrent event at The Forum) would cause four freeway off-ramps to experience queuing that exceeds the applicable threshold.

³² Driveway vehicle counts were taken before and after four concerts at The Forum, Fleetwood Mac (December 13 and 15, 2018) and Childish Gambino (December 16 and 17, 2018). For each concert, observations were made at driveways used by The Forum concert attendees, and the number of people in each vehicle entering was observed. Driveway counts over a three-hour pre-event period and a two-hour post-event period were also used to estimate arrival and departure patterns for attendees. The number of people accessing public transit at key bus stops in the vicinity of The Forum was also observed.

				Weekday Post-Event	Does Not Exist		N / A	N / A
				Weekend Pre-Event			51.2	D

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 2 (Major Event at Proposed Project and Football Game at NFL Stadium)

This scenario consists of a 70,240-person NFL football game at the NFL Stadium that begins on a weekend at 1:25 PM and ends at about 4:30 PM, with some NFL Stadium departure traffic overlapping with a major event at Proposed Project (18,500-person concert that begins at 7 PM). This scenario is studied for the 6 to 7 PM peak hour, which represents the combined peak hour of travel associated with attendees departing the football game and arriving to the concert.

The NFL Stadium site on Hollywood Park will provide parking for 9,000 vehicles. However, the stadium parking demand during football games will exceed this supply and necessitate the use of off-site parking and shuttles. The City of Inglewood, in coordination with the NFL Stadium operator and local parking suppliers, has identified up to 70 off-site parking facilities that could be available during NFL football games and other overlapping events. The following lists some of the prospective sites with larger quantities of parking supply.

- Los Angeles Southwest College
- El Camino College
- Playa District
- Wateridge Office Park (located northeast of the intersection of La Cienega Boulevard & Slauson Avenue)

- Pacific Concourse
- 5200 West Century Boulevard Garage

The intent is that NFL football game attendees would pre-purchase parking at a selected off-site location and then be taken by shuttle to the stadium itself.

Trip generation estimates for an NFL football game at the NFL Stadium were developed based on mode split information from the draft Transportation Management and Operations Plan (TMOP) for the Inglewood Sports & Entertainment District³³ and are presented in Appendix K.2. During the weekend 6 to 7 PM peak hour, 6 percent of NFL Stadium game attendees and 10 percent of employees are projected to depart. This translates into 1,836 outbound vehicle trips and 191 inbound vehicle trips. The departure percentage estimates are derived from other NFL venues (e.g., Levi's Stadium in Santa Clara, which is home to the San Francisco 49ers). While much of that traffic will be departing from lots surrounding the stadium within Hollywood Park, some trips will also be leaving remote lots, thereby resulting in dispersed traffic flows. A large number of shuttles will be used to transport these patrons from the stadium to these remote lots. Traffic forecasts were developed for the weekend pre-event peak for an Adjusted Baseline (with Football Game at NFL Stadium) No Project condition by adding NFL Football game trips to the Adjusted Baseline No Project forecasts.

The TMOP will be implemented before and after football games. It will include both on-site and off-site traffic management, special event signal timings, wayfinding, and many other traffic management components. The TMOP is assumed in place for Adjusted Baseline (with Football Game at NFL Stadium) No Project conditions.

Parking demands for a weekend afternoon NFL football game would not substantively affect the ability of concertgoers to park at Hollywood Park for a weekend evening concert at the Proposed Project since the majority of fans for an afternoon football game will have departed before the majority of concertgoers arrive for the evening concert. Off-site parking for the Proposed Project event under this scenario would occur at Hollywood Park and the Hollywood Park Casino as for a standalone Proposed Project event.

Project trips were added to the Adjusted Baseline (with Football Game at NFL Stadium) No Project Conditions to yield the Adjusted Baseline (with Football Game at NFL Stadium) Plus Project (Major Event) scenario.

Table 3.14-67 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Adjusted Baseline (with Football Game at NFL Stadium) No Project and Adjusted Baseline (with Football Game at NFL Stadium) Plus Project (Major Event) conditions.

³³ City of Inglewood, Public Works Department, *Inglewood Sports & Entertainment District, Transportation Management and Operations Plan*, July 2019 draft.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions.

SOURCE: Fehr & Peers, 2019.

As shown in the table, the project would cause a number of intersections to have degraded operations, many of which are considered significant.

Table 3.14-68 displays the freeway LOS results under Adjusted Baseline (with Football Game at NFL Stadium) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in **Table 3.14-69**, a major event (assuming a concurrent Football Game at the NFL Stadium) would cause two freeway off-ramps to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

Scenario 3 (Major Event at Proposed Project and Midsize Event at NFL Stadium)

This scenario is analyzed for the weekday pre-event and post-event peak hours. Traffic forecasts were developed for Adjusted Baseline (with Midsize NFL Stadium Event) No Project forecasts by adding Midsize NFL Stadium Event trips to the Adjusted Baseline No Project forecasts.

This scenario would result in all parking in the NFL Stadium lots being fully utilized by NFL Stadium event attendees and employees. Thus, the major event at the Proposed Project would require between 3,100 and 3,500 vehicles related to the NBA game or concert at the Proposed Project that would have otherwise parked at stadium parking facilities within Hollywood Park to

be parked in various other off-site locations. The following potential additional off-site parking locations have been identified:

- Approximately 1,050 spaces located 1 mile or less from the Arena Site (located on school campuses and office/administrative buildings). Many attendees parking in these areas would be expected to walk to/from the Arena Site.

The Los Angeles Gateway Area (located between I-405 and LAX, 1.6 miles from the Arena Site) and Southwest College have ample reserve overflow parking (i.e., nearly 12,000 spaces). Attendees parking in these areas would likely take a shuttle to/from the Arena Site, but may also use a TNC. The Los Angeles Gateway Area would also be used for employee parking during concurrent events.

Figure 3.14-23 illustrates the locations of these off-site parking facilities relative to the Arena Site.

According to the Proposed Project site plan, a 120-foot bus turnout would be created along the project frontage on South Prairie Avenue to accommodate shuttle buses to these off-site parking lots.

Trips associated with the Proposed Project were assigned to the study intersections in accordance with the trip generation and distribution patterns described previously. However, the assignment of those trips varied due to the aforementioned changes in off-site parking locations for concert attendees. A second set of shuttle buses (i.e., in addition to shuttles transporting attendees to/from light rail stations) to transport concert attendees to more remote parking areas is also included in the analysis. Additionally, trip routing to the Proposed Project would likely change in response to congested conditions in the immediate vicinity of the NFL Stadium. Project trips were added to the Adjusted Baseline (with Midsize NFL Stadium Event) No Project Conditions to yield the Adjusted Baseline (with Midsize NFL Stadium Event) Plus Project (Major Event) scenario.

Trip generation estimates for the Midsize Event at the NFL Stadium were developed based on mode split information from the Inglewood Sports & Entertainment District TMOP and arrival and departure information from The Forum and are presented in Appendix K.2.

Table 3.14-70 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis for weekday pre-event and post-event peak hour conditions under Adjusted Baseline (with Midsize Event at NFL Stadium) Plus Project (Major Event) conditions. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

Table 3.14-71 displays the freeway LOS results under Adjusted Baseline (with Midsize Event at NFL Stadium) conditions, without and with a major event at the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in **Table 3.14-72**, a major event (assuming a concurrent mid-sized event at NFL Stadium) would result in three freeway off-ramp experiencing maximum vehicle queues that exceed the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes. Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

I-110 NB Off-Ramp at Manchester Blvd	3,655	1,369	No	1,369	No

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 4 (Major Events at Proposed Project and The Forum, and Midsize Event at NFL Stadium)

This scenario would consist of a weekday 17,500-person concert at The Forum that begins on a weekday at 7 PM and ends at 9:15 PM, a 25,000-person event at the NFL Stadium that begins at 7 PM and ends at 9:15 PM, and a major event at Proposed Project (18,000-person NBA game for pre-event peak hour and 18,500-person concert for post-event analysis).

Traffic forecasts were developed for Adjusted Baseline (with The Forum and Midsize NFL Stadium Event) No Project forecasts by adding the Forum Event and Midsize NFL Stadium Event trips to the Adjusted Baseline No Project forecasts. Trips associated with the Proposed Project

were then added to those volumes to yield the Adjusted Baseline (with The Forum and Midsize NFL Stadium Event) Plus Project (Major Event) conditions.

Table 3.14-73 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Adjusted Baseline (with The Forum and Midsize NFL Stadium Event) No Project and Adjusted Baseline (with The Forum and Midsize NFL Stadium Event) Plus Project (Major Event) conditions for the two peak hours under study. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

NOTES:

Shaded cells Identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

SOURCE: Fehr & Peers, 2019.

Table 3.14-74 displays the freeway LOS results under Adjusted Baseline (with The Forum and Midsize NFL Stadium Event) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, many of which are considered significant. As shown in **Table 3.14-75**, a major event (assuming both other concurrent events) would cause five freeway off-ramps to exceed their applicable threshold or further exacerbate an already unacceptable queuing condition.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 5 (Major Events at Proposed Project and The Forum, and Football Game at NFL Stadium)

This scenario would consist of a weekend 70,240-person NFL football game at the NFL Stadium that begins at 1:25 PM and ends at about 4:30 PM, an 17,500-person event at The Forum that begins at 7 PM, and a major event at Proposed Project (18,500-person concert that begins at 7 PM). This scenario is studied for the 6 to 7 PM peak hour of Proposed Project Major Event traffic.

Traffic forecasts were developed for Adjusted Baseline (with The Forum and Football Game at NFL Stadium Events) No Project forecasts by adding the Forum Event and Football Game at NFL Stadium Event trips to the Adjusted Baseline No Project forecasts. Trips associated with the Proposed Project were then added to those volumes to yield the Adjusted Baseline (with The Forum and Football Game at NFL Stadium Events) Plus Project (Major Event) conditions.

Table 3.14-76 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Adjusted Baseline (with The Forum and football game at NFL Stadium events) No Project and Adjusted Baseline (with The Forum and football game at NFL Stadium events) Plus Project (Major Event) conditions. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions.

SOURCE: Fehr & Peers, 2019.

Table 3.14-77 displays the freeway LOS results under Adjusted Baseline (with The Forum and Football Game at NFL Stadium Events) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in Table 3.14-78, a major event (assuming both other concurrent events) would cause four freeway off-ramps to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Table 3.14-79 displays the specific number of study intersections, individual freeway facilities, and freeway off-ramps that would be significantly impacted by a major event at the Proposed Project for the Adjusted Baseline Plus Project and five overlapping event scenarios presented here. Data is organized by peak hour and increasing numbers of overlapping activities to enable readers to visualize how the number of overlapping events in the study area influences the magnitude of impacts. Scenarios are shown under relevant time periods. For example, Scenario 2 (Major Event at Proposed Project Plus NFL Football game at stadium) is not listed under Weekday Pre-Event Peak Hour because this scenario would arise on the weekend. That scenario is instead listed under Weekend Pre-Event Peak Hour.

Key findings from Table 3.14-79 include the following:

- With respect to intersections:
 - Proposed Project intersection impacts are more frequent during the weekday pre-event peak hour than during the other two study periods regardless of which concurrent event condition is being studied.
 - The number of intersections impacted by the Proposed Project increases substantially (from 42 to 62 during the weekday pre-event peak hour, from 11 to 45 during the weekday post-event peak hour, and from 26 to 41 during the weekend pre-event peak hour) when the concurrent event condition includes an event at The Forum.
 - The number of intersections impacted by the Proposed Project during the weekday pre-event and post-event peak hours is less when the background condition consists of a mid-sized weekday event at the NFL Stadium versus an event at The Forum. This is because the mid-sized event at the NFL Stadium occupies all of its surrounding parking, thereby requiring a greater number of Proposed Project attendees to park remotely and be shuttled to the Proposed Project. As a result, less trips are added and therefore fewer impacts occur in the immediate vicinity of the Project Site and the NFL Stadium.
 - The overall operation of the street system is projected to be substantially worse under each concurrent event scenario than for the Proposed Project alone. One measure of this is the number of study intersections projected to operate at LOS F under each scenario, as shown on **Table 3.14-80**.
- With respect to freeway facilities:
 - Proposed Project impacts on freeway segments would be generally more extensive during the weekday pre-event peak hour than during the other two study periods regardless of which concurrent event condition is being studied (the exception being the weekday post-event hour with concurrent events at both The Forum and the NFL Stadium).
- With respect to freeway off-ramp queuing:
 - Off-ramp queues longer than the applicable standard would be expected at three off-ramps during the weekday pre-event hour and at two off-ramps during the weekend pre-event hour with the Proposed Project but without events at the other two venues. The estimated queues would be longer with each added concurrent event. Off-ramp queues would be projected to exceed the applicable standard at up to two additional off-ramps depending on the concurrent event.

Cumulative Plus Project (Overlapping Major Events) Conditions

This subsection analyzes the Proposed Project under cumulative conditions assuming one or more overlapping events at the nearby NFL Stadium and The Forum. The same five overlapping major events scenarios analyzed under Adjusted Baseline conditions are also analyzed under cumulative conditions.

TABLE 3.14-79
SUMMARY OF PROPOSED PROJECT (MAJOR EVENT) SIGNIFICANT ROADWAY IMPACTS FOR CONCURRENT SCENARIOS UNDER ADJUSTED BASELINE CONDITIONS

Freeway Facility Components	6	12	11	14	3	6	8	14	6	10	5	6
Freeway Off-Ramp Queuing	3	4	3	5	Not Applicable				2	4	2	4

NOTE:

Impacts of "Proposed Project" are judged directly against the Adjusted Baseline No Project condition. For all other scenarios, Proposed Project impacts are judged against the given scenario. Values specified in cells refer to the specific number of study intersections, individual freeway facilities, and freeway off-ramps that are significantly impacted for the given scenario and peak hour.

Scenario 1 (Major Events at Proposed Project and The Forum)

This scenario is analyzed for the weekday pre-event and post-event peak hours and the weekend pre-event peak hour. Travel characteristics for the Proposed Project under this scenario are consistent with data reported in the Adjusted Baseline Plus Project (Major Event) Conditions subsection.

Table 3.14-81 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Cumulative (with The Forum) No Project and Cumulative (with The Forum) Plus Project (Major Event) conditions for the three event-related peak hours. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

NOTES:

Shaded cells represent significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

SOURCE: Fehr & Peers, 2019.

Table 3.14-82 displays the freeway LOS results under Cumulative (with The Forum) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in Table 3.14-83, a major event (assuming a concurrent event at The Forum) would cause four freeway off-ramps to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 2 (Major Event at Proposed Project and Football Game at NFL Stadium)

This scenario consists of a 70,240-person NFL football game at the NFL Stadium that begins on a weekend at 1:25 PM and ends at about 4:30 PM, overlapping with a Major Event at Proposed Project (18,500-person concert that begins at 7 PM). This scenario is studied for the 6 to 7 PM peak hour, which represents the combined peak hour of travel associated with attendees departing the football game and arriving to the concert.

Table 3.14-84 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Adjusted Baseline (with Football Game at NFL Stadium) No Project and Adjusted Baseline (with Football Game at NFL Stadium) Plus Project (Major Event) conditions. As shown in the table, the project would cause a number of intersections to have degraded operations, many of which are considered significant.

NOTES:

Shaded cells represent significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions.

SOURCE: Fehr & Peers, 2019.

Table 3.14-85 displays the freeway LOS results under Adjusted Baseline (with Football Game at NFL Stadium) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in Table 3.14-86, a major event (assuming a concurrent Football Game at the NFL Stadium) would cause three freeway off-ramps to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

I-110 NB Off-Ramp at Manchester Blvd	3,655	1,873	No	1,873	No

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 3 (Major Event at Proposed Project and Midsize Event at NFL Stadium)

Table 3.14-87 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis for weekday pre-event and post-event peak hour conditions under Cumulative (with Midsize Event at NFL Stadium) Plus Project (Major Event) conditions. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

Table 3.14-88 displays the freeway LOS results under Cumulative (with Midsize Event at NFL Stadium) conditions, without and with a major event at the Proposed Project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in Table 3.14-89, a major event at the Proposed Project (assuming a concurrent mid-sized event at NFL Stadium) would cause four freeway off-ramps to experience queuing that exceeds the applicable threshold.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

I-110 NB Off-Ramp at Manchester Blvd	3,655	1,791	No	1,791	No

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 4 (Major Events at Proposed Project and The Forum, and Midsize Event at NFL Stadium)

This scenario would consist of a weekday 17,500-person concert at The Forum that begins on a weekday at 7 PM and ends at 9:15 PM, a 25,000-person event at the NFL Stadium that begins at 7 PM and ends at 9:15 PM, and a Major Event at Proposed Project (18,000-person NBA game for pre-event peak hour and 18,500-person concert for post-event analysis).

Traffic forecasts were developed for Cumulative (with The Forum and Midsize NFL Stadium Event) No Project forecasts by adding the Forum Event and Midsize NFL Stadium Event trips to the Cumulative No Project forecasts. Trips associated with the Proposed Project were then added

to those volumes to yield the Cumulative (with The Forum and Midsize NFL Stadium Event) Plus Project (Major Event) conditions.

Table 3.14-90 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Cumulative (with The Forum and Midsize NFL Stadium Event) No Project and Cumulative (with The Forum and Midsize NFL Stadium Event) Plus Project (Major Event) conditions for the two peak hours under study. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

Table 3.14-91 displays the freeway LOS results under Cumulative (with The Forum and Midsize NFL Stadium Event) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant. As shown in **Table 3.14-92**, a major event (assuming both other concurrent events) would cause five freeway off-ramps to either experience queuing that exceeds the applicable threshold or worsen an already unacceptable queuing condition.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

Shaded cells represent significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions. Impacts are identified when the LOS worsens from D or better to E, or from E to F, or the volume increase is greater than 1 percent when already at F (see Appendix K.2).

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

SOURCE: Fehr & Peers, 2019.

I-110 NB Off-Ramp at Manchester Blvd	3,655	1,877	No	1,877	No

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp termini intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Scenario 5 (Major Events at Proposed Project and The Forum, and Football Game at NFL Stadium)

This scenario would consist of a weekend 70,240-person NFL football game at the NFL Stadium that begins at 1:25 PM and ends at about 4:30 PM, an 17,500-person event at The Forum that begins at 7 PM, and a Major Event at Proposed Project (18,500-person concert that begins at 7 PM). This scenario is studied for the 6 to 7 PM peak hour.

Traffic forecasts were developed for Cumulative (with The Forum and Football Game at NFL Stadium Events) No Project forecasts by adding the Forum Event and Football Game at NFL Stadium Event trips to the Cumulative No Project forecasts. Trips associated with the Proposed

Project were then added to those volumes to yield the Cumulative (with The Forum and Football Game at NFL Stadium Events) Plus Project (Major Event) conditions.

Table 3.14-93 displays the LOS and average delay or V/C ratio at the 114 intersections selected for analysis under Cumulative (with The Forum and Football Game at NFL Stadium Events) No Project and Cumulative (with The Forum and Football Game at NFL Stadium Events) Plus Project (Major Event) conditions. As shown in the table, a large number of intersections would be significantly impacted under this scenario.

Table 3.14-94 displays the freeway LOS results under Cumulative (with The Forum and Football Game at NFL Stadium Events) conditions, without and with the project. As shown, a major event would cause degraded operations at several facilities, some of which are considered significant.

Table 3.14-95 shows that a major event (assuming both concurrent events) would cause six freeway off-ramps to experience queuing that exceeds the applicable threshold or worsens an already unacceptable queuing condition.

NOTES:

Shaded cells identify significant impacts.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

NOTES:

Shaded cells identify significant impacts.

¹ Density (expressed as passenger car equivalents per mile per lane) and LOS calculated using procedures from the *Highway Capacity Manual, 6th Edition* (Transportation Research Board, 2016). Per the *HCM 6th Edition*, density is not provided for LOS F conditions.

² LOS F reported for this facility based on average existing speed of 35 mph or less (per Caltrans PeMS data). HCM results would have shown better LOS because of suppressed volumes due to downstream congestion.

NOTES:

Shaded cells identify significant impacts.

¹ Auxiliary lanes are present at each of these off-ramps.

² Per Caltrans letter dated April 22, 2019, ramp threshold is 85 percent of maximum ramp length (which is measured from the ramp terminus to freeway off-ramp gore point), unless an auxiliary lane is present. If an auxiliary lane is present, the ramp threshold is calculated by summing the total length of the ramp from the intersection to the gore point and the lesser of 1,000 feet or one half the length of the auxiliary lane. Storage capacity in additional turn lanes at the ramp terminus intersection is also included.

³ 95th percentile queue estimated using HCM methodologies (Synchro or SimTraffic). This queue length implies a 5 percent probability that the actual queue will be greater than this estimate, and is routinely used in infrastructure design. Values shown represent the total length of 95th percentile queues across all turn lanes on the off-ramp.

⁴ If the 95th percentile queue is greater than the ramp capacity threshold, then the queue exceeds the available storage.

SOURCE: Fehr & Peers, 2019.

Table 3.14-96 displays the specific number of study intersections, individual freeway facilities, and freeway off-ramps that would be significantly impacted by a major event at the Proposed Project for the Cumulative Plus Project and five overlapping event scenarios presented here. Data is organized by peak hour and increasing numbers of overlapping activities to enable readers to visualize how the number of events in the study area influences impact identification. Scenarios are shown under relevant time periods. For example, Scenario 2 (Major Event at Proposed Project Plus NFL Football game at stadium under cumulative conditions) is not listed under Weekday Pre-Event Peak Hour because this scenario would arise on the weekend. That scenario is instead listed under Weekend Pre-Event Peak Hour.

Freeway Off-Ramp Queuing	3	4	4	5	Not Applicable				3	4	3	6

NOTE:

Impacts of "Proposed Project" are judged directly against the Cumulative No Project condition. For all other scenarios, Proposed Project impacts are judged against the given scenario. Values specified in cells refer to the specific number of study intersections, individual freeway facilities, and freeway off-ramps that are significantly impacted for the given scenario and peak hour.

SOURCE: Fehr & Peers, 2019.

Key findings from Table 3.14-96 include the following:

- With respect to intersections:
 - Under weekday pre-event peak hour cumulative conditions, the Proposed Project would cause significant impacts at more than half of study intersections.
 - When compared to Adjusted Baseline impacts, Proposed Project impacts under cumulative conditions would be more frequent regardless of which peak hour or concurrent event condition is being studied. This is due to increased background traffic, which increases the potential for Proposed Project vehicle trips to exacerbate unacceptable conditions.
 - The increase in Proposed Project impacts between Adjusted Baseline and cumulative conditions would be the lowest when all three venues would be operating concurrently. This is due to severe congestion that is projected to be equally present under both Adjusted Baseline and cumulative conditions.
 - As for Adjusted Baseline conditions, the overall operation of the street system is projected to be substantially worse under each concurrent event scenario than for the Proposed Project alone under cumulative conditions. One measure of this is the number of study intersections project to operate at LOS F under each scenario, as shown on **Table 3.14-97**.
 - The overall operation of the street system is generally projected to be worse under cumulative conditions than under Adjusted Baseline conditions due to increased background traffic. Comparing Table 3.14-80 to Table 3.14-97, the number of study intersections projected to operate at LOS F consistently increases from Adjusted Baseline to cumulative conditions.
- With respect to freeway facilities:
 - Cumulative freeway impacts due to the Proposed Project would be more frequent than under Adjusted Baseline conditions. Concurrent background events typically cause one or two additional components to be impacted between Adjusted Baseline and cumulative conditions.
- With respect to freeway off-ramp queuing:
 - Off-ramp queues longer than the applicable standard would be expected at three off-ramps during the weekday and weekend pre-event hours with the Proposed Project but without events at the other two venues. The estimated queues would be longer with each added concurrent event. Off-ramp queues would be projected to exceed the applicable standard at up to three additional off-ramps depending on the concurrent event.

Project-Specific Impacts and Mitigation Measures Associated with Other Concurrent Events

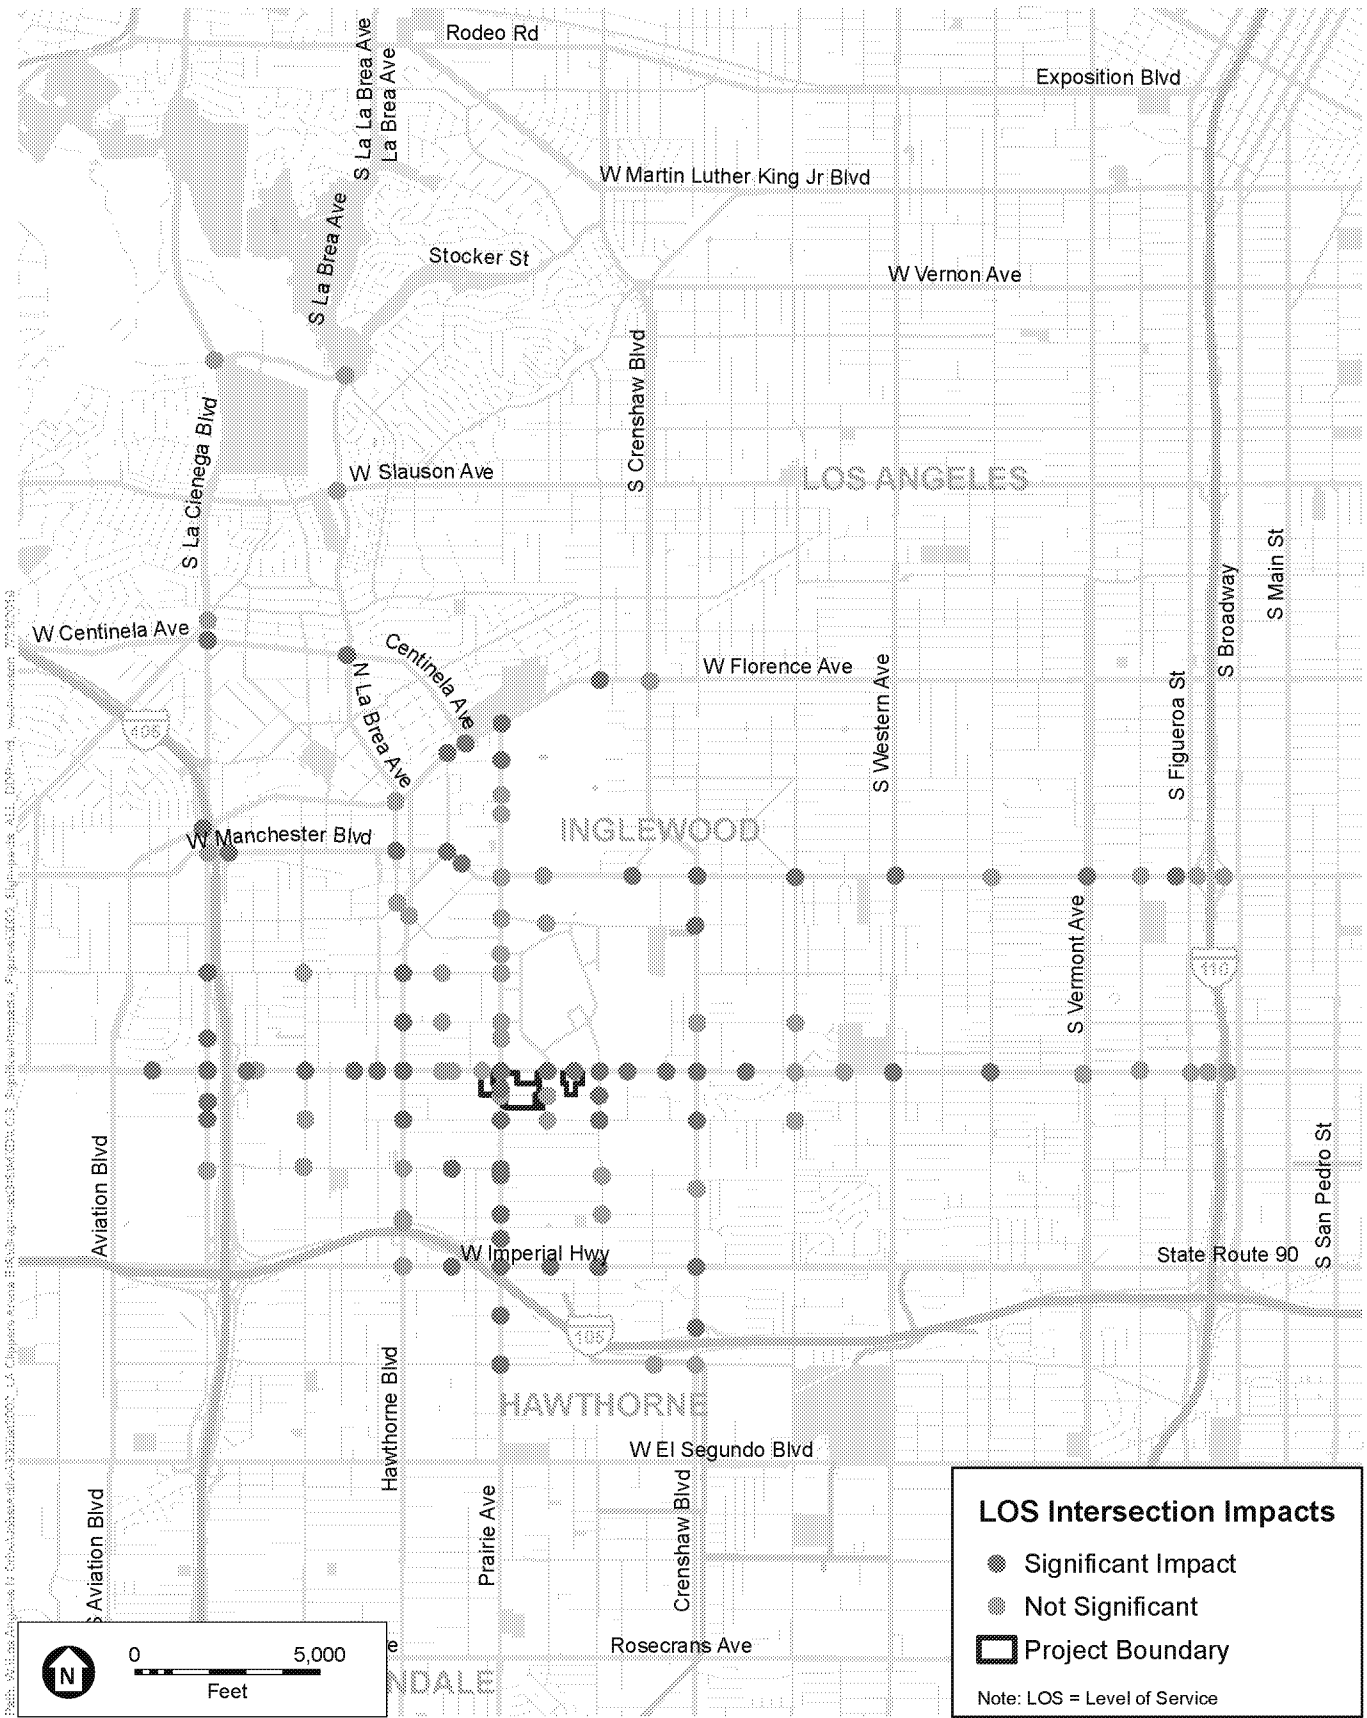

As described above and summarized in Table 3.14-3, this EIR analyzes combined effect of the Proposed Project assuming that one or more overlapping events would be occurring at the nearby NFL Stadium and The Forum. The following five overlapping major events scenarios are analyzed:

- Scenario 1 (Major Events at Proposed Project and The Forum)
- Scenario 2 (Major Event at Proposed Project and Football Game at NFL Stadium)
- Scenario 3 (Major Event at Proposed Project and Mid-Sized Event at NFL Stadium)
- Scenario 4 (Major Events at Proposed Project and The Forum, and Mid-Sized Event at NFL Stadium)
- Scenario 5 (Major Events at Proposed Project and The Forum, and Football Game at NFL Stadium)

As described previously, analyses of neighborhood traffic volumes were not performed for these concurrent scenarios. Also as described previously, concurrent event Scenario 1 was selected as the most appropriate concurrent event to mitigate because it would occur much more frequently than the other scenarios, direct Project impacts are greater in Scenario 1 than Scenarios 2 and 3, and Scenarios 4 and 5 would be infrequent. The detailed results are presented below.

Impact 3.14-28: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under Adjusted Baseline conditions. (Significant and Unavoidable)

Significant impacts were identified based on the results in Tables 3.14-64, 3.14-67, 3.14-70, 3.14-73, and 3.14-76 and the significance criteria. **Figures 3.14-24, 3.14-25, and 3.14-26** are study area maps displaying those intersections that would be significantly impacted during the weekday pre-event, weekday post-event, and weekend pre-event peak hours, respectively, for Scenario 1. **Figure 3.14-27** is a study area map displaying those intersections that would be significantly impacted during the weekend pre-event peak hours for Scenario 2. **Figures 3.14-28 and 3.14-29** are study area maps displaying those intersections that would be significantly impacted during the weekday pre-event and weekday post-event peak hours, respectively, for Scenario 3. **Figures 3.14-30 and 3.14-31** are study area maps displaying those intersections that would be significantly impacted during the weekday pre-event and weekday post-event peak hours, respectively, for Scenario 4. **Figure 3.14-32** is a study area map displaying those intersections that would be significantly impacted during the weekend pre-event peak hour for Scenario 5.

Intersections could also be significantly impacted under concurrent event conditions for a situation in which the Proposed Project is not hosting a daytime or major event, a football game is played at the NFL Stadium, and attendees to the football game park in one or more of the Proposed Project garages. During such conditions, the Proposed Project would not operate its Event TMP, and therefore, traffic operational concerns could arise at the garage access points, which could affect adjacent intersections.

These impacts are considered **significant**.

The above figures refer to “baseline” conditions as the various scenarios atop of which the Proposed Project’s impacts are measured. The term “baseline” as used in these figures, does not refer to the existing environmental setting as described in CEQA Guidelines section 15125. Each figure describes the specific scenario that constitutes the concurrent event baseline condition to which the project’s traffic is added.

Mitigation Measure 3.14-28(a)

Implement Mitigation Measures 3.14-3(a) through 3.14-3(o).

Mitigation Measure 3.14-28(b)

The project applicant shall make a funding contribution to the City of Inglewood Public Works Traffic Division to help fund and implement Intelligent Transportation Systems (ITS) improvements at intersections in which the Project causes a significant impact for which a specific mitigation that would reduce this impact to less than significant could not be identified.

Mitigation Measure 3.14-28(c)

On days with concurrent events at The Forum, the City shall coordinate the Event TMP with the operator of The Forum to expand traffic control officer coverage and implement temporary lane assignments through the use of cones as follows:

- *At South Prairie Avenue and Arbor Vitae Street under pre-event conditions, through the use of cones and signs temporarily suspend curb parking to allow approximately 150’ eastbound right turn pocket; lane widths may be reduced to approximately 11’ to accommodate the turn pocket. This modification reduces a bottleneck during the pre-event peak hour that affects upstream traffic.*
- *At Hawthorne Boulevard and West Century Boulevard, through the placement of a TCO and cones, temporarily reassign the northbound approach as 2 left turn lanes, 2 through lanes, and 2 right turn lanes, allowing a northbound right turn phase overlap with the westbound left turns.*

Mitigation Measure 3.14-28(d)

On days with concurrent events at the NFL Stadium, the City shall coordinate the Event TMP with the operator of the NFL Stadium Transportation Management and Operations Plan (TMOP).

Mitigation Measure 3.14-28(e)

Implement Mitigation Measure 3.14-2(c) (West Century Boulevard/La Cienega Boulevard Improvements).

Mitigation Measure 3.14-28(f)

The City of Inglewood shall require the NFL Stadium TMOP to incorporate special traffic management provisions to cover conditions during which attendees to an NFL football game would utilize parking within the Project garages.

Level of Significance After Mitigation: Mitigation Measures 3.14-3(a) and 3.14-3(b) identified within Mitigation Measure 3.14-28(a) require implementation of the Event TMP and TDM program, respectively. Mitigation Measures 3.14-3(c) – (n) identified within Mitigation Measure 3.14-28(a) and 3.14-2(c) identified within Mitigation Measure 3.14-28(e) consist of physical and/or operational improvements at a variety of surface streets and freeway off-ramps significantly impacted by the Proposed Project. Mitigation Measure 3.14-3(o) requires coordination with the City to operate corridors with coordinated, special event signal timings.

Mitigation Measure 3.14-28(b) requires a contribution to the ITS Program; refer to Mitigation Measure 3.14-2(o) for details of the ITS Program. The financial contribution shall be available for ITS improvements at the following intersections and to the corridors where these intersections are located. The list below contains only those intersections that are significantly impacted (under either/both Adjusted Baseline or cumulative conditions) due to a Major Event at the Proposed Project operating concurrently with an event at The Forum (i.e., they are not listed in Mitigation Measure 3.14-2(o)).

- Hillcrest Boulevard/Florence Avenue
- Arbor Vitae Street/La Brea Avenue
- West Century Boulevard/Van Ness Avenue
- Yukon Avenue/Imperial Highway
- Crenshaw Boulevard/Manchester Boulevard

The modifications included in Mitigation Measure 3.14-28(c) would improve operations throughout the network, particularly along South Prairie Avenue and West Century Boulevard approaching the Project Site and The Forum. The ability to implement these measures would depend, in part, on The Forum venue operator's willingness to cooperate, which is currently unknown.

Mitigation Measure 3.14-28(d) requires the City to coordinate with operators of the NFL Stadium TMOP and the Event TMP on days with concurrent events at each venue. This would allow each plan to operate more efficiently and in coordination with each other.

Mitigation Measure 3.14-28(f) requires the City to ensure that the NFL Stadium TMOP operator conducts traffic management at Proposed Project garages in a manner generally consistent with the Event TMP for conditions in which NFL football game attendees park in these garages, and the Proposed Arena is otherwise not utilized.

The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-98** for Scenario 1 (with The Forum). Based on network-level microsimulation analysis, under major event conditions, the mitigations at major bottlenecks often result in increased traffic flow at adjacent and/or downstream intersections. Improving the flow at major bottleneck locations, although desirable, can cause secondary, significant impacts. The following describes their effectiveness during each peak hour.

Weekday Pre-Event Peak Hour

Of the 61 significant intersection impacts, the above mitigation measures would cause 15 to become **less than significant**. These mitigation measures would not cause any otherwise not significantly impacted intersections to become a secondary, significant impact. The average percent demand served at the intersections analyzed using microsimulation increased from 58 percent (Adjusted Baseline (With The Forum) Plus Project without mitigation) to 71 percent with the recommended mitigation measures in place.

Weekday Post-Event Peak Hour

Of the 45 significant intersection impacts, the above mitigation measures would cause ten to become **less than significant**. These mitigation measures would cause an additional three intersections to become new secondary, significantly impacted locations. Opportunities for physical or further operational/signal timing improvements at these locations were investigated, but no feasible mitigations were identified. The average percent demand served at the intersections analyzed using microsimulation increased from 65 percent (Adjusted Baseline (With The Forum) Plus Project without mitigation) to 69 percent with the recommended mitigation measures in place.

Weekend Pre-Event Peak Hour

Of the 41 significant intersection impacts identified during the weekend pre-event peak hour, the above mitigation measures would cause 15 to become **less than significant**. These mitigation measures would cause an additional three intersections to become new secondary, significantly impacted locations. The average percent demand served at the intersections analyzed using microsimulation increased from 79 percent (Adjusted Baseline (With The Forum) Plus Project without mitigation) to 85 percent with the recommended mitigation measures in place.

The precise degree of effectiveness of proposed TDM strategies to shift the mode split away from driving and reduce the project's vehicular trip generation is not known. Therefore, mitigation measure testing did not explicitly account for a certain amount of reduced vehicle travel due to TDM strategies. The above list of mitigation measures would reduce vehicle travel demand, accommodate the remaining travel demand in a more efficient manner, and provide physical improvements, where feasible, to add capacity to the roadway system. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies, and there would be no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

NOTES:

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections that do not require mitigation and therefore LOS results are anticipated to be similar.

Intersections analyzed using HCM may show "with mitigation" LOS results despite the particular intersection not being impacted because micro-simulation analysis of mitigations reveals effects on nearby intersections.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

SOURCE: Fehr & Peers, 2019.

Impact 3.14-29: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under Adjusted Baseline conditions. (Significant and Unavoidable)

Significant impacts were identified based on the significance criteria and the results are presented for freeway operations in Tables 3.14-65, 3.14-68, 3.14-71, 3.14-74, and 3.14-77 and for freeway ramp queuing in Tables 3.14-66, 3.14-69, 3.14-72, 3.14-75, and 3.14-78. Major events at the Proposed Project Arena, when held concurrently with major events at the NFL Stadium and/or The Forum, would cause significant impacts at a number of the study freeway components (refer to tables for specific segments and off-ramps under each scenario).

Weekday Pre-Event Hour

- 3 to 6 impacted components on I-405
- 7 to 8 impacted components on I-105
- 0 impacted components on I-110
- Project causes or contributes to queue exceeding storage at up to five off-ramps depending on the concurrent scenario

Weekday Post-Event Hour

- 2 to 3 impacted components on I-405
- 2 to 6 impacted components on I-105
- 1 to 6 impacted components on I-110

Weekend Day Pre-Event Hour

- 3 to 4 impacted components on I-405
- 2 to 7 impacted components on I-105
- 0 impacted components on I-110
- Project causes or contributes to queue exceeding storage at up to four off-ramps depending on the concurrent scenario

These freeway components and ramp queue impacts are considered **significant**.

Mitigation Measure 3.14-29(a)

Implement Mitigation Measure 3.14-3(h) (I-105 Westbound Off-ramp Widening at Crenshaw Boulevard).

Mitigation Measure 3.14-29(b)

Implement Mitigation Measure 3.14-3(c) (Restripe I-405 NB Off-Ramp at West Century Boulevard).

Mitigation Measure 3.14-29(c)

Implement Mitigation Measure 3.14-3(o) (Retime and optimize traffic signals on Inglewood streets).

Mitigation Measure 3.14-29(d)

Implement Mitigation Measure 3.14-3(g) (I-105 Off-ramp Widening at South Prairie Avenue).

Mitigation Measure 3.14-29(e)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-29(f)

*Implement the trip reduction measures included in the Project Transportation Demand Management Program described in **Mitigation Measure 3.14-2(b)**.*

Mitigation Measure 3.14-29(g)

Implement Mitigation Measure 3.14-8(b) (Work with Caltrans to implement traffic management system improvements along the I-105 corridor).

Level of Significance After Mitigation: The combined effect of the above mitigation measures would be improved operations of streets in the vicinity of the Proposed Project, which would result in less overall delay and vehicle queuing. Additionally, widening and/or lane reassignments on several of the impacted off-ramps would improve their capacity and ability to store vehicles. The following describes how impacted off-ramps would be improved in concurrent Scenario 1 (with The Forum) (for the more critical weekday pre-event peak hour):

- At the I-105 off-ramp at South Prairie Avenue, the maximum vehicle queue would be reduced from an estimated 9,175 feet (without mitigation) to 7,700 feet with mitigation, which is less than the applicable 8,720-foot storage. Thus, storage would be adequate with mitigation.
- At the I-105 Westbound off-ramp at Crenshaw Boulevard, the maximum vehicle queue would be reduced from an estimated 6,247 feet (without mitigation) to 3,585 feet with mitigation, which is less than the applicable 4,065-foot storage. Thus, storage would be adequate with mitigation.
- The surface street improvements and traffic management strategies would result in small decreases in the maximum queue at the I-405 northbound and southbound off-ramps at West Century Boulevard. However, the northbound off-ramp and the more southerly southbound off-ramp (south of West Century Boulevard) would continue to exceed the applicable storage threshold.

These mitigation measures, if implemented, would reduce two of the impacted off-ramp queues to within the available ramp storage during the weekday and weekend pre-event peak hours under concurrent Scenario 1, thereby mitigating impacts at these off-ramps to less than significant. However, the maximum queue at the I-405 northbound off-ramp onto West Century Boulevard and at the I-405 southbound off-ramp onto La Cienega (south of West Century Boulevard) would continue to exceed the applicable storage

threshold. Since the improvements involve another jurisdiction in addition to the City of Inglewood, however, their implementation cannot be guaranteed and the impacts are considered to be **significant and unavoidable**.

The queue impacts on the off-ramps under the other concurrent event scenarios and the freeway segment impacts are considered **significant and unavoidable**.

Impact 3.14-30: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions. (Significant and Unavoidable)

The project vehicular traffic has the potential to affect on-time performance for buses operating in the study area because of congestion associated with event arrival and departure traffic under conditions with a major event at The Forum or the NFL Stadium. This adverse impact to bus operations is considered **significant**.

The draft Transportation Management and Operations Plan for the Inglewood Sports & Entertainment District³⁴ states that Metro is proposing to run special event service for large events at the Stadium, serving the Hawthorne/Lennox and Crenshaw Stations on the Green Line and the Downtown Inglewood Station on the Crenshaw/LAX line, and that shuttle bus service would be provided between the Inglewood Intermodal Transit Facility adjacent to the NFL Stadium and the light rail stations.

Project-related vehicular traffic is not expected to affect Green Line and Crenshaw/LAX Transit Corridor run time, as the Green Line is fully grade separated, and the Crenshaw/LAX Transit Corridor is grade separated at most major arterial crossings. However, increased ridership generated by concurrent project events and events at The Forum or the NFL Stadium will increase station dwell time at the Downtown Inglewood and Hawthorne/Lennox Stations, compared with non-event conditions. As there would be no other impacts to run time, this extra station dwell time should be able to be made up along the routes, and therefore no adverse impact to rail transit operations is expected for either line. Consistent with OPR guidance, an increase in transit demand is not considered an impact for CEQA purposes. This impact is considered to be **less than significant**.

As discussed previously, a concurrent event scenario when there is an overlapping event at the NFL Stadium would result in all parking in the NFL Stadium lots being fully utilized by NFL Stadium event attendees and employees. Thus, the major event at the Proposed Project would require between 3,100 and 3,500 vehicles related to the NBA game or concert at the Proposed Project that would have otherwise parked at stadium parking facilities within the HPSP site to be parked in various other off-site remote locations when there is an overlapping event at the NFL Stadium. Under such a scenario, about 3,500 vehicles and 7,600 attendees would have otherwise

³⁴ City of Inglewood, Public Works Department, *Inglewood Sports & Entertainment District, Transportation Management and Operations Plan*, July 2019 draft.

parked in stadium parking lots at the HPSP site, but would instead park at various remote locations and be transported to/from the Proposed Arena via shuttle bus. At an average capacity of 45 persons per bus, this would equate to about 170 busloads required in each direction of travel. Several loading zones may be considered to accommodate this level of bus loading demand including the South Prairie Avenue project frontage, East Transportation Hub, and a four-acre transit center within Hollywood Park Specific Plan. While the majority of bus loadings would be expected to occur at the above locations, it may also be necessary to load attendees from the Proposed Project internal access road as well as portions of Doty Avenue. Because details of how bus route/loadings/pedestrian staging during these types of concurrent events are not known, this impact is considered **significant**.

The following mitigation measures have been identified that could reduce the impacts regarding adequate access to transit.

Mitigation Measure 3.14-30(a)

The project applicant shall implement Mitigation Measures 3.14-2(a) (Event Transportation Management Plan), 3.14-2(b) (Transportation Demand Management Program), and the intersection improvements in Mitigation Measures 3.14-2 and 3.14-3.

Mitigation Measure 3.14-30(b)

The project applicant shall implement Mitigation Measures 3.14-11(b) to lengthen the proposed shuttle pull-out.

Mitigation Measure 3.14-30(c)

The project applicant shall coordinate with the City and NFL Stadium operator prior to concurrent events to develop a mutually acceptable strategy for accommodating shuttle buses that would transport Project Major Event attendees to/from remote parking locations.

Level of Significance After Mitigation: Mitigation Measure 3.14-30(b) would provide additional load/unload area for shuttles and would also allow for the lane to serve as a bus queue jumper (operated by traffic control officers) at the South Prairie Avenue/West Century Boulevard intersection during the pre-event and post-event period. Moreover, implementation of the Event TMP would require that the Proposed Project to provide sufficient shuttles to ensure that there is successful and convenient connectivity with short wait times to light rail stations such that peak wait times before or after major events does not exceed 15 minutes. As such, implementation of Mitigation Measures 3.14-30(a) and 3.14-30(b) would reduce transit impacts associated with attendees using shuttles to access light rail under a concurrent event scenario.

Mitigation Measure 3.14-30(c) requires coordination with the City and the NFL Stadium operator to develop a strategy for accommodating the shuttle buses required to transport Project Major Event attendees to/from remote parking locations when there is a concurrent event at the Stadium. The draft TMP does not prescribe precisely how many buses should drop-off/pick-up attendees or employees at specific locations for several reasons. First, these types of overlapping events would be rare and will include unique types of artists/attractions, which could influence event start/end times and desire for off-

site parking. Real-time planning for such conditions should occur. Second, observations of operating conditions at the NFL Stadium and IBEC will be valuable in understanding where such pick-up/drop-off locations make the most sense (e.g., where can buses most directly access curb space, where are pedestrian areas most accommodating, which areas have reduced travel times to enter/exit, etc.).

Implementation of these mitigation measures would reduce but not eliminate project impacts on traffic operational conditions; as such, the impacts on public bus operations are considered during concurrent events are considered **significant and unavoidable**. During a concurrent event with the NFL Stadium, project impacts on access to transit are considered **significant and unavoidable** because a plan has not been prepared to adequately accommodate shuttle bus loadings for each venue.

Impact 3.14-31: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under Adjusted Baseline conditions. (Significant and Unavoidable)

As documented in **Impact 3.14-28**, on the infrequent days when there would be overlapping or concurrent events at the Proposed Project, the NFL Stadium, and/or The Forum, the congestion created would result in significant delays at multiple intersections along the key major corridors accessing the Project area, including West Century Boulevard, South Prairie Avenue, Crenshaw Avenue, Manchester Boulevard, and La Brea/Hawthorne Avenue. According to Table 3.14-66, concurrent major events at the Proposed Project and The Forum would cause four freeway off-ramps along the I-405 and I-105 corridors to experience excessive levels of vehicular queuing during pre-event conditions. Recommended mitigations would be able to reduce the amount of queuing below the applicable threshold at two of those ramps, though vehicle queues would remain lengthy and cause substantial delays to off-ramp traffic at all four locations. Because this scenario would result in increased travel times to exit the freeway and reach surface streets (and since alternative routes are equally congested), the impact on emergency access with concurrent major events is considered **significant**.

Mitigation Measure 3.14-31

Implement Mitigation Measure 3.14-14 (Local Hospital Access Plan).

Level of Significance After Mitigation: The above mitigation measure would reduce travel times to access the CHMC once vehicles reach surface streets. However, the added delays motorists would experience during concurrent events while waiting to exit the freeway ramps would not be remedied by the plan.

The implementation of the above mitigation measure would reduce the significance of this impact, but not to a less-than-significant level. This impact is considered **significant and unavoidable**.

Impact 3.14-32: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under Adjusted Baseline conditions. (Significant and Unavoidable)

Temporary construction impacts of the Proposed Project on traffic, access, bus stops, and on-street parking were identified in **Impact 3.14-15**. In that section, construction impacts on traffic were determined to be **significant** in the vicinity of the South Prairie Avenue/West Century Boulevard intersection due to temporary lane closures along the Project frontage, and temporary impacts on access, bus stops and on-street parking was determined to be **less than significant**. When an event is being held at The Forum or NFL Stadium, surrounding roadways experience more traffic and congestion develops. For example, according to Table 3.14-98, an event at The Forum would result in LOS F conditions during the weekday pre-event peak hour and LOS E conditions during the weekday post-event and weekend pre-event peak hours at the South Prairie Avenue/West Century Boulevard intersection. During construction of the Proposed Project, lane closures would cause the capacity of this intersection to be reduced. This would result in greater delays at this intersection, and the potential for diversion of traffic to other routes, thereby worsening conditions along those corridors. Since lane closures along the project frontage would occur for nearly a three-year duration, the construction-related effects under concurrent event conditions would be noticeable and considered a **significant** impact.

Mitigation Measure 3.14-32

The project applicant shall implement Mitigation Measure 3.14-15, Construction Traffic Management Plan.

Level of Significance after Mitigation: As described in Mitigation Measure 3.14-15, the Construction Traffic Management Plan includes strategies for reducing the adverse effects during events at The Forum or NFL Stadium of construction-related closures of travel lanes along the project frontage. The implementation of the above mitigation measure would reduce the significance of this impact, but not to a less-than-significant level. Lane closures at the South Prairie Avenue/West Century Boulevard intersection would cause temporary, but noticeable worsening of traffic conditions throughout construction, and particularly when events are held at The Forum or NFL Stadium. This impact is considered **significant and unavoidable**.

Cumulative Project Impacts and Mitigation Measures with Other Concurrent Events

Impact 3.14-33: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under cumulative conditions. (Significant and Unavoidable)

As presented in Tables 3.14-81, 3.14-84, 3.14-87, 3.14-90, and 3.14-93, and based on the significance criteria, significant impacts were identified at intersections during Major Events at the Proposed Project, when operating concurrently with major events at The Forum and/or the

NFL Stadium. **Figures 3.14-33, 3.14-34, and 3.14-35** are study area maps displaying those intersections that would be significantly impacted during the weekday pre-event, weekday post-event, and weekend pre-event peak hours, respectively, for Scenario 1. **Figure 3.14-36** is a study area map displaying those intersections that would be significantly impacted during the weekend pre-event peak hours for Scenario 2. **Figures 3.14-37 and 3.14-38** are study area maps displaying those intersections that would be significantly impacted during the weekday pre-event and weekday post-event peak hours, respectively, for Scenario 3. **Figures 3.14-39 and 3.14-40** are study area maps displaying those intersections that would be significantly impacted during the weekday pre-event and weekday post-event peak hours, respectively, for Scenario 4. **Figure 3.14-41** is a study area map displaying those intersections that would be significantly impacted during the weekend pre-event peak hour for Scenario 5.

Intersections could also be significantly impacted under concurrent event conditions for a situation in which the Proposed Project is not hosting a daytime or major event, a football game is played at the NFL Stadium, and attendees to the football game park in one or more of the Proposed Project garages. During such conditions, the Proposed Project would not operate its Event TMP, and therefore, traffic operational concerns could arise at the garage access points, which could affect adjacent intersections.

These impacts are considered **significant**.

Mitigation Measure 3.14-33(a)

Implement Mitigation Measures 3.14-18(a) through 3.14-18(r).

Mitigation Measure 3.14-33(b)

Implement Mitigation Measure 3.14-28(b) (Additional TCO placement and temporary lane changes at select intersections).

Mitigation Measure 3.14-33(c)

Implement Mitigation Measure 3.14-28(f) (City of Inglewood shall require the NFL Stadium TMOP to incorporate special traffic management provisions to cover conditions during which attendees to an NFL football game would utilize parking within the Project garages).

Level of Significance After Mitigation: Mitigation Measures 3.14-33(a) and 3.14-33(b) requires implementation of the Event TMP and TDM program, payment into the City's ITS Program, and various physical and/or operational improvements at a variety of surface streets and freeway off-ramps significantly impacted by the Proposed Project.

Mitigation Measure 3.14-33(c) requires the City to coordinate with operators of the NFL Stadium TMOP and the Event TMP on days with concurrent events at each venue. This would allow each plan to operate more efficiently and in coordination with each other.

The combined effectiveness of the above mitigation measures is displayed on **Table 3.14-99** for Scenario 1 (with The Forum). Based on network-level microsimulation analysis, under major event conditions, the mitigations at major bottlenecks often result

in increased traffic flow at adjacent and/or downstream intersections. Improving the flow at major bottleneck locations, although desirable, can cause secondary, significant impacts. The following describes the effectiveness of the above mitigation measures during each peak hour.

Weekday Pre-Event Peak Hour

Of the 71 significant intersection impacts, the above mitigation measures would cause 16 to become **less than significant**. No intersections would experience a secondary, significant impact due to these mitigation measures. The average percent demand served at the intersections analyzed using microsimulation increased from 60 percent without mitigation 65 percent with the recommended mitigation measures in place.

Weekday Post-Event Peak Hour

Of the 53 significant intersection impacts, the above mitigation measures would cause 14 to become **less than significant**. Two intersections would experience a secondary, significant impact due to these mitigation measures. The average percent demand served at the intersections analyzed using microsimulation increased from 61 percent without mitigation to 70 percent with the recommended mitigation measures in place.

Weekend Pre-Event Peak Hour

Of the 58 significant intersection impacts, the above mitigation measures would cause eight to become **less than significant**. These mitigation measures would cause one additional intersection to become new secondary, significantly impacted location. The average percent demand served at the intersections analyzed using microsimulation increased from 72 percent without mitigation to 78 percent with the recommended mitigation measures in place.

The precise degree of effectiveness of proposed TDM strategies to shift the mode split away from driving and reduce the project's vehicular trip generation is not known. Therefore, mitigation measure testing did not explicitly account for a certain amount of reduced vehicle travel due to TDM strategies. The above list of mitigation measures would reduce vehicle travel demand, accommodate the remaining travel demand in a more efficient manner, and provide physical improvements, where feasible, to add capacity to the roadway system. None of the physical improvements described above would require additional right-of-way; however, some would require coordination with other responsible agencies. Further, there would be no assurances that these agencies would permit these improvements to be constructed. Thus, for the various reasons described here, these impacts are considered **significant and unavoidable**.

NOTES:

Shaded cells identify significant impacts.

Blank cells under the "With Mitigation" columns represent intersections that do not require mitigation and therefore LOS results are anticipated to be similar.

Intersections analyzed using HCM may show "with mitigation" LOS results despite the particular intersection not being impacted because micro-simulation analysis of mitigations reveals effects on nearby intersections.

¹ Analysis methods vary by jurisdiction (refer to previous pages for description).

² Each of the above intersections are signalized with exception of 55, 56, and 61, which feature stop-control and are located within Inglewood. They were analyzed using HCM methods. Impacts are identified when the Plus Project LOS grade is E or F and the peak hour signal warrant is met.

³ Intersection 54 becomes a side-street stop-controlled intersection under the Plus Project conditions and is analyzed using HCM methods. Although this method is not directly comparable with ICU, impacts are identified when the Plus Project LOS grade is at LOS E or F and the peak hour signal warrant is met.

*** Represents over-saturated conditions (i.e., average delay exceeds five minutes). Per the HCM, delay estimates in over-saturated conditions are unreliable.

N / A = Not applicable because intersection 115 would permit inbound right-turns only under pre-event conditions, while intersection 116 would be manually controlled with continuous flow for all movements under post-event conditions.

SOURCE: Fehr & Peers, 2019.

Impact 3.14-34: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under cumulative conditions. (Significant and Unavoidable)

Significant impacts for were identified based on the significance criteria and the results for freeway operations in Tables 3.14-82, 3.14-85, 3.14-88, 3.14-91, and 3.14-94 and in Tables 3.14-83, 3.14-86, 3.14-89, 3.14-92, and 3.14-95 for freeway ramp queuing. Major events at the Proposed Project Arena, when held concurrently with major events at the NFL Stadium and/or The Forum, would cause significant impacts on the study freeway components and off-ramps (refer to tables for specific segments and off-ramps under each scenario).

Weekday Pre-Event Hour

- 3 to 6 impacted components on I-405
- 7 to 8 impacted components on I-105
- 1 impacted component on I-110
- Project causes or contributes to queues exceeding storage at up to five off-ramps depending on the concurrent scenario

Weekday Post-Event Hour

- 2 to 3 impacted components on I-405
- 2 to 6 impacted components on I-105
- 2 to 6 impacted components on I-110

Weekend Day Pre-Event Hour

- 3 impacted components on I-405
- 2 to 7 impacted components on I-105
- 0 to 1 impacted components on I-110
- Project causes or contributes to queues exceeding storage at up to six off-ramps depending on the concurrent scenario

These freeway components and ramp queue impacts are considered **significant**.

Mitigation Measure 3.14-34(a)

Implement Mitigation Measure 3.14-3(h) (I-105 Westbound Off-ramp Widening at Crenshaw Boulevard).

Mitigation Measure 3.14-34(b)

Implement Mitigation Measure 3.14-3(c) (Restripe I-405 NB Off-Ramp at West Century Boulevard).

Mitigation Measure 3.14-34(c)

Implement Mitigation Measure 3.14-3(o) (Retime and optimize traffic signals on Inglewood streets).

Mitigation Measure 3.14-34(d)

Implement Mitigation Measure 3.14-3(g) (I-105 Off-ramp Widening at South Prairie Avenue).

Mitigation Measure 3.14-34(e)

Implement Mitigation Measure 3.14-2(a) (Implement Event TMP).

Mitigation Measure 3.14-34(f)

*Implement the trip reduction measures included in the Project Transportation Demand Management Program described in **Mitigation Measure 3.14-2(b)**.*

Mitigation Measure 3.14-34(g)

Implement Mitigation Measure 3.14-8(b) (Work with Caltrans to implement traffic management system improvements along the I-105 corridor).

Level of Significance After Mitigation: The combined effect of the above mitigation measures would be improved operations of streets in the vicinity of the Proposed Project, which would result in less overall delay and vehicle queuing. Additionally, widening and/or lane reassignments on several of the impacted off-ramps would improve their capacity and ability to store vehicles. The following describes how impacted off-ramps would be improved in concurrent Scenario 1 (with The Forum) (for the more critical weekday pre-event peak hour):

- At the I-105 Westbound off-ramp at Crenshaw Boulevard, the maximum vehicle queue would be reduced from an estimated 6,755 feet (without mitigation) to 3,926 feet with mitigation, which is less than the applicable 4,065-foot storage. Thus, storage would be adequate with mitigation.
- The surface street improvements and traffic management strategies would result in decreases in the maximum queue at the I-405 northbound and southerly southbound off-ramps at West Century Boulevard and at the I-105 westbound off-ramp to South Prairie Avenue. However, the queues on these ramps would continue to exceed the applicable storage threshold.

These mitigation measures, if implemented, would reduce one of the impacted off-ramp queues to within the available ramp storage during the weekday and weekend pre-event peak hours under concurrent Scenario 1, thereby mitigating this impact to less than significant. However, the maximum queues at the I-405 northbound off-ramp onto West Century Boulevard, at the I-405 southbound off-ramp onto La Cienega (south of West Century Boulevard), and at the I-105 off-ramp onto South Prairie Avenue would continue to exceed the applicable storage threshold. Since the improvements involve another jurisdiction in addition to the City of Inglewood, however, their implementation cannot be guaranteed and the impacts are considered to be **significant and unavoidable**.

The queue impacts on the off-ramps under the other concurrent event scenarios and the freeway segment impacts are considered **significant and unavoidable**.

Impact 3.14-35: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions. (Significant and Unavoidable)

The Proposed Project vehicular traffic has the potential to affect on-time performance for buses operating in the study area because of congestion associated with event arrival and departure traffic under cumulative conditions with a major event at The Forum or the NFL Stadium. This adverse impact to bus operations is considered **significant** and the project contribution would be considerable. Consistent with OPR guidance, an increase in transit demand is not considered an impact for CEQA purposes.

The draft Transportation Management and Operations Plan for the Inglewood Sports & Entertainment District³⁵ states that Metro is proposing to run special event service for large events at the Stadium, serving the Hawthorne/Lennox and Crenshaw Stations on the Green Line and the Downtown Inglewood Station on the Crenshaw/LAX line, and that shuttle bus service would be provided between the Inglewood Intermodal Transit Facility adjacent to the NFL Stadium and the light rail stations.

Project-related vehicular traffic would not be expected to affect Green Line and Crenshaw/LAX Transit Corridor run time, as the Green Line is fully grade separated, and the Crenshaw/LAX Transit Corridor is grade separated at most major arterial crossings. However, increased ridership generated by concurrent project events and events at The Forum or the NFL Stadium and cumulative development would increase station dwell time at the Downtown Inglewood and Hawthorne/Lennox Stations, compared with non-event conditions. As there would be no other impacts to run time, this extra station dwell time should be able to be made up along the routes, and therefore no adverse impact to rail transit operations is expected for either line. This impact is considered to be **less than significant**.

As discussed previously, a concurrent event scenario when there is an overlapping event at the NFL Stadium would result in all parking in the NFL Stadium lots being fully utilized by NFL Stadium event attendees and employees. Thus, the major event at the Proposed Project would require between 3,100 and 3,500 vehicles related to the NBA game or concert at the Proposed Project that would have otherwise parked at stadium parking facilities within the HPSP site to be parked in various other off-site remote locations when there is an overlapping event at the NFL Stadium. Under such a scenario, about 3,500 vehicles and 7,600 attendees would have otherwise parked in the stadium parking lots at the HPSP site, but would instead park at various remote

³⁵ City of Inglewood, Public Works Department, *Inglewood Sports & Entertainment District, Transportation Management and Operations Plan*, July 2019 draft.

locations and be transported to/from the Proposed Arena via shuttle bus. At an average capacity of 45 persons per bus, this would equate to about 170 busloads required in each direction of travel. Several loading zones may be considered to accommodate this level of bus loading demand including the South Prairie Avenue project frontage, East Transportation Hub, and a four-acre transit center within Hollywood Park Specific Plan. While the majority of bus loadings would be expected to occur at the above locations, it may also be necessary to load attendees from the Proposed Project internal access road as well as portions of Doty Avenue. Because details of how bus route/loadings/pedestrian staging during these types of concurrent events are not known, this impact is considered **significant**.

The following mitigation measures have been identified that could reduce the impacts regarding adequate access to transit.

Mitigation Measure 3.14-35(a)

The project applicant shall implement Mitigation Measures 3.14-2(a) (Event Transportation Management Plan), 3.14-2(b) (TDM Program), and the entirety of the intersection improvements in Mitigation Measures 3.14-2 and 3.14-3.

Mitigation Measure 3.14-35(b)

The project applicant shall implement Mitigation Measures 3.14-11(b) to lengthen the proposed shuttle pull-out.

Mitigation Measure 3.14-35(c)

The project applicant shall coordinate with the City and NFL Stadium TMOP operator prior to concurrent events to develop a mutually acceptable strategy for accommodating shuttles buses that would transport Project Major Event attendees to/from remote parking locations.

Level of Significance After Mitigation: Implementation of these mitigation measures would reduce but not eliminate project impacts on traffic operational conditions; as such, the impacts on public bus operations under a concurrent event scenario are considered **significant and unavoidable**. During a concurrent event with the NFL Stadium, project impacts on access to transit are considered **significant and unavoidable** because a plan has not been prepared to adequately accommodate shuttle bus loadings for each venue.

Impact 3.14-36: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under cumulative conditions. (Significant and Unavoidable)

As documented in **Impact 3.14-33**, on the infrequent days when there would be overlapping or concurrent events at the Proposed Project, the NFL Stadium, and/or The Forum, the congestion created under cumulative conditions with cumulative traffic growth (particularly buildout of HPSP Phase 2) would result in significant delays at multiple intersections along the key major

corridors accessing the Project area, including West Century Boulevard, South Prairie Avenue, Crenshaw Avenue, Manchester Boulevard, and La Brea/Hawthorne Avenue.

Concurrent major events at the Proposed Project and The Forum would cause up to six different freeway off-ramps along the I-405 and I-105 corridors to experience excessive levels of vehicular queuing during pre-event conditions. Because this scenario would result in increased travel times to exit the freeway and reach surface streets (and since alternative routes are equally congested), the cumulative impact on emergency access with concurrent major events is considered **significant**.

Mitigation Measure 3.14-36

Implement Mitigation Measure 3.14-14 (Local Hospital Access Plan).

Level of Significance After Mitigation: The above mitigation measure would reduce travel times to access the CHMC once vehicles reach surface streets. However, the added delays motorists would experience during concurrent events while waiting to exit the freeway ramps would not be remedied by the plan.

The implementation of the above mitigation measure would reduce the significance of this impact, but not to a less-than-significant level. This impact is considered **significant and unavoidable**.

Impact 3.14-37: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under cumulative conditions. (Significant and Unavoidable)

The cumulative context for construction impacts would be other projects in the immediate vicinity that would be constructed concurrently with the Proposed Project. As discussed in **Impact 3.14-27**, the only known related projects in the vicinity of the Proposed Project that could have construction occurring concurrently with the construction of the Proposed Project would be construction of elements of the Hollywood Park Specific Plan Phase 1 that would not be completed prior to commencement of construction of the Proposed Project and construction at the hotel renovation project at 3900 West Century Boulevard adjacent to the Project Site if it is not completed prior to commencement of construction of the Proposed Project. Cumulative construction impacts on traffic, access, bus stops, and on-street parking during major events at The Forum and/or the NFL Stadium would therefore be similar to those identified in **Impact 3.14-27** for the Proposed Project itself. In that section, construction impacts on traffic were determined to be **significant** in the vicinity of the South Prairie Avenue/West Century Boulevard intersection due to temporary but prolonged lane closures along the Project frontage, which would result in degraded operations throughout the duration of construction. The project's contribution to cumulative construction impacts would be considerable. Temporary impacts on access, bus stops and on-street parking was determined to be **less than significant**.

Mitigation Measure 3.14-37

The project applicant shall implement Mitigation Measure 3.14-15 (Construction Traffic Management Plan).

Level of Significance after Mitigation: The implementation of the above mitigation measure would reduce the significance of this impact, but not to a less-than-significant level. Lane closures at the South Prairie Avenue/West Century Boulevard intersection would cause temporary, but noticeable worsening of traffic conditions throughout construction. This impact is considered **significant and unavoidable**.

3.15 Utilities and Service Systems

This section describes and evaluates potential impacts of the Proposed Project related to utility and service systems including water supply, wastewater generation and treatment, storm drainage capacity and conveyance, and solid waste generation and landfill capacity that could result from implementation of the Proposed Project. The section contains: (1) a description of the existing environmental setting as well as a description of the Adjusted Baseline Environmental Setting for each utility and service system; (2) a summary of the federal, state, and local regulations related to the utilities and service systems; and (3) an analysis of potentially significant environmental impacts related to utilities and service systems that could result from the Proposed Project as well as identification of potentially feasible mitigation measures that could mitigate significant impacts.

Comments received in response to the NOP for the EIR regarding utilities and service systems can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to utilities and service systems that were raised in comments on the NOP are analyzed within this section.

The analysis in this section is based on Project-specific construction and operational features, data provided in the City of Inglewood General Plan, the *Sewer Area Study Inglewood Basketball and Entertainment Center* (Sewer Area Study) (Appendix L), the Golden State Water Company's (GSWC) Urban Water Management Plan (UWMP), CalRecycle's Solid Waste Information System, a Water Supply Assessment prepared for the City by Todd Groundwater (Appendix M), and the *Inglewood Basketball and Entertainment Center Low-Impact Development (LID) Report* (Appendix Q). Also refer to Section 3.9, Hydrology and Water Quality, as it relates to the analysis for storm drainage capacity and conveyance.

Water Supply

3.15.1 Environmental Setting

Regional and Local Setting

Water Sources and Supplies

Water for drinking, irrigation, and other municipal and industrial purposes is supplied to areas within the City of Inglewood within three distinct water service areas. The City of Inglewood serves water to the largest area of the City, GSWC serves water to the southern portion of the City, and Cal-America Water Company serves water to a small area in the northwest part of the City.

Water Suppliers

Golden State Water Company

The Project Site is located in the portion of Inglewood served by the GSWC – Southwest System. GSWC's Southwest System is located in Los Angeles County and serves the Cities of Gardena and Lawndale, parts of the cities of Carson, Compton, El Segundo, Redondo Beach, Hawthorne

and Inglewood, and portions of unincorporated parts of Los Angeles County. The service area is primarily characterized by residential, commercial, and industrial land uses.

GSWC owns 39 water systems throughout California and currently serves more than 1 million customers across the state. It serves 54,994 customers in southwest Los Angeles County.¹ GSWC infrastructure includes approximately 2,800 miles of pipe, 200 groundwater wells, 400 booster pump stations, 25,000 hydrants, and four surface-water treatment plants.

The GSWC Southwest System obtains its water supply from three sources: treated imported surface water, local groundwater via GSWC-operated groundwater wells, and recycled water.² Imported surface water is provided to GSWC through wholesalers West Basin Municipal Water District (WBMWD) and Central Basin Municipal Water District (CBMWD), which in turn obtain imported water from Metropolitan Water District of Southern California (Metropolitan). GSWC provides groundwater to this service area through GSWC-owned wells in the West Coast Groundwater Basin (WCGB) and Central Basin. In addition, recycled water is supplied to GSWC by WBMWD.

To meet the water supply needs of the Southwest System service area, GSWC draws on a variety of supply sources, each of which is generally described below. GSWC relies on a combination of groundwater and imported surface water and the percentage that each contributes to the annual total water supply varies; between 2010 and 2015 imported surface water represented approximately 42 to 77 percent of the annual delivered supply while groundwater supplies constituted from 22 to 57 percent of annual deliveries. Recycled water represents about 1 percent of annual supply deliveries and is used for landscape irrigation. **Table 3.15-1** and **Table 3.15-2** present GSWC’s recent past water supplies.

West Basin Municipal Water District

As described in its most recent UWMP, WBMWD has an approximately 185-square-mile service area and provides wholesale potable water to 17 cities through three investor-owned utilities, four municipal water departments and one county waterworks district, in southwest Los Angeles County. WBMWD supplies recycled water to over 400 customer meter connections for municipal, commercial and industrial use as well as for injection into the West Coast Basin Seawater Barrier to halt seawater intrusion and replenish the WCGB aquifers.³

WBMWD has been able to support the diversification of supplies available to its customer agencies by providing access to imported water supplies from Metropolitan as well as through the development of recycled water supplies. These supplies are served directly to its customer agencies and indirectly as the replenishment supplies necessary to maintain groundwater production. WBMWD is projected to increase current recycled water supplies as well as invest in over 20,000 acre-feet per year (AFY) of ocean water desalination supply. In combination with additional conserved supply through water use efficiency programs, imported water use is expected to be reduced significantly by 2040, just over 50 percent now to less than 40 percent, as a percentage of WBMWD’s overall annual supply deliveries.

Central Basin Municipal Water District

CBMWD was established in 1952 to provide access to imported water as an alternative to groundwater. CBMWD joined Metropolitan in 1954 to purchase, on a wholesale level, imported potable water for resale to cities, mutual water companies, investor-owned utilities, water districts and private water companies in the region. In addition, CBMWD supplies recycled water to the region for municipal, commercial and industrial use. With a diversified portfolio of water supplies (groundwater, imported and recycled water), CBMWD is able to serve its customer agencies and help protect the Central Groundwater Basin from overdraft conditions. Central

³ West Basin Municipal Water District, 2016. *2015 Urban Water Management Plan*. p. 2-1.

Basin's service area is approximately 227 square miles and includes 24 cities and several unincorporated areas in southeast Los Angeles County.⁴

CBMWD has provided its retail agencies with supplemental supplies to reliably meet their demands. With diversification a key to a reliable future water supply, CBMWD has been able to support the diversification of supplies available to its customer agencies by providing access to imported water supplies from Metropolitan as well as through the development of recycled water supplies. These supplies are served directly to its retail agencies and indirectly as the replenishment supplies necessary to maintain groundwater production. Diversification of water resources is expected to continue over the next 25 years with recycled water system expansions along with increased conservation efforts including groundwater storage opportunities. CBMWD's dependence on imported sources is expected to continue to decrease with the expansion of these alternative sources.⁵

Metropolitan Water District of Southern California

Metropolitan is a public agency formed by a legislative act in 1928 to form a regional water cooperative "for the purpose of developing, storing, and distributing water" to the rapidly urbanizing areas of Southern California.⁶ As a wholesaler, Metropolitan has no retail customers, and distributes treated and untreated water directly to its 26 member agencies, including the City. Some member agencies, provide retail water service, while others provide water to the local area as wholesalers; some member agencies provide water both as a retailer and a wholesaler. These member agencies and sub agencies provide water for nearly 19 million people across six Southern California counties. Metropolitan is governed by a 38-member Board of Directors made up of representatives from each of Metropolitan's member agencies.

Metropolitan's service area encompasses the Southern California coastal plain and covers nearly 5,200 square miles, including portions of Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties. Notably, Metropolitan's service area contains only 13 percent of the land area of those counties but nearly 90 percent of the county populations. Metropolitan provides 45 to 60 percent of all municipal, industrial, and agricultural water used in its service area.

Water Sources

Imported Surface Water

Metropolitan draws imported water supplies from the Colorado River through the Colorado River Aqueduct (CRA), which it owns and operates; from Northern California via its participation in the State Water Project (SWP); and also from storage facilities and agreements, water system programs, and transfer arrangements. Imported water from the CRA and SWP is treated prior to distribution to its 26 member agencies.

⁴ Central Basin Municipal Water District, 2016. *2015 Urban Water Management Plan*. p. 1-7.

⁵ Central Basin Municipal Water District, 2016. *2015 Urban Water Management Plan*. p. 3-1.

⁶ Metropolitan Water District of Southern California, 2016. *Integrated Resources Plan, 2015 Update* p. ES-VI, 2005. *Regional Urban Water Management Plan*, p. I-3.

CBMWD and WBMWD are two of Metropolitan's member agencies. They are large wholesale purveyors of water in the central and west portions of Los Angeles County that purchase imported surface water supply from Metropolitan and retail this water to their respective retail agencies. Imported surface water is delivered through purchase order agreements. Long-term purchase order agreements are contract vehicles that establish water supply terms and conditions between Metropolitan and its member agencies. Purchase orders⁷ are voluntary agreements that establish both an obligation to purchase a minimum quantity of imported water over a 10-year term, also known as a Purchase Commitment, and an annual limit that allows the member agency to purchase water at the lower Tier 1 rate (Tier 1 Maximum) while encouraging local supply development.

Prior to 2014, GSWC and other retail agencies entered into 10-year purchase agreements with both wholesale agencies. GSWC had 5-year purchase agreements with WBMWD and CBMWD that were effective January 1, 2008, through December 31, 2012. The purchase agreements were extended an additional two years to December 31, 2014. The purchase agreements were both based on a two-tier rate structure: Tier 1 for quantities purchased within the Tier 1 allocation and Tier 2 for supply purchases in excess of the Tier 1 quantity. In November 2014, Metropolitan approved a new 10-year purchase order that provides a framework for individual Purchase Agreements between the member agencies and their water retailers.⁸ Effective January 1, 2015, both CBMWD and WBMWD entered into new 10-year purchase agreements with Metropolitan that run through December 31, 2024. For the first 5 years of the new purchase agreement terms, WBMWD staff recommended against entering into new purchase agreements with its customer agencies including GSWC.

During the term of the original Purchase Order with Metropolitan, WBMWD executed "Purchase Agreements" with each of the retail water agencies to protect against the potential financial risk to WBMWD of purchasing imported water at the higher Tier 2 rate. Instead of encumbering its member agencies with another 10-year agreement, WBMWD offered consecutive 5 year agreements with its retail agencies. In the previous contractual terms, WBMWD met its Purchase Commitment with Metropolitan and did not exceed its Tier 1 maximum in any year of the original Purchase Order. As a result of not exceeding its Tier 1 maximum in any year, for the first five years of the new Purchase Order term, WBMWD staff recommends not entering into agreements with its retail agencies.

WBMWD staff determined its Purchase Commitment with Metropolitan is attainable given the flexible terms that allows the commitment to be met cumulatively by the end of the Purchase Order term (over 10 years), and that allow an appeal for the unmet commitment that could result from local resource production such as recycled water brought on-line after 2015. With this

⁷ The Purchase Order establishes contractual conditions between Metropolitan and its 26 member agencies. The Purchase Order provides a framework for individual Purchase Agreements between the member agencies and their water retailers.

⁸ Imported Water Purchase Order Agreement, December 2014, WBMWD Agenda Item 22.

determination, WBMWD staff concluded that there was no reasonable risk of WBMWD exceeding the Tier 1 Maximum during the term of the Purchase Order. WBMWD staff therefore concluded that the administrative burden of executing and administering agreements with every customer agency was no longer justified.⁹ However, at the 5-year mark, WBMWD staff will reevaluate the need to have purchase order agreements with the retail agencies with which it contracts. As noted in WBMWD Resolution 22 on December 16, 2014, this change was not unusual as several other Metropolitan member agencies did not have purchase order agreements with their retail agencies during the previous 12-year period. CBMWD also did not enter into purchased water agreements with its retail agencies but instead staff recommended a Tier 1 budget for each agency establishing annual Tier 1 water purchase limits. These limits are shared by all of GSWC's systems served by CBMWD.

GSWC purchases treated surface water purchased from WBMWD and CBMWD. GSWC takes delivery of imported surface water through thirteen water connections: two with CBMWD for maximum supply of 18,057 AFY and eleven with WBMWD for a maximum supply of 76,020 AFY. Combined, these connections have a total delivery capacity of 83,304 AFY.¹⁰

Groundwater

Regional

Groundwater sources account for about 90 percent of the local water supplies, which are found in many basins throughout the Southern California region and provide an annual average total production of about 1.35 million AFY. Groundwater within the underlying water-bearing units comes from natural recharge from the percolation of rainfall and stream runoff and active recharge from spreading and injection of captured stormwater, recycled water, and imported water. In certain major drainage areas, runoff is retained in flood control reservoirs and released into spreading basins for percolation into the ground. In Los Angeles County, many groundwater recharge facilities located along the upper reaches of the Los Angeles River and San Gabriel River systems provide recharge to San Fernando, Raymond, Main San Gabriel, Central, and West Coast groundwater basins.¹¹

Almost all major groundwater basins in Southern California are either adjudicated or managed by special districts or agencies. Over 90 percent of the groundwater used in Metropolitan's service area is produced from adjudicated or managed groundwater basins. Adjudicated basins in the region include: Raymond Basin, Upper Los Angeles River Area basins (which include San Fernando, Sylmar, Verdugo, and Eagle Rock Basins), Main San Gabriel Basin, Central Basin, West Coast Basin, Six Basins, Chino Basin, and Cucamonga Basin.¹²

Central Groundwater Basin. The Central Basin underlies approximately 277 square miles in the southeastern part of the of the Los Angeles Coastal Plain. The Central Basin is bounded on the north by the Hollywood Basin and the Elysian, Repetto, Merced, and Puente Hills; to the east by the

⁹ Imported Water Purchase Order Agreement, December 2014, WBMWD Agenda Item 22.

¹¹ Metropolitan Water District of Southern California, 2016. *2015 Urban Water Management Plan* p. A.2-4.

¹² Metropolitan Water District of Southern California, 2016. *2015 Urban Water Management Plan* p. A.2-4.

Los Angeles County/Orange County line; and to the south and west by the Newport-Inglewood Uplift, a series of discontinuous faults and folds that form a prominent line of northwest-trending hills including the Baldwin Hills, Dominguez Hills, and Signal Hill. Twelve aquifers underlie the Central Groundwater Basin. The Central Groundwater Basin is divided into four sections—the Los Angeles Forebay, the Montebello Forebay, the Whittier Area, and the Pressure Area.^{13,14}

Central Basin storage capacity is estimated to be approximately 13.8 million AF.¹⁵ The two forebays represent areas of unconfined aquifers that allow percolation of surface water down into the deeper production aquifers to replenish the rest of the basin. The Whittier Area and Pressure Area are confined aquifer systems that receive relatively minimal recharge from surface water, but are replenished from the upgradient forebay areas or other groundwater basins.

The Montebello Forebay in the northeast corner of the basin straddles the San Gabriel River and the Rio Hondo (a tributary of the Los Angeles River) at the point where they emit from the Whittier Narrows. The Montebello Forebay lies directly downstream of the San Gabriel Valley. The Los Angeles Forebay straddles the Los Angeles River. Due to the concrete lining of the Los Angeles River and the lack of spreading facilities, only minor amounts of water are recharged into the Central Groundwater Basin through the Los Angeles River system.

The Central Groundwater Basin is adjudicated and based upon Watermaster services under two Court Judgements: The Third Amended Central Basin Judgement, managed by the Central Basin Water Rights Panel and the Long Beach Judgement, which is managed by the San Gabriel River Watermaster.

Long Beach Judgment – San Gabriel River Watermaster. Entered in 1965, the Long Beach Judgment provides an adjudication of Upper and Lower Areas on the San Gabriel River supply through Whittier Narrows and is administered by the court appointed San Gabriel River Watermaster. The water supply of the San Gabriel River System is divided at Whittier Narrows, the boundary between San Gabriel Valley upstream and Los Angeles County downstream. The area downstream from Whittier Narrows receives a quantity of water from the San Gabriel River system. This includes water exported to the Lower Area, usable surface flow and subsurface flow at Whittier Narrows. The San Gabriel River Watermaster monitors and reviews activities affecting water supply in the river system, performs operational repairs as deemed necessary and compiles data to determine usable water and make-up water. Four agencies that include the Upper San Gabriel Valley Municipal Water District, Central Basin, the City of Long Beach and the City of Compton rely on the San Gabriel River Watermaster to cover hydrologic analyses, data collection, field inspection, report calculations, conservancy and master planning.¹⁶

¹⁶ Central Basin Municipal Water District, 2016. *2015 Urban Water Management Plan*.

Third Amended Central Basin Judgement – Central Basin Water Rights Panel. The production of groundwater from the Central Groundwater Basin underwent adjudication in the early 1960s, which developed an allowable pumping allocation at 217,367 AFY. In 2014, a Third Amended Judgement was enacted, which allowed development of a Central Basin Water Rights Panel to govern issues pertaining to parties with groundwater pumping rights. The Third Amended Judgement also established the Water Replenishment District of Southern California (WRD) as the new Watermaster, which replaced the California DWR in the prior role.

West Coast Basin. The West Coast Basin covers approximately 140 square miles and is bounded on the north by the Baldwin Hills and the Ballona Escarpment (a bluff just south of Ballona Creek), on the east by the Newport-Inglewood Uplift, to the south by San Pedro Bay and the Palos Verdes Hills, and to the west by Santa Monica Bay.¹⁷

In the West Coast Basin, aquifers are generally confined and receive the majority of their natural replenishment from adjacent groundwater basins or from the Pacific Ocean (seawater intrusion). Both the Newport-Inglewood Uplift and the Charnock Fault (in the West Coast Basin) are partial barriers to groundwater flow, causing differences in water levels on opposite sides of each fault system. Groundwater flows between the West Coast and Central Basins based on the groundwater elevations on either side of the Newport-Inglewood Uplift. The storage capacity of the West Coast Basin is estimated to be approximately 6.5 million AF.

In the early 1940s, extensive over pumping of the West Coast Basin had led to critically low groundwater levels, resulting in seawater intrusion along the coast, serious overdraft, and the decline of water levels. Annual pumping prior to the adjudication of groundwater rights in the early 1960s reached levels as high as 94,100 AF. This situation precipitated an adjudication that limits the allowable extraction that could occur in any given year and assigned water rights to West Coast Basin pumpers. The adjudication for the West Coast Basin was set at 64,468.25 AFY. This amount was set higher than the natural replenishment amounts, creating an annual deficit known as the “Annual Overdraft.” In order to combat this Annual Overdraft, the WRD purchases and recharges additional water to make up for the overdraft.¹⁸

In December 2014, the Superior Court granted a motion by WRD, City of Inglewood, City of Long Beach, City of Manhattan Beach, City of Los Angeles, City of Torrance, California Water Service, GSWC and other parties to amend the West Coast Basin Judgment to establish a legal framework for the storage and extraction of stored water in the West Coast Basin. The Judgment Amendment will permit the storage of up to 120,000 AF, which is the available, safe storage capacity of that basin. The legal framework permits a groundwater pumper with adjudicated rights to store water and subsequently extract that stored water without the extraction counting against its water rights and without having to pay the Replenishment Assessment (RA). The Judgment Amendment makes possible the storage of surplus imported water in the rare instances

¹⁷ West Basin Municipal Water District, 2016. *2015 Urban Water Management Plan*.

¹⁸ West Basin Municipal Water District, 2016. *2015 Urban Water Management Plan*.

when it is available for use in the more frequent instances when it is not, further enhancing the region's water supply reliability.

Pursuant to the Judgment Amendment, WRD assumed administrative Watermaster duties from the California DWR on July 1, 2015.¹⁹

Golden State Water Company

GSWC can pump and use groundwater from both the WCGB and the Central Subbasin. CBMWD and WBMWD manage groundwater underlying their respective service areas. Retail agencies within CBMWD and WBMWD service areas own and operate their groundwater wells but are subject to groundwater extraction limits also known as Allowed Pumping Allocation (APA). These groundwater pumping limitations were established through court adjudication processes as described below.

In 1961, due to serious overdraft of the WCGB, water levels declined, groundwater was lost from storage, and seawater intruded into the groundwater basin. To remedy this problem, the courts adjudicated the basin to limit pumping, and the total WCGB adjudication was set at 64,468 AFY. The City of Inglewood's WCGB adjudicated APA is 4,449 AFY per year, and the GSWC's adjudicated annual limit is 7,502 AFY.

Similar to the WCGB, the Central Basin was adjudicated by the courts in 1965 due to over pumping and a decline in water levels. The Central Basin adjudication was originally set at 267,900 AFY, and adjusted to 217,367 AFY to impose stricter control.²⁰ The GSWC's Central Basin adjudicated annual pumping limit is 16,439 AFY.²¹

The annual groundwater pumping limit for each basin is the allotted amount for all GSWC systems, not just the Southwest System. However, the total allowable pumping allocation can be adjusted based on carryover rules and additional water can be leased from other water rights holders in the Central Basin.

The California DWR estimated groundwater for urban use in the WCGB at 51,673 AFY. Estimates of urban groundwater extraction in the Central Basin are significantly higher at 204,335 AFY. The Salt and Nutrient Management Plan for the Central Basin and West Coast Basin²² documents that average salt and nutrient concentrations in the WCGB groundwater do not meet water quality objectives of the Regional Water Quality Control Board (RWQCB) because of historical seawater intrusion. However, existing and planned implementation measures

(including the barrier projects, desalters, recharge projects and other programs) are designed to ensure that salt and nutrient levels in groundwater will achieve the objectives in the future.

GSWC operates and maintains ten groundwater well sites; two in the Central Basin and eight in the WCGB. The groundwater wells for the Southwest System in the WCGB meet all current state and federal drinking water standards; however there are impacts from manganese, hydrogen sulfide, and iron, which are treated as needed at the well-head to insure compliance with drinking water standards.²³

Regional Agencies Managing West Coast Groundwater Basin and Central Basin

As part of the adjudication process for these two groundwater basins, the WRD was created to manage, regulate, and replenish the Central Basin and WCGB. WRD along with the Los Angeles County Department of Public Works (LACDPW), and CBMWD and WBMWD, work with the water producers to ensure that the APA is available to the pumpers in both basins.

LACDPW operates and maintains the Rio Hondo and San Gabriel spreading grounds in the Montebello forebay. LACDPW diverts and recharges storm flows from the Rio Hondo and San Gabriel Rivers, highly treated wastewater from the Sanitation Districts of Los Angeles County (LACSD) (Whittier and San Jose Wastewater Reclamation Plants), and purchased water from Metropolitan (including both SWP water and Colorado River water). LACDPW, in conjunction with Orange County Water District, WRD, City of Long Beach and GSWC, operates and maintains the Alamitos Barrier Project to recharge imported water into this injection barrier, which is designed to prevent seawater intrusion into the Central Basin.

WRD collects a replenishment assessment from all groundwater producers in the Central Basin to pay for water supplies to replenish the Basin. Annually, by statute, WRD is required to determine replenishment requirements. WRD pays CBMWD for imported and recycled water for recharge into the Central Basin.

In the West Coast Basin, LACDPW operates and maintains the West Coast Barrier Project and the Dominguez Gap Barrier Project. Both of these projects involve monitoring groundwater levels at the coast line, and injecting groundwater as necessary to establish a groundwater “barrier” to prevent seawater intrusion. LACDPW injects a combination of equal parts of highly treated wastewater from the WBMWD’s water recycling plant located in El Segundo and imported water from Metropolitan (including both SWP water and Colorado River water).

WBMWD is expanding the West Basin recycled water plant to allow up to 100 percent recycled water injection into the West Coast Basin Barrier Project. LACDPW injects imported water from Metropolitan (including both SWP water and Colorado River water) into the Dominguez Gap Barrier Project. The project currently is permitted for up to 6 million gallons per day (MGD) of recycled

²³ Golden State Water Company, 2016. *2015 Urban Water Management Plan – Southwest*. p. 6-5.

water to be injected into the barrier with a 50 percent blend with potable water over a 60-month running average. Plans are underway to increase the permitted amount to 100 percent by 2018.

WRD collects a replenishment assessment from all groundwater producers in the Basin to pay for water supplies to replenish the Basin. The Basin is replenished by injecting water to establish and maintain the groundwater barriers described above. WRD determines replenishment requirements annually. WRD pays WBMWD for imported and recycled water for recharge into the West Coast Basin.

Recycled Water (Non-Potable)

The GSWC purchases non-potable recycled water from WBMWD.²⁴ WBMWD acquires, controls, distributes, and sells recycled water to several cities, agencies, and customers in the greater Los Angeles area. The GSWC Southwest System currently receives recycled water from WBMWD as part of the District's West Basin Recycled Water Project. The West Basin Recycled Water Project collects secondary effluent from the Hyperion Waste Water Treatment Plant and treats it to meet Title 22 recycled water standards at WBMWD's West Basin Water Recycling Facility in El Segundo, California. The recycled water purchased is used throughout the region for beneficial uses such as landscape irrigation, industrial applications (including cooling water and boiler feeder water), and other purposes such as groundwater injections to control seawater intrusion. GSWC is pursuing opportunities to increase its use of recycled water as part of its overall water supply portfolio.

Existing Water Demand

Golden State Water Company Southwest System Service Area

Existing water demand within GSWC's Southwest System service area is primarily for residential uses (both single-family and multi-family), which makes up 60 to 70 percent of the total annual demand, but also includes commercial, industrial, institutional/governmental, irrigation, agricultural uses and more.²⁵ During preparation of its current 2015 UWMP, GSWC analyzed water use within the Southwest System service area since 1994 to assess historical water usage trends. Connection and water sales data were grouped into eight DWR use categories as shown in **Table 3.15-3**.

GSWC considers the period of 2008 through 2013 to be representative of the Southwest System's average water demand pattern as GSWC implemented tiered rates beginning in 2008. Water use for recent years 2014-2015 is considered atypical because it reflects mandatory conservation imposed by the Governor's drought emergency declarations. Water use began to decline in the service area in 2007 leading to a decline of approximately 19 percent from 2008 to 2015, from a high of approximately 38,500 AFY to a low of approximately 27,000 AFY. As noted in GSWC UWMP (p. 4-3), "the recent decline in water use is not fully understood, but may be the result of several factors including implementation of tiered water rates, changes in plumbing codes, the economic downturn beginning in 2008 and the statewide drought that extended from 2012 to 2016."

²⁴ Golden State Water Company, 2016. *2015 Urban Water Management Plan – Southwest*. p. 6-12.

²⁵ Golden State Water Company, 2016. *2015 Urban Water Management Plan – Southwest*. p. 4-2 through 4-5.

**TABLE 3.15-3
 DEMANDS FOR POTABLE AND RAW WATER WITHIN GSWC SOUTHWEST SYSTEM BY USE CATEGORY**

Use Type	2015 Actual	
	Level of Treatment When Delivered	Volume (AFY)
Single Family	Drinking Water	9,027
Multi-Family	Drinking Water	8,784
Commercial	Drinking Water	4,133
Industrial	Drinking Water	1,770
Institutional/Governmental	Drinking Water	904
Landscape	Drinking Water	672
Agricultural irrigation	Drinking Water	378
Other	Drinking Water	10
Losses	Drinking Water	1,262
Total		26,940

NOTES:

1. Potable demands only. Raw water is not used within the Southwest System.
2. 2015 losses are preliminary and estimated as the volume of potable water entering the distribution system minus metered uses.

SOURCE: Golden State Water Company, *Final Report, 2015 Urban Water Management Plan – Southwest*, Table 4-1, p. 4-2.

As shown in **Table 3.15-4**, total water supply delivered to customers in 2010 was 28,013 AFY and in 2015 was slightly less at 27,333 AFY (Appendix M, Table 6). The largest reductions in water use between 2010 and 2015, as a percent, occurred in the single-family residential and landscape irrigation customer type categories. GSWC projected a slight increase in potable water demand for 2017 through 2019 to 29,823 AFY, as reported in its report filing to the State Water Resources Control Board (SWRCB) in June 2016 to comply with emergency conservation regulations.²⁶

Project Site

Under existing conditions, the Project Site includes eight parcels currently occupied by various uses including a fast-food restaurant, a hotel, warehouse and light manufacturing facilities. Actual water usage for these parcels was not available from GSWC, but water use was estimated by Stetson Engineers to be approximately 7.6 AFY.²⁷ The estimate was based on water use records of similar establishments in the City of Lakewood, City of Inglewood, and City of Long Beach.

²⁶ From GSWC website under Drought Tab: On June 22, 2016, Golden State Water submitted its self-certification data on local water supply, anticipated demand and conservation strategies to the SWRCB to comply with the revised emergency regulations that were issued by the State on May 18, 2016. This data considers a three-dry-year scenario based on hydrology of the 2012-13, 2013-14 and 2014-15 water years and demand from 2013-14.

²⁷ Stetson Engineers, 2019. Review of Water Demands Memo.

**TABLE 3.15-4
 HISTORICAL WATER DEMAND BY WATER USE SECTORS (AFY)**

Customer Type	Actual Water Demand (AFY)	
	2010	2015
Single-Family Residential	10,422	9,027
Multi-Family Residential	9,367	8,784
Commercial	4,425	4,133
Industrial	1,921	1,770
Institutional/Governmental	873	904
Landscape Irrigation	755	672
Agricultural	4	378
Other	27	10
Losses	— ^a	1,262
Total Potable Demand	27,794	26,940
Recycled Water Demand	219	393
TOTAL WATER CONSUMPTION	28,013	27,333

NOTE:

Existing Water Infrastructure

Golden State Water Company Southwest System Service Area

GSWC operates and maintains ten active groundwater well sites; two in the Central Basin and eight in the WCGB. These wells serve multiple GSWC service areas including the Southwest System. Imported water supplied to GSWC from Metropolitan is delivered through two connections with CBMWD and eleven connections with WBMWD and finally to GSWC’s conveyance system for distribution within its Southwest System. The Southwest System service area is comprised of four pressure zones – the Lawndale-Gardena 250 Hydraulic Grade Line (HGL) Gradient, the Dominguez 310 HGL Gradient, the Belhaven 310 HGL Gradient, and the Athens-Normandie 350 HGL Gradient. The Proposed Project location is located within Southwest System’s largest Lawndale-Gardena 250 HGL Gradient service area. Lawndale-Gardena 250 HGL Gradient has redundant water supply sources and capacity through multiple Metropolitan connections and GSWC’s water supply wells.

Metropolitan

Metropolitan operates and maintains five water treatment facilities: the F.E Weymouth Treatment Plant in La Verne; the Robert B. Diemer (Diemer) Treatment Plant in Yorba Linda; the Joseph Jensen (Jensen) Treatment Plant in the northwest end of San Fernando Valley; the Henry J. Mills Treatment Plant in the City of Riverside and the Robert A. Skinner Treatment Plant near Hemet. Metropolitan treats imported water at each of these water treatment plants prior to transmission

and distribution to its member agencies throughout the Los Angeles basin, Orange County, and San Diego County. CBMWD, and WBMWD receive treated water from either the Diemer Treatment Plant or the F.E Weymouth Treatment Plant.

The Diemer Filtration Plant has an operating capacity of 550 MGD and at times delivers up to 400 MGD,²⁸ while the F.E Weymouth Filtration Plant currently has an operating capacity of 520 MGD.²⁹ The 10-year average (2009–2018) daily treatment flow at Diemer Treatment Plant is 220 MGD, while daily treatment flow at F.E. Weymouth is 205 MGD.³⁰

Project Site

Arena Site

The Arena Site is the central part of the Project Site that would include the Arena, public plaza, outdoor stage, community space, practice facility, retail/restaurants, employee access pavilion, and a parking structure. The Arena Site currently includes a fast food restaurant, motel, a warehouse and light manufacturing facility, a commercial catering business, a City groundwater well, and vacant commercial uses. Existing water lines are located within West Century Boulevard north of the Arena Site, and include 8-inch-, 36-inch-, and 54-inch-diameter lines. South Prairie Avenue includes an 8-inch-diameter water line and a 36-inch-diameter reclaimed water pipeline. West 102nd Street bisects the Arena Site in an east–west direction, and includes a 6-inch- and 27-inch-diameter water line.

West Parking Garage Site

The West Parking Garage Site is part of the Project Site west of the Arena Site. The West Parking Garage Site is currently vacant, with West 101st Street bisecting the site in an east–west direction. This portion of the Project Site includes an 8-inch-diameter water line within West 101st Street and a 27-inch-diameter water line within West 102nd Street. This portion of the Project Site also utilizes the abovementioned 8-inch-, 36-inch-, and 54-inch-diameter water line within West Century Boulevard.

East Transportation and Hotel Site

The East Transportation and Hotel Site is an element of the Project Site that is located east of the Arena Site and would include a hotel and parking structure and transportation hub. The East Transportation and Hotel Site is currently vacant. An existing water line is located within South Doty Avenue. In addition, West 102nd Street includes 27-inch- and 6-inch-diameter water lines. This portion of the Project Site also is proximate to the abovementioned 8-inch, 36-inch, and 54-inch-diameter water lines within West Century Boulevard.

³⁰ Metropolitan Water District of Southern California, 10-year average daily treatment flow. Pers. Comm. Media Relations, July 31, 2019.

Well Relocation Site

The Well Relocation Site is located east of the Arena Site and would contain a city-owned and operated potable water well. The Well Relocation Site is currently vacant. This portion of the Project Site is adjacent to a 6-inch- and a 27-inch-diameter water line within West 102nd Street.

3.15.2 Adjusted Baseline Environmental Setting

Section 3.15, Utilities and Service Systems assumes the Adjusted Baseline Environmental Setting as discussed in Section 3.0, Introduction to the Analysis. Accordingly, the changes to water supply associated with these developments within the Hollywood Park Specific Plan (HPSP) area are considered as part of the Adjusted Baseline.

3.15.3 Regulatory Setting

Federal

Clean Water Act

The federal Clean Water Act (CWA) establishes regulatory requirements for potable water supplies including raw treated water quality criteria. The United States Environmental Protection Agency (US EPA) established primary drinking water standards in CWA section 304. States are required to ensure that potable water retailed to the public meets these standards. Standards for a total of 81 individual constituents have been established under the federal Safe Drinking Water Act (SDWA), as amended in 1985, described further below. The US EPA may add additional constituents in the future.

The GSWC is required to monitor water quality and conform to the regulatory requirements of the CWA.

Safe Drinking Water Act

Enacted in 1974 and implemented by the US EPA, the federal SDWA imposes water quality and infrastructure standards for potable water delivery systems nationwide. The primary standards are health-based thresholds established for numerous toxic substances. Secondary standards are recommended thresholds for taste and mineral content.

State

State Drinking Water Act

The 2014 transfer of the California Department of Public Health Drinking Water Program (DWP) to the SWRCB brought with it not only the primary enforcement authority to enforce federal and state SDFAs, and the regulatory oversight of ~8,000 public water systems throughout California, but also the responsibility for completing the next Safe Drinking Water Plan.

With the transfer of DWP to the SWRCB, while the role and responsibility remained unchanged, the name was changed to the Division of Drinking Water (DDW). DDW has been granted primary enforcement responsibility for the federal SDWA. California enacted its own SDWA.

The DDW is responsible for implementing the federal SDWA and its updates, as well as California statutes and regulations related to drinking water. As part of their efforts, the DDW inspects and provides regulatory oversight for public water systems within California. The RWQCB also has the responsibility for protecting the beneficial uses of the state's waters, including groundwater, and these include municipal drinking water supply, as well as various other uses.

California Administrative Code Title 22 establishes DDW authority and stipulates drinking water quality and monitoring standards. These standards are equal to, or more stringent than, the federal standards. Public water system operators are required to monitor their drinking water sources regularly for microbiological, chemical, and radiological contaminants to show that drinking water supplies meet the regulatory requirements listed in California Code of Regulations (CCR) Title 22 as primary maximum contaminant levels.

Recycled Water Policy (Policy for Water Quality Control for Recycled Water)

The Recycled Water Policy was first adopted in 2009, and then subsequently amended in 2013 and 2018. The purpose of the Recycled Water Policy is to increase the use of recycled water from municipal wastewater sources that meets the definition in California Water Code (CWC) section 13050(n), in a manner that implements federal and state water quality laws. More specifically, recycled water is the reuse of treated wastewater derived from municipal sources (i.e., water that is covered under CCR Title 22, Water Recycling Criteria). The Recycled Water Policy provides goals for recycled water use in California, guidance for use of recycled water that considers protection of water quality, criteria for streamlined permitting of recycled water projects, and requirements for monitoring recycled water for constituents of emerging concern (CECs).

The 2018 amendment codified the following:

- (1) Removes statewide recycled water mandates;
- (2) Sets narrative goals for the production and use of recycled water;
- (3) Establishes treated wastewater and recycled water reporting requirements statewide;
- (4) Clarifies the process for recycled water project proponents to comply with CWC section 1211 for wastewater change petitions;
- (5) Updates requirements for salt and nutrient management planning;
- (6) Improves consistency in permitting of recycled water projects by encouraging the use of statewide water reclamation requirements for non-potable recycled water use, removing streamlined permitting criteria for landscape irrigation recycled water projects, and adding permitting guidance for reservoir augmentation projects, updates monitoring requirements for CECs in recycled water used for groundwater recharge and reservoir water augmentation; and
- (7) Incorporates other substantive and non-substantive changes.

Title 22

The CWC requires the DDW to establish water reclamation criteria. In 1975, the DDW prepared Title 22 regulations to satisfy this requirement. Title 22 regulates production and use of reclaimed water in California by establishing three categories of reclaimed water: primary effluent, secondary effluent and tertiary effluent. Primary effluent typically includes grit removal and initial sedimentation or settling tanks. Secondary effluent is adequately disinfected, oxidized effluent, which typically involves aeration and additional settling basins. Tertiary effluent is adequately disinfected, oxidized, coagulated, clarified, filtered effluent which typically involves filtration and chlorination. In addition to defining reclaimed water uses, Title 22 also defines requirements for sampling and analysis of effluent and specifies design requirements for treatment facilities.

Water Conservation Projects Act

California's requirements for water conservation are codified in the Water Conservation Projects Act of 1985 (CWC sections 11950–11954), as reflected below:

11952 (a). It is the intent of the Legislature in enacting this chapter to encourage local agencies and private enterprise to implement potential water conservation and reclamation project.

Water Supply Assessments (CWC Sections 10910 through 10915)

Senate Bill (SB) 610 was adopted in 2001 and reflects the State's awareness of the need to incorporate water supply and demand analysis at the earliest possible stage in the land use planning process. SB 610 amended the statutes of the Urban Water Management Planning Act, as well as the CWC section 10910 et seq.

Water supply planning under CWC sections 10910–10915 requires reviewing and identifying adequate available water supplies necessary to meet the demand generated by a project, as well as the cumulative demand for the general region over the next 20 years, under a range of water conditions including normal, single-dry-, and multiple-dry-year conditions. This information is typically found in the current water supplier's UWMP. SB 610 requires the identification of the public water supplier. Under SB 610, a WSA need only be prepared if a project exceeds thresholds of development identified, thereby relieving projects of less significance from the requirements of the bill. Although it is unclear whether the Proposed Project is required to prepare a WSA pursuant to CWC section 10912,³¹ a WSA was prepared by Todd Groundwater for the Proposed Project and is included as Appendix M in this Draft EIR.

³¹ CWC section 10912 does not specifically identify an arena or sports and entertainment venue as a use for which a WSA is required. Sections 10912(a)(2, 3, and 5) refer to industrial, retail, or office projects that employ more than 1,000 people. The Proposed Project is not exclusively one of those uses, and only employs more than 1,000 persons when considering the event-related employment which are not full time jobs. Section 10912(a)(7) requires a WSA for "a project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project." Based on an estimated 127 gpd identified in the 2015 GSWC UWMP, a 500 dwelling unit project would generate a demand for approximately 211 AFY, more than double the estimated demand for the Proposed Project.

Urban Water Management Planning Act

The California Urban Water Management Planning Act was established in 1983, which recognizes that the waters of the state are a limited and renewable resource, and that planning and implementation of water management programs can best be accomplished at the local level. One of the Act's primary goals is to encourage urban water suppliers to develop long range plans in an effort to ensure appropriate levels of reliability in their water service during normal, dry, and multiple dry years. Thus, in accordance with the Act, urban water suppliers are required to develop water management plans to actively pursue the efficient use of available supplies. Specifically, the Act requires that urban water suppliers providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 AF of water annually prepare and adopt an UWMP. In accordance with this Act, GSWC has prepared an UWMP for the Southwest System every five years since 1985, with its most recent in 2015.

Senate Bill 7 of the Seventh Extraordinary Session of 2009

SB 1 (or SBX7 1) from the Extraordinary Legislative Session of the fall of 2009 established a statutory framework intended to achieve the co-equal goals of providing a more reliable water supply to California and restoring and enhancing the Sacramento-San Joaquin River Delta ecosystem. The co-equal goals will be achieved in a manner that protects the unique cultural, recreational, natural resource, and agricultural values of the Delta. Specifically, SB 1:

- Created the Delta Stewardship Council, consisting of seven members with diverse expertise providing a broad statewide perspective. The Chairperson of the Delta Protection Commission (DPC) is a permanent member of the Council. The Council was also tasked with:
 - a. Developing a Delta Plan to guide state and local actions in the Delta in a manner that furthers the co-equal goals of Delta restoration and water supply reliability
 - b. Developing performance measures for the assessment and tracking of progress and changes to the health of the Delta ecosystem, fisheries, and water supply reliability
 - c. Determining if a state or local agency's project in the Delta is consistent with the Delta Plan and the co-equal goals, and acting as the appellate body in the event of a claim that such a project is inconsistent with the goals
 - d. Determining the consistency of the Bay-Delta Conservation Plan (BDCP) with the co-equal goals
- Ensured that the Department of Fish and Wildlife and the SWRCB identify the water supply needs of the Delta estuary for use in determining the appropriate water diversion amounts associated with BDCP
 - a. Establishes the Sacramento-San Joaquin Delta Conservancy to implement ecosystem restoration activities within the Delta. In addition to the restoration duties the Conservancy is required to:
 - b. Adopt a strategic plan for implementation of the Conservancy goals
 - c. Promote economic vitality in the Delta through increased tourism and the promotion of Delta legacy communities

- d. Promote environmental education about, and the public use of, public lands in the Delta
- e. Assist in the preservation, conservation, and restoration of the region's agricultural, cultural, historic, and living resources
- Restructured the current DPC, reducing the membership from 23 to 15 members, and tasks DPC with the duties of:
 - a. Adopting an economic sustainability plan for the Delta, which is to include flood protection recommendations to state and local agencies
 - b. Submitting the economic sustainability plan to the Delta Stewardship Council for inclusion in the Delta Plan
- Appropriated funding from Proposition 84 to fund the Two-Gates Fish Protection Demonstration Program, a project in the central Delta, which will utilize operable gates for protection of sensitive species and management of water supply.

The following are key legislative findings from SB 1, now found in various provisions of the CWC:

85002. The Legislature finds and declares that the Sacramento–San Joaquin Delta is a critically important natural resource for California and the nation. It serves Californians concurrently as both the hub of the California water system and the most valuable estuary and wetland ecosystem on the west coast of North and South America.

85004. The Legislature finds and declares all of the following:

- (a) The economies of major regions of the state depend on the ability to use water within the Delta watershed or to import water from the Delta watershed. More than two-thirds of the residents of the state and more than 2 million acres of highly productive farmland receive water exported from the Delta watershed.
- (b) Providing a more reliable water supply for the state involves implementation of water use efficiency and conservation projects, wastewater reclamation projects, desalination, and new and improved infrastructure, including water storage and Delta conveyance facilities.

85020. The policy of the State of California is to achieve the following objectives that the Legislature declares are inherent in the coequal goals for management of the Delta:

- (a) Manage the Delta's water and environmental resources and the water resources of the state over the long term.
- (b) Protect and enhance the unique cultural, recreational, and agricultural values of the California Delta as an evolving place.
- (c) Restore the Delta ecosystem, including its fisheries and wildlife, as the heart of a healthy estuary and wetland ecosystem.
- (d) Promote statewide water conservation, water use efficiency, and sustainable water use.
- (e) Improve water quality to protect human health and the environment consistent with achieving water quality objectives in the Delta.
- (f) Improve the water conveyance system and expand statewide water storage.
- (g) Reduce risks to people, property, and state interests in the Delta by effective emergency preparedness, appropriate land uses, and investments in flood protection.

- (h) Establish a new governance structure with the authority, responsibility, accountability, scientific support, and adequate and secure funding to achieve these objectives.

The legislation also recognizes, however, that Southern California should do more going forward to make the most of regionally available water resources:

85021. The policy of the State of California is to reduce reliance on the Delta in meeting California's future water supply needs through a statewide strategy of investing in improved regional supplies, conservation, and water use efficiency. Each region that depends on water from the Delta watershed shall improve its regional self-reliance for water through investment in water use efficiency, water recycling, advanced water technologies, local and regional water supply projects, and improved regional coordination of local and regional water supply efforts.

The Water Conservation Act of 2009 (SBx7 7), amended and repealed CWC section 10631.5 to add Part 2.55 (commencing with section 10608) to CWC Division 6, and repealed and added Part 2.8 (commencing with section 10800) of CWC Division 6, relating to water. Specific text from CWC Part 2.55 for urban water suppliers as it relates to water conservation and water use efficiencies is listed below. The complete text for the Water Conservation Act of 2009 can be found at <https://water.ca.gov/LegacyFiles/wateruseefficiency/sb7/docs/SB7-7-TheLaw.pdf>.

Specifically, SBx7 7 from this Extraordinary Session requires each urban retail water supplier to develop urban water use targets to help meet the 20 percent reduction goal by 2020 (20x2020), and an interim water reduction target by 2015. Key elements of the CWC text are listed below:

It is the intent of the Legislature, by the enactment of this part, to do all of the following:

CWC Section 10608.4.

- (a) Require all water suppliers to increase the efficiency of use of this essential resource.
- (b) Establish a framework to meet the state targets for urban water conservation identified in this part and called for by the Governor.
- (c) Measure increased efficiency of urban water use on a per capita basis.
- (d) Establish a method or methods for urban retail water suppliers to determine targets for achieving increased water use efficiency by the year 2020, in accordance with the Governor's goal of a 20-percent reduction.
- (e) Establish consistent water use efficiency planning and implementation standards for urban water suppliers and agricultural water suppliers.
- (f) Promote urban water conservation standards that are consistent with the California Urban Water Conservation Council's adopted best management practices and the requirements for demand management in section 10631.
- (g) Establish standards that recognize and provide credit to water suppliers that made substantial capital investments in urban water conservation since the drought of the early 1990s.
- (h) Recognize and account for the investment of urban retail water suppliers in providing recycled water for beneficial uses.
- (i) Require implementation of specified efficient water management practices for agricultural water suppliers.

- (j) Support the economic productivity of California's agricultural, commercial, and industrial sectors.
- (k) Advance regional water resources management.

CWC Section 10608.16.

- (a) The state shall achieve a 20-percent reduction in urban per capita water use in California on or before December 31, 2020.
- (b) The state shall make incremental progress towards the state target specified in subdivision (a) by reducing urban per capita water use by at least 10 percent on or before December 31, 2015.

CWC Section 10608.20.

- (a) (1) Each urban retail water supplier shall develop urban water use targets and an interim urban water use target by July 1, 2011. Urban retail water suppliers may elect to determine and report progress toward achieving these targets on an individual or regional basis, as provided in subdivision (a) of section 10608.28, and may determine the targets on a fiscal year or calendar year basis.
- (2) It is the intent of the Legislature that the urban water use targets described in subdivision (a) cumulatively result in a 20 percent reduction from the baseline daily per capita water use by December 31, 2020.
- (b) An urban retail water supplier shall adopt one of the following methods for determining its urban water use target pursuant to subdivision (a):
 - Method 1—Eighty percent of the water supplier's baseline per capita potable water use
 - Method 2—Per capita daily water use estimated using the sum of performance standards applied to indoor residential use; landscape area water use, and commercial, industrial, and institutional uses
 - Method 3—Ninety-five percent of the applicable state hydrologic region target as stated in the state's draft 20x2020 Water Conservation Plan.
 - Method 4—Draft Provisional Target Method 4 (January 2011)

CWC Section 10608.24.

- (a) Each urban retail water supplier shall meet its interim urban water use target by December 31, 2015.
- (b) Each urban retail water supplier shall meet its urban water use target by December 31, 2020.

CWC Section 10608.28.

- (a) An urban retail water supplier may meet its urban water use target within its retail service area, or through mutual agreement, by any of the following:
 - (1) Through an urban wholesale water supplier.
 - (2) Through a regional agency authorized to plan and implement water conservation, including, but not limited to, an agency established under the Bay Area Water Supply and Conservation Agency Act (Division 31 [commencing with section 81300]).
 - (3) Through a regional water management group as defined in section 10537.

- (4) By an integrated regional water management funding area.
 - (5) By hydrologic region.
 - (6) Through other appropriate geographic scales for which computation methods have been developed by the department.
- (b) A regional water management group, with the written consent of its member agencies, may undertake any or all planning, reporting, and implementation functions under this chapter for the member agencies that consent to those activities. Any data or reports shall provide information both for the regional water management group and separately for each

Model Water Efficient Landscape Ordinance, CCR Title 23, Waters Division 2, Department of Water Resources Chapter 2.7

In 2015, Executive Order B-29-15 charged DWR with revising the 2010 MWELO to increase water efficiency standards for new and retrofitted landscapes through encouraging the use of more efficient irrigation systems, graywater usage, and on-site stormwater capture, and by limiting the portion of landscapes that can be covered in turf. The Executive Order B-29-15 also required that agencies report on their implementation and enforcement of local ordinances.

- (b) Consistent with the legislative findings, the purpose of this [Model Water Efficient Landscape Ordinance] is to:
- (1) promote the values and benefits of landscaping practices that integrate and go beyond the conservation and efficient use of water;
 - (2) establish a structure for planning, designing, installing, maintaining and managing water efficient landscapes in new construction and rehabilitated projects by encouraging the use of a watershed approach that requires cross-sector collaboration of industry, government and property owners to achieve the many benefits possible;
 - (3) establish provisions for water management practices and water waste prevention for existing landscapes;
 - (4) use water efficiently without waste by setting a Maximum Applied Water Allowance as an upper limit for water use and reduce water use to the lowest practical amount;
 - (5) promote the benefits of consistent landscape ordinances with neighboring local and regional agencies;
 - (6) encourage local agencies and water purveyors to use economic incentives that promote the efficient use of water, such as implementing a tiered-rate structure; and
 - (7) encourage local agencies to designate the necessary authority that implements and enforces the provisions of the Model Water Efficient Landscape Ordinance or its local landscape ordinance.
- (c) Landscapes that are planned, designed, installed, managed and maintained with the watershed based approach can improve California's environmental conditions and provide benefits and realize sustainability goals. Such landscapes will make the urban environment resilient in the face of climatic extremes. Consistent with the legislative findings and purpose of the Ordinance, conditions in the urban setting will be improved by:

- (1) Creating the conditions to support life in the soil by reducing compaction, incorporating organic matter that increases water retention, and promoting productive plant growth that leads to more carbon storage, oxygen production, shade, habitat and esthetic benefits.
- (2) Minimizing energy use by reducing irrigation water requirements, reducing reliance on petroleum based fertilizers and pesticides, and planting climate appropriate shade trees in urban areas.
- (3) Conserving water by capturing and reusing rainwater and graywater wherever possible and selecting climate appropriate plants that need minimal supplemental water after establishment.
- (4) Protecting air and water quality by reducing power equipment use and landfill disposal trips, selecting recycled and locally sourced materials, and using compost, mulch and efficient irrigation equipment to prevent erosion.
- (5) Protecting existing habitat and creating new habitat by choosing local native plants, climate adapted non-natives and avoiding invasive plants. Utilizing integrated pest management with least toxic methods as the first course of action.

California Green Building Standards Code, CCR Title 24, Part 11

CALGreen is California's first green building code and first in the nation state-mandated green building code. CALGreen applies to the planning, design, operation, construction, use, and occupancy of every newly-constructed building or structure. The purpose of CALGreen is to improve public health, safety, and general welfare through enhanced design and construction of buildings.

CALGreen was adopted to address the five divisions of building construction:

- Planning and design
- Energy efficiency
- Water efficiency and conservation
- Material conservation and resource efficiency
- Environmental quality

CALGreen provisions under the jurisdiction of the California Department of Housing and Community Development (HCD) are for newly constructed residential structures, as well as additions and alterations to existing buildings which increase the building's "conditioned area, interior volume or size. "CALGreen applies to the following types of residential structures:

- Hotels, motels, lodging houses
- Apartment houses, condominiums
- One- and two-family dwellings, townhouses, factory-built housing
- Dormitories, shelters for homeless persons, congregate residences, employee housing
- Other types of dwellings containing sleeping accommodations with or without common toilets or cooking facilities

These areas are required to be provided with both a potable water supply system and a recycled water supply system allowing the use of reclaimed (recycled) water for landscape irrigation systems. HCD developed new requirements for outdoor recycled water supply systems for all newly constructed residential developments, hotels and motels, if disinfected tertiary recycled water is available from a municipal source.

HCD amended the maximum flow rate of showerheads from 2.0 gallons per minute (gpm) to 1.8 gpm to align with CCR Title 20, Appliance Efficiency Regulations.

HCD adopted a new elective measure for hot water recirculation systems.

Making Conservation a Way of Life, Implementing Executive Order B-37-16

After the most recent drought, in 2018 the California State Legislature enacted two policy bills: SB 606 and Assembly Bill (AB) 1168 to establish a new foundation for long-term improvements in water conservation goals and drought planning to adapt to the longer and more intense droughts climate change is causing in California.

Collectively, these efforts provide a road map for all Californians to work together to ensure that we will have enough water now and in the future. The 2018 legislation applies to the actions of DWR, the SWRCB, and water suppliers.

DWR and the SWRCB will work closely together to develop new standards for:

- Indoor residential water use standard will be 55 gallons per capita daily until January 2025; the standard will become stronger over time, decreasing to 50 gallons per capita daily in January 2030. For the water use objective, the indoor use is aggregated across population in an urban water supplier's service area, not each household;
- Outdoor residential water use standard will be based on land cover [landscaping], climate, and other factors, i.e., geography, pastures and other irrigated lands, or open space determined by the DWR and the SWRCB. The SWRCB will adopt the outdoor standard by June 2022;
- Commercial, industrial, and institutional water use for landscape irrigation with dedicated meters; and
- System water losses, formerly known as unaccounted for water.

Urban water suppliers must stay within annual water budgets based on these standards for their service areas. The 2018 legislation also supports drought planning. In urban areas, drought plans will be primarily led by local water suppliers. DWR and the SWRCB will develop recommendations to strengthen drought planning in rural areas and areas served by small water systems by coordinating with counties and other stakeholders.

Regional

Metropolitan Water District of Southern California – Integrated Water Resources Plan

Metropolitan, its member agencies, sub-agencies, and groundwater basin managers developed an Integrated Water Resources Plan (IRP) that was adopted by the Board in January 1996 as a long-term planning guideline for resources and capital investments. The purpose of the IRP was the development of a preferred resource mix to meet the water supply reliability and water quality needs for the region in a cost-effective and environmentally sound manner. The IRP has been updated several times since its inception. The most recent update occurred in 2015.

The 2015 IRP Update focused on ascertaining how conditions have changed in the region since 2010 when the last IRP was adopted. The 2015 Update involved developing new reliability targets to meet the evolving outlook of the region's reliability needs, assessing strategies for managing short and long-term uncertainty and communicating technical findings. The 2015 IRP Update also identified areas where policy development and implementation approaches are needed.³²

As described above, Metropolitan's principal sources of water are the SWP and the CRA. In 1996, Metropolitan developed its Preferred Resource Mix that identified a balance of local and imported water resources within Metropolitan's service area. Over the last 15 years Metropolitan has continually reviewed and updated its IRP in five year increments and the associated resource targets and capital expenditure strategies necessary to reflect changing demand and supply conditions.

The following paragraphs describe the key elements of Metropolitan's water supply portfolio and investment programs.

Water Conservation

Conservation and water use efficiency are the foundation of the IRP. Metropolitan and its member agencies have invested in conservation programs since the 1980s.

Water conservation is encouraged through financial rebates and incentives for water-efficient fixtures and devices, and through plumbing codes and regulations that facilitate water savings. In addition, retail customer conservation and efficient water use is encouraged through tiered pricing: as consumers are shown the higher cost-of-service of increased water use in higher priced tiers, customers seek ways to become more efficient and reduce water use. Public outreach and education brings awareness for the need to adopt conservation measures in dry years. Water savings can be achieved through three primary programs: active (e.g., investment and rebate) programs that incentivize water use efficiency; code-based (passive) efficiency through new plumbing codes for smart-controllers, devices, fixtures, equipment and price-effect conservation attained through usage reductions resulting from increases in the price of water.

³² Metropolitan Water District of Southern California, 2016. Integrated Resources Plan. 2015 Update. Report No. 1518.

Local Water Supplies

Local supplies are a significant and growing component to Metropolitan's water supply portfolio. According to the IRP Update 2015, local supplies can provide over half of the region's water in a given year. Local supplies reduce dependence on imported water and combined with conservation bolster the region's water supply sufficiency. Local supplies are composed of five main sources: Groundwater; Recycled Water; Seawater desalination; Los Angeles Aqueduct (LAA); Local surface water sources; and, other identified resources.

Groundwater

Groundwater basins within Metropolitan's service area provide the potential for operational flexibility to manage water supplies in Southern California. Many local groundwater storage programs have been implemented over the years to maximize the use of in-region water supplies. The integration of groundwater and surface water has been part of the local water management in Metropolitan's service area since the 1950s. Groundwater recovery projects have been implemented to recover otherwise unusable groundwater that has been degraded by minerals and other contaminants. These projects include the treatment of groundwater contaminated by various industrial operations and the desalination of brackish groundwater, which has a higher salinity than fresh water, but a lower salinity than seawater. In the last 10 years, groundwater storage levels in the region have dropped significantly. However, groundwater production has remained relatively constant despite a substantial decrease in groundwater recharge. Use of imported water for groundwater recharge has also declined in recent years, and has partially been replaced with greater recharge of recycled water. Expansion of recycled water recharge has buffered the region from more severe declines in groundwater supplies.³³

Recycled Water

Recycled water is wastewater that has been treated so that it can be beneficially used for a variety of purposes ranging from landscape irrigation to groundwater recharge. Recycled water uses include:

- Non-potable reuse for non-consumptive use (agriculture, landscape irrigation and industrial uses);
- Indirect potable reuse (groundwater recharge and surface water augmentation); and
- Direct potable reuse (purified water directly into a potable water supply distribution system).

Metropolitan and its member agencies continue to invest in recycled water development programs that will enhance current and future recycled water programs. In July 2014, because retrofitting existing plumbing is generally cost-prohibitive, Metropolitan established the On-Site Retrofit Pilot Program to provide financial incentives to customers for the conversion of their potable industrial and irrigation systems to recycled water.

³³ Metropolitan Water District of Southern California. 2016. Integrated Resources Plan, 2015 Update. p. 3.8-3.9.

In 2014, non-potable, and indirect potable reuse projects in the Metropolitan service area collectively produced a total of 414,000 acre-feet (AF). Regulations are currently under development for direct potable reuse and surface water augmentation.³⁴

Saltwater Desalination

The constant availability of ocean water is one of the key benefits of seawater desalination. In 2014, Metropolitan included seawater desalination projects in the Local Projects Program (LRP) for the development of additional local supplies. With this initiative in place, desalination will eventually become an important component of Local Water Supplies. Recently, the San Diego County Water Authority completed construction of the 56,000 AF capacity Carlsbad Desalination project.

Los Angeles Aqueduct

Los Angeles Department of Water and Power (LADWP), a Metropolitan member agency, imports water from the eastern Sierra Nevada through the LAA. Average LAA deliveries since 1990 have been approximately 240,000 AF, meeting about 40 percent of the LADWP's total water needs.

Local Surface Water

Local surface water resources consist of runoff captured in storage reservoirs and diversions from streams. Reservoirs hold the runoff for later direct use, and diversions from streams are delivered directly to local water systems. Within Metropolitan's service area, local water agencies currently own and operate 34 reservoirs. Although these reservoirs provide a storage capacity of 737,000 AF, annual yield is dependent on rainfall, runoff and other operational considerations.

Other Identified Resources

On-Site Stormwater Capture and Use

On-Site Stormwater Capture and Use includes: on-site cisterns and the collection of rainwater for use in cooling towers, truck washes, drip irrigation, toilet flushing, rain barrels and other non-potable uses such as restrooms, on-site irrigation and subregional/regional storage.

Graywater

Graywater includes wastewater from bathtubs, showers, bathroom washbasins, clothes washing machines and laundry tubs. The effectiveness of graywater systems can vary based on recycled water programs that are in place.

Storage and Transfers

Over the past two decades, Metropolitan has developed a large regional storage portfolio that includes both dry year and emergency storage capacity. Storage enables the capture of surplus amounts of water in normal and wet hydrologic conditions. Stored water can then be used in dry years when augmented water supplies are needed to meet regional demands. Storage generally takes two forms: surface reservoirs and groundwater basin storage. Metropolitan has developed

³⁴ Metropolitan Water District of Southern California, 2016. Integrated Resources Plan, 2015 Update. p. 3.8-3.9.

dry-year storage with a capacity of more than 5.5 million AF. Groundwater and surface water storage generally takes two forms: surface reservoirs and groundwater basin storage.

Groundwater Storage

- Member Agency Conjunctive Use Programs (210,000 AF)
- Semitropic Storage Program (350,000 AF)
- Arvin-Edison Storage Program (350,000 AF)
- San Bernardino Municipal Water District Storage Program (50,000 AF)
- Kern Delta Water District Storage Program (250,000 AF)
- Mojave Storage Program (390,000 AF)

Surface Water Storage

- Diamond Valley Lake (810,000 AF);
- SWP Article 56 Carryover Storage (up to 200,000 AF);
- Flexible Storage in Castaic Lake and Lake Perris (219,000 AF);
- Intentionally Created Surplus in Lake Mead (1.5 million AF).

State Water Project

One of Metropolitan's two major sources of water is the SWP, which is owned by the State and operated by the state DWR. This project transports Feather River water stored in and released from Oroville Dam and unregulated flows diverted directly from the San Francisco Bay/Sacramento-San Joaquin River Delta (Bay-Delta) south via the California Aqueduct to four delivery points near the northern and eastern boundaries of Metropolitan's service area. The total length of the California Aqueduct is approximately 444 miles.

In 1960, Metropolitan signed a contract with DWR. Metropolitan is one of 29 agencies that have long-term contracts for water service from DWR, and is the largest agency in terms of the number of people it serves (almost 19 million), the share of SWP water that it has contracted to receive (approximately 46 percent), and the percentage of total annual payments made to DWR by agencies with state water contracts (approximately 60 percent in 2008). Upon expiration of the state water contract term (currently in 2035), Metropolitan has the option to continue service under substantially the same terms and conditions. Metropolitan presently intends to exercise this option to continue service to at least 2052.

Metropolitan's Table A contract amount for SWP water is 1,911,500 AFY. This represents the amount of water supply that would be available to Metropolitan in years where there is sufficient water supply for the SWP to deliver 100 percent of its total contract amounts.

Article 21 Interruptible Supplies

Metropolitan has a contract right to water supplies that are made available on an intermittent basis. Storm flows can occasionally make water supplies available that are in excess to the Table A allocation. State water contractors can take delivery of these supplies, with their rights being

based on their proportional Table A contract amounts. Historically, Article 21 interruptible supplies have ranged from 0 to 240,000 AFY.

Turnback Pool

State water contractors have an option to return unused water supplies. These unused supplies are then made available through the Turnback Pool and can be purchased by other contractors. Turnback Pool supplies have ranged from 0 to 282,000 AFY but historically, these supplies are not frequently available.

Article 56 Carryover Storage

Metropolitan has the right to store its allocated Table A contract amount for delivery in the following year. Metropolitan can store between 100,000 and 200,000 AF, depending on the final water supply allocation percentage.

SWP Terminal Storage

Metropolitan has contractual rights to store up to 65,000 AF of water in Lake Perris (East Branch terminal reservoir) and 153,940 AF of water in Castaic Lake (West Branch terminal reservoir). This storage provides Metropolitan with additional options for managing SWP deliveries to maximize yield from the project.

Agreements with Desert Water Agency/Coachella Valley Water District

Metropolitan has several agreements in place with Desert Water Agency/Coachella Valley Water District that allows for CRA to be delivered to Desert Water Agency/Coachella Valley Water District in place of their Table A SWP water. Other agreements with Desert Water Agency/Coachella Valley Water District allow for operational flexibility through Table A supply transfers, special deliveries and arrangements between Metropolitan and Desert Water Agency/Coachella Valley Water Districts.

Colorado River Aqueduct

The Colorado River was Metropolitan's original source of water after Metropolitan's establishment in 1928. Metropolitan has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior. Water from the Colorado River or its tributaries is also available to other users in California, as well as users in the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming (the "Colorado River Basin States"), resulting in both competition and the need for cooperation among these holders of Colorado River entitlements. In addition, under a 1944 treaty, Mexico has an allotment of 1.5 million AFY of Colorado River water except in the event of extraordinary drought, or serious accident to the delivery system in the United States, when the water allotted to Mexico would be curtailed. Mexico also can schedule delivery of an additional 200,000 AFY of Colorado River water if water is available in excess of the requirements in the United States and the 1.5 million AF allotted to Mexico.

The CRA, which is owned and operated by Metropolitan, transports water from the Colorado River approximately 242 miles to its terminus at Lake Mathews in Riverside County. After deducting for conveyance losses and considering maintenance requirements, up to 1.2 million AFY of water may be conveyed through the CRA to Metropolitan's member agencies, subject to availability of Colorado River water for delivery to Metropolitan as described below. California is apportioned the use of 4.4 million AFY of water from the Colorado River plus one-half of any surplus that may be available for use collectively in Arizona, California and Nevada. In addition, California has historically been allowed to use Colorado River water apportioned to but not used by Arizona or Nevada when such supplies have been requested for use in California. Under the 1931 priority system that has formed the basis for the distribution of Colorado River water made available to California, Metropolitan holds the fourth priority right to 550,000 AFY. This is the last priority within California's basic apportionment of 4.4 million AF. In addition, Metropolitan holds the fifth priority right to 662,000 AF of water, which is in excess of California's basic apportionment.

Imperial Irrigation District/Metropolitan Conservation Program

Since 1988, Metropolitan has funded water conservation programs within Imperial Irrigation District's service area. The conserved water from these programs is then transferred to Metropolitan. Conservation approaches range from distribution system improvements. Through this conservation program, 105,000 AF of water is saved annually.

Palo Verde Land Management & Crop Rotation Program

In 2005, Metropolitan entered into a 35-year program with the Palo Verde Irrigation District (PVID). Under the program, participating farmers in PVID are paid to reduce water use by leaving up to 35 percent of their PVID acreage unirrigated. Between 33,000 and 133,000 AF are made available to Metropolitan under this program.

Southern Nevada Water Authority Exchange

In 2004, Metropolitan and Southern Nevada Water Authority (SNWA) entered into an interstate storage and release program, in which Metropolitan stores otherwise unused SNWA supplies with an agreement to return the stored water in the future when needed by SNWA. As of 2015, Metropolitan had stored more than 400,000 AF of water on behalf of SNWA, with a commitment to return 330,000 AF at a later date.

Intentionally Created Surplus Program

Metropolitan and the Bureau of Reclamation executed an agreement on May 26, 2006 for a demonstration program that allowed Metropolitan to leave conserved water in Lake Mead that Metropolitan would otherwise have used in previous years. Only "intentionally-created surplus" water (water that has been conserved through an extraordinary conservation measure, such as land fallowing) was eligible for storage in Lake Mead under this program.

Comprehensive Transfers and Exchanges Strategy

Water transfers and exchanges can play a major role in addressing near-term vulnerability. A comprehensive strategy to pursue transfers and exchanges can be used to hedge against these shorter-term imbalances until long-term solutions are in place. Water transfers and exchanges can be used to augment water supplies, offset storage withdrawals and add to storage reserves. This strategy places an emphasis on obtaining larger amounts of transfer and exchange supplies in wet and normal years.

Case for Supply Sufficiency

Of the 91 supply and demand modelling scenarios Metropolitan performed while preparing the IRP 2015 Update, investigated the potential benefits of developing additional supplies to guard against the risk of reduced local supplies, for this scenario 200,000 AF was added to the supplies available in 2006 through 2015. In this case, even with actual local supplies being reduced by 10 percent, the additional supplies improved storage reserves and allowed for effectively managing drought and reduced imported supplies. The additional supplies also improved the overall balance between water supplies and demands in each year. In this analysis, regional storage levels never fell below 1 million AF. Having an additional 200,000 AF available would have fully mitigated the risk from reduced supplies and allowed for managing through the 10-year period without a need for a supply allocation in any of the years.

With this scenario as key result the Metropolitan’s “Integrated Water Resources Plan Approach” case builds in the additional development targeted for CRA, SWP, conservation, and local supplies as described above. For long-term water supply planning purposes, Metropolitan and its member agencies will be implementing several programs, plans and initiatives as described above. With these programs, plans and initiatives in place and in progress, over the planning horizon of 2040 water supplies will continue to improve as shown in **Table 3.15-5**.

**TABLE 3.15-5
 METROPOLITAN INTEGRATED WATER RESOURCES PLAN SUPPLY SUFFICIENCY**

Achieve Additional Conservation Savings	Develop Additional Local Water Supplies	Maintain CRA Supplies	Stabilize SWP Supplies	Maximize the Effectiveness of Storage and Transfer
Pursue further water conservation savings of 485,000 AFY by 2040 through increased emphasis on outdoor water-use efficiency using incentives, outreach/education and other programs.	Develop 230,000 AF of additional local supplies produced by existing and future projects. The region would reach a target of 2.4 million AF by 2040, a key to providing water supply reliability into the future.	Develop programs to ensure that a minimum of 900,000 AF is available when needed, with access to 1.2 million AF in dry years.	Manage SWP supplies in compliance with regulatory restrictions in the near-term for an average of 980,000 AF of SWP supplies	Manage SWP supplies in compliance with regulatory restrictions in the near-term for an average of 980,000 AF of SWP supplies

Central Basin Municipal Water District UWMP

CBMWD's UWMP was finalized in May 2015. This UWMP provides a detailed summary of CBMWD's present and future water resources and demands within its service area and assesses its water resource needs. Specifically, the UWMP provides water supply planning for a 25-year planning period in five-year increments and identifies water supplies needed to meet existing and future demands. The demand analysis must identify supply reliability under three hydrologic conditions: a normal year, a single dry year, and multiple dry years.

West Basin Municipal Water District UWMP

WBMWD's UWMP was finalized in June 2016. This UWMP provides a detailed summary of WBMWD's present and future water resources and demands within its service area and assesses its water resource needs. Specifically, the UWMP provides water supply planning for a 25-year planning period in five-year increments and identifies water supplies needed to meet existing and future demands. The demand analysis must identify supply reliability under three hydrologic conditions: a normal year, a single dry year, and multiple dry years.

Local

Golden State Water Company UWMP

GSWC's adopted 2015 UWMP reflects the GSWC's Southwest System water supply and demand comparison in 5-year increments showing future supplies, demand forecasts and measures to monitor and control future demand. The UWMP, along with Water Master Plan, Capital Improvement Plan and other water resources planning documents, is used by GSWC staff to guide the water use and management efforts over a 20-year planning horizon.

City of Inglewood General Plan

The City of Inglewood General Plan Conservation Element, adopted on October 21, 1997, addresses the conservation, development and utilization of natural resources found within the jurisdiction of the City. Chapter III of the Conservation Element address resource conservation and management and contains several goals, objectives, and policies related to water production. The following goals and policies from the City of Inglewood General Plan Conservation Element are relevant to the Proposed Project.

Policy 2: Reduce the ever-increasing demand being placed on the aquifers and on the statewide water sources.

The Proposed Project would increase demand for water supply over existing levels at the Project Site and within GSWC's Southwest System service area. The Proposed Project would be within the planned growth for the City of Inglewood and, correspondingly, is anticipated within the water supply plans for the agencies charged with providing adequate water supplies to meet the land use plans of the jurisdictions they serve. The Proposed Project would incorporate water conserving design and operational features to insure not only that water usage complies with all relevant state, regional and local water conservation requirements but also meets the voluntary standards of the LEED Gold certification program, which set water conservation performance

expectations above and beyond the mandatory compliance levels. With this commitment to a high level of water conservation and use efficiency, the Proposed Project would reduce water supply demand consistent with the City of Inglewood's policy.

In addition, as reported in the GSWC 2015 UWMP – water use per capita within its Southwest System service area has declined notably over the last decade due to a combination of factors including tiered water pricing, increasing water conservation regulations, the extended drought, and the recession. This documented reduction in per capita water use, combined with GSWC's commitment to continued water conservation efforts and compliance with relevant State requirements, as well as efforts by WBMWD to increase recycled water use, further reinforce that both the Proposed Project and water service within GSWC's Southwest System are in alignment with the City's policy regarding water demand management.

The final determination of consistency with the City's General Plan is the responsibility of the City of Inglewood City Council.

3.15.4 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to water supply. The following thresholds of significance have been adapted from CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Require or result in the relocation or construction of new or expanded water treatment facilities or expansion of existing facilities, the construction or relocation of which could cause significant environmental effects; or
2. Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

Methodology and Assumptions

Estimating Project Water Demand

As detailed in the Water Supply Assessment (Appendix M), potential water demand for the Proposed Project was estimated using a water use factor and a base unit for each use. For example, water use in the Arena is estimated with a maximum capacity of 18,500 attendees and 4 gallons per day (gpd) per attendee. The Arena water demand factor is based on a Water and Sewer Analysis prepared for the Golden State Warriors Arena in San Francisco.³⁵ Water demand estimates for the plaza assumed approximately 10 percent of the space would be landscaping and the remainder would be hardscaping. Outdoor hardscaping water demand is assumed to be driven by washing surfaces, assumed to occur four times per year.

³⁵ Todd Groundwater, 2019. *Water Supply Assessment: Golden State Water Company – Southwest, Inglewood Basketball and Entertainment Center*. July 2019.

Estimating GSWC Future Demand

Population, housing, and employment projections were developed for the Southwest System using the Southern California Association of Governments (SCAG) population, housing, and employment data. SCAG updated its projections in 2012 for population, household, and employment growth through the year 2035 using 2010 U.S. Census data. SCAG’s methodology is summarized below, followed by the derivation of population projections for the Southwest System. On a regional level, the SCAG forecast uses a cohort component model to project birth and death rates based on demographic factors and estimates migration based on economic fluctuations. Projected growth of an individual jurisdiction is assumed to be proportionate to the jurisdiction’s historic contribution to county growth. SCAG’s projections undergo extensive local review, incorporating zoning information from city and county general plans. A detailed explanation of the population, household and employment projection process employed by SCAG can be found in the report: Growth Forecast, a supplemental report to the SCAG Regional Transportation Plan, 2012–2035.

SCAG city level projections were used to determine projected population from 2020 to 2040. The Southwest System serves the Cities of Gardena and Lawndale, parts of the cities of Carson, Compton, El Segundo, Redondo Beach, Hawthorne and Inglewood, and portions of unincorporated parts of Los Angeles County. The SCAG historic growth rate for the City of Hawthorne more closely matches that of the Southwest System’s historic population growth rate than that for the surrounding cities or unincorporated areas. Therefore, the SCAG growth rate for 2015 through 2035 for the City of Hawthorne was used to project the population, household, and employment of the Southwest System. This methodology applies the SCAG growth rate to a consistent system boundary through 2040; therefore, it is assumed that the projected population accounts for system in-fill only and does not include geographic growth such as tariff area expansion. **Table 3.15-6** presents the current and projected population for the Southwest System.

**TABLE 3.15-6
 GSWC SOUTHWEST SYSTEM SERVICE AREA – POPULATION PROJECTIONS**

Population	2015	2020	2025	2030	2035	2040
GSWC-SW Population Served	275,369	282,455	289,326	296,365	303,576	310,961
Assumed Annual Growth	0	0.51%	0.48%	0.48%	0.48%	0.48%

SOURCE: Todd Groundwater, 2019. *Water Supply Assessment: Golden State Water Company – Southwest, Inglewood Basketball and Entertainment Center*. July 2019. Table 5 [EIR Appendix M].

According to SCAG data for Hawthorne, population is expected to increase by a total of 14 percent from 2008 to 2035, which translates to a 0.5 percent growth rate per year. The number of households is expected to grow 7 percent during the same period, which equates to an annual household growth rate of 0.3 percent. Employment is expected to grow 6 percent during the same period, which equates to an annual employment growth rate of 0.2 percent.

Growth projections for the number of service connections and water use were calculated for the year 2020 through 2040 in 5-year increments using the SCAG-based approach. SCAG (Hawthorne) household projections were used to determine the growth in single family and multi-family service connections for the years 2020, 2025, 2030, 2035, and 2040. For example, the percent growth rate in households from the year 2015 to year 2020 was multiplied by the number of service connections in 2015 to obtain a projection of the number of connections in the year 2020. Similarly, employment growth projections were used to determine the growth for commercial, industrial, institutional/government, agricultural irrigation, landscape, and other service connections.

Impacts and Mitigation Measures

Impact 3.15-1: Construction and operation of the Proposed Project could require or result in the relocation or construction of new or expanded water facilities, the construction of which could cause significant environmental effects. (Less Than Significant)

Water Conveyance Infrastructure

GSWC operates a water supply system currently consisting of 8 wells that pump from the WCGB and 2 wells that pump from the Central Basin, 13 imported water connections, storage and distribution reservoirs, and a variety of transmission and conveyance facilities. Wells vary in production capacity but all wells combined to serve the Southwest System can produce up to 10,865 gpm or 17,525 AFY.³⁶ GSWC takes delivery of imported surface water through two water connections with CBMWD for maximum supply of 18,057 AFY and eleven connections with WBMWD for a maximum supply of 76,020 AFY. Combined, these connections have a total delivery capacity of approximately 94,059 AFY.³⁷

The existing water pipelines throughout the project area would provide some of the infrastructure necessary to provide water service to future uses. However, it is likely that new on-site and off-site improvements would be required to provide adequate service for the increase in water demand. Project plans indicate that some existing water pipelines on the Project Site, currently within the rights-of-way of West 101st and West 102nd streets, would be relocated to the perimeter of the site as the existing parcels and streets are reconfigured for the Proposed Project.

Within the Project Site, new water distribution infrastructure would be constructed as part of the project development. Construction of new water pipes would require demolition of surface improvements and excavation activities. Future construction of water infrastructure would adhere to existing laws and regulations, and the water conveyance infrastructure would be appropriately sized for each site-specific development, which includes potable water, domestic irrigation, and fire flow demands. The environmental effects of building the on-site water distribution infrastructure are addressed in environmental analyses in other sections of this Draft EIR, such as

³⁶ Golden State Water Company, 2016. *2015 Urban Water Management Plan – Southwest*. pp. 6-1, 6-8.

³⁷ Golden State Water Company, 2016. *2015 Urban Water Management Plan – Southwest*. pp. 6-1, 6-8

in Sections 3.4, Cultural and Tribal Cultural Resources; 3.6, Geology and Soils; 3.8, Hazards and Hazardous Materials; 3.9, Hydrology and Water Quality; and 3.11, Noise and Vibration.

Water Treatment Facilities

The demand for groundwater generated by the Proposed Project is not anticipated to require additional treatment facilities because GSWC has existing facilities that are maintained in place and connected to existing boost pumps, transmission and distribution systems. These facilities provide direct water treatment at the originating wells prior to distribution within GSWC's service area.

GSWC maximum delivery from imported water is up to 58,313 gpm (74.4 MGD) and maximum groundwater extraction is 10,865 gpm (15.6 MGD). GSWC annual average production and delivery from imported water between 2011 and 2015 averaged 14.8 MGD and groundwater production averaged 12.5 MGD over the same period. Average total water deliveries were 27.3 MGD. Assuming a total system capacity of 69,178 gpm or 90.1 MGD, there remains a surplus capacity of 62.7 MGD. Therefore, existing capacity within the groundwater supply system or surplus capacity within the imported water supply system could easily accommodate the new demand of 0.056 MGD generated by the Proposed Project.

As stated above, Metropolitan treats imported water at five treatment plants located around the Los Angeles basin. It is expected that the majority of the CBMWD and WBMWD supplies from Metropolitan come from either the Diemer Treatment Plant or the F.E Weymouth Treatment Plant, which treat water prior to distribution to Los Angeles, Orange County, parts of Los Angeles County, including the San Gabriel Valley and areas of Orange County. The Diemer Filtration Plant has an operating capacity of 550 MGD. Diemer Treatment Plant's 10-year average daily treatment is 220 MGD, while the F.E Weymouth Treatment Plant has an operating capacity of 520 MGD with a 10-year average daily treatment of 205 MGD. If the proposed Project water demands were to be treated solely at either filtration plant, this increase would represent less than 1 percent (0.0001 percent at Diemer Treatment Plant or 0.0001 percent at F.E. Weymouth Treatment Plant) of the design capacities of either facility. In terms of comparing the proposed Project's contribution to the average daily treatment flows from Diemer Treatment Plant or F.E. Weymouth Treatment Plant, water demand from the Proposed Project (0.056 MGD) would be less than 1 percent (0.0003 MGD) of the average daily treatment flow at either water treatment plant.

Because water supply for the proposed Project represents a fraction of the remaining operating capacity at both Diemer Treatment Plant and F.E Weymouth Treatment Plant, it is expected that the existing plants could adequately serve the additional demand generated by the Proposed Project without requiring new facilities or expansions to these facilities. Furthermore, Metropolitan manages and maintains all of the treatment plants, and any improvements or expansions are the responsibility of Metropolitan and would not adversely affect the CBMWD, WBMWD, GSWC, or the Proposed Project. In terms of groundwater, GSWC's existing groundwater treatment systems associated with its ten wells and existing water distribution

system combined with imported water from CBMWD or WBMWD could adequately meet the new water demand associated with the Proposed Project. Therefore, this impact is considered **less than significant**, and no mitigation is required.

City of Inglewood Well 6 Relocation

The City of Inglewood has several groundwater wells within its service area. Currently, groundwater well (Well 6) is located within the Project Site. As a result of the Proposed Project, Well 6 would be abandoned in place and a new Well 8 would be constructed and installed in order to maintain water supply to this portion of the City's distribution system.

Well 6 was constructed in 2003 and has experienced declining pumping capacity over the years. Well 6 was designed for 2,800 gpm but initial pumping tests were at flows of 1,500 to 4,400 gpm. The pump was replaced in 2011 with a reduced flow of 1,400 gpm, since then water quality issues have reduced the average day use to approximately 1,200 gpm. The City of Inglewood scheduled Well 6 for rehabilitation to increase its capacity to 1,500 gpm in 2017. However, rehabilitation of the Well 6 has been postponed and Well 8 would be constructed and installed at new location outside of the Proposed Project area. In July 2018, the City of Inglewood prepared a Preliminary Well Design Report for the proposed new Well 8 that would replace Well 6.

The City of Inglewood has identified Lot 35, located near the intersection of Doty Avenue and 102nd Street, as the proposed location for Well 8. Well 8 would be approximately 500 feet from Well 6. Lot 35 is rough-graded level and unimproved with native grasses. This is an urbanized area. Lot 35 is bounded on the north by 102nd Street, residential properties on the east and south and commercial property to the west. Based on the Preliminary Well Design Report, Well 8 would be designed as an in-kind replacement of Well 6 with no capacity upgrades.

Typically, groundwater well construction and installation activities are short-term projects, less than 30 days to drill, develop, test, and then connect to the existing distribution system. Well 8 improvements would occur on 0.75 acres with 3,000 square feet of impervious surfaces. Construction and installation of Well 8 could potentially cause adverse environmental impacts that would be reduced or eliminated through standard operating procedures, scheduling, best management practices, and adherence to municipal codes and ordinances. Above-ground structures and facilities associated with Well 8 would be designed to match the local urbanized surroundings with landscaped areas along the sidewalk of 102nd Street. New impervious site improvements would be a new 15-foot-wide paved access road leading to a small paved area around Well 8 and appurtenances. The remainder of Lot 35 would be unpaved and pervious, allowing some stormwater to percolate to groundwater and excess stormwater to flow to the on-site catch basin.

Operation of Well 8 would be similar to existing groundwater well facilities in the City of Inglewood and would not have adverse environmental effects.

Mitigation Measure

None required.

Impact 3.15-2: Construction and operation of the Proposed Project could result in insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. (Less Than Significant)

Construction

Project construction would require water for dust suppression, grading, and general demolition and construction activities. Water would be supplied by existing water mains and connections within surrounding streets. As described in the setting section, existing water use at the Project site is estimated to be about 8 AFY. As the existing on-site uses (a fast-food restaurant, a hotel, and warehouse and light manufacturing facilities) would cease to operate prior to the start of project construction, water currently used at the site would instead be available to support construction activities.

Construction water demand was estimated for the project site, using landscape irrigation assumptions appropriate to the Los Angeles region's Mediterranean climate and assuming high water demand landscaping materials, which yield a demand factor of 20.94 gallons per year per square foot of area.³⁸ Total construction period water demand for the Proposed Project is estimated to be 42 AF over the three-year construction period. Construction water use per year over the project construction period would depend on how the construction proceeds in phases over the three-year period and thus would be less than the full 42 AF in a single year. However, for purposes of analyzing whether there would be adequate water supply to meet project construction demands along with other water demands within the GSWC's service area, the 42 AF total construction water demand is considered to occur in a single year.

A 42 AFY demand for construction water is just under half the annual water demand of 103 AFY estimated for full project operation. Please see the detailed discussion in the section below on Project Operation that analyzes the water supply sufficiency to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. That analysis documents that GSWC has adequate supply to serve the project operations and future projected demands within its Southwest System service and therefore also confirms that GSWC has adequate supply to meet the construction period water demands of the Proposed Project. The impact of project construction on water supply, therefore, would be **less than significant**.

Operation

Consistent with the analysis undertaken in the WSA that was prepared and is provided in Appendix M of this Draft EIR, this assessment of water supply sufficiency first reviews the

³⁸ U.S. Department of Energy, Energy Efficiency and Renewable Energy, Federal Energy Management Program, "Guidelines for Estimating Unmetered Landscaping Water Use" July 2010, p. 12, Table 4.

projected water demand for both the Proposed Project and future uses within the GSWC Southwest System service area, then reviews GSWC’s projected future water supply sources and amounts to meet that demand, and finally, reviews the reliability of GSWC’s future water supplies under three scenarios: a normal year, a single dry year, and multiple dry years.

Project Water Demand

Water demand for operation of the Proposed Project was estimated by Stetson Engineers.³⁹ Annual Proposed Project water demands were assessed under two scenarios – standard water conservation measures and enhanced water conservation and water reuse measures based on the requirements established for the Leadership in Energy and Environmental Design (LEED) certification.

Proposed Project water demand estimates are shown in **Table 3.15-7**. Future annual water demand for the Proposed Project is estimated to be 103 AFY under the standard conservation measures scenario, and 63 AFY as described above, under LEED Gold certification requirements scenario that would result in annual water savings of 40 AF.

**TABLE 3.15-7
 SUMMARY OF STETSON ENGINEERS WATER DEMANDS ANALYSIS**

Water Use Type	Estimated Water Demands (AFY)	
	Baseline Conservation	LEED Gold Certification
Indoor		
Arena and Plaza Events ^a	21.0	10.7
Office Space	8.8	6.1

³⁹ Stetson Engineers, 2019. Review of Water Demands Memo.

LEED Gold Water Conservation

For Proposed Project to achieve LEED certification it must fulfill three prerequisites in order to receive LEED points under the Water Efficiency” credit category. The LEED certification prerequisites for new building construction are:

1. Outdoor Water Use Reduction
 - Designed to reduce outdoor water use (by at least 30 percent from a calculated baseline) or eliminate the need for [outdoor] water usage.
2. Indoor Water Use Reduction
 - Reduce aggregate water use by 20 percent from the baseline. Install only toilets, urinals, private lavatory faucets and showerheads that are labeled as WaterSense eligible or meet WaterSense criteria.
3. Building-Level Water Metering
 - Install permanent meters that measure total potable water (indoor and outdoor), and record total water use data on a monthly basis, and
 - Agree to share the water data with the U.S. Green Building Council (USGBC) for five years following project certification or building occupancy, whichever comes first.

According to the Sustainability/LEED Checklist⁴⁰ the Proposed Project could fulfill the LEED certifications prerequisites through the following actions:

- Use recycled water to service water conscious landscape design necessary to reduce outdoor water use by at least 50 percent;
- Incorporate water efficient fixtures to necessary to achieve approximately 40 percent reduction in indoor water use; and
- Install smart water meters.

Upon fulfilling the LEED prerequisites, the Proposed Project could earn LEED certification points, through four Water Efficiency categories as listed below:

1. Outdoor Water Use Reduction – earn 2 points by eliminating outdoor water use or reducing outdoor water use by 50 percent or more;
2. Indoor Water Use Reduction- earn up to 6 points by reducing indoor water use by more than 20 percent;
3. Cooling Tower Water Use – earn 2 points through makeup water efficiencies while effectively controlling microbes, corrosion and scale in the condenser water system; and
4. Additional Water Metering – earn 1 point each for installing submeters for two or more of the following:
 - Irrigation
 - Indoor plumbing fixtures and fittings
 - Domestic hot water

⁴⁰ Sustainability / LEED Checklist, AECOM, August 2018

- Boilers
- Reclaimed water
- Other process water

The Proposed Project would be designed for LEED Gold certification that would be attained by earning 60 to 79 LEED certification points. Within the Water Efficiency categories, the Proposed Project would earn LEED certification points through installation of:

- Landscape materials that would result in a 50 percent reduction in outdoor water use and designing for, and installing plumbing to use recycled water for the majority of outdoor irrigation purposes;
- Water efficient fixtures and equipment that achieves 40 percent reduction in indoor water use;
- A specialized cooling tower system that is equipped with water-efficient technologies. Per the Sustainability/LEED Checklist, recycled water could be used blended into the makeup water while maximizing the cycles of concentration; and
- Submeters to track water use for indoor hot water, boiler make-up water, and recycled water systems.

Water Demand Confirmation

In preparing the WSA for the Proposed Project, an independent review and analysis of water demand for the Proposed Project corroborated the estimated annual water demand for the Proposed Project to be about 100 AFY. **Table 3.15-8** summarizes the independent calculation of water demand for the Proposed Project prepared by Todd Groundwater. This independent assessment confirmed that the total water demand estimate prepared for the Proposed Project by Stetson Engineers of 103 AFY is reasonable given the anticipated events, uses and level of use proposed, and assuming implementation of standard conservation measures (rather than the LEED Gold certification criteria for water-use efficiency, which the Proposed Project would be designed to achieve and would result in total water use for the Proposed Project of 63 AFY).

GSWC Southwest System – Projected Future Water Demand

Table 3.15-9 summarizes actual 2015 and projected future water demands for the GSWC's Southwest System's service area from 2020 to 2040 (see the methodology section above for an overview of how GSWC developed its future water demand projections based on SCAG projections of population, household and employment growth). Between 2015 and 2040 total annual water demands are projected to increase about 30 percent, an increase of 7,458 AFY from 2015 use levels of 27,331 AFY to a projected 2040 use of 34,789 AFY. Demands are projected to increase in all water use categories but predominantly residential and commercial uses. As described in the setting section, water use within the Southwest System service area declined between 2000 and 2015 due to several factors and the projected 2040 demand remains below the 2000 actual water use, which exceeded 35,000 AF.⁴¹

Analysis of GSWC Supply Availability to Meet Future Demands

Table 3.15-10 shows actual water supply by source delivered by GSWC in years 2010 and 2015 and the projected water supply by source that GSWC proposes to make use of to meet the projected future demands within the Southwest System service area. As Table 3.15-10 shows, in 2015 GSWC purchased more imported surface water supply and used less groundwater supply than it did in 2010. The supply mix pattern for 2015 was atypical. In 2015, GSWC's purchased imported supply of 21,000 AF represented 77 percent of the annual total and groundwater represented only 22 percent of the annual total. GSWC indicates that it experienced operational issues in 2015 and 2016 that reduced groundwater pumping. GSWC's projected future supply through 2040 reflects the more typical supply source mix, with purchased imported water representing about 50 percent of the annual supply and groundwater representing about 50 percent of the supply. Recycled water use is projected to increase from 1 to 2 percent of the total supply.

**TABLE 3.15-10
 GSWC HISTORICAL AND PROJECTED WATER SUPPLY SOURCES (AFY)**

Water Supply	Source	2010	2015	2020	2025	2030	2035	2040

NOTE:

* In addition to GSWC's groundwater adjudicated rights in the WCGB and Central Basin, GSWC also has the ability to annually lease groundwater rights, if needed and available.

SOURCE: Todd Groundwater, 2019. *Water Supply Assessment: Golden State Water Company – Southwest, Inglewood Basketball and Entertainment Center*. July 2019 [EIR Appendix M].

To assess its future water supply portfolio, GSWC assumes constant supplies through 2040 of imported water from CBMWD, as well as constant supplies of groundwater from the Central Basin and WCGB, and recycled water. To meet rising demand in the future (7,458 AFY over 2015 by 2040), GSWC plans to increase imported water supply purchases from WBMWD and to lease additional groundwater from the WCGB. In general, GSWC's supply is expected to be highly reliable through 2040. This reliability is a result of the following:

- Adjudicated groundwater rights in the Central and West Coast basins;

- Availability of contractual purchases of leased groundwater;
- Benefits of conjunctive use storage programs to be developed in accordance with the Central and West Coast Basin Judgments;
- Water supplies available from the supplemental supplier, Metropolitan, projected to be highly reliable;
- Conservation derived supply; and
- Availability of recycled water.

In addition to GSWC's groundwater adjudication rights in the WCGB and Central Basin, GSWC also has the ability to annually lease groundwater rights, if needed and available. GSWC estimates that it would lease approximately 5,498 AFY of additional groundwater supply. While quantifiable estimates of groundwater leases are not available for future years, projections are based on historical pumping amounts, including leased groundwater, and assume that available unpumped groundwater would continue to be available as in the past.⁴² As discussed in its 2015 UWMP (page 6-8), GSWC has historically obtained leases to augment its APA in the Central Basin, averaging 4,190 AFY from 1999 to 2015 and leased groundwater pumping rights in the West Coast Basin, averaging 5,336 AFY over the last ten years. Leases for additional groundwater in both the Central Basin and West Coast Basin are renewed annually, on an as needed basis, and after an evaluation of the economic benefits to rate payers.

In each year, between 27,392 AFY and 61,067 AFY of available APA has not been pumped in the Central Basin and between 31,678 and 39,889 AFY of adjudicated rights has not been pumped in the West Coast Basin. A portion of this un-pumped water could be available for GSWC to lease, on an annual basis, to augment its Central Basin APA and/or West Coast Basin water rights and support overall water supply reliability. In addition, under the adjudication terms, GSWC (and other authorized pumpers) have an opportunity to store additional water in the groundwater basin up to 200 percent of their APA per year. Water transfers and exchanges may also be undertaken as part of conjunctive use storage programs to be developed.

GSWC's projected future water demands reflect demand increases associated with general commercial and residential growth in the Southwest System service area and have not been allocated to specific development projects. GSWC requires that new projects within the service area register as a new business and provide information about proposed water supplies needs. GSWC assesses each application to determine if each project would be within the capability of its water system. The Proposed Project submitted preliminary information to GSWC and received a "will serve" letter in November 2017 indicating GSWC ability to serve the project.⁴³

The Proposed Project would be operational by mid-2024. With an estimated water demand of 103 AFY that does not include a greater level of water savings that would be achieved by meeting LEED Gold certification standards (potentially reducing water demand to 63 AFY), the Proposed

⁴² Golden State Water Company, *Final Report, 2015 Urban Water Management Plan – Southwest*, p. 6-20.

⁴³ Golden State Water Company, 2017. Will Serve Letter for 17-Acre Development between Century Boulevard to the north, 103rd Street to the south, Prairie Avenue to the west and Doty Avenue to the east. November 13.

Project would represent approximately 2 percent of the 2025 projected commercial use water demand in the GSWC service area. By 2025, commercial water use in the service area is projected to increase 642 AFY over 2015 levels; the Proposed Project would represent 16 percent of this projected commercial use demand increase. By 2040, GSWC is planning for an additional 161 AFY increase in commercial demand. GSWC is planning sufficient supply for commercial development within the Southwest System service area to serve the Proposed Project, as well as other reasonably foreseeable development in all water use categories (e.g., residential, commercial, etc.) through 2040.

GSWC future water supply projections by source, shown above in Table 3.15-10, reflect a normal year condition. In order to assess supply availability during drought conditions, the WSA prepared for the Proposed Project also evaluates future supply reliability in single- and a multiple-dry-year scenarios. As discussed in the WSA, and in their respective UWMPs, WBMWD and CBMWD each document that they each have sufficient water supplies to meet projected future demands within their regional service areas during all future conditions, including normal, dry, and multiple dry years.^{44,45,46} Furthermore, Metropolitan's IRP describes a diversified water supply portfolio with current and water supplies to meet its member agencies demands.⁴⁷ Please see Appendix M for the WSA prepared for the Proposed Project for more detailed review of these agencies' supply reliability assessments.

Based on information provided by these three wholesale water agencies that supply water to GSWC, the future reliability of GSWC's supply portfolio was evaluated. **Table 3.15-11** compares GSWC supply availability in a single dry year scenario and projected future demand and **Table 3.15-12** compares GSWC supply availability in a multiple-dry-year scenario and projected future demand. As these tables indicate, based on information provided by Metropolitan, WBMWD and CBMWD in their respective UWMPs, GSWC projects that it would be able to acquire sufficient water supplies each year from the multiple and diverse sources it has in its supply portfolio to match the projected future demand. Thus, these tables show no difference between supply and demand. Further, because the future demand projections already incorporate conservation and water use efficiency, the demand estimates for single and multiple-dry-year scenarios are the same as for normal year. GSWC is not expected to rely on water use cutbacks to meet demand in dry years.

As detailed in the WSA and GSWC's UWMP, and shown in these two tables, GSWC has sufficient water supply to fulfill demand in normal, dry, and multiple dry years during a 20-year projection.⁴⁸ To further increase its supply portfolio, GSWC plans to purchase and store water in the Central Basin and/or WCGB. The exact amounts to be supplied from these projects are not yet quantified, pending further development of purchase agreements, but base agreement water

supply will continue to be available. GSWC has a portfolio of supplies to rely on during normal and dry years. The most recent multi-year drought that extended from 2012 through 2016 provides a useful demonstration of the reliability the supply portfolio as GSWC was supplied with 100 percent of demand through this period.

As presented in the UWMP reviewed in this section for the relevant agencies that provide water supply to GSWC, to achieve supply adequacy to meet future demand increases across Southern California, various actions and projects will be needed to both further reduce demand and augment supply. There are three proposed projects in particular that would play a notable role in insuring adequate supply availability to GSWC for its Southwest System service area.

- **SWProject – Delta Conveyance Project.** The California DWR is revising its proposal to modernize the delta conveyance infrastructure component of the SWP. The current proposed project, now under development, will modify the former WaterFix project proposal, and centers on a single Delta tunnel and smaller capacity. The project is intended to help stabilize the reliability of surface water supplies from the Sacramento-San Joaquin Delta while protecting the resources of the Delta. As discussed in the Setting section above, Metropolitan imports surface via the SWP and distributes this supply to its member agencies, including WBMWD and CBMWD. WBMWD and CBMWD, in turn, sell a portion of the imported supply to GSWC and also use some of it to replenish the WCGB and CGWB, from which GSWC pumps groundwater. The WaterFix Project Final EIR was certified on July 21, 2018, and the project was approved that same day. The EIR certification and approval has since been rescinded by DWR Director, Karla Nemeth on May 2, 2019⁴⁹ consistent with Governor Newsom’s comments at the February 12, 2019 State of the State address indicating that he did not support the WaterFix project as presently configured and consistent with the Governor’s April 29, 2019 Executive Order N-10-19 directing preparation of a water resilience portfolio that would include developing a revised delta conveyance project. DWR has stated that it will initiate a new environmental review and permitting process for the updated delta conveyance project with a single tunnel solution.
- **WBMWD Desalinated Ocean Water Supply Project.** WBMWD is pursuing an ocean desalination project that would provide up to 21,500 AFY to its long-term water supply and represents its chief plan to increase water supply to meet future demand increases. GSWC indicates in its UWMP that it plans to look primarily to WBMWD for the additional water supply it needs to meet increases in future demand. WBMWD released a Draft EIR for this project on March 27, 2019.⁵⁰ The Final EIR is in preparation.
- **Cadiz Valley Water Conservation, Recovery, and Storage Project (Cadiz Project).** GSWC indicates in its UWMP that the Cadiz project represents a long-term water transfer opportunity.⁵¹ The project, located in eastern San Bernardino County, is designed to capture and conserve up to 50,000 AFY of groundwater that is largely “lost” through evaporation each year through area dry lakes. GSWC is one of several potential participants that has expressed interest in receiving water from the project, signing a letter of intent to purchase up to 5,000 AFY in 2009. A Final EIR for this project was certified in July 2012 and the project approved.⁵² The EIR was upheld through a round of legal challenge and appeals.

The environmental impacts of each of these projects have been documented in previously completed EIRs in compliance with CEQA. Although a new EIR/EIS will be prepared for the

⁴⁹ https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Delta-Conveyance/Rescission-Document_a.pdf?la=en&hash=D5DD2AA425716D87564D71AF13A9608DBE3A594A.

⁵⁰ West Basin Municipal Water District, West Basin Ocean Water Desalination Project Draft Environmental Impact Report, March 2019. State Clearinghouse No. 2015081087 Available online at westbasindesal.com.

⁵¹ Golden State Water Company UWMP 2016, page 6-18.

⁵² Santa Margarita Water District, Final EIR for the Cadiz Valley Water Conservation, Recovery, and Storage Project, July 2012, SCH #2011031002.

updated project, the EIR/EIS document prepared on WaterFix EIR/EIS identified, in detail, the environmental impacts and mitigation requirements for such a delta conveyance project, albeit one of a large scale with two delta tunnels rather than one. Given that the environmental effects of these key projects have been documented, with CEQA to be fully completed for each project, no further discussion of the potential environmental effects of these key projects is provided here.

For the reasons described above and as documented in its UWMP, GSWC would have sufficient planned water supplies available to serve the Proposed Project along with other reasonably foreseeable development within the service area in normal, single-dry-, and multiple-dry-year scenarios during both the construction period and long-term operation. This impact is **less than significant**.

Mitigation Measure

None required.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to water supply and demand is the geographic boundaries of the service area of the GSWC Southwest System.

Impact 3.15-3: Construction and operation of the Proposed Project, in conjunction with other cumulative development within the GSWC Southwest System, could require or result in the relocation or construction of new or expanded water treatment facilities or expansion of existing facilities, the construction or relocation of which could cause significant environmental effects. (Less Than Significant)

As discussed under Impact 3.15-1, water deliveries needed to serve the Proposed Project would use a fraction of the capacity remaining in existing water supply system infrastructure, from major water treatment facilities through the treated water distribution system and the groundwater pumping and distribution system. The Proposed Project would not make a considerable contribution to the cumulative demand on existing water system infrastructure resulting in the need for construction of new or expanded water supply system infrastructure. Therefore, this cumulative impact would be less than significant.

Mitigation Measure

None required.

Impact 3.15-4: Operation of the Proposed Project, in conjunction with other cumulative development and future water demands within GSWC's Southwest System, could result in insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years. (Less Than Significant)

Because the impact analysis discussed under Impact 3.15-2 is based on the WSA, which includes consideration of a 20-year cumulative demand within the GSWC Southwest System, the analysis presented under Impact 3.15-2 is the same as that required under Impact 3.15-4. Given that the analysis of water supply sufficiency to serve the Proposed Project considered a 20-year horizon through the year 2040 and also considered future water demand associated with projected growth within GSWC's Southwest System service area, it addresses cumulative effects along with project-specific impacts. The analysis in Impact 3.15-2 documents that GSWC has adequate supply to meet the project demand as well as reasonably foreseeable development during normal, dry, and multiple dry years; therefore, this cumulative impact would be **less than significant**.

Mitigation Measure

None required.

Wastewater Generation and Treatment

3.15.5 Environmental Setting

Regional and Local Setting

Municipal wastewater is generated in the City of Inglewood from residential, commercial, industrial, and public/institutional land uses. LACSD Number 5 manages the wastewater collection and treatment system within the City.⁵³ Wastewater is collected by gravity sewers and lift stations owned by the City and LACSD.⁵⁴ There are two separate sewer systems in the vicinity of the Project Site where wastewater is conveyed: two LACSD trunk sewers (Prairie Avenue Trunk Sewer and South Inglewood Orange Trunk Sewer), and the City of Inglewood local collector sewer lines. Wastewater is transported through these sewer lines to LACSD's Joint Water Pollution Control Plant (JWPCP) in Carson, California. The JWPCP provides both primary and secondary wastewater treatment for an average dry weather flow of 261 MGD, and a peak flow of 330 MGD.⁵⁵ The JWPCP has a design capacity of 400 MGD. In 2015, 6,179 AF of wastewater was collected from within the City of Inglewood.

⁵³ AECOM, 2019. *Sewer Area Study Inglewood Basketball and Entertainment Center*. April 30, 2019. p. 2.

⁵⁴ Golden State Water Company, 2016. *2015 Urban Water Management Plan – Southwest*.

⁵⁵ LACSD, personal communication with Naoko Munakata. May 22, 2019.

The JWPCP only provides primary and secondary treatment, and effluent produced at the plant does not meet recycled water quality standards. The treated wastewater is disinfected with hypochlorite and discharged to the Pacific Ocean through LACSD’s network of outfalls.⁵⁶

Existing Wastewater Generation and Infrastructure at the Project Site

The West Parking Garage Site, East Transportation and Hotel Site, and Well Relocation Site are currently vacant and do not generate wastewater. The six existing developed parcels located in the Arena Site include a fast food restaurant, a motel, a warehouse and light manufacturing facility, a commercial catering business, and a groundwater well and related facilities. These existing uses, excluding the groundwater well and related facilities, generate wastewater that is conveyed by City and LACSD sewer lines and treated at the JWPCP. The existing wastewater demand is estimated based on LACSD wastewater generation factors. Table 3.15-13 details the existing land uses, the estimated daily average wastewater flow, and estimated peak flow. Based on the existing land uses, the estimated existing peak wastewater flow generated at the Project Site is approximately 0.032 MGD.

**TABLE 3.15-13
 ESTIMATED EXISTING WASTEWATER GENERATION AT THE PROJECT SITE**

Existing Land Use	Unit Contribution	Daily Average Wastewater Generation Factor (gpd)	Daily Average Flow (gpd)	Peak Flow (2.5 x Average) (MGD)	Peak Flow (cfs)
Commercial (Restaurant and Catering)	2,252 sf	1,000 gallons/1,000 sf	2,252	0.006	0.009
Commercial (Motel)	38 rooms	125 gallons/room	4,750	0.012	0.019
Manufacturing/Warehouse (Food Warehouse)	28,809 sf	200 gallons/1,000 sf	5,762	0.014	0.022
Total	—	—	12,764	0.032	0.050

NOTE:
 gpd = gallons per day; MGD = million gallons per day; cfs = cubic feet per second; sf = square feet

SOURCE: ESA, 2019. Generation rates are based off of AECOM, 2019. *Sewer Area Study Inglewood Basketball and Entertainment Center*. April 30, 2019.

The following discussion presents the existing wastewater infrastructure at the Project Site.

Arena Site

The Arena Site is served by the City’s 8-inch-diameter sewer lines located within South Prairie Avenue, West 102nd Street, and West Century Boulevard. In addition, LACSD’s 15-inch-diameter Orange Trunk Sewer Line is located within South Doty Avenue, east of the Arena Site.

⁵⁶ In 2015, the Metropolitan Water District of Southern California and LACSD announced a joint proposal to add Advanced Wastewater Treatment facilities to the JWPCP that would meet recycled water quality standards, and could result in the reuse of up to 168,000 AFY of wastewater. Under this program, water would be purified at the plant and then injected or spread into local groundwater basins.

West Parking Garage Site

The West Parking Garage Site is served by the City's existing 8-inch-diameter sewer lines located within West Century Boulevard, West 101st Street, West 102nd Street, and South Prairie Avenue. The LACSD's 30-inch-diameter Prairie Avenue Trunk Sewer is located northwest of the West Parking Garage Site, at the intersection of West Century Boulevard and South Flower Street. The Prairie Avenue Trunk Sewer follows west along West Century Boulevard before turning south along Freeman Avenue, west of the Project Site.

East Transportation and Hotel Site

The East Transportation and Hotel Site is served by LACSD's 15-inch-diameter Orange Trunk Sewer line located north and west of the East Transportation and Hotel Site within West Century Boulevard and South Doty Avenue. Additionally, the site is served by the City's 8-inch-diameter sewer line located within West 102nd Street.

Well Relocation Site

The Well Relocation Site is served by the City's 8-inch-diameter sewer line within West 102nd Street.

3.15.6 Adjusted Baseline Environmental Setting

Section 3.15, Utilities and Service Systems, assumes the HPSP Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Accordingly, the wastewater generation associated with the HPSP Adjusted Baseline projects are accounted for as part of the Adjusted Baseline.

Table 3.15-14 details the land uses, daily average, and peak flows for the HPSP Adjusted Baseline projects, which shows that the HPSP Adjusted Baseline projects would generate an estimated peak wastewater flow of 2.38 MGD. This estimate conservatively assumes that no wastewater is currently being generated at the HPSP area under existing conditions.

The JWPCP currently provides treatment for a peak flow of 330 MGD, with a capacity of 400 MGD. With the HPSP Adjusted Baseline projects peak flow included as part of the Adjusted Baseline, this analysis reflects that the JWPCP provides treatment for a peak flow of 332.38 MGD of wastewater.⁵⁷

The Sewer Area Study considers the HPSP Inglewood NFL Stadium at Hollywood Park Sewer Area Study findings. The capacities of existing City and LACSD sewer lines were analyzed using the HPSP peak flows and HPSP sewer line extensions,⁵⁸ City and LACSD as-built record plans, and existing peak flows and sewer monitoring data.

⁵⁷ The HPSP peak flow, rather than average flow, was added to existing average flow conditions to provide a conservative analysis.

⁵⁸ HPSP sewer line extension along Hardy and Arbor Vitae is already constructed and taken into account in the Sewer Area Study. No other upgrades are anticipated or planned at the time of this analysis.

**TABLE 3.15-14
 ESTIMATED HOLLYWOOD PARK SPECIFIC PLAN WASTEWATER GENERATION**

Hollywood Park Specific Plan Land Use	Unit Contribution	Daily Average Wastewater Generation Factor (gpd)	Daily Average Flow (gpd)	Peak Flow (2.5 x Average) (MGD)	Peak Flow (cfs)
Stadium ^a	70,000 seats	10 gallons/seat/day	700,000	1.75	2.71
Performance Venue ^a	6,000 seats	10 gallons/seat/day	60,000	0.15	0.23
Retail	518,077 sf	100 gallons/1,000 sf	51,808	0.13	0.20
Office	466,000 sf	200 gallons/1,000 sf	93,200	0.23	0.36
Residential	314 du	156 gallons/du	48,984	0.12	0.19
Total	—	—	953,992	2.38	3.69

NOTE:

gpd = gallons per day; MDG = million gallons per day; cfs = cubic feet per second; sf = square feet; du = dwelling unit

^a The Sewer Area Study differentiates generation rates between the stadium use and the performance venue use. Since the uses of a stadium and a performance venue are similar in nature, the generation rate for both the stadium and the performance venue is the number of seats.

SOURCE: ESA, 2019. Generation rates are based off of AECOM, 2019. *Sewer Area Study Inglewood Basketball and Entertainment Center*. April 30, 2019.

3.15.7 Regulatory Setting

Federal

Clean Water Act

Water quality objectives for all waters of the United States are established under applicable provisions of CWA section 303. The CWA prohibits the discharge of pollutants to navigable waters from a point source unless authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Point sources are defined as any discernible, confined, and discrete conveyance including but not limited to any pipe, ditch, channel, tunnel, well, or vessel from which pollutants are discharged. Nonpoint sources come from many different sources including land runoff, precipitation, drainage, seepage, or hydrologic modification. Because implementation of these regulations has been delegated to the State, additional information regarding this permit is discussed under the “State” subheading, below.

National Pollutant Discharge Elimination System Permits

The NPDES permit system was established in the CWA to regulate municipal and industrial point discharges to surface waters of the US. Each NPDES permit for point discharges contains limits on allowable concentrations of pollutants contained in discharges. Sections 401 and 402 of the CWA contain general requirements regarding NPDES permits. CWA section 307 describes the factors that the US EPA must consider in setting effluent limits for priority pollutants.

The CWA was amended in 1987 to require NPDES permits for non-point source (i.e., stormwater) pollutants in discharges. Stormwater sources are diffuse and originate over a wide area rather than from a definable point. The goal of NPDES stormwater regulations is to improve the quality of stormwater discharged to receiving waters to the “maximum extent practicable” through the use of

structural and non-structural Best Management Practices (BMPs). BMPs can include the development and implementation of various practices including educational measures (workshops informing public of what impacts results when household chemicals are dumped into storm drains), regulatory measures (local authority of drainage facility design), public policy measures, and structural measures (filter strips, grass swales and detention ponds). The NPDES permits that apply to activities in the City of Inglewood are described under local regulations below.

United States Environmental Protection Agency's National Combined Sewer Overflow Control Policy

The US EPA initiated its Combined Sewer Overflow (CSO) Control Policy (40 CFR 122) in April 1994. The CSO Policy provides a national level framework for the control and management of CSOs. The CSO Policy provides guidance regarding how to achieve CWA goals and requirements when faced with management of a CSO.

State

Porter-Cologne Water Quality Control Act

The SWRCB and the Los Angeles RWQCB are delegated authority from the US EPA to implement portions of the CWA, and also implement the state's water quality law, the Porter-Cologne Water Quality Control Act (Porter-Cologne Act). These agencies have established water quality standards that are required by CWA section 303 and the Porter-Cologne Act. The Porter-Cologne Act states that a Water Quality Control Plan, or Basin Plan, will consist of beneficial uses, water quality objectives, and a program of implementation for achieving water quality objectives. A Basin Plan, prepared by the Los Angeles RWQCB, establishes water quality numerical and narrative standards and objectives for rivers and their tributaries within the area subject to the Basin Plan. In cases where the Basin Plan does not contain a standard for a particular pollutant, other criteria apply such as US EPA water quality criteria developed under CWA section 304(a). The Basin Plan that applies to the Project Site is described under local regulations below.

Local

City of Inglewood General Plan

The City of Inglewood General Plan Conservation Element, adopted on October 21, 1997, addresses the plan for conservation, development and utilization of natural resources found within the jurisdiction of the City. Chapter IV of the Conservation Element addresses the City's wastewater system. While the Conservation Element details the City's concerns related to effluent contaminating the ocean, no specific goals or policies are stated that are relevant to the Proposed Project.

Municipal Separate Storm Sewer System Permit

Los Angeles County and 84 incorporated cities, including the City of Inglewood, have a joint Municipal Separate Storm Sewer System NPDES permit (MS4 Permit) (Permit Order No. R4-2012-0175, NPDES Permit No. CAS004001) that was granted on November 8, 2012, and most recently modified in July 2018. The MS4 Permit is intended to implement BMPs to reduce

pollutants in stormwater discharges to the maximum extent practicable. The permittees listed under the joint permit have the authority to develop, administer, implement, and enforce storm water management programs within their own jurisdiction. On June 27, 2013, the cities of El Segundo, Hawthorne, Inglewood, Carson, Lawndale, Lomita, Los Angeles (including the Port of Los Angeles), and the Los Angeles County Flood Control District formed the Dominguez Channel Watershed Management Area Group to develop a collaborative approach to meet the requirements of the MS4 Permit.

Urban storm water runoff is defined in the MS4 Permit as including stormwater and dry weather flows from a drainage area that reaches a receiving water body or subsurface. The permit regulates the discharge of all wet and dry weather urban storm water runoff within the County of Los Angeles (with the exception of the City of Long Beach). Part VI.C of the Los Angeles County MS4 permit allows permittees the flexibility to develop Watershed Management Programs (WMPs) or Enhanced Watershed Management Programs (EWMPs) to implement the requirements of the permit on a watershed scale through customized strategies, control measures, and BMPs. The Dominguez Channel Watershed Management Area Group developed a EWMP that was approved by the Los Angeles Water Board on February 26, 2016.⁵⁹ The EWMP includes water quality priorities for the Dominguez Channel Watershed Management Area, watershed control measures consisting of both structural and non-structural BMPs, financial strategies, and legal authority (permittees have the necessary legal authority to implement the BMPs identified in the EWMP or the legal authority exists to compel implementation of the BMPs).

Water Quality Control Plan: Los Angeles Region Basin Plan

The Los Angeles Region Basin Plan is designed to preserve and enhance water quality and protect beneficial uses of all regional waters. Specifically, the Basin Plan designates beneficial uses for surface and ground waters, sets narrative and numerical objectives that must be attained or maintained to protect designated beneficial uses, and describes implementation programs to protect all waters in the region. The Basin Plan incorporates all applicable state and regional board plans and policies and other pertinent water quality policies and regulations. The Basin Plan is a resource for the regional board and others who use water and discharge wastewater in the Los Angeles Region, and provides valuable information to the public about local water quality issues.

3.15.8 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to wastewater generation and treatment. The following thresholds of significance have been adapted from CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Result in a determination by the LACSD, which would serve the project, that it does not have adequate capacity to serve the project's projected demand in addition to LACSD's existing commitments; or

⁵⁹ Dominguez Channel Watershed Management Area Group, 2015. *Enhanced Watershed Management Program*.

2. Require or result in the relocation or construction of new or expanded wastewater treatment facilities, the construction or relocation of which could cause significant environmental effects.

Methodology and Assumptions

The following impact analysis evaluates the potential for the Proposed Project to result in changes to existing infrastructure, as well as supply and demand relating to wastewater resources.

A Sewer Area Study was prepared for the Proposed Project (Appendix L), and its analysis and findings are integrated into the analysis below. It is assumed that all aspects of the Proposed Project would comply with all applicable laws, regulations, design standards, and plans.

As detailed in the Sewer Area Study, the capacities of existing City and LACSD sewer lines were analyzed using City and LACSD as-built record plans, existing peak flows and sewer monitoring data, and the HPSP Inglewood NFL Stadium at Hollywood Park Sewer Area Study⁶⁰ findings.

The Proposed Project's wastewater generation, which is the basis for demand on treatment capacity, is based on the Proposed Project's estimated water demand of 0.056 MGD (63.0 AFY), described under Impact 3.15-2, above. Typically, wastewater generation is assumed to be 85 to 95 percent of potable water demand. For conservative planning purposes, wastewater generation was assumed to be equal to the potable water demand, or 0.056 MGD.

Wastewater engineering and design for sewer collection and conveyance systems are based on peak flow capacities, or two and half times the potable water inflows. The Project Site is subdivided into four tributary areas, which are based on the four locations where the Project proposes to connect to the sewer lines. These points of connection include: (1) the City's sewer line at South Prairie Avenue and West 102nd Street (point of connection 1); (2) the City's sewer line at West 102nd Street west of South Doty Avenue (point of connection 2); (3) the LACSD Prairie Trunk Sewer at Freeman Avenue and 103rd Street (point of connection 3); and (4) the City's sewer line at West 102nd Street at a manhole east of South Doty Avenue (point of connection 4). Parking structures are not part of the calculations because these facilities would have negligible wastewater generation.

Table 3.15-15 details the main points of connection to the existing sewer system, the daily average and peak flows to each point of connection, and whether there is sufficient capacity to serve the Proposed Project.

⁶⁰ AECOM, 2019. *Sewer Area Study Inglewood Basketball and Entertainment Center*, Appendix L, April 30, 2019.

**TABLE 3.15-15
 ESTIMATED PROPOSED PROJECT WASTEWATER GENERATION AND SEWER CAPACITY SUMMARY**

Point of Connection	Proposed Land Use	Unit Contribution	Daily Average Wastewater Generation Factor (gpd)	Project Daily Average Flow (gpd)	Project Peak Flow (2.5 x Average) (MGD)	Project Peak Flow (cfs)	Pipeline Segment Diameter	Total Pipe Capacity ^a (cfs)	Cumulative Contributing Flow (cfs) ^b	Cumulative Contributing Flow (MGD) ^b	Capacity? ^b

Impacts and Mitigation Measures

Impact 3.15-5: Operation of the Proposed Project could result in a determination by LACSD, which would serve the project, that it does not have adequate capacity to serve the project's projected demand in addition to LACSD's existing commitments. (Less than Significant)

Construction

Construction of the Proposed Project would not result in additional wastewater discharges to the JWPCP. Use of the existing on-site uses within the Arena Site (i.e., the existing restaurant, hotel, warehouse and light manufacturing facilities, and commercial catering business) would cease prior to commencement of construction, which would, in turn, eliminate existing wastewater generation. All construction workers would use on-site portable restrooms. No other wastewater would be generated on site that would require treatment during construction. Therefore, because no wastewater would be generated during construction, **no impact** would occur related to the capacity of the JWPCP.

Operation

The Proposed Project would increase wastewater generation at the Project Site with the addition of the Arena, practice facility, sports medicine clinic, team offices, retail/restaurants, community space, outdoor plaza, and hotel uses. The Proposed Project would have four points of connection to the existing sewer systems. These points of connection include connections to the City's sewer line at South Prairie Avenue and West 102nd Street (point of connection 1), the City's sewer line at West 102nd Street west of South Doty Avenue (point of connection 2), the LACSD Prairie Trunk Sewer at Freeman Avenue and 103rd Street (point of connection 3), and the City's sewer line at West 102nd Street east of South Doty Avenue (point of connection 4). According to the Sewer Area Study, the existing 8-inch-diameter sewer line along West 102nd Street would be removed or abandoned in the approximately 900-foot linear section of the street that would be vacated to accommodate construction of the Proposed Project. New 8-inch- and 10-inch-diameter pipelines along West 102nd Street would be constructed to serve the proposed uses and their laterals.

Ultimately, the northwestern portion of the Arena Site, which includes the plaza retail and restaurant uses, would drain to City sewer lines at South Prairie Avenue and West 102nd Street. The eastern portion of the Arena Site, which would include 20 percent of the wastewater generated by the Arena, would drain to the existing sewer line along West 102nd Street and then to the Orange Avenue Trunk Sewer along South Doty Avenue. The central and southern portion of the Arena Site, which includes 80 percent of the wastewater generated by the Arena, the practice facility, office space, sports medicine clinic, and community spaces, would drain to the Prairie Avenue Trunk Sewer along Freeman Avenue. In addition, wastewater generated by the proposed hotel use located on the East Transportation and Hotel Site would drain to the City's sewer line at West 102nd Street at the manhole east of South Doty Avenue.

All sewer point of connections that would serve the Project Site are sized between 8 inches and 12 inches in diameter. According to the Sewer Area Study, and as detailed in Table 3.15-15, the sewer mains that would serve the Proposed Project would meet the Los Angeles County capacity

standards of no more than half full for mains under 15-inch-diameter and no more than three-quarters full for mains with a diameter of 15 inches and larger. More specifically:

- The Proposed Project peak wastewater flows would contribute 0.10 cubic feet per second (cfs) (or 0.07 MGD) to the City's sewer line at point of connection 1, which does not exceed the available capacity of 0.17 MGD⁶¹. Therefore, point of connection 1 would have a remaining capacity of 0.10 MGD;
- The Proposed Project peak wastewater flows would contribute 0.14 cfs (or 0.09 MGD) to point of connection 2, which does not exceed the available capacity of 0.11 MGD. In addition, existing structures on the Project Site have a current existing peak flow of 0.16 MGD. Therefore, the reduction in proposed flow to point of connection 2 would result in additional capacity of 0.07 MGD, which, in turn, results in a remaining capacity of 0.18 MGD;
- The Proposed Project peak wastewater flows would contribute approximately 0.77 cfs (or 0.50 MGD) to point of connection 3, which does not exceed the available capacity of 2.53 MGD. In addition, existing structures on the Project Site have a current existing peak flow of 0.04 MGD and proposed upstream projects would generate a future peak flow of 0.21 MGD. This results in remaining capacity of 1.78 MGD for point of connection 3; and
- The Proposed Project peak wastewater flows would contribute 0.07 cfs (or 0.05 MGD) to point of connection 4, which does not exceed the available capacity of 0.13 MGD. Therefore, point of connection 4 would have a remaining capacity of 0.06 MGD.

An existing City 8-inch-diameter sewer line along West 103rd Street would be upsized to a 12-inch-diameter sewer line and would extend to the Project Site, with a capacity of 0.83 cfs (or 0.54 MGD). With proposed improvements along West 103rd Street to upsize the existing 8-inch-diameter sewer line to a 12-inch-diameter sewer line extended to the Project Site, the existing City collector sewer lines and LACSD sewer system would have adequate capacity to serve the Proposed Project.

The wastewater generated by the Proposed Project would be treated at the JWPCP, which has a maximum treatment capacity of 400 MGD and currently provides treatment for a peak flow of 330 MGD. Including peak flows of the Adjusted Baseline projects, the JWPCP provides treatment for a peak flow of 332.38 MGD. Thus, the JWPCP has the capacity to treat an additional 67.62 MGD of peak wastewater flows. The Proposed Project water demand is estimated to be 0.056 MGD.⁶² Peak wastewater flows from the Proposed Project are assumed to be 0.14 MGD,⁶³ which is two and half times the Proposed Project's water demand estimate of 0.056 MGD. Assuming peak wastewater flows of 0.14 MGD from the Proposed Project this would be less than 1 percent of the available capacity of the JWPCP. Because the surrounding

⁶¹ Estimated capacity for the City's sewer line at South Prairie Avenue and West 102nd Street is 0.23 MGD. Existing peak flow shows an existing peak of 0.06 MGD. This results in an available capacity of 0.17 MGD.

⁶² Stetson Engineers, 2019. Review of Water Demands Memo and Todd Groundwater, 2019. *Water Supply Assessment: Golden State Water Company – Southwest, Inglewood Basketball and Entertainment Center*. July 2019. [EIR Appendix M].

⁶³ Stetson Engineers, 2019. Review of Water Demands Memo and Todd Groundwater, 2019. *Water Supply Assessment: Golden State Water Company – Southwest, Inglewood Basketball and Entertainment Center*. July 2019. [EIR Appendix M].

sewer mains are sized to accommodate peak wastewater flows and the JWPCP has adequate capacity to serve the Proposed Project, this impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.15-6: Operation of the Proposed Project could require or result in the relocation or construction of new or expanded wastewater treatment facilities, the construction or relocation of which could cause significant environmental effects. (Less than Significant)

The Proposed Project would result in an increase in wastewater generation at the Project Site. The Proposed Project would include new sewer lines to connect to the existing sewer lines in surrounding streets. As previously explained, wastewater generated by the Proposed Project would be treated at the JWPCP, which has a maximum treatment capacity of 400 MGD. The JWPCP currently provides treatment for a peak flow of 330 MGD, and with the peak flow from the HPSP Adjusted Baseline projects included, the JWPCP provides treatment for a peak flow of 332.38 MGD of wastewater. Thus, the JWPCP has the capacity to treat an additional 67.62 MGD of wastewater. The Proposed Project would generate an average of 0.056 MGD⁶⁴ wastewater or peak flows of up to 0.14 MGD. In either case wastewater generation would be less than 1 percent of the JWPCP's available capacity. Therefore, the JWPCP would have sufficient capacity to treat all wastewater generated from the Proposed Project. Because there would be adequate capacity to treat wastewater from the Proposed Project, no new or expanded wastewater treatment facilities would be required, and, thus, this impact would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to the JWPCP is the drainage basin of wastewater that is received for treatment at the JWPCP. The geographic scope of analysis for City and LACSD sewer and trunk lines are the network of those sewer lines.

⁶⁴ Stetson Engineers, Inc., *Inglewood Basketball and Entertainment Center Project Review of Water Demands*, May 10, 2019. Todd Groundwater, *Water Supply Assessment: Golden State Water Company – Southwest, Inglewood Basketball and Entertainment Center*. July 2019. (see Appendix M).

Impact 3.15-7: Operation of the Proposed Project, in conjunction with other cumulative development that would be served by the JWPCP, could cumulatively result in a determination by LACSD that it does not have adequate capacity to serve the project’s projected demand in addition to LACSD’s existing commitments. (Less than Significant)

Cumulative projects (listed in Section 3.0, Introduction to the Analysis, Table 3.0-2), in conjunction with other cumulative development served by the JWPCP, would increase wastewater generation throughout the region. Of the jurisdictions listed in Table 3.0-2, Cumulative Projects List, the cities of Inglewood, Hawthorne and El Segundo east of Sepulveda Boulevard are served by the JWPCP. Table 3.15-16 shows the estimated wastewater generation that would be produced by the cumulative projects in these cities, based on land use.

Approximately 5.86 MGD of wastewater requiring treatment at the JWPCP would be generated by cumulative projects under peak flow conditions. As previously detailed, the JWPCP has a maximum treatment capacity of 400 MGD, and currently provides treatment for a peak flow of 332.38 MGD of wastewater (including the HPSP Adjusted Baseline projects). Therefore, the JWPCP would have capacity to treat both the Proposed Project and cumulative projects and can accommodate this projected growth of the cities it serves.

NOTE:

gpd = gallons per day; MDG = million gallons per day; sf = square feet; du = dwelling unit

SOURCE: ESA, 2019. Generation rates are based off of AECOM, 2019. *Sewer Area Study Inglewood Basketball and Entertainment Center*. April 30, 2019.

In addition, similar to the Proposed Project, all cumulative projects within the JWPCP service area would be required to verify to coordinate with their respective wastewater treatment providers to ensure that existing capacity exists to convey and treat the wastewater generated by the new developments prior to implementation. Based on the above considerations, the Proposed

Project, in conjunction with cumulative development within the City and LACSD sewer and trunk line service area, implementation of the Proposed Project would not result in a determination by LACSD, which would serve the Project, that it does not have adequate capacity to serve the Project's projected demand in addition to LACSD's existing commitments. Therefore, the cumulative impact would be **less than significant**

Mitigation Measures

None required.

Impact 3.15-8: Operation of the Proposed Project, in conjunction with other cumulative development, could require or result in the relocation or construction of new or expanded wastewater treatment facilities, the construction or relocation of which could cause significant environmental effects. (Less than Significant)

The geographic scope for cumulative impacts on City and LACSD wastewater services is the network of City and LACSD sewer lines running to the JWPCP. The JWPCP treats wastewater generated throughout the region, including for the cities of Inglewood, Hawthorne, and El Segundo east of Sepulveda Boulevard. Table 3.15-16 shows the wastewater generation that would be produced by the cumulative projects in cities served by the JWPCP. The cumulative projects would generate approximately 3 MGD requiring treatment at the JWPCP under peak flows. The JWPCP collects a peak flow of 332.38 MGD (including the HPSP Adjusted Baseline projects), leaving a remaining capacity of 67.62 MGD. The Proposed Project (0.14 MGD) plus the cumulative projects (5.86 MGD) would generate a total of 6.0 MGD under peak flow conditions. Therefore, the JWPCP would have capacity to treat both the Proposed Project and cumulative projects.

In addition, similar to the Proposed Project, other cumulative projects within the JWPCP service area would be required to verify with LACSD and City engineers that existing capacity exists to convey and treat the wastewater generated by the new developments prior to implementation. Based on the above considerations, the Proposed Project, in conjunction with cumulative development within the City and LACSD sewer and trunk line area, implementation of the Proposed Project would not require new or expanded wastewater treatment facilities. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Storm Drainage Conveyance and Treatment

3.15.9 Environmental Setting

Existing Soil Drainage

The Project Site currently consists of both pervious and impervious surfaces, including commercial buildings, a hotel, a fast-food restaurant, and large portions of vacant land. The Project Site is currently made up of approximately 15 percent impervious surfaces and 85 percent pervious surfaces.

Preliminary investigations of the Project Site indicate that the site's native soil characteristics have poor drainage with a low infiltration rate.^{65,66} According to the Los Angeles County Guidelines for LID Stormwater Infiltration, minimum standard for soil infiltration is 0.3 inches per hour.⁶⁷ Preliminary percolation tests were conducted at five selected locations at the Project Site. Based on the results, infiltration rates for the soils in the upper 10 feet range from 0.32 to 3.52 inches per hour. However, the deeper subsurface native soils at the Project Site consist predominately of clayey soils with estimated infiltration rates lower than 0.3 inches per hour and with little or no connectivity to permeable soil horizons.

These characteristics indicate that infiltration is largely infeasible at the Project Site, and that the Project Site currently provides very little percolation of soils. Thus, under existing conditions, stormwater reaching the Project Site does not percolate, and existing drainage from the Project Site flows to adjacent off-site storm drain facilities and ultimately into the City maintained storm drain mains located along all streets surrounding the Project Site.

Existing Drainage Infrastructure at the Project Site

Arena Site

Storm drainage facilities that serve the Arena Site include a 60-inch-diameter storm drain pipeline within South Prairie Avenue and a storm drain pipeline within West 102nd Street which bisects the Arena Site in an east–west direction.⁶⁸ In addition, an existing catch basin is located at the intersection of West 102nd Street and South Prairie Avenue.

West Parking Garage Site

The West Parking Garage Site is currently undeveloped, with West 101st Street crossing through the site in an east–west direction. This portion of the Project Site includes a 24-inch-diameter storm drain pipeline that begins in West 101st Street, travels north to West Century Boulevard,

⁶⁵ AECOM, 2019. *Inglewood Basketball & Entertainment Center Project Low-Impact Development (LID) Report*. May 2, 2019. p. 2.

⁶⁶ AECOM, 2018. *Preliminary Geotechnical Investigation*. September 14, 2018. p. 34.

⁶⁷ County of Los Angeles Department of Public Works, 2014. *Administrative Manual: Guidelines for Design, Investigation, and Reporting Low-Impact Development Stormwater Infiltration*. p. 2.

⁶⁸ AECOM, 2015. *Existing Conditions Plan Sheet C-101*.

and turns east along West Century Boulevard. This portion of the Project Site also utilizes the abovementioned 60-inch-diameter storm drain pipeline within South Prairie Avenue.

East Transportation and Hotel Site

The East Transportation and Hotel Site is currently undeveloped. Storm drainage pipelines are located within South Doty Avenue. In addition, a 54-inch-diameter storm drainage pipeline crosses under parcels to the west of the East Transportation and Hotel Site, extending north through West Century Boulevard and south through West 102nd Street.

Well Relocation Site

The Well Relocation Site is located east of the Arena Site and would contain a city-owned and operated potable water well. The Well Relocation Site is currently undeveloped. This portion of the Project Site includes storm drainage pipelines within West 102nd Street and South Doty Avenue, detailed above.

Existing Runoff at the Project Site

The existing site runoff is discharging to surrounding public streets where it is collected by the existing storm drain system. There are currently no existing on-site storm drain systems in place. The existing runoff from the Project Site to existing storm drain systems is as follows: (1) Arena Site runoff of 18.4 cfs flows to storm drain lines located on South Prairie Avenue; (2) West Parking Garage Site runoff includes 2.6 cfs to storm drain lines located on West Century Boulevard and 4.8 cfs to storm drain lines east of Doty Avenue; and (3) East Transportation and Hotel Site runoff of 6.3 cfs flows to storm drain lines east of Doty Avenue.⁶⁹

3.15.10 Adjusted Baseline Environmental Setting

Section 3.15, Utilities and Service Systems, assumes the HPSP Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis.

In its current condition, a portion of the HPSP area is under construction, largely resulting in pervious exposed soils, haul roads, and some paved areas. Compared to the area's previous use as a horse racetrack with large expanses of paved surface parking, and current construction conditions, the HPSP Adjusted Baseline projects will add impervious surfaces. At the time of the opening of the Proposed Project, the permeability of the HPSP Adjusted Baseline projects area would be limited to landscaped areas, designed open space and stormwater management facilities (Lake Park), and unpaved surfaces which may be used for parking on an interim basis. These features would be designed to reduce runoff and treat pollutants of concern in accordance with NPDES stormwater regulations, discussed further below.

Drainage infrastructure at the HPSP area associated with the previous horse racetrack is currently being rerouted and replaced as necessary and additional drainage infrastructure will be

⁶⁹ AECOM, 2019. *Inglewood Basketball & Entertainment Center Project Preliminary Hydrology Report*. May 1, 2019. pp. 3-4.

constructed to accommodate the new HPSP Adjusted Baseline projects. New drainage infrastructure includes various on-site drains, open-channel drainage, an off-site bypass north of the HPSP area, catch basins, vegetated bio-retention areas, and the Lake Park stormwater treatment system through which runoff from developed portions of the HPSP Adjusted Baseline projects area will be directed. The HPSP Adjusted Baseline projects will include BMPs as required by the site-specific Stormwater Pollution Prevention Plan (SWPPP) to reduce runoff flows and treat runoff water leaving the site, in accordance with federal, state, and local regulations. As a result of the implementation of BMPs and compliance with NPDES stormwater regulations within the HPSP area, under the Adjusted Baseline stormwater flows in the vicinity of the Project Site will remain similar to existing conditions.

3.15.11 Regulatory Setting

Federal

National Pollutant Discharge Elimination System Permits

The NPDES permit system was established in the CWA to regulate municipal and industrial point discharges to surface waters of the US. Each NPDES permit for point discharges contains limits on allowable concentrations of pollutants contained in discharges. Sections 401 and 402 of the CWA contain general requirements regarding NPDES permits. CWA section 307 describes the factors that the US EPA must consider in setting effluent limits for priority pollutants.

The CWA was amended in 1987 to require NPDES permits for non-point source (i.e., stormwater) pollutants in discharges. Stormwater sources are diffuse and originate over a wide area rather than from a definable point. The goal of NPDES stormwater regulations is to improve the quality of stormwater discharged to receiving waters to the “maximum extent practicable” through the use of structural and non-structural BMPs. BMPs can include the development and implementation of various practices including educational measures (workshops informing public of what impacts results when household chemicals are dumped into storm drains), regulatory measures (local authority of drainage facility design), public policy measures, and structural measures (filter strips, grass swales and detention ponds). The NPDES permits that apply to activities in the City of Inglewood are described under local regulations below.

State

General Construction Activity Stormwater Permit

In accordance with NPDES regulations, to minimize the potential effects of construction runoff on receiving water quality, the State requires that any construction activity affecting 1 acre or more obtain coverage under a General Construction Activity Stormwater Permit (General Construction Permit). The current General Construction Permit is the NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Order No. 2009-0009-DWQ, NPDES No. CAS000002, effective July 1, 2010. General Construction Permit applicants are required to prepare and implement a SWPPP which includes implementing BMPs to reduce construction effects on receiving water quality by implementing erosion and

sediment control measures and reducing or eliminating non-stormwater discharges. Examples of typical construction BMPs in SWPPPs include, but are not limited to: using temporary mulching, seeding, or other suitable stabilization measures to protect uncovered soils; storing materials and equipment so as to ensure that spills or leaks cannot enter the storm drain system or surface water; developing and implementing a spill prevention and cleanup plan; and installing sediment control devices such as gravel bags, inlet filters, fiber rolls, or silt fences to reduce or eliminate sediment and other pollutants from discharging to the City drainage system or receiving waters.

Construction activity that results in soil disturbances of less than 1 acre is subject to the General Construction Permit if there is potential for significant water quality impairment resulting from the activity as determined by the RWQCB.

Local

City of Inglewood General Plan

The City of Inglewood General Plan Conservation Element, adopted on October 21, 1997, addresses the plan for conservation, development and utilization of natural resources found within the jurisdiction of the City. Chapter IV of the Conservation Element addresses the City's storm drain system. While the Conservation Element details the City's concerns related to pollutants entering the storm drainage system and contaminating the coastal and ocean environment, no specific goals or policies are stated that are relevant to the Proposed Project.

Municipal Separate Storm Sewer System Permit

The City of Inglewood, along with Los Angeles County and its 83 other incorporated cities, operate pursuant to a joint Municipal Separate Storm Sewer System NPDES permit (MS4 Permit) intended to implement BMPs to reduce pollutants in stormwater discharges to the maximum extent practicable. Refer to Section 3.15.7, above, for a more detailed discussion of the City's MS4 Permit.

Standard Urban Stormwater Mitigation Plan and City of Inglewood Municipal Code Low-Impact Development Requirements

In 2000, the Standard Urban Stormwater Mitigation Plan (SUSMP) was approved by the Los Angeles RWQCB as part of the MS4 program to address stormwater pollution from new construction and redevelopment. The SUSMP contains a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control peak flow discharge, and reduce post-project discharge of pollutants from stormwater conveyance systems. Based upon land type, the SUSMP defines the types of practices that must be included and issues that must be addressed as appropriate to the development type and size.

One of the most important requirements of the SUSMP is the specific sizing criteria for stormwater treatment BMPs for new development and significant redevelopment projects. In 2015, the City replaced the SUSMP with City of Inglewood Municipal Code section 10-208 (Low-Impact Development Requirements for New Development and Redevelopment). This portion of the Municipal Code builds on the SUSMP and establishes requirements for construction activities and

facility operations of development projects to comply with the current MS4 Permit. These include requirements to lessen the water quality impacts of development by using smart growth practices and integrate LID practices and standards for stormwater pollution mitigation

County of Los Angeles Low-Impact Development Standards Manual

In 2014, the County of Los Angeles prepared the LID Standards Manual to comply with the requirements of the NPDES MS4 Permit for stormwater and non-stormwater discharges from the MS4 within the coastal watersheds of Los Angeles County.⁷⁰ The LID Standards Manual provides guidance for the implementation of stormwater quality control measures in new development and redevelopment projects in unincorporated areas of the County with the intention of improving water quality and mitigating potential water quality impacts from stormwater and non-stormwater discharges. The City of Inglewood implements these standards for projects within the city.

3.15.12 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to storm drainage capacity and conveyance. The following threshold of significance has been adapted from CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Require or result in the relocation or construction of new or expanded storm water drainage facilities, the construction or relocation of which could cause significant environmental effects.

Methodology and Assumptions

The following impact analysis evaluates the potential for the Proposed Project to result in changes to existing infrastructure and capacity relating to stormwater drainage and conveyance. It is assumed that all aspects of the Proposed Project would comply with all applicable laws, regulations, design standards, and plans. An analysis of impacts to hydrology, water quality, and groundwater is included in Section 3.9, Hydrology and Water Quality.

Impacts and Mitigation Measures

Impact 3.15-9: Construction and operation of the Proposed Project could have the potential to require or result in the relocation or construction of new or expanded storm water drainage facilities or expansion of existing facilities, the construction or relocation of which could have the potential to cause significant environmental effects. (Less than Significant with Mitigation)

Construction

Existing drainage from the Project Site flows to adjacent off-site City-maintained storm drain facilities and ultimately into storm drain mains located along all streets surrounding the Project Site. Construction activities, including grading, excavation, and installation of on-site drainage

⁷⁰ County of Los Angeles Department of Public Works, 2014. *Low-Impact Development Standards Manual*. February 2018.

systems, would alter the drainage pattern of the Project Site potentially increasing runoff flows into the existing City drainage system.

In compliance with Municipal Code section 10-208, the project applicant would be required to prepare and submit to the City an LID Plan, which would establish LID standards and practices for stormwater pollution mitigation consistent with the County's LID Standards Manual. The LID Plan would demonstrate the Proposed Project's compliance with the MS4 Permit.

Before construction could begin, a SWPPP would be developed and a Notice of Intent (NOI) filed with the Los Angeles RWQCB. After the Los Angeles RWQCB and the City of Inglewood confirm the applicability of the General Construction Permit, and approve the LID Plan and the SWPPP, construction could commence. Construction would thereafter be required to implement and maintain the BMPs outlined in the LID Plan and SWPPP. Through the building inspection process, the City would verify and enforce the implementation of the LID Plan and SWPPP

With implementation of BMPs as required by the LID Plan and SWPPP, runoff discharged from the Project Site would be reduced. The rate of runoff flows leaving the Project Site would be reduced through implementation of typical construction BMPs including, but not limited to, silt fences, fiber rolls, compost blankets, avoiding heavy grading and earthwork operations during the rainy season, and incorporating landscaping as early as possible. By limiting and controlling runoff, the flow of water to stormwater drainage systems would be reduced.

The expansion of stormwater drainage facilities at the Project Site would be a component of the Proposed Project itself, the construction of which is addressed as part of the Proposed Project. The environmental effects of construction of the Proposed Project stormwater drainage facilities is addressed in environmental analyses in other sections of this Draft EIR, such as in Sections 3.4, Cultural and Tribal Cultural Resources; 3.6, Geology and Soils; 3.8, Hazards and Hazardous Materials; 3.9, Hydrology and Water Quality; and 3.11, Noise and Vibration. Compliance with the MS4 permit regulations, NPDES General Construction Permit, and Inglewood Municipal Code regulations as outlined above would reduce runoff discharged from the Project Site during construction of the Proposed Project. While these regulatory instruments are designed to ensure that construction projects result in reduced runoff, because final stormwater drainage improvement plans have not yet been reviewed and approved by the City or Los Angeles RWQCB, this impact would be considered **potentially significant**.

Operation

As detailed above, preliminary engineering investigations of the Project Site indicate that the site's native soil characteristics have poor drainage with low infiltration rates.^{71,72} Under existing conditions, stormwater reaching the Project Site does not percolate, and existing drainage from the Project Site flows to adjacent off-site storm drain facilities and ultimately in to the City

⁷¹ AECOM, 2019. *Inglewood Basketball & Entertainment Center Project Low-Impact Development (LID) Report*. May 2, 2019. p. 2.

⁷² AECOM, 2018. *Preliminary Geotechnical Report*. September 14, 2018. p. 34.

maintained storm drain mains located along all streets surrounding the Project Site. While the Project Site would add impervious surfaces, drainage would continue to run into surrounding drainage infrastructure, similar to existing conditions. In addition, as detailed in Section 3.9, Hydrology and Water Quality, the Proposed Project would include the following on-site drainage features and infrastructure improvements at the Arena Site, West Parking Garage Site, and East Transportation and Hotel Site, all of which would connect to existing storm drains within surrounding streets, described under Environmental Setting, above.

Arena Site

Under the Proposed Project, an approximately 350-foot linear section of West 102nd Street from South Prairie Avenue to a line approximately 335 feet west of South Doty Avenue would be vacated and the Arena would be built over the street. The Proposed Project would construct new site access roads along the periphery of the Arena. The existing catch basin at the intersection of West 102nd Street and South Prairie Avenue would be removed, along with the existing storm drain line within West 102nd Street. Stormwater pipelines, storm drains, and storm drain overflow pipes would be installed within and along the proposed site access roads.

The new stormwater pipelines within the proposed site access roads would connect to the existing storm drain lines within South Prairie Avenue. Grate opening catch basins, stormwater pipelines, and storm drain overflow pipelines would also be installed within the northern portion of the Arena Site to accommodate the public plaza, outdoor stage, community space, and retail/restaurant uses. Bio-filtration systems would be installed throughout the Arena Site, including but not limited to, along South Prairie Avenue, along the proposed site access roads, and within the public plaza space.

West Parking Garage Site

With implementation of the Proposed Project, the proposed parking garage would be constructed over a portion of West 101st Street, and new site access roads would be constructed along the periphery of the parking garage to redirect traffic. An underground precast detention and pretreatment system would be installed west of the parking garage under the westerly proposed site access road. Stormwater pipelines and a side opening catch basin would be installed within West 101st Street to connect the proposed detention and pretreatment system to the existing storm drain line within West 101st Street. Stormwater pipelines, storm drain overflow pipe, and bio-filtration systems would be installed within the proposed periphery site access roads. In addition, a trench drain would be installed at the southwest corner of the West Parking Garage Site.

East Transportation and Hotel Site

Under the Proposed Project, stormwater pipelines and storm drain overflow pipe would be installed along the boundary of the East Transportation and Hotel Site. An underground precast detention and pretreatment system would be installed at the southwest corner of the East Transportation and Hotel Site. Stormwater pipelines would be installed within West 102nd Street to connect the proposed detention and pretreatment system to existing storm drain line within West 102nd Street.

Well Relocation Site

Under the Proposed Project, no storm drain infrastructure improvements would occur on the Well Relocation Site.

Analysis

As discussed above, under existing conditions, stormwater reaching the Project Site does not percolate, and existing drainage from the Project Site flows to adjacent off-site storm drain facilities and ultimately in to the City maintained storm drain mains located along all streets surrounding the Project Site. In particular, existing runoff from the Project Site to existing storm drain systems is as follows: (1) Arena Site runoff of 18.4 cfs flows to storm drain lines located on South Prairie Avenue; (2) West Parking Garage Site runoff includes 2.6 cfs to storm drain lines located on West Century Boulevard and 4.8 cfs to storm drain lines east of Doty Avenue; and, (3) East Transportation and Hotel Site runoff of 6.3 cfs flows to storm drain lines east of Doty Avenue.

Under the Proposed Project, portions of West 102nd Street and West 101st Street that cross the Project Site would be vacated and constructed over, which would include the removal of drainage features (including stormwater pipelines and an existing catch basin) within these roadways. The Proposed Project would include new site access roads around the periphery of the Arena Site and West Parking Garage Site, which would include new stormwater pipelines, storm drains, and storm drain overflow pipes. These features would also be constructed at the East Transportation and Hotel Site. In addition, the Proposed Project would include grate opening catch basins, side opening catch basins, underground precast detention and pretreatment systems, and bio-filtration systems throughout the Project Site. All proposed on-site drainage features would be required to be approved by City engineers and comply with local regulations.

The Proposed Project would be required to comply with all applicable drainage regulations and standards, including the City's Municipal Code and the County's LID Standards Manual. An LID Report was prepared for the Proposed Project, and acts as the Proposed Project's preliminary stormwater drainage plan. According to the LID Report, the Proposed Project would utilize bio-filtration planters and bio-filtration systems to treat the stormwater runoff. Runoff would be directed from drainage areas to on-site bio-filtration plants and bio-swales, slowing the rate of runoff and in turn slowing the amount of water entering the stormwater drainage system. The bio-filtration systems are designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to mimic pre-developed conditions. As shown in **Table 3.15-17**, based on a design storm 24-hour rain event, the Proposed Project would include sufficient bio-filtration systems to treat stormwater run-off from the Project Site.

The expansion of stormwater drainage facilities at the Project Site are a component of the Proposed Project itself, the construction of which and their environmental effects is considered throughout the EIR. With construction of on-site drainage features and infrastructure improvements that would connect to existing storm drains within surrounding streets, along with implementation of regulations and BMPs, the Proposed Project would not create or contribute

runoff water that would exceed the capacity of existing or planned stormwater drainage systems. According to the LID Report, drainage infrastructure at the Project Site would be designed to discharge stormwater at a rate intended to mimic pre-developed conditions.⁷³ However, final plans, including the SWPPP and operational BMPs, have not yet been approved by the City, and therefore, impacts related to the alteration of drainage patterns during operation would be **potentially significant**.

**TABLE 3.15-17
 POST-DEVELOPMENT CONDITIONS AND BMP SUFFICIENCY SUMMARY**

Drainage Subarea	Area (sf)	Qpm (cfs)	SWQDv ^a x 1.5 (cf)	BMP Sufficiency Summary			
				Bio-Filtration System	Required (sf)	Provided (sf)	Sufficient
A (Hotel portion of the East Transportation and Hotel Site)	55,094	0.3687	6,251	Bio-filtration/ Stormwater Planter	2,500	2,600	Yes
B (Parking portion of the East Transportation and Hotel Site)	168,409	0.8625	18,122	Bio-filtration/ Stormwater Planter	7,249	7,300	Yes
CD (Arena Site)	712,655	3.8106	81,434	Bio-filtration/ Stormwater Planter	32,573	33,000	Yes
E (Southern portion of the West Parking Garage Site)	136,207	1.0662	15,122	Bio-filtration/ Stormwater Planter	6,049	6,100	Yes
F (Northern portion of the West Parking Garage Site)	105,106	0.8028	10,950	Bio-filtration/ Stormwater Planter	4,380	4,500	Yes
Totals	1,101,446	7.8659	120,855				

NOTES:

cfs = cubic feet per second; sf = square feet

a Requirements are based on treating a specific volume of stormwater run-off from the Project Site (SWQDv). The design storm from which the SWQDv is calculated is defined as the greater of: the 0.75-inch, 24-hour rain event, or; the 85th percentile, 24-hour rain event determined by the Los Angeles County 85th percentile precipitation isohyetal map. In this case, the SWQDv volume from the 85th percentile, 24-hour rain event is utilized.

SOURCE: AECOM, 2019. *Inglewood Basketball & Entertainment Center Project Low-Impact Development (LID) Report*. May 2, 2019. p. 4

Mitigation Measure 3.15-9

Implement Mitigation Measure 3.9-1(a) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB).

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.15-9, construction of the Proposed Project would comply with applicable regulations as approved by the City and the Los Angeles RWQCB that require preparation and implementation of an LID Plan and SWPPP. Thus, the effects of expansion of storm water drainage facilities would be reduced to insignificance. Thus, this impact would be

⁷³ AECOM, 2019. *Inglewood Basketball & Entertainment Center Project Low-Impact Development (LID) Report*. May 2, 2019. p. 3.

considered less than significant.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to surface water runoff and drainage capacity is the drainage basin that contributes stormwater runoff flows to the network of existing City-maintained storm drain facilities which would also serve the Project Site.

Impact 3.15-10: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could have the potential to result in the relocation or construction of new storm water drainage facilities or expansion of existing facilities, the construction or relocation of which could have the potential to cause significant environmental effects. (Less than Significant with Mitigation)

Because the City is largely developed with impervious surfaces, cumulative projects (listed in Section 3.0, Introduction to the Analysis, Table 3.0-2) would involve redevelopment of existing paved or developed sites, and would not substantially increase the amount of impervious surfaces. Thus, the change of runoff to stormwater drainage systems would largely be negligible after development of cumulative projects. Additionally, as previously discussed, construction and operation of cumulative projects, including the Proposed Project, would be required to comply with applicable stormwater runoff regulations, including the NPDES General Construction Permit, the City's Municipal Code section 10-208, and the County's LID Standards Manual. BMPs associated with these regulations would reduce runoff, therefore reducing the amount of stormwater entering the drainage systems.

In addition, over time the redevelopment of previously urbanized parcels would eliminate outdated water drainage features that no longer meet current regulations. Older infrastructure would be replaced with features that would provide higher quality of stormwater runoff than exists under current conditions. Nevertheless, because final stormwater drainage improvement plans for most cumulative projects have not yet been reviewed and approved by the local municipal government or the Los Angeles RWQCB, the cumulative impact of construction and operation of cumulative projects, including the Proposed Project, would be considered **potentially significant**.

As discussed above in Impact 3.15-9, the design of the Proposed Project is in an early phase, and specific BMPs have not been identified and approved by the City or the Los Angeles RWQCB. Therefore, the Proposed Project would have a considerable contribution to this impact, and the cumulative impact would be **potentially significant**.

Mitigation Measure 3.15-10

Implement Mitigation Measure 3.9-1(a) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB).

Level of Significance After Mitigation: With the implementation of Mitigation Measures 3.15-10, construction of the Proposed Project would comply with applicable regulations as approved by the City and the Los Angeles RWQCB and the expansion of storm water drainage facilities would not cause a significant environmental effect.

Therefore, the Proposed Project with mitigation would not result in a considerable contribution to a potentially significant cumulative impact. Thus, this cumulative impact would be **less than significant**.

Solid Waste Generation and Landfill Capacity

3.15.13 Environmental Setting

Regional and Local Setting

The City of Inglewood is served by Consolidated Disposal Services (CDS), a subsidiary of Republic Services, Inc., which provides waste and recycling collection services for residential and commercial uses.⁷⁴ Solid waste is taken to the CDS American Waste Transfer Station where it is sorted. Residual garbage is taken to the Consolidated Volume Transport Disposal and Recycling Center. Recycling and green waste is taken to CDS' Compton Transfer Station. Solid waste is then transferred to a CDS-owned facility, the Sunshine Canyon Landfill in Sylmar, California.⁷⁵

The Sunshine Canyon Landfill handles approximately one-third of the daily waste of all of Los Angeles County.⁷⁶ The landfill is permitted to receive a maximum of 12,100 tons per day of solid waste, or 4.4 million tons per year of solid waste. In 2016 the landfill accepted an average of 7,496 tons of waste per day, and in 2018 accepted an average of 8,300 tons of waste per day (or 3 million tons per year of solid waste).^{77,78} The landfill has an approximate cease operation date of 2037, and has approximately 96,800,000 cubic yards, or 62,110,000 tons, of remaining capacity.^{79,80}

3.15.14 Adjusted Baseline Environmental Setting

Section 3.15, Utilities and Service Systems, assumes the HPSP Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. **Table 3.15-18** details the estimated solid waste that would be generated by the HPSP Adjusted Baseline projects, by land use. The HPSP Adjusted Baseline projects are anticipated to generate approximately 6,785 tons per year of solid waste. Assuming all projects become operational in 2020, the four years between operation of the HPSP Adjusted Baseline projects (2020) and operation of the Project (2024) would generate a total of approximately 27,140 tons of solid waste. The Sunshine Canyon

⁸⁰ County of Los Angeles, 2017. Countywide Integrated Waste Management Plan 2016 Annual Report. Available: <https://dpw.lacounty.gov/epd/swims/ShowDoc.aspx?id=6530&hp=yes&type=PDF>. Appendix E-2, Table 1, Remaining Permitted Disposal Capacity of Existing Solid Waste Disposal Facilities in Los Angeles County.

Landfill currently accepts an average of 8,300 tons of waste per day, or 3 million tons per year of solid waste, with a maximum allowable throughput of 4.4 million tons per year of solid waste. The Adjusted Baseline’s solid waste contribution is estimated to reduce the capacity of the Sunshine Canyon Landfill to approximately 62,082,860 tons per year of solid waste.

**TABLE 3.15-18
 HPSP SOLID WASTE GENERATION ESTIMATES**

Proposed Use	Unit Contribution	Solid Waste Generation Factor	Solid Waste Generation (tons/yr)
Stadium ^a	2,700,000 ^b	1.29 tons/1,000 sf/year	3,483
Performance Venue ^a	153,913 ^c	1.29 tons/1,000 sf/year	199
Office ^d	466,000 sf	6 lbs/1,000 sf/day	510
Retail/Restaurant ^d	518,077 sf	2.5 lbs/100 sf/day	2,364
Residential ^d	314 du	4 lbs/du/day	229
Total	—	—	6,785

NOTES:

yr = year; sf = square feet; du = dwelling unit

a Solid waste generation from the Sacramento Entertainment and Sports Center EIR

b To find the square footage of a 70,000-seat NFL Stadium, comparable stadiums were researched. The Mercedes Benz Stadium in Atlanta, Georgia has a capacity of 71,000 seats and is 2,000,000 square feet.

c To find the square footage of a 6,000 seat performance venue, comparable performance venues were researched. The Novo by Microsoft in Los Angeles, California has a capacity of 2,300 seats and is 59,000 square feet. 59,000 square feet/2,300 seats = approximately 25 square feet per seat. 6,000 seats X 25 square feet = 153,913 square feet. Source: <https://www.discoverlosangeles.com/la-concert-venues-that-double-as-event-space>.

d Solid waste generation estimates derived from a list of generation rates maintained by CalRecycle. CalRecycle does not provide standard solid waste generation rates by land use.

SOURCE: ESA, 2019. Generation factors are based off of the Sacramento Entertainment and Sports Center EIR, 2014 and CalRecycle.

3.15.15 Regulatory Setting

Federal

There are no federal regulations, plans, or policies applicable to solid waste that relate to the Proposed Project.

State

California Integrated Waste Management Act

The California Integrated Waste Management Act of 1989 (AB 939) was enacted to reduce, recycle, and reuse solid waste generated in the state to the maximum extent feasible. Specifically, AB 939 requires city and county jurisdictions to identify an implementation schedule to divert 50 percent of the total waste stream from landfill disposal by the year 2000. AB 939 also requires each city and county to promote source reduction, recycling, and safe disposal or transformation. Cities and counties are required to maintain the 50 percent diversion specified by AB 939 past the year 2000. AB 939 also requires each city and county to promote source reduction, recycling, and

safe disposal or transformation. The City of Inglewood's City-wide diversion rate per AB 939 was 62 percent in 2010.⁸¹

In 2007, SB 1016 was passed, changing the way the State measured waste diversion. SB 1016 builds on AB 939 compliance requirements by implementing a simplified measure of jurisdictions' performance. SB 1016 accomplishes this by changing to a disposal-based indicator (a per capita disposal rate). The AB 939 50 percent solid waste disposal reduction requirement is now measured in terms of per-capita disposal expressed as pounds of waste generated per person per day, or pounds per employee per day. The focus is on program implementation, actual recycling, and other diversion programs instead of estimated numbers.

The State of California took another step to increase diversion in 2011, when the governor signed AB 341, increasing the current state goal from 50 percent diversion to 75 percent recycling by 2020. AB 341 created the Mandatory Commercial Recycling law, which requires that all businesses that generate four or more cubic yards of waste each week and all multi-family communities with five or more units must arrange for recycling service.

In 2014, Governor Brown signed AB 1826 into law, requiring businesses to recycle their organic waste, effective April 1, 2016, depending on the amount of waste generated per week. This law also requires that local jurisdictions across the state implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. Organic waste means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste. This law phases in the mandatory recycling of commercial organics over time, as follows:

- April 1, 2016: Businesses that generate eight cubic yards of organic waste per week shall arrange for organic waste recycling services.
- January 1, 2017: Businesses that generate four cubic yards of organic waste per week shall arrange for organic waste recycling services.
- January 1, 2019: Businesses that generate four cubic yards or more of commercial solid waste per week shall arrange for organic waste recycling services.
- Year 2020 Assessment: If CalRecycle determines that the statewide disposal of organic waste in 2020 has not been reduced by 50 percent of the level of disposal during 2014, the organic recycling requirements on businesses will expand to cover businesses that generate two cubic yards or more of commercial solid waste per week. Additionally, certain exemptions may no longer be available if this target is not met.

Construction and Demolition Waste Materials Diversion Requirements

SB 1374 was signed into law in 2002 to assist jurisdictions with diverting their construction and demolition (C&D) waste material. The legislation requires that the CIWMB (now CalRecycle)

⁸¹ City of Inglewood, 2012. Special Meeting of Special Council Evaluation of Solid Waste and Recycling Services Proposals. Available: <http://v1.cityofinglewood.org/pdfs/wastemanagement/hfh.pdf>. Accessed December 4, 2018.

complete five items in regards to the diversion of construction and demolition waste: (1) adopt a model ordinance for diverting 50 percent to 75 percent of all construction and demolition debris from landfills; (2) consult with multiple regulators and waste entities (e.g., California State Association of Counties, private and public waste services, building construction materials industry, etc.) during the development of the model ordinance; (3) compile a report on programs that can be implemented to increase diversion of C&D debris; (4) post a report on the agency's website for general contractors on methods that contractors can use to increase diversion of C&D waste materials; and (5) post on the agency's website a report for local governments with suggestions on programs to increase diversion of C&D waste materials. Under SB 1374, jurisdictions must also include in their annual AB 939 report a summary of the progress made in diverting construction and demolition waste. The model ordinance was adopted by CalRecycle on March 16, 2004.⁸²

California Green Building Standards Code

In 2007 the California Building Standards Commission (CBSC) was directed to develop green buildings standards in an effort to meet the goals of California's landmark AB 32 initiative, which established a comprehensive program of cost-effective reductions of greenhouse gases to 1990 levels by 2020. The result, the California Green Building Standards Code (CALGreen Code), CCR Title 24, is the first-in-the-nation mandatory green building standards code. The purpose of the CALGreen Code is to improve public health, safety, and general welfare by enhancing the design and construction of buildings. Material conservation and resource efficiency is one of the categories of sustainable construction. Measures include means of achieving material conservation and resource efficiency through reuse of existing building stock and materials; use of recycled, regional, rapidly renewable and certified wood materials; and employment techniques to reduce pollution through recycling of materials.

Local

City of Inglewood General Plan

The City of Inglewood General Plan Conservation Element, adopted on October 21, 1997, addresses the conservation, development and utilization of natural resources within the City. Chapter IV of the Conservation Element addresses the City's solid waste management. The Conservation Element notes that the City's goal of a 25 percent reduction of solid waste between 1990 and 1995 was met. While the Conservation Element discusses the City's concerns related to landfill capacities and the City's programs to minimize solid waste generation, no specific goals or policies relevant to the Proposed Project are included in the Conservation Element.

⁸² CalRecycle, Senate Bill 1374 (2002), August 24, 2018, <https://www.calrecycle.ca.gov/lgcentral/library/canddmodel/instruction/sb1374>.

3.15.16 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to solid waste generation and landfill capacity. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or
2. Conflict with federal, state, and local management and reduction statutes and regulations related to solid waste.

Methodology and Assumptions

The following impact analysis evaluates the potential for the Proposed Project to result in changes to existing solid waste generation and landfill capacity. Potential changes in solid waste generation are evaluated using waste generation factors shown in **Table 3.15-19**. It is assumed that the Proposed Project would comply with all applicable laws, regulations, design standards, and plans for solid waste reduction and recovery.

**TABLE 3.15-19
 EXISTING AND PROPOSED SOLID WASTE GENERATION**

Proposed Use	Unit Contribution	Solid Waste Generation Factor	Solid Waste Generation (tons/yr)
Existing			
Retail/Commercial	54,098 sf	2.5 lbs/100 sf/day	247
Proposed			
Arena ^a	915,000 sf	1.29 tons/1,000 sf/year	1,180
Office ^b	71,000 sf	6 lbs/1,000 sf/day	78
Practice and Training Facility ^b	85,000 sf	6 lbs/1,000 sf/day	93
Sports Medicine Clinic ^b	25,000 sf	6 lbs/1,000 sf/day	27
Retail/Commercial ^b	48,000 sf	2.5 lbs/100 sf/day	219
Community Space ^b	15,000 sf	2.5 lbs/100 sf/day	68
Hotel ^b	150 rooms	2 lbs/room/day	55
Total			1,721
Net Increase			1,474

NOTES:

yr = year; sf = square feet

a Solid waste generation estimate for the arena uses based on the Sacramento Entertainment and Sports Center EIR.

b Solid waste generation estimates derived from a list of generation rates maintained by CalRecycle. CalRecycle does not provide standard solid waste generation rates by land use.

SOURCE: ESA, 2019. Generation factors are based off of the Sacramento Entertainment and Sports Center EIR, 2014 and estimated solid waste generation rates provided by CalRecycle.

Impacts and Mitigation Measures

Impact 3.15-11: Construction and operation of the Proposed Project could generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, and could otherwise impair the attainment of solid waste reduction goals. (Less than Significant)

Construction

As previously discussed, the City of Inglewood is served by CDS, which transfers solid waste to the Sunshine Canyon Landfill in Sylmar, California. The Sunshine Canyon Landfill currently receives an average of 3 million tons per year of solid waste, and is permitted to receive a maximum of 4.4 million tons per year of solid waste.^{83,84} The landfill has approximately 62,082,860 tons of remaining capacity. Based on the landfill's throughput and availability of land, the landfill has a cease operation date of 2037. Construction of the Proposed Project would include demolition of existing buildings on the Project Site, and would result in the generation of various construction waste including scrap lumber, scrap finishing materials, various scrap metals, and other recyclable and non-recyclable construction related wastes. Recyclable construction materials, including concrete, metals, wood, and various other recyclable materials would be diverted to recycling facilities.

Table 3.15-20 presents the solid waste that would be generated by the demolition of existing uses at the Project Site, which would total approximately 4,274 tons. This construction debris would be approximately 0.1 percent of the average waste that enters the landfill per year. The landfill has approximately 62,082,860 tons of remaining capacity. After demolition of existing uses, the landfill would still have approximately 62,078,586 tons of remaining capacity.

**TABLE 3.15-20
 SOLID WASTE GENERATION DURING DEMOLITION OF EXISTING USES**

Land Use to be Demolished	Unit Contribution	Solid Waste Generation Factor	Solid Waste Generation (tons)
Restaurant (Non-residential)	1,118 sf	158 lbs/sf	88
Motel (Non-residential)	16,806 sf	158 lbs/sf	1,328
Food Warehouse (Non-residential)	28,809 sf	158 lbs/sf	2,276
Commercial Vacant (Non-residential)	6,231 sf	158 lbs/sf	492
Catering (Non-residential)	1,134 sf	158 lbs/sf	90
Total	54,098 sf	-	4,274

NOTE:
 sf = square feet

⁸³ Republic Services, Inc., 2018. Sunshine Canyon Landfill: About. Available: <https://sunshinecanyonlandfill.com/about/>. Accessed November 28, 2018.

⁸⁴ CalRecycle, 2018. SWIS Facility Detail: Sunshine Canyon Landfill. Available: <https://www2.calrecycle.ca.gov/swfacilities/Directory/19-AA-2000>. Accessed November 28, 2018.

The above estimates are conservative as the Proposed Project would be required to comply with State requirements to divert a minimum of 75 percent of construction wastes to a certified recycling processor, pursuant to AB 1374. In addition, the Proposed Project would meet or exceed current uniform codes designed to achieve a LEED Gold rating. The Proposed Project would apply for LEED certification of the proposed buildings and accompanying development in the Building Design + Construction (BD+C) category, and would adopt a LEED approach in order to capture site-wide strategies such as those related to solid waste management. The Proposed Project would commit to recycling construction wastes in excess of the minimum requirements of the State. Adhering to LEED Gold standards would minimize the total volume of demolition and construction waste that would be landfilled, but would not avoid landfilling entirely.

In consideration of the large volume of landfill capacity available at Sunshine Canyon Landfill, sufficient landfill capacity would be available to serve the Proposed Project during construction. Therefore, the Proposed Project would not require new or expanded solid waste management or disposal facilities. Thus, as there is sufficient landfill capacity to serve the Proposed Project's solid waste disposal needs during construction, impacts would be **less than significant**.

Operation

Operation of the Proposed Project would result in the generation of waste in accordance with the proposed increase in use of intensity at the Project Site. Proposed operational wastes would include retail/commercial, office, hotel, and entertainment and sports center-related wastes. As shown in Table 3.15-19, the existing uses at the Project Site generate 247 tons per year of solid waste. The Proposed Project would generate approximately 1,721 tons per year of solid waste, a net increase of 1,474 tons per year of solid waste over baseline conditions.

Waste generated by the Proposed Project would be removed from the site by CDS and recycled in accordance with City requirements, with the remaining waste landfilled at Sunshine Canyon Landfill. As noted previously, this landfill currently accepts an average of 3 million tons per year of solid waste, and is permitted to receive a maximum of 4.4 million tons per year of solid waste. The landfill has approximately 62,082,860 tons of remaining capacity. The net increase in Project-related wastes would represent less than 0.1 percent of the remaining capacity for this landfill, with 62,081,386 additional tons still available before the landfill reaches its remaining capacity.

The lifespan of a landfill is determined by land availability and its topography, refuse-to-cover ratios, settlement rates, and its planned throughput.⁸⁵ Even with the Proposed Project, there would still be an additional 62,081,386 tons of remaining capacity. Thus, the Proposed Project is within planned waste acceptance growth for the landfill, and would not change the lifespan of the landfill, which would continue to have availability until 2037.

Because sufficient landfill capacity would be available to serve the Proposed Project, the Proposed Project would not require new or expanded solid waste management or disposal

⁸⁵ CalRecycle, 2018. Methodology for Determining Remaining Landfill Capacity. Available: <https://www.calrecycle.ca.gov/lea/advisories/45>. Accessed January 14, 2019.

facilities. Additionally, implementation of typical recycling rates and state diversion requirements would result in a portion of the total waste stream being diverted to recycling, consistent with the California Integrated Waste Management Act's goal of 75 percent recycling by 2020. This would further minimize impacts to landfill capacity. Therefore, because there is sufficient landfill capacity to serve the Proposed Project's solid waste disposal needs during operation, this impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.15-12: Construction and operation of the Proposed Project could conflict with federal, State, and local management and reduction statutes and regulations related to management and reduction of solid waste. (Less than Significant)

The Proposed Project would comply with federal, state, and local statutes and regulations related to solid waste. The City would be required to maintain the 75 percent diversion rate required by the State pursuant to AB 341. In addition, the Proposed Project would meet or exceed current uniform codes designed to achieve a LEED Gold rating. The Proposed Project would apply for LEED certification of the proposed buildings and accompanying development in the BD+C category, and would adopt a LEED approach in order to capture site-wide strategies such as those related to solid waste management. The Proposed Project would commit to recycling construction wastes in excess of the minimum requirements of the State.

Adhering to LEED Gold standards would minimize the total volume of demolition and construction waste that would be landfilled. In addition, the Proposed Project would contract with CDS for all bin removal activities. Compliance with construction and operational debris removal and recycling requirements would occur with the City's Environmental Services Department and CDS' Sunshine Canyon Landfill. Therefore, as the Proposed Project would not conflict with federal, state, and local statutes related to solid waste, and would meet LEED Gold requirements, impacts would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to solid waste and landfill capacity is the Sunshine Canyon Landfill service area.

Impact 3.15-13: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could cumulatively generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, and could otherwise cumulatively impair the attainment of solid waste reduction goal. (Less than Significant)

Cumulative projects (listed in Section 3.0, Introduction to the Analysis, Table 3.0-2, Cumulative Projects List) would increase solid waste generation. Of the cumulative projects listed in Table 3.0-2, those located in the Inglewood, El Segundo, Hawthorne, Culver City, Gardena, and the City of Los Angeles would have waste delivered to the Sunshine Canyon Landfill.⁸⁶ While solid waste from cumulative projects within the County of Los Angeles to certain landfills is variable by location, it was conservatively assumed that solid waste from the cumulative projects within the jurisdiction of the County of Los Angeles also would be delivered to the Sunshine Canyon Landfill. **Table 3.15-21** shows the solid waste generation that is estimated to be produced by all of the cumulative projects listed in Section 3.0, Introduction to the Analysis, based on land use. A total of 29,908 tons per year of solid waste would be generated by these cumulative projects.

NOTES:

sf = square feet; lbs = pounds; du = dwelling unit

* These uses use the solid waste generation from the Qualcomm Stadium Reconstruction EIR, which uses a generation rate based on number of seats.

SOURCE: ESA, 2019. Generation factors derived from a list of generation rates maintained by CalRecycle. CalRecycle does not provide standard solid waste generation rates by land use.

As discussed previously, the Sunshine Canyon Landfill currently accepts an average of 3 million tons per year of solid waste, and is permitted to receive a maximum of 4.4 million tons per year of solid waste. The landfill has approximately 62,082,860 tons of remaining capacity. The solid waste generated by the combination of the Proposed Project plus other cumulative projects would represent less than 1 percent of the average throughput for this landfill. After acceptance of the solid waste from the Proposed Project and other cumulative projects, there would still be an additional 62,052,952 tons of remaining capacity. Thus, the Proposed Project and cumulative projects are within planned waste acceptance growth for the landfill, and would not materially reduce the planned lifespan of the landfill, which would continue to have availability until 2037.

Similar to the Proposed Project, cumulative projects would be required to comply with State requirements to divert a minimum of 75 percent of waste to a certified recycling processor to ensure solid waste generation is minimal. Existing capacity at the Sunshine Canyon Landfill exists to serve both the Proposed Project and cumulative projects as well as existing developments within the County of Los Angeles.

Based on the above considerations, the Proposed Project, in conjunction with other cumulative projects within the Sunshine Canyon Landfill service area, would not generate solid waste that would be in excess of state or local standards and would not exceed the capacity of local infrastructure. The Proposed Project, in conjunction with other cumulative development, would not otherwise impair the attainment of solid waste reduction goal. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.15-14: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could conflict with federal, State, and local statues and regulations related to management and reduction of solid waste. (Less than Significant)

As detailed above, the City is required to maintain the 50 percent diversion rate required by the State through the California Solid Waste Management Act. Similar to the Proposed Project, cumulative projects would contract with CDS for bin removal activities. Compliance with construction and operational debris removal and recycling requirements would occur with the City's Environmental Services Department and CDS' Sunshine Canyon Landfill. As previously detailed, the Proposed Project would also adhere to the LEED Gold standards, committing to recycling construction waste in excess of the minimum requirements of the State. Based on the above considerations, the Proposed Project, in conjunction with cumulative development within the Project vicinity, implementation of the Proposed Project would not conflict with federal, state, and local statues and regulations related to management and reduction of solid waste. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

CHAPTER 4

Other CEQA-Required Considerations

4.1 Introduction

CEQA Guidelines section 15126 requires that all phases of a project must be considered when evaluating its impact on the environment, including planning, acquisition, development, and operation. Further, CEQA Guidelines section 15126.2(a) requires that the evaluation of significant impacts consider direct and reasonably foreseeable indirect effects of the Proposed Project over the short-term and long-term. The EIR must identify (1) significant environmental effects of the Proposed Project, (2) potentially feasible mitigation measures proposed to avoid or substantially lessen significant effects, (3) significant environmental effects that cannot be avoided if the Proposed Project is implemented, (4) significant irreversible environmental changes that would result from implementation of the Proposed Project, (5) growth-inducing impacts of the Proposed Project, and (6) alternatives to the Proposed Project.¹

Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, Sections 3.1 through 3.15, of the EIR provide a comprehensive presentation of the Proposed Project's environmental effects, potentially feasible mitigation measures, and conclusions regarding the level of significance of each impact both before and after mitigation.

Chapter 5, Project Variants, provides descriptions and analysis of environmental impacts for two variations of the Proposed Project. Project Variants are included and considered in the CEQA-required analyses discussions below.

Chapter 6, Project Alternatives, presents a comparative analysis of alternatives to the Proposed Project.

The other CEQA-required analyses described above are presented below.

4.2 Significant Environmental Effects That Cannot Be Avoided if the Proposed Project Is Implemented

CEQA Guidelines section 15126.2(c) requires that an EIR describe any significant impacts that cannot be avoided, even with the implementation of feasible mitigation measures. The significant environmental impacts of the Proposed Project, West Century Boulevard Pedestrian Bridge

¹ CEQA Guidelines sections 15126.2(a), (c-e), 15126.4, and 15126.6.

Variant, and Alternate Prairie Access Variant are discussed in detail in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, and in Chapter 5, Project Variants.

4.2.1 Unavoidable Significant Impacts of the Proposed Project

Proposed Project

Project-specific and cumulative impacts that cannot be avoided if the Proposed Project is approved as proposed include:

Project-Specific Significant and Unavoidable Impacts

Impact 3.2-1: Construction and operation of the Proposed Project would conflict with implementation of the applicable air quality plan.

Impact 3.2-2: Construction and operation of the Proposed Project would result in a cumulatively considerable net increase in NO_x emissions during construction, and a cumulatively considerable net increase in VOC, NO_x, CO, PM₁₀, and PM_{2.5} during operation of the Proposed Project.

Impact 3.11-1: Construction of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact 3.11-2: Operation of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact 3.11-3: Construction of the Proposed Project would generate excessive groundborne vibration levels.

Impact 3.14-1: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-2: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-3: Major events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-4: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-5: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-6: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-8: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-9: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-10: Certain components of the Proposed Project would generate VMT in excess of applicable thresholds.

Impact 3.14-11: Operation of the Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions.

Impact 3.14 15: The Proposed Project would substantially affect circulation for a substantial duration of construction under Adjusted Baseline conditions.

Impact 3.14-28: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-29: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-30: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions.

Impact 3.14-31: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under Adjusted Baseline conditions.

Impact 3.14-32: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under Adjusted Baseline conditions.

Cumulative Significant and Unavoidable Impacts

Impact 3.2-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in inconsistencies with implementation of applicable air quality plans.

Impact 3.2-6: Construction and operation Proposed Project, in conjunction with other cumulative development, would result in cumulative increases in short-term (construction) and long-term (operational) emissions.

Impact 3.11-5: Construction of the Proposed Project, in conjunction with other cumulative development, would result in cumulative temporary increases in ambient noise levels.

Impact 3.11-6: Operation of the Proposed Project, in conjunction with other cumulative development, would result in cumulative permanent increases in ambient noise levels.

Impact 3.11-7: Construction of the Proposed Project, in conjunction with other cumulative development, would generate excessive groundborne vibration.

Impact 3.14-16: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-17: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-18: Major events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-19: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-20: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-21: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-23: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-24: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-25: The Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions.

Impact 3.14-27: The Proposed Project would substantially affect circulation for a substantial duration of construction under cumulative conditions.

Impact 3.14-33: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-34: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-35: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions.

Impact 3.14-36: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under cumulative conditions.

Impact 3.14-37: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under cumulative conditions.

4.2.2 Unavoidable Significant Impacts of the West Century Boulevard Pedestrian Bridge Variant

The changes to the Proposed Project that would be included in the West Century Boulevard Pedestrian Bridge Variant would not change or would not be substantial enough to change the conclusions, or add or alter significant impacts previously discussed in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. Therefore, Project-specific and cumulative impacts that cannot be avoided if the West Century Boulevard Pedestrian Bridge Variant is approved as proposed would be the same as those identified for the Proposed Project, in Section 4.2.1, above.

4.2.3 Unavoidable Significant Impacts of the Alternate Prairie Access Variant

The changes to the Project that would be included in the Alternate Prairie Access Variant would not change or would not be substantial enough to change the conclusions, or add or alter significant impacts previously discussed in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. Therefore, Project-specific and cumulative impacts that cannot be avoided if the Alternate Prairie Access Variant is approved as proposed would be the same as those identified for the Proposed Project, in Section 4.2.1, above.

4.3 Significant Irreversible Environmental Changes That Would Be Caused by the Proposed Project Should It Be Implemented

Under CEQA, an EIR must evaluate the extent to which the Proposed Project primary and secondary effects would generally commit future generations to the allocation of nonrenewable resources and to irreversible environmental damage. Specifically, CEQA Guidelines section 15126.2(d) states:

Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible, since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

The evaluation below addresses whether the Proposed Project would result in significant irreversible environmental changes if they would:

- Involve a large commitment of nonrenewable resources;
- Result in primary or secondary impacts that would generally commit future generations to similar uses;
- Involve uses in which irreversible damage could result from any potential environmental accidents associated with the project; or
- Result in consumption of resources that is not justified (e.g., the project involves the wasteful use of energy).

Each of these issues is discussed below for the Proposed Project.

Large Commitment of Resources

Implementation of the Proposed Project would result in the long-term commitment of resources to continued urban development. As is described previously in Chapter 1, Introduction, Chapter 3, Sections 3.4, Cultural and Tribal Cultural Resources, and 3.10, Land Use and Planning, of this Draft EIR, the Project Site was originally developed for and committed to urban uses starting in the late 1920s and continuing on into the post-World War II years. In the 1950s and 1960s, single family homes were redeveloped to more intensive multi-family housing and industrial uses. Beginning in the mid-1980s, the City received FAA-issued noise mitigation grants as part of the LAX Noise Control/Land Use Compatibility Program, with the objective of disposing and recycling incompatible land uses to land uses which are compatible with the noise levels of airport operations. As a result, much of the Project Site was cleared to eliminate noise-sensitive uses that were considered incompatible with the aviation noise from aircraft approaching and departing from LAX, to the west. The Proposed Project would recommit the land resources of the site to urban development compatible with the ambient noise environment.

In addition, construction activities related to the Proposed Project would result in the irretrievable commitment of construction materials (e.g., steel products, cement, glass, etc.).

Commitment of the Project Site for Future Generations

Development of the Proposed Project would result in the commitment of the Project Site to a sports and entertainment venue use along with accompanying commercial, hotel, and parking uses, thereby precluding other uses for the lifespan of the Proposed Project or Project Variants, a period of time anticipated to be at least 30 years.

Irreversible Environmental Damage

The CEQA Guidelines also require a discussion of the potential for irreversible environmental damage that could be caused by an accident associated with the Proposed Project. While the Proposed Project could result in the use, transport, storage, and disposal of limited amounts of hazardous wastes during construction and operation, as described in Section 3.8, Hazards and Hazardous Materials, all activities would comply with applicable state and federal laws related to hazardous materials, which significantly reduce the likelihood and severity of the occurrence of accidents that could result in irreversible environmental damage.

Over the past decade, the understanding of global climate change and the role that communities can play in mitigating and/or adapting to it has grown tremendously. There is broad scientific consensus that recent changes in climatic conditions, including increases in global temperatures, are associated with corresponding increases of greenhouse gases (GHGs). Temperature increases are beginning to affect regional climates and continued increases are expected result in impacts to the southern California region and the world. Climate change is anticipated to have profound implications for the availability of the natural resources on which economic prosperity and human development depend.

As discussed in detail in Section 3.7, Greenhouse Gas Emissions, the emission of GHGs is known to have long-term effects on atmospheric conditions that affect the global climate, with resultant changes in sea level, hydrological conditions in rivers, heat island effects, and a range of other conditions. While these changes are not considered irreversible, they could last for generations. As further described in Section 3.7, Greenhouse Gas Emissions, the Proposed Project could result in short-term increases in GHG emissions, but through the implementation of mitigation measures, including those required pursuant to the requirements of Public Resources Code section 21168.6.8 (AB 987) as well as additional measures identified in this Draft EIR, would result in no net increase in GHG emissions. As such, the Proposed Project would not contribute to global climate changes and related irreversible environmental damage.

The most notable significant irreversible impacts of the Proposed Project or Project Variants are intensification of the visual character of the Project Site, increased generation of pollutants from vehicle travel and stationary operations, and the short-term commitment of non-renewable and/or slowly renewable natural and energy resources, such as water and energy resources used during construction activities. Operations associated with future uses would also consume water, natural

gas and electrical energy. The unavoidable environmental consequences of the Proposed Project are described in the appropriate sections in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, and Section 4.2, above.

Unjustified Consumption of Resources

Resources that would be permanently and continually consumed by implementation of the Proposed Project include water, electricity, natural gas, and fossil fuels; however, the amount and rate of consumption of these resources would not result in the unnecessary, inefficient, or wasteful use of resources (see Chapter 3, Sections 3.5, Energy Demand and Conservation, and 3.15, Utilities and Service Systems). As shown in Table 3.5-4a of Section 3.5, the Proposed Project's annual net new energy demand for the Full Backfill Scenario would be approximately 16,934 megawatt hours (MWh) of electricity, 22,767 MMBtu of natural gas, 1,583,770 gallons of gasoline, and 91,347 gallons of diesel fuel. As shown in Table 3.5-4b, the Proposed Project's annual net new energy demand for the Partial Backfill Scenario would be approximately 13,194 MWh of electricity, 16,413 MMBtu of natural gas, 1,011,301 gallons of gasoline, and 66,983 gallons of diesel fuel. In addition, electricity and fossil fuels would also be consumed in the use of vehicles and equipment during construction of the Proposed Project.

Project Construction

Consumption of non-renewable fossil fuels during construction of the Proposed Project is described in Section 3.5, Energy Demand and Conservation. Construction of the Proposed Project would result in the irretrievable commitment of construction materials (e.g., steel products, cement, glass). While construction of the Proposed Project would result in the irretrievable commitment of nonrenewable energy resources, primarily in the form of fossil fuels (including fuel oil), natural gas, and gasoline for automobiles and construction equipment, the consumption of fossil fuels would occur on a temporary basis during the construction period.

Construction of the Proposed Project would employ fuel-efficient equipment consistent with State and federal regulations, such as fuel efficiency regulations in accordance with the CARB Pavley Phase II standards, the anti-idling regulation in accordance with section 2485 in Title 13 of the CCR, and fuel requirements for stationary equipment in accordance with section 93115 (concerning Airborne Toxic Control Measures) in Title 17 of the CCR. Use of construction equipment that is compliant with these regulations would result the use of more fuel-efficient engines and associated fuel savings.

The Proposed Project would divert mixed construction and demolition debris to City-certified construction and demolition waste processors using City-certified waste haulers, which would reduce truck trips to landfills, and increase the amount of waste recovered (e.g., recycled, reused, etc.) at material recovery facilities, thereby further reducing transportation fuel consumption. As such, the consumption of energy during project construction would not be wasteful, inefficient, or unnecessary.

Project Operation

Operation of the Proposed Project would result in the demand for electricity and natural gas for project operations, and gasoline and diesel fuel for transportation and backup generation functions. As described in Section 3.5, Energy Demand and Conservation, The Full Backfill Scenario future energy use would represent about 0.016 percent and the Partial Backfill Scenario future energy use would represent about 0.012 percent of total SCE sales, and both scenarios would be within the SCE projected electricity supplies. The Proposed Project would result in an annual net increase in demand for natural gas of approximately 22,767 MMBtu for the Full Backfill Scenario and 16,413 MMBtu for the Partial Backfill Scenario. Under both scenarios, the Proposed Project would account for approximately 0.002 percent of the 2024 forecasted annual consumption in the SoCalGas planning area and would fall within the SoCalGas projected consumption for the area and would be consistent with the SoCalGas anticipated regional demand from population or economic growth. As reported in Table 3.5-4a and Table 3.5-4b, the Proposed Project estimated annual net increase in petroleum-based fuel usage would be approximately 1,583,770 gallons of gasoline and 91,347 gallons of diesel for the Full Backfill Scenario and 1,011,301 gallons of gasoline and 66,983 gallons of diesel under the Partial Backfill Scenario. The Proposed Project would account for 0.043 percent of County-wide gasoline consumption and 0.015 percent of County-wide diesel consumption under the Full Backfill Scenario and account for 0.028 percent of County-wide gasoline consumption and 0.011 percent of County-wide diesel consumption under the Partial Backfill Scenario, based on the available County fuel sales data for the year 2017.

Operation of the Proposed Project would comply with all applicable building codes, including the 2019 Title 24 building energy efficiency standards, CAFE fuel economy standards, consistency with the SCAG 2016-40 RTP/SCS, achievement of LEED Gold status through design and operations of the Proposed Project, compliance with the County's Low Impact Development (LID) Development Standards Manual, compliance with the City's Low Impact Development Requirements for New Development and Redevelopment,² the City's Green Street Policy, the City's Water Conservation and Water Supply Shortage Program, as well as mitigation measures included in this Draft EIR, would ensure that natural resources are used efficiently and conserved to the maximum extent possible. Further, it is expected that, over time, new technologies or systems will emerge, or will become more cost-effective or user-friendly, to further reduce the reliance upon nonrenewable natural resources. For example, future implementation of the Clean Fuel Standard and the Renewable Portfolio Standard are expected to decrease the use of nonrenewable fossil fuels.

The Proposed Project would incorporate a variety of measures and features to reduce electricity use and minimize natural gas demand, including achieving USGBC LEED Gold Certification level. As described in Chapter 2, Project Description, several sustainable design features are under consideration for inclusion for the Proposed Project, including but not limited to, heat island reduction measures, light pollution reduction measures, indoor and outdoor water reduction

² City of Inglewood Municipal Code, Chapter 10, Article 16, Section 10-208.

measures, renewable energy production, and optimized energy performance. More specifically, the Proposed Project would incorporate a variety of energy and water conservation measures and features to minimize energy demand; these measures would include reducing indoor water use by 40 percent and outdoor water use by 50 percent, which would be elements of the Proposed Project effort to achieve USGBC LEED Gold certification.

In order to reduce the use of transportation energy, the Proposed Project would comply with CAFE fuel economy standards, which would result in more efficient use of transportation fuels (lower consumption). Proposed Project-related vehicle trips would also comply with Pavley and Low Carbon Fuel Standards which are designed to reduce vehicle GHG emissions, but would also result in fuel savings in addition to compliance with CAFE standards. The close proximity of the Proposed Project to retail, restaurant, entertainment, commercial, and job destinations support achievement of reductions in VMT. Additionally, the Proposed Project design would provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations for a minimum of 8 percent of the parking spaces pursuant to the CALGreen Code, reducing the amount of fossil fuel consumed during vehicular travel to and from the project site.

Collectively, the incorporation of the above described conservation measures and features, operation of the Proposed Project would minimize the consumption of electricity, natural gas, and transportation fuels. Therefore, as proposed operation of the Proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of electricity, natural gas, and transportation fuels, and thus would not result in the unjustified consumption of natural resources.

4.4 Growth-Inducing Effects

As required CEQA Guidelines section 15126.2(e), an EIR must discuss ways in which a project could foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment. Also, an EIR must discuss the characteristics of a project that could encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. Growth can be induced in a number of ways, such as through the elimination of obstacles to growth, through the stimulation of economic activity within the region, or through the establishment of policies or other precedents that directly or indirectly encourage additional growth. The purpose of this section is to evaluate the potential growth-inducing effects resulting from the implementation of the Proposed Project or Project Variants in the greater Los Angeles area. Additional analysis of the effects of the Proposed Project or Project Variants on population and employment growth is provided in Section 3.12, Population, Employment, and Housing, and in Chapter 5, Project Variants.

In general, a project may foster spatial, economic, or population growth in a geographic area if the project removes an impediment to growth (e.g., the establishment of an essential public service, the provision of the new access to or infrastructure capacity that serves an area; a change in zoning or general plan designations that increase density for areas outside the boundaries of a project site); or indirectly stimulates economic expansion or growth that occurs in an area in

response to the project (e.g., changes in revenue base, employment expansion, etc.). These circumstances are further described below:

- **Elimination of Obstacles to Growth:** This refers to the potential for a project to remove infrastructure limitations or provide infrastructure capacity, or remove regulatory constraints that could result in growth unforeseen at the time of project approval; and
- **Economic Effects:** This refers to the potential for a project to cause increased activity in the local or regional economy. Economic effects can include such effects as the Multiplier Effect. A “multiplier” is an economic term used to describe inter-relationships among various sectors of the economy. The Multiplier Effect provides a quantitative description of the direct employment effect of a project, as well as indirect and induced employment growth. The multiplier effect recognizes that the onsite employment and population growth of each project may not be the complete picture of growth caused by the project.

4.4.1 Elimination of Obstacles to Growth

The elimination of physical obstacles to growth is considered a growth-inducing effect. The Project Site is located in a highly urbanized area in the vicinity of other facilities designed to accommodate large sporting and entertainment events. Common factors that limit growth include limited capacities of local or regional utility infrastructure, such as storm drainage systems, or wastewater conveyance and treatment systems. Transportation infrastructure can also be a factor that limits growth.

The Project Site is located within a fully urbanized landscape, with extensive transportation and utility infrastructure designed to accommodate urban development in the City of Inglewood and the larger South Bay region. The Proposed Project would include localized circulation improvements, such as the retiming of traffic signals, construction of one or more pedestrian bridge, and improvement of sidewalks and crosswalks in and around the Project Site frontage, which would be designed to facilitate Project-related circulation and would not substantially expand the capacity of area roadways. As described in Section 3.15, Utilities and Service Systems, existing service systems for water supply, wastewater, and storm drainage are either currently adequate to serve the Proposed Project, or would require improvements to accommodate the Proposed Project. Such improvements would not be sized to provide substantial excess capacity beyond what is needed to serve the Proposed Project.

The Project Site includes parcels that are currently a combination of vacant or developed land, and is surrounded by urban uses. As described above, the primary potential obstacle to growth is the transportation and utility infrastructure that serve the Project site. The Proposed Project would be served by transportation and circulation infrastructure and utility systems that already exist or would be subject to improvements to accommodate the project-related demands. These improvements would not expand the capacity of local infrastructure to the extent that current constraints to development in surrounding areas would be eliminated. As such, the Proposed Project would not eliminate obstacles to further growth in the City of Inglewood or surrounding areas.

4.4.2 Economic Effects

Project Employment

Section 3.12, Population, Employment, and Housing, describes potential employment on the project site as totaling 1,087 jobs, including 768 non-event jobs and 319 full-time-equivalent event-related jobs. The approximately 119 existing onsite jobs would be eliminated with the current uses on the project site. Therefore, the Proposed Project would result in a net increase of approximately 968 jobs within the City.

As is presented in Table 2-4 of Chapter 2, the Proposed Project would include 768 non-event jobs, including 254 full-time-equivalent LA Clippers employees being relocated from other places of work in the LA metropolitan area. The Proposed Project Arena would employ approximately 75 new full time arena operations and maintenance employees. As Staples Center would continue to operate, these 75 employees would represent new jobs added by the Proposed Project. In addition to the employees of the LA Clippers and the proposed arena operator, the Proposed Project would add approximately 439 new jobs, including approximately 112 restaurant jobs, 216 retail jobs, 35 sports medicine jobs, 26 jobs associated with the community space, and 50 hotel jobs. The LA Clippers currently employ approximately 254 full-time equivalent employees in a variety of positions supporting the team's basketball and business operations; it is unlikely that this level of employment would change. This level of employment represents a conservative estimate of employment at the Project Site since a number of these jobs are either remote (e.g., team scouts that work across the nation or internationally), or involve substantial amounts of travel both during the NBA season and off-season (e.g., players and coaches) and thus are not located at the Project Site on a year-round basis.

The Proposed Project would also include approximately 319 full-time-equivalent jobs, comprised of part-time event employment that could vary depending on the type of event (see Section 3.12, Table 3.12-8). As shown in Chapter 2, Table 2-3, event employment would range from a low of approximately 25 employees for the estimated over 100 small civic and corporate events, to as many as approximately 1,200 for basketball games and other large events. For NBA basketball games, an additional 120 LA Clippers employees would be present working on aspects of the game operations. Based on analysis of the estimated event employment by event type, and the number and frequency of events (see Chapter 2, Table 2-3), the estimated arena event employment represents approximately 319 full-time- equivalent jobs (see Table 4-1, below).

Multiplier Effect

In addition to the employment growth generated by the Proposed Project, additional employment could be generated in the local and regional economy through what is commonly referred to as the "Multiplier Effect." The Multiplier Effect generally refers to the secondary economic effects caused by spending from Project-generated residents and employees and resulting in additional employment in the local and regional economy; because neither the Proposed Project nor Project Variants include residential uses, this analysis only considers the effects of Project-related employees. The Multiplier Effect tends to be greater in regions with larger diverse economies due

to a decrease in the requirement to import goods and services from outside the region, as compared to the effects of spending in smaller economies where goods and services must be imported from elsewhere. Because the Project Site is located in the Los Angeles metropolitan area, a large, diverse, and complex economy, the Multiplier Effect would tend to be greater than if the Proposed Project or Project Variants were constructed and operated in a smaller region.

Two different types of secondary economic effects (additional employment) are tracked through the Multiplier Effect. *Indirect* employment includes those additional jobs that are generated through the expenditure patterns of residents and direct employment associated with the Proposed Project. For example, future workers at the proposed arena and in the hotel and retail portions of the Proposed Project would spend money in the local economy, and the expenditure of that money would result in additional jobs. Indirect jobs tend to be in relatively close proximity to the places of employment and residence because that is where people typically spend money on groceries and their other day-to-day needs.

The multiplier effect also calculates *induced* employment. Induced employment follows the economic effect of employment beyond the expenditures of the employees within the area surrounding the Project Site to include jobs created by the stream of goods and services necessary to support businesses within that area. For example, when the Proposed Project or its vendors buys products or sells products, the employment associated with those purchases or sales (inputs or outputs) are considered *induced* employment. As an additional example, when an employee from the Proposed Project goes out to lunch, the person who serves that Project-employee lunch holds a job that was *indirectly* caused by the Proposed Project. When that server then spends money in the economy, the jobs generated by this third-tier effect are considered *induced*.

In Chapter 2, Project Description, it is estimated that the mixed-use development in the Proposed Project would relocate 254 existing full-time equivalent LA Clippers employees from their current places of employment to the City of Inglewood, and would result in an increase in direct employment of 514 new non-event jobs in arena operations and maintenance, as well as the retail, restaurant, sports medicine and other new uses at the Project Site. When added to the 319 full time equivalent event-related jobs, there would be a total of 833 new direct jobs as a result of the Proposed Project. As is presented below, in **Table 4-1**, the indirect and induced employment growth associated with the increased employment in the Proposed Project would add an additional 550 jobs in the Los Angeles metropolitan regional economy, which, when added to the direct full time equivalent jobs, would bring the total increase in jobs associated with the Proposed Project to 1,383 jobs.

**TABLE 4-1
INDIRECT AND INDUCED EMPLOYMENT**

Employment Description	IMPLAN Employment Type	Net New Direct Employment	Indirect		Induced		Total Indirect + Induced Employment	Total Employment
			Type I Multiplier ^a	Change from Direct	Type II Multiplier ^a	Change from Indirect		
Arena Operations and Management	Promoters of performing arts and sports and agents for public figures (491)	75 ^b	1.7684	58	1.5297	31	89	164
Arena Event Employment	Promoters of performing arts and sports and agents for public figures (491)	319	1.7684	245	1.5297	130	375	694
Restaurant	Full Service Restaurant (501)	112	1.1330	15	1.1523	2	17	129

NOTES:

^a IMPLAN 2016 dataset for Los Angeles County. *Employment Multipliers*.

^b Excludes 254 existing full-time equivalent LA Clippers employees relocating from elsewhere in the region to the Project Site.

^c Event employment is estimated as net new full time employment equivalent, based on maximum event numbers and employees per event type from Table 2-3, assuming 6 hours per event, 250 work days per year. Actual number of workers on site for any given event may be more, and is described in Table 2-3.

SOURCES: ALH Urban & Regional Economics and Applied Economics, LLC, 2019. Personal communications with Jonathan Teofilo, March 21, 2019, March 22, 2019, and March 25, 2019; ESA, 2019.

4.4.3 Environmental Effects of Induced Growth

While economic and employment growth at the Project Site is an intended consequence of the Proposed Project or Project Variants, growth induced directly and indirectly by the Proposed Project or Project Variants could also affect the greater region. Increased future employment generated by employee spending ultimately results in physical development of space to accommodate those employees. It is the characteristics of this developed physical space at a specific location that determines the type and magnitude of environmental impacts of this additional economic activity.

Depending on its location and design, potential effects caused by induced growth in the region could include: increased traffic congestion; increased air pollutant emissions; loss of open space; loss of habitat and associated flora and fauna; increased demand on public utilities and services, such as fire and police protection, water, recycled water, wastewater, solid waste, energy, and natural gas; and increased demand for housing.

Specifically, an increase in housing demand in the greater Los Angeles region could cause significant environmental effects as new residential development would require governmental services, such as schools, libraries, and parks. Indirect and induced employment and population growth could further contribute to the loss of open space because it could encourage conversion to urban uses for housing, commercial space, and infrastructure.

Nevertheless, the incremental increase in economic activity created by the indirect and induced employment associated with the Proposed Project or Project Variants would be a small part of the overall future growth in economic activity in the Los Angeles metropolitan region. Local governments throughout the region are planning for additional residential and employment-generating land uses, some of which could meet the demands created indirectly by the Proposed Project or Project Variants. Through their planning and entitlement actions, the future actions of those local agencies would be subject to environmental review under CEQA, and would be required to be consistent with regional and state plans and regulations. To the extent that future development that accommodates indirect and induced growth from the Proposed Project or Project Variants is undertaken in a manner consistent with the multitude of planning and regulatory documents referred to throughout the technical sections of Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, of this EIR, many of the potential adverse environmental consequences would be reduced in magnitude or avoided altogether.

Although the economic effect of indirect and induced employment can be predicted, because the adverse physical environmental impacts of these economic effects could occur at locations throughout the Los Angeles metropolitan region, the environmental consequences of this type of economic growth are too speculative to evaluate or predict. Pursuant to CEQA Guidelines section 15145, no further analysis of the environmental consequences of indirect or induced growth associated with the Proposed Project or Project Variants is proper under CEQA.

4.5 Urban Decay

Under CEQA, economic or social effects are not considered significant effects on the environment. Rather, these effects are considered as potential linkages or indirect connections between the Proposed Project and physical environmental effects. More specifically, the direction for treatment of economic and social effects is stated in CEQA Guidelines section 15131(a):

Economic or social effects of a project shall not be treated as significant effects on the environment. An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis shall be on physical changes.

Anticipated economic or social effects of a project may be used in the determination of the significance of physical changes caused by the project.³ As required by CEQA, the focus of the analysis in this EIR is on the physical changes that would result from the approval and implementation of the Proposed Project. Consistent with the requirements of CEQA, this EIR includes consideration of potential adverse physical environmental effects that could be the result of socioeconomic and/or economic changes that could be triggered by the Proposed Project, and as appropriate considers social and economic factors that may affect the significance of a physical effect. Section 3.12, Population, Employment, and Housing, Impacts 3.12-2 and 3.12-4 considers socio-economic effects related to the potential of the Proposed Project to result in displacement of housing or residents. The discussion below focuses on the socio-economic issue of urban decay.

As used in CEQA, the term “urban decay” was introduced by the Court of Appeal in the case entitled *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184 (*Bakersfield Citizens*). In that decision, the court required the City of Bakersfield to revise and recirculate two EIRs for two proposed Wal-Mart stores because the documents both failed to address the possible indirect physical effects flowing from the direct economic effects of the two projects. Though the court did not expressly define “urban decay,” the court seemed to equate the concept with a “chain reaction of store closures and long-term vacancies, ultimately destroying existing neighborhoods and leaving decaying shells in their wake.”⁴

For the purposes of this assessment and consistent with the above described court decision, “urban decay” is not simply a condition in which buildings become vacant as businesses compete with each other in the normal course of the market-based economy, nor is it a condition where a building may be vacated by one business or use and reused by a different business or for alternative purposes. Rather, under CEQA and for the purposes of analysis in this EIR, “urban decay” is defined as physical deterioration of properties or structures that is so prevalent, substantial, and lasting a significant period of time that it impairs the proper utilization of the properties and structures, and the health, safety, and welfare of the surrounding community.

³ CEQA Guidelines sections 15064(e), 15131(b).

⁴ *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184. p. 1204.

Physical deterioration includes abnormally high business vacancies, abandoned buildings, boarded doors and windows, and long-term unauthorized use of the properties and parking lots, extensive or offensive graffiti painted on buildings, dumping of refuse or overturned dumpsters on properties, dead trees and shrubbery, and uncontrolled weed growth.

Prolonged business vacancies which could result in urban decay generally result from a lack of sufficient demand for commercial goods or services within a market area. Under these conditions, there isn't sufficient demand for the provision of goods or services to support the existing inventory of developed commercial space within a market area. Within any market area a small percentage of commercial vacancy is common and is considered a natural part of the market economy. In most market areas, the vacant or partially occupied commercial spaces are regularly maintained, as vacancies are assumed to be temporary and building owners have an economic incentive to maintain their property in order to make it more attractive for future tenants. Urban decay conditions can potentially occur in market areas where a large, persistent deficit in the demand for commercial services exists, relative to the available inventory of commercial space.

Effects of Retail and Restaurant Uses

This analysis addresses the potential for the 48,000 sf of restaurant and retail uses that are included in the Proposed Project to create increased competition with other retail and restaurant uses in the local market, resulting in the physical urban decay of those retail and restaurant buildings.

The existing restaurant and retail uses within a market area constitute *supply*, which is the necessary volume of goods and services that must be sold for those businesses to meet operating costs. The demand for goods and services by retail and restaurant consumers within a market area constitute their *spending potential*. If the supply of space within the market area exceeds the spending potential for goods and services, commercial establishments become strained. Under those conditions, consumers in a market area do not have enough demand for goods and services to meet the supply of the businesses within that market area. It is reasonably anticipated that existing businesses can absorb a small percentage excess supply. However, periods of severe and/or prolonged excess supply result in business closures within an effected market area and ensuing commercial space vacancies. Under most conditions, business closures result in temporary vacancies that are eventually filled by similar new or alternative uses. Under more severe and prolonged conditions of excess supply, where the demand for commercial space is well below the available inventory, prolonged vacancies, property repossessions and declining maintenance of those properties can occur, resulting in urban decay.

Analysis of the potential for a project to cause or contribute to urban decay evaluates the project's impact on the existing market area to determine if the additional supply introduced by the commercial land uses in a proposed project would increase the total market area supply, to the extent that it would result in the types of conditions under which urban decay could be anticipated to occur or already is occurring. For this reason, analysis of urban decay takes into consideration conditions in the existing market area, the characteristics of the market area, and the impacts of the Proposed Project.

Existing Market Area

The conditions under which the Proposed Project would be constructed are much different than conditions that were relevant to the *Bakersfield Citizens* case. The Project Site is set within the urbanized greater Los Angeles area, which encompasses five counties in southern California, extending from Ventura County in the west to San Bernardino County and Riverside County in the east. Within this environment, market areas for various types of retail vary by product or service type, each of which is subject to the furthest anticipated distance that consumers are willing to travel for those particular goods or services, while such goods or services are commonly available beyond those distances. Under these conditions numerous markets for particular goods or services can exist within the region. Consumers are typically less willing to travel large distances to obtain goods or services from neighborhood-serving retail establishments, such as grocery stores, but typically have a greater willingness to travel for specialty goods or services. For these reasons the distribution of specific types of retailers is commensurate to the size of the market area for the goods or services they provide. Smaller market areas will only allow a certain number of businesses providing particular goods or services before exceeding the retail spending potential for that market area. Specialty goods or services have larger market areas and greater flexibility to respond to changes in the market, including the introduction of new retail supply. The larger market area provides flexibility and a decreased likelihood that individual retail projects would have a substantial impact on the overall market area.

Project Impact

The Project Site is located along the West Century Boulevard and South Prairie Avenue corridors, which are lined with Commercial, Major-Mixed-Use, Commercial/Residential, and Industrial general plan land uses.⁵ As described in Section 3.10, Land Use and Planning, commercial development along these corridors includes big- and small-box retail, fast food, restaurants, fitness, entertainment and service uses. Community-serving retail and restaurant space in the vicinity of the Project Site do not exhibit high rates of vacancy. Commercial buildings in the vicinity of the Proposed Project are generally maintained and vacant commercial spaces do not reveal prolonged vacancy and stalled maintenance. With consideration of these characteristics, the area surrounding the Project Site does not appear to exhibit signs of urban decay. With the added context of development occurring pursuant to the Hollywood Park Specific Plan (HPSP), north of the Project Site, the area surrounding the Project Site is evolving to become a destination for large sporting and entertainment events, as well as regional-serving retail uses. The City anticipates that local businesses will benefit from consumer spending related to the HPSP, and ongoing operations at The Forum. For these reasons, the City anticipates that demand in the area surrounding the Project Site for commercial goods and services, and in turn for commercial space, would increase, which would lessen the potential for prolonged commercial space vacancies to occur.

⁵ City of Inglewood, 2017. *City of Inglewood General Plan, Land Use Map*. Revised January 2017. Available: <https://www.cityofinglewood.org/DocumentCenter/View/11512/General-Plan-Land-Use-Map->. Accessed March 15, 2019.

The parcels included in the Project Site are currently undeveloped or developed with less intensive uses, relative to the uses the Proposed Project would introduce to the area. The Proposed Project would include the 18,000-seat arena, along with 48,000 sf of retail and restaurant space, 25,000 sf of sports medicine use, 85,000 sf of practice facility and team administrative offices, and 15,000 sf of community or related uses. The proposed commercial uses would be anticipated to be partially related to the Proposed Project arena and its main tenant, the LA Clippers, and would include an LA Clippers team store along with other retail and food and drink establishments, including a full-service restaurant/bar, coffee shop, and quick service restaurant. While some proposed retail uses would be community-serving (such as a coffee shop or restaurant), other retail would be regional serving (such as an LA Clippers Team Store). This latter type of retail would not be reasonably anticipated to create competitive pressure for nearby community-serving retail uses. Proposed retail uses would occupy approximately 24,000 square feet of the proposed commercial space, and proposed food and drink uses would occupy approximately 24,000 square feet of the development, comprising approximately 48,000 square feet of proposed commercial space, including a 7,000 sf LA Clippers Team Store. As described above, proposed retail uses would be complementary to the Proposed Project arena, likely providing specialty goods and services considered to be attractive to event attendees.

Under the market area conditions described above, addition of the proposed restaurant and retail space included in the Proposed Project would not be anticipated to have a substantial impact on sales demand in the area surrounding the Project Site. The amount of the restaurant and retail space in the Proposed Project would be very small in comparison to existing commercial development along the West Century Boulevard and South Prairie Avenue corridors. For example, the Costco and Target shopping centers to the east of Yukon Avenue include retail and restaurant space many times the size of that included in the Proposed Project. Further, the retail and restaurant uses in the Proposed Project would be less than one tenth of the size of the over 500,000 sf of such uses that will be constructed as part of the HPSP Adjusted Baseline projects. The 48,000 sf of retail and restaurant uses located in the Proposed Project would have minimal, if any, effect on the overall supply of commercial space in the vicinity or the larger Los Angeles market area.

Further, with more than 1 million annual attendees at events at the Proposed Project arena, spending potential in the local commercial market area would increase. Much of that spending already occurs in the larger Los Angeles market area, but to the extent that some of the spending of these attendees would be shifted to the Inglewood area, arena attendance would support the retail and restaurant uses in the Proposed Project as well as other Inglewood area businesses.

Effects of Arena Operations

Introduction of a new basketball and entertainment center to the greater Los Angeles area would create increased competition for arena events among the existing venues of similar size within the market. To better understand the potential for market-related shifts of events from existing venues to the Proposed Project, the City commissioned a study by Stone Planning LLC (Stone Report),

included as Appendix R, Analysis of Future Events, to evaluate the effects of introduction of the Proposed Project arena on the Los Angeles area market for arena events.⁶

The study described the overall trends in the live entertainment industry, the current and future arena environment in the Los Angeles area, historic usage for other arenas in the market, and estimated the percentage of major third-party events projected to occur at the Proposed Project arena that would either be new to the market, or that would relocate to the Proposed Project arena from other venues in the market. The study focused on the market for third-party events including concerts, family shows, and other types of sporting and entertainment events; the study did not address local civic or corporate events all of which are reasonably anticipated to be occurring at specific locations in the region today pursuant to existing agreements. The focus on third-party events evaluated anticipated market conditions to project the number of arena events that would be held in the Los Angeles Market during the periods leading up to opening-year operations at the Proposed Project arena through stabilization of the arena market, following the commencement of operations at the Proposed Project arena. The study evaluated the number of events anticipated to exist in the market prior to the first partial year and second full year of Proposed Project arena operations, projecting the number of those events that would be captured by the Proposed Project arena when it becomes operational, attracting those events away from existing venues. In addition, the study projects the share of new events to the market that would be captured by the Proposed Project arena, during those same study years.

The study identified The Forum and the Staples Center as venues that share the Los Angeles market and which would be anticipated to directly compete with the Proposed Project to attract third-party arena events.⁷ The Forum (which reopened in 2014 after a major renovation) and Staples Center are the two major arenas that currently exist in the market area.^{8,9} The study included analysis of the historical data, review of overall industry trends, and interviews with industry stakeholders, and concluded that with the introduction of the Proposed Project there would be overall growth in the number of events in the Los Angeles market.¹⁰

Given factors that include the Proposed Project being the third major arena added to the market, the addition of the new NFL Stadium with a 6,000-seat performance venue at the HPSP area, and the create of more available dates at Staples Center that would make it competitive for more third-party events than has been possible in the past (due to the relocation of the LA Clippers), the study concludes that the size of the market would continue to increase, but that the rate of growth in the market would be smaller than what occurred when The Forum reopened in 2014.¹¹ Further,

⁶ Stone Planning, 2019. Inglewood Basketball and Entertainment Center – Analysis of Future Events. July 2019.

⁷ Stone Planning, 2019. Inglewood Basketball and Entertainment Center – Analysis of Future Events. July 2019. p. 15.

⁸ Stone Planning, 2019. Inglewood Basketball and Entertainment Center – Analysis of Future Events. July 2019. pp. 11 and 12.

⁹ In looking at past market conditions, the study also considers the L.A. Sports Arena, which was closed and demolished in 2016, to make way for construction of the Banc of California Stadium. Prior to its demolition, the L.A. Sports Arena hosted a small number of arena events, on an annual basis, that were equivalent in size to those likely to occur at the Proposed Project.⁹ Thus for years prior to 2016, events that took place at the L.A. Sports Arena were also included in the analysis of previous arena events in the Los Angeles market.

¹⁰ Stone Planning, 2019. Inglewood Basketball and Entertainment Center – Analysis of Future Events. July 2019. p. 20.

¹¹ Stone Planning, 2019. Inglewood Basketball and Entertainment Center – Analysis of Future Events. July 2019. p. 29.

the study notes that it could take about two years for the market to adjust prior to stabilization, as was observed with the reopening of The Forum.

The study concludes that upon market stabilization, approximately 20% of the concerts and family shows, and about 60% of Other Events at the Proposed Project arena would be new-to-market. Remaining concerts, family shows, and other events are already occurring in the Los Angeles market and would be shifted from other venues currently in the market. Thus, the environmental consequences of those events are already largely occurring in the region and the effects of the Proposed Project involve the relocation of such events to the Proposed Project. **Table 4-2** presents the number of new events anticipated for each sector.

**TABLE 4-2
PROPOSED PROJECT NEW-TO-MARKET EVENTS BY TYPE**

Event Type	Anticipated Number of Annual Events	New to Market % of Events	New to Market # of Events
Concerts	23	20%	5
Family Shows	20	20%	4
Other Events	35	59%	21
Total	78	38%	29

SOURCE: Stone Planning, 2019. Inglewood Basketball and Entertainment Center – Analysis of Future Events. July 2019.

This analysis of urban decay focuses on the potential for addition of the Proposed Project to result in competitive pressure on other current venues, such that any other venue would be unable to capture sufficient events to remain viable, and would be forced to permanently close, leading to potential urban decay effects. Because the Staples Center would retain three of its existing major league sports team tenants (i.e., the NBA Los Angeles Lakers, NHL Los Angeles Kings, and WNBA Los Angeles Sparks), it is less available for or reliant on third-party events. The Forum, as a specialty concert venue that has increased its capture of concerts and other third-party events each year since it has been open, would be anticipated to continue to capture such events. While there could be some decrease in events at other venues during the initial years after opening of the Proposed Project, the evidence does not suggest that the Proposed Project would affect the viability of competing arenas in the arena market. Therefore, the City does not anticipate that addition of the Proposed Project to the Los Angeles area market would result in conditions that would contribute to or cause urban decay of other major sports and entertainment venues in the region.

Conclusion

As described above, the addition of commercial space included in the Proposed Project is very small in comparison to the existing and Adjusted Baseline commercial development. The combination of a relatively small amount of commercial development in the Proposed Project and a large number of event attendees who would be attracted to the project vicinity suggest that it is very unlikely that the Proposed Project would have a negative impact on market area retailers that would

result in the prolonged closure of market-area businesses. Any closures and ensuing commercial vacancies that may result from competitive market pressures would be anticipated to be temporary and would be backfilled by other retail or restaurant uses, or by other commercial uses that would be compatible with available space. Further, these uses would be supported by the spending of event attendees who travel to the Inglewood area as a result of the Proposed Project.

The discussion above describes the potential for changes in the market for arena events as a result of the addition of the Proposed Project arena to a market that is currently exclusively shared between The Forum and Staples Center. As described above, when the Proposed Project commences operation, it will be anticipated to capture a portion of existing arena events occurring at the other two arenas in the market, as well as a portion of the new events that would result from anticipated annual growth and additional growth in arena events available to the arena market as a result of the increased capacity within the market for arena events. The projected relocation of events from existing venues to the Proposed Project does not appear to be of sufficient magnitude to affect the viability of the existing arenas in the arena market.

For the reasons described above, the City does not anticipate that the Proposed Project would result in conditions that would contribute to or cause urban decay of retail commercial space or sports and entertainment arena venues in the local market. This impact would be **less than significant**.

CHAPTER 5

Project Variants

5.1 Introduction

This chapter describes and discusses variations of the Proposed Project that are under consideration by the project applicant and the City. There are two variants to the Proposed Project: the West Century Boulevard Pedestrian Bridge Variant, and the Alternate Prairie Access Variant. Each variant modifies one limited feature or element of the Proposed Project. Each variant is the same as the Proposed Project in every respect, with the exception of the specific variation described. Each variant would be available for selection by the project applicant and consideration by the decision makers. The variants are not mutually exclusive; one or both of the variants could be included in the Proposed Project as part of an approval action.

The Project Variants are different than the Alternatives to the Proposed Project described and analyzed in Chapter 6. The Alternatives are designed to provide alternatives to the Proposed Project as a whole, and meet the requirements of CEQA Guidelines section 15162.6, wherein the alternatives must meet most of the basic objectives of the Proposed Project, but differ in a way so as to avoid or lessen one or more of the significant impacts of the Proposed Project.

Neither variant would change the basic characteristics of the Proposed Project. Rather, each variant would change the design of the Proposed Project in discrete ways. The reason the variants are described as such, rather than as components of the Proposed Project, is that the feasibility of each of the variants is beyond the control of either the project applicant or the City. Thus, even if either the project applicant or the City wishes to incorporate a variant into the Proposed Project, the approval of another person or entity would be required. The analysis of each variant identifies the reasons why the feasibility of that variant is uncertain.

This chapter describes each variant and provides a comparative analysis of how the environmental impacts of the variant that would be different from impacts identified for the Proposed Project in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, and Chapter 4, Other CEQA-Required Considerations. Unless otherwise stated, all mitigation measures described in Chapter 3 that would be required to reduce impacts associated with the Proposed Project would also be applicable to each of the variants. Where applicable in order to address different or more severe environmental impacts, additional mitigation measures that would be required to mitigate impacts of the variant are identified.

In the event that one or both of the project variants prove to be feasible and desirable, the project applicant could propose, and based on the information provided in this chapter the City could consider approval of, one or both project variants with the Proposed Project. If the Proposed Project were altered to include one or both project variants, the City's approval documents, including the CEQA Findings of Fact, Statement of Overriding Consideration, and Mitigation Monitoring and Reporting Plan, would need to be adjusted accordingly pursuant to information in this chapter.

5.2 West Century Boulevard Pedestrian Bridge Variant

5.2.1 Description

The West Century Boulevard Pedestrian Bridge Variant (Century Pedestrian Bridge Variant) would include the construction of a pedestrian bridge across West Century Boulevard, connecting a retail and plaza portion of the Arena Site to the Hollywood Park Specific Plan (HPSP) area to the north (see **Figure 5-1**). The pedestrian bridge would provide a grade-separated connection that would allow pedestrians to travel between the Arena Site and commercial and parking uses within the HPSP on the north side of West Century Boulevard without affecting the flow of traffic on West Century Boulevard.

This variant would increase the capacity for pedestrians to cross West Century Boulevard before and after events, and improve connectivity between the Proposed Project and the HPSP development. The Century Pedestrian Bridge is being included as a variant because the project applicant does not have control of the property where the north portal and bridge abutment would be located, and it is unknown whether the HPSP property owner north of the Project Site would allow a pedestrian bridge portal and abutment on its property on the north side of West Century Boulevard.

The Century Pedestrian Bridge Variant could be incorporated into the development of either the Proposed Project (described in Chapter 2, Project Description), or the Proposed Project plus the Alternate South Prairie Access Variant (described below).

5.2.2 Bridge Design

As presented on Figure 5-1, the pedestrian bridge would be approximately 170 feet long and approximately 27 feet wide, and would provide a minimum vertical clearance of approximately 17 feet over West Century Boulevard. The bridge would extend north across West Century Boulevard perpendicular to the roadway from the second level of a commercial/retail building on the Arena Site and then turn east at a 90-degree angle at a point along the edge of the HPSP and extend along viaduct for approximately 100 yards before turning north at a 90-degree angle and emptying into an outdoor plaza located in the HPSP development.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 5-1
West Century Pedestrian Bridge Variant

The design of the Century Pedestrian Bridge would be similar to that of the South Prairie Avenue pedestrian bridge included as part of the Proposed Project and would be constructed of materials similar to the Proposed Project's retail building in the plaza. The bridge would consist of a steel spanning structure, with no vertical supports. The pedestrian bridge would be open-air with an approximately 5-foot parapet on each side with a series of light-emitting diode (LED) lighting elements spaced at close intervals on both sides of the parapet.

Construction of the bridge would occur in four phases over a five-month period, and would occur concurrently with the construction of other elements of the Proposed Project and immediately following the construction of the South Prairie Avenue pedestrian bridge. Stage 1 would consist of erecting the bridge, building the bridge on site, the delivery a steel structure from off site, and pouring concrete on site. Stage 2 would consist of bridge installation. Stage 3 would consist of another concrete pour while Stage 4 would consist of cladding the bridge, finishing the installation, installing the handrails, and applying the final treatment. Construction of the bridge would require either removing or encroaching on several existing street trees on both sides of West Century Boulevard. In addition, construction of the bridge would require the full closure of West Century Boulevard for three nights during Phase 1 and one night during Phase 3, and the closure of select lanes on West Century Boulevard for three to four nights during Phases 2 and 4. No additional construction workers and equipment would be required to construct the bridge; the same construction crew and equipment used on the South Prairie Avenue Pedestrian Bridge would be assign to the construction of the Century Pedestrian Bridge.

The Century Pedestrian Bridge would provide access to the Project Site for pedestrians traveling to or from the Project Site from the north side of West Century Boulevard. Such pedestrians would not be required to cross West Century Boulevard at street level. Under the Cumulative Scenario, this could include transit users who travel on the Inglewood Transit Connector and disembark at the Century Boulevard station. In addition, by providing more direct access to commercial and retail uses on the HPSP property, this variant would further integrate the Proposed Project and the HPSP. Such integration may be desirable, in that the Proposed Project and the commercial/retail uses on the HPSP are potentially complementary; to the extent that Proposed Project event attendees arrive early or stay late to patronize HPSP commercial uses, the transportation effects of the Proposed Project would be moderated.

The project applicant does not control the portion of the HPSP area required to construct the north portal, viaduct and landing area of the Century Pedestrian Bridge, and there is uncertainty about whether the HPSP property owner would agree to a pedestrian bridge connection. Because the agreement of the HPSP property owner would be required in order to construct this variant, the feasibility of the Century Pedestrian Bridge Variant is currently unknown.

5.2.3 Comparative Impact Analysis

Aesthetics

Aesthetics impacts under Century Pedestrian Bridge Variant would be similar to those addressed in Section 3.1, Aesthetics, for the Proposed Project, as there are no scenic vistas in the vicinity of the Project Site and the Project site is not located within the view shed of an officially designated State or county scenic highway. The only exceptions to the analysis in Section 3.1 are impacts related to visual character, lighting and glare, which are discussed below.

The Century Pedestrian Bridge Variant would add a new structure across West Century Boulevard and thus would change views for motorists, bicyclists, and pedestrians traveling east and west along West Century Boulevard. The design of the pedestrian bridge across West Century Boulevard would be visually distinctive and similar in design and materials to the proposed pedestrian bridge crossing South Prairie Avenue. In addition, with a parapet height of 5 feet and LED lighting elements extending above the parapet, the Century Pedestrian Bridge Variant would not substantially block existing views along the West Century Boulevard corridor. As a result, the change in visual character along West Century Boulevard would not be adversely affected.

LED lighting elements that would be installed on the pedestrian bridge would be required to comply with all requirements pertaining to lighting and signage in the Inglewood Municipal Code, which would ensure that light impacts would be minimized, including ensuring that illuminated signage on the proposed pedestrian bridge would not present hazards related to vehicular travel. Finally, the Pedestrian Bridge Variant would be constructed of steel and would not contain windows or other reflective surfaces, thus limiting daytime glare. The change in visual character and the addition of light and glare associated with the Pedestrian Bridge Variant would be similar in scope and magnitude to that of the South Prairie Avenue Pedestrian Bridge included in the Proposed Project, and thus these changes would not be substantial. As a result, the Century Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.1, Aesthetics.

Air Quality

Impacts related to air quality under Century Pedestrian Bridge Variant would be essentially the same as those addressed in Section 3.2, Air Quality, for the Proposed Project, as the variant would not result in operational emissions. The only exception to the analysis in Section 3.2 are impacts related to emissions during construction. Construction of the Century Pedestrian Bridge would result in emissions of ozone precursors (volatile organic compounds [VOC] and oxides of nitrogen [NO_x]), particulate matter, and toxic air contaminants (TACs) from construction equipment and haul trucks, and thus would increase the overall amount of criteria air pollutant emissions, particulate matter, and TACs generated by the Proposed Project during construction. Construction-related daily emissions associated with the Proposed Project would not exceed the SCAQMD daily significance thresholds for VOC and NO_x. In addition, localized particulate matter emissions associated with construction of the Proposed Project would not exceed SCAQMD's allowable incremental increase thresholds. Finally, TAC emissions associated with

construction of the Century Pedestrian Bridge Variant would not exceed SCAQMD's cancer risk significance and chronic hazard thresholds. Given the size of the Century Pedestrian Bridge Variant compared to the overall size of the Proposed Project, the increase in emissions of ozone precursors, particulate matter, and TACs associated with the variant would not be enough for the overall project to exceed SCAQMD thresholds. As a result, the Century Pedestrian Bridge Variant would not change the analysis or conclusions related to the Proposed Project that are discussed in Section 3.2 or the mitigation measures identified to limit these impacts.

Biological Resources

Impacts on biological resources under the Century Pedestrian Bridge Variant would be essentially the same as those addressed in Section 3.3, Biological Resources, for the Proposed Project, as no suitable habitats for special-status species occur in the area, including the site of the variant. The only exception to the analysis in Section 3.3 are impacts related to the removal of nesting habitat for resident or migratory bird species and the loss of protected trees. Implementation of the Century Pedestrian Bridge Variant could result in the potential removal or encroachment of one to two existing street trees on the north and south sides of West Century Boulevard. As a result, the Century Pedestrian Bridge Variant could remove marginal nesting habitat for resident or migratory avian species and/or result in the loss of a tree that is protected under Inglewood Municipal Code Chapter 12, Article 32. These impacts are the same in scope and magnitude to those of the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts to these resources. As a result, the Century Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.3 or the mitigation measures identified to limit these impacts.

Energy Demand and Conservation

Impacts related to energy demand and conservation under Century Pedestrian Bridge Variant would be similar as those addressed in Section 3.5, Energy Demand and Conservation, for the Proposed Project, as the variant would demand a negligible amount energy during operation to provide nighttime lighting on the bridge. The only exception to the analysis in Section 3.5 are impacts related to energy demand during construction. Construction of the Century Pedestrian Bridge would demand energy such as fuel and electricity, and thus would increase the overall amount of energy demanded by the Proposed Project during construction. However, given the size of the Pedestrian Bridge Variant compared to the overall size of the Proposed Project, the increase in energy demand associated with the variant would not be substantial enough to change the analysis or conclusions discussed in Section 3.5.

Greenhouse Gas Emissions

Impacts related to greenhouse gas (GHG) emissions under the Pedestrian Bridge Variant would be the same as those addressed in Section 3.7, Greenhouse Gas Emissions, for the Proposed Project, as the variant would generate a negligible amount of GHG emissions associated with the generation of energy to light the bridge during operation. The only exception to the analysis in Section 3.7 are impacts related to GHG emissions during construction. Construction of the

Century Pedestrian Bridge would result in GHG emissions from construction equipment and haul trucks, and would slightly increase the overall amount of GHG emissions generated by the Proposed Project during construction. Given the size of the Century Pedestrian Bridge compared to the overall size of the Proposed Project, the increase in GHG emissions associated with the variant would not be substantial enough to change the analysis or conclusions discussed in Section 3.7 or the mitigation measures identified to limit these impacts.

Hazards and Hazardous Materials

Impacts related to hazards and hazardous materials under the Century Pedestrian Bridge Variant would be essentially the same as those addressed in Section 3.8, Hazards and Hazardous Materials, for the Proposed Project, as the variant would not utilize hazardous materials during operation, and thus would not create significant hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions, during operation. In addition, the variant would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school during operation for the same reasons, and would not pose a risk a risk to flight operations at LAX as the pedestrian bridge would have a clearance of approximately 17 feet. The only exception to the analysis in Section 3.8 are impacts related to the use hazardous materials during construction and the interference of emergency response times and access during construction. These impacts are discussed further below.

Construction of the Century Pedestrian Bridge would require the use of limited quantities of hazardous materials such as fuels, oils, and lubricants for construction equipment; paints and thinners; and solvents and cleaners, and construction of the variant could increase opportunities for the accidental release of hazardous materials, thereby increasing the risk of exposure to site occupants. However, like other elements of the Proposed Project, construction of the Century Pedestrian Bridge would be required to adhere to numerous laws and regulations that govern the transportation and management of hazardous materials that would reduce potential hazards. This impact is the same in scope and magnitude to the impact described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to the use of hazardous materials during construction.

Construction of the Century Pedestrian Bridge would result in the full closure of West Century Boulevard for three nights during Phase 1 and one night during Phase 3, and the closure of select lanes on West Century Boulevard for three to four nights during Phases 2 and 4. These temporary closures would create barriers and/or obstacles for emergency responders that could affect emergency responses times and emergency access. The Century Pedestrian Bridge would be incorporated into the Proposed Project's Construction Management Plan, which would be prepared to minimize disruptions to traffic flow, maintain emergency vehicle access to the Project Site and neighboring land uses during periods in which road access would be limited or blocked, and schedule worker and construction equipment delivery to avoid peak traffic hours. Implementation of such a Construction Management Plan would ensure that emergency response or evacuation would not be substantively impaired during construction. This impact is the same in

scope and magnitude to the impact described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to emergency response times and access.

In summary, impacts related to hazards and hazardous materials under the Century Pedestrian Bridge Variant would not change the analysis or conclusions in Section 3.8, Hazards and Hazardous Materials.

Hydrology and Water Quality

Impacts related to hydrology and water quality under the Century Pedestrian Bridge Variant would be the same as those addressed in Section 3.9, Hydrology and Water Quality, for the Proposed Project, as runoff from the variant would be managed in accordance with existing regulations, and thus would not result in an impact to water quality during operation. In addition, the variant would not add any additional impervious surfaces, and thus would not impact ground water recharge or substantially alter the existing drainage pattern of the site or area, which could result in erosion or siltation or flooding on or off site. The only exception to the analysis in Section 3.9 are impacts related to water quality during construction, which is discussed below.

Construction of the Century Pedestrian Bridge Variant could increase opportunities for spills of oil, grease, gasoline, brake fluid, antifreeze, or other vehicle-related fluids and pollutants on the Project Site. Construction of the Century Pedestrian Bridge would be required to adhere to numerous laws and regulations designed to reduce or eliminate construction-related water quality effects, including the NPDES General Construction Permit and the City's Municipal Code section 10-208, Low Impact Development Requirements. In addition, construction would be required to implement mitigation that would require adherence to these requirements. This impact is the same in scope and magnitude to those described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to water quality during construction. As a result, the Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.9, Hydrology and Water Quality, or the mitigation measures identified to limit these impacts.

Noise and Vibration

Impacts related to noise and vibration under the Century Pedestrian Bridge Variant would be the same as those addressed in Section 3.11, Noise and Vibration, for the Proposed Project, as the Century Pedestrian Bridge would not generate any noticeable noise and vibration during operation. The only exception to the analysis in Section 3.11 are impacts related to noise and vibration during construction, which are discussed below.

Construction of the Century Pedestrian Bridge would cause temporary construction noise and vibration at the same time as other construction on the Project Site, and would occur during both the daytime and evening hours, similar to the Proposed Project. The noise and vibration levels from the pieces of equipment that would be used during the construction of the Century Pedestrian Bridge would be the same as the noise and vibration levels generated by the Proposed

Project. However, construction of the variant would place construction noise and vibration closer to nearby sensitive receptors (see Figure 3.11-2). Single family residential uses (R1) are located approximately 310 feet to the northwest of the Arena Site, across West Century Boulevard and South Prairie Avenue, and the north portal of the Century Pedestrian Bridge would be located about 260 feet from these uses, a decrease in distance between construction and the residences of 50 feet. In addition, multi-family residential uses with HPSP area (R21) that are currently under construction are located approximately 900 feet north of the Arena Site, and the variant would be located about 750 feet from these uses, an increase of approximately 150 feet.

Under the Proposed Project, construction noise at the sensitive receptors discussed above would not exceed a threshold of 20 dBA Lmax increase over base ambient noise levels. At R1 the noise increase under the Proposed Project would be 2.6 dBA during the daytime and 7.1 dBA during the nighttime while the noise increase at R21 under the Proposed Project would be -6.9 dBA during the daytime and -2.4 dBA during the nighttime. While the Century Pedestrian Bridge would be located about 50 feet closer to these receptors than the Proposed Project, the increase in construction noise at the receptors as a result of the variant would be less than 3 dBA, not be substantial enough to exceed the construction noise threshold. In addition, under the Proposed Project, construction vibration at R1 and R21 would not exceed the vibration threshold of 0.3 peak particle velocity (PPV) inches per second (in/sec) for structural damage and 72 VdB for human annoyance. The vibration level at R1 under the Proposed Project was estimated to be 0.002 PPV in/sec (54.1 VdB) while the vibration level at R21 under the Proposed Project was estimated to be 0.000 PPV in/sec (38.1 VdB). Again, while the north portal of the Century Pedestrian Bridge would be located about 50 feet closer to these receptors than the Proposed Project, the increase in construction vibration at these receptors would not be substantial enough to exceed the vibration thresholds for structural damage and human annoyance.

These impacts are similar in scope and magnitude to the impacts described for the Proposed Project, and thus would not increase the overall severity of impacts with respect to construction noise and vibration. As a result, the Century Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.11, Noise and Vibration, or the mitigation measures identified to limit these impacts.

Public Services

Impacts related to public services under the Century Pedestrian Bridge Variant would be the same as those addressed in Section 3.13, Public Services, for the Proposed Project, as this variant would not add employees and visitors to the Project Site, and thus would not place additional demands on police services, fire and emergency services, parks and recreation facilities, and public schools during operation. The only exception to the analysis in Section 3.13 are impacts related to the provision of fire and emergency medical services during construction. Construction of the Century Pedestrian Bridge would marginally increase the amount of construction compared to that under the Proposed Project, and the additional construction activity associated with the Pedestrian Bridge Variant could result in a slight increase in calls for service to local first responders from the Project Site. These impacts are the same in scope and magnitude to those

described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to public services. As a result, the Century Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.13.

Transportation and Circulation

The Century Pedestrian Bridge Variant would not alter in any way the trip generation or travel demand characteristics that are described for the Proposed Project in Section 3.14, Transportation and Circulation. The addition of a pedestrian bridge across West Century Boulevard would provide pedestrians an alternate path to cross between the Project Site and the HPSP area to the north where they may be walking to and from HPSP retail and food and drink businesses, or parking lots and garages. As discussed further below, the addition of the Century Pedestrian Bridge would reduce use of sidewalks and crosswalks along and across West Century Boulevard, and as such would increase the vehicular capacity of the intersection of West Century Boulevard and South Prairie Avenue. In addition, as described above, during construction of the Century Pedestrian Bridge there would be a limited number of temporary closures of West Century Boulevard.

During the pre- and post-event periods for major events at the Proposed Project, the east leg crosswalk at the South Prairie Avenue/West Century Boulevard intersection is projected to carry a high volume of pedestrians (e.g., approximately 3,500 pedestrians per hour during the post-event hour). This volume of pedestrian traffic cannot be accommodated within the current 12-foot crosswalk. Hence, a project mitigation recommends that this crosswalk be widened to 20 feet. The Century Pedestrian Bridge Variant would substantially reduce the pedestrian demand for this crosswalk, thereby eliminating the need to widen it. Further, the reduction in pedestrian flows in this crosswalk would benefit traffic operations. Approximately 400 vehicles are anticipated to turn right from northbound South Prairie Avenue onto eastbound West Century Boulevard during peak hours with a major event. Pedestrian traffic on the east leg of the crosswalk at the South Prairie Avenue/West Century Boulevard intersection would constrain this turning movement. The Century Pedestrian Bridge Variant would benefit traffic operations in the area during the event by reducing the number of pedestrians using this crosswalk, and thereby increasing the capacity of this intersection to accommodate vehicles turning right from northbound South Prairie Avenue onto eastbound West Century Boulevard.

The Century Pedestrian Bridge Variant would likely also shift some pedestrians from using the south side of West Century Boulevard east of the Proposed Project to the north side. This effect is considered beneficially because the south side of West Century Boulevard (east of the plaza) consists of an 8-foot sidewalk that would be heavily traveled and operate at level of service (LOS) E. In contrast, the north side is expected to be sparsely used and operate at LOS A. The Century Pedestrian Bridge Variant would better disperse these pedestrian flows, thereby creating an improved pedestrian walking experience.

With the exception of the above, the Century Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.14, Transportation and Circulation, or the mitigation measures identified to limit these impacts.

Utilities and Service Systems

Impacts related to utilities and service systems under the Pedestrian Bridge Variant would be the same as those addressed in Section 3.15, Utilities and Service Systems, for the Proposed Project, as the variant would not add employees and visitors to the Project Site, and thus operation of the Century Pedestrian Bridge would not create additional demand for water supply, generate additional wastewater or solid wastes. In addition, the variant would not increase the amount of impervious surface associated with the Proposed Project, and thus would not create additional demand for storm drain capacity. The only exception to the analysis in Section 3.15 are impacts related to the generation of solid waste during construction, which are discussed below.

Construction of the Century Pedestrian Bridge would result in the generation of various construction waste including scrap lumber, scrap finishing materials, various scrap metals, and other recyclable and non-recyclable construction related wastes. As a result, the additional construction activity associated with the Century Pedestrian Bridge could result in a minor overall increase in amount of solid waste generated by the Proposed Project. The Proposed Project would be constructed in a manner to qualify for Leadership in Energy and Environmental Design (LEED) Gold certification in the Building Design + Construction (BD+C) category, and would adopt a LEED approach in order to capture site-wide strategies such as those related to solid waste management. Therefore, in addition to complying with State requirements to divert a minimum of 50 percent of construction wastes to a certified recycling processor, construction of the Century Pedestrian Bridge would adhere to LEED Gold standards to minimize the total volume of construction waste that would be landfilled, similar to the Proposed Project. This impact would be the same in scope and magnitude to the impact described for the Proposed Project, and thus would not increase the overall severity of the impacts of the Proposed Project with respect to utilities and service systems. As a result, the Century Pedestrian Bridge Variant would not change the analysis or conclusions discussed in Section 3.15, Utilities and Service Systems, or the mitigation measures identified to limit these impacts.

Other Topics

Impacts associated with cultural and tribal cultural resources would not change as the Century Pedestrian Bridge Variant would not result in an increase in the amount of soil disturbance associated with the Proposed Project. In addition, impacts associated with geology and soils would not change as the construction and installation of the Century Pedestrian Bridge would adhere to state and local building codes. Impacts related to land use and planning would not change as the Century Pedestrian Bridge Variant is a transportation conveyance and not a land use and no change in the land use designation of the Arena Site and HPSP area would be required. Finally, impacts associated population, employment, and housing would not change as construction of Century Pedestrian Bridge would use existing construction workers; no additional construction workers would be required.

5.2.4 Conclusion – Century Pedestrian Bridge Variant

As described above, implementation of the Century Pedestrian Bridge Variant would result in the same or similar significant impacts as those described in Chapter 3 of this Draft EIR. There is one exception to this general statement. As explained above, under the Century Pedestrian Bridge Variant, the recommended mitigation measure to widen the east leg crosswalk of the South Prairie Avenue/West Century Boulevard intersection to 20 feet would no longer be required because pedestrian demand for this crosswalk during event peak hours would decrease. No new significant impacts would be generated under this Variant. While there would be some minor increases in construction-related impacts, the Century Pedestrian Bridge Variant would generate beneficial effects related to pedestrian access and vehicular circulation.

5.3 Alternate Prairie Access Variant

5.3.1 Description

The Alternate Prairie Access Variant (Prairie Access Variant) would expand the size of the Arena Site by adding two additional parcels to the Project Site: 10204 South Prairie Avenue and 10226 South Prairie Avenue (see Figure 2-25 in Chapter 2, Project Description). These two parcels currently contain a triplex and a single-family home, respectively. Under this variant, the properties would be acquired through voluntary sales agreements between the current property owners and the project applicant. Incorporation of these parcels into the Arena Site would increase the Project Site by approximately 8,400 square feet (sf) to a total of 28.3 acres.

Under the Alternate Prairie Access Variant, the two parcels would be acquired by the applicant, the existing structures demolished, and the properties cleared and prepared for development. Under this variant, the vehicular access to/from South Prairie Avenue would be moved 75 feet to the south, and this shift would result in a straight east–west alignment for the southernmost access road with West 103rd Street. The pickup/drop-off area would be reconfigured, and two new driveways to/from South Prairie Avenue to the pickup/drop-off area would be provided. As a result, the area devoted to hardscape and landscaping along South Prairie Avenue would increase by roughly 4,200 sf.

This variant is being included because the project applicant does not currently have control of the parcels, and it is unknown whether the parcels may be acquired by the project applicant in the future. For this reason, there is uncertainty about whether these parcels could be added to the Project Site.

The Prairie Access Variant could be incorporated into either the Proposed Project, or the Proposed Project plus the West Century Boulevard Pedestrian Bridge Variant (described in Section 5.2, above).

5.3.2 Variant Design

With the addition of the two additional properties, the Project Site would be expanded and the hardscape and landscape areas connected to the plaza would increase (see **Figure 5-2**). The Prairie Access Variant would slightly expand the plaza and increase the area devoted to hardscape and landscaping along South Prairie Avenue by roughly 4,200 sf (about 0.1 acres). As part of the Alternate Prairie Access Variant, the drop-off area for employees, team members, and visitors to the Proposed Project Arena would also shift slightly south. Site access to South Prairie Avenue would shift approximately 75 feet south to more closely align with West 103rd Street. This shift to the south would also result in a straight east–west alignment for the southernmost access road. However, the overall circulation plan for the Project Site would not materially change.

The removal of the structures on the two properties would occur at the same time as the removal of the existing structures on the Arena Site. Implementation of this variant could also result in the removal of a tree on the property located at 10204 South Prairie Avenue and the removal of three trees on the property located at 10226 South Prairie Avenue.

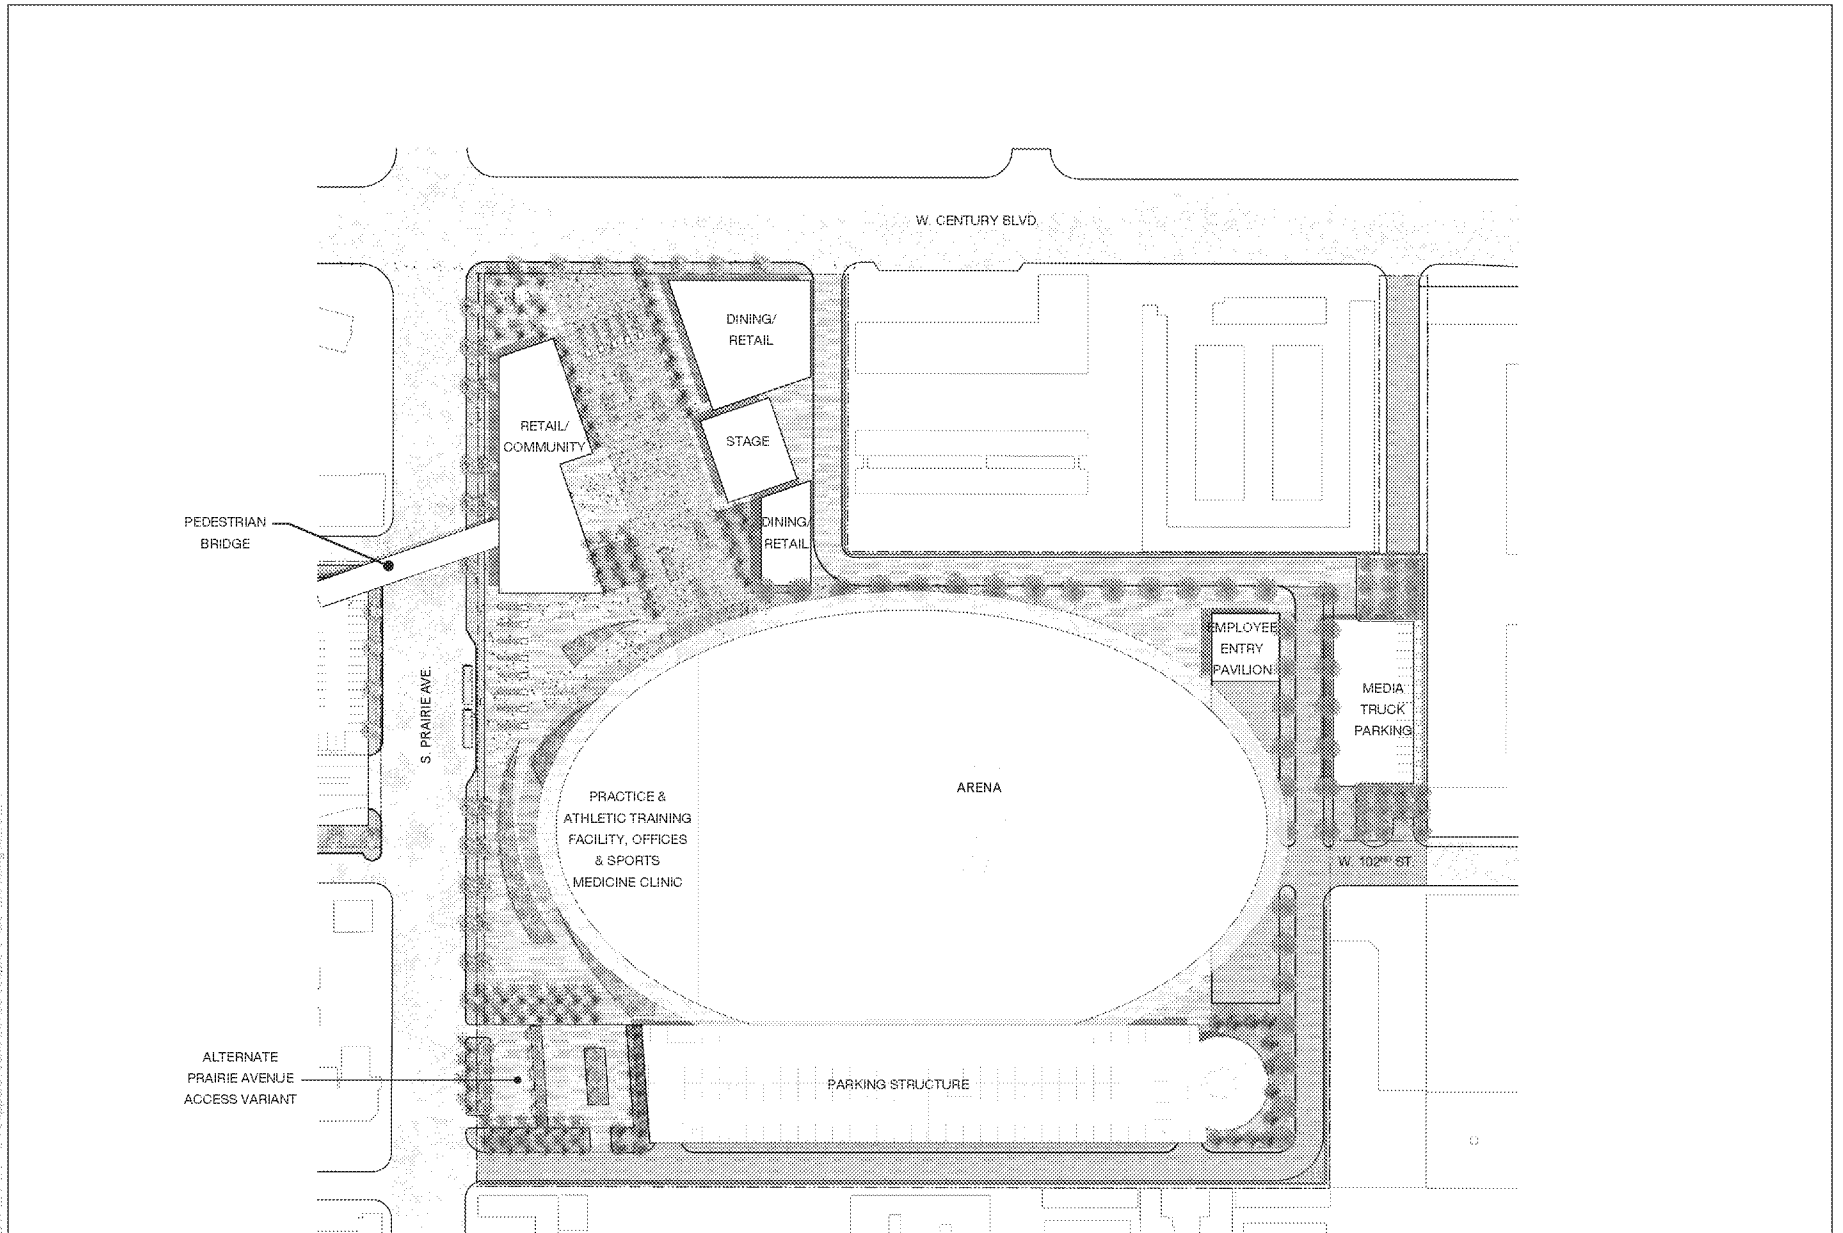

5.3.3 Comparative Impact Analysis

Aesthetics

Impacts related to scenic vistas and scenic highways under the Alternate Prairie Access Variant would be the same as those addressed in Section 3.1, Aesthetics, for the Proposed Project, as there are no scenic vistas in the vicinity of the Project Site and the Project Site is not located within the viewshed of an officially designated State or county scenic highway.

With regard to visual character, implementation of the Alternate Prairie Access Variant would slightly modify the view north along the South Prairie Avenue corridor that is depicted in Figure 3.1-9 in Section 3.1, Aesthetics. Instead of views of two one-story residential structures with the Arena Structure in the background, the views would consist of hardscape and landscaping that would be similar to the hardscape and landscaping planned for adjacent parcels on the Project Site. Compared to Adjusted Baseline conditions, the change in visual character associated with the Prairie Access Variant would be similar in scope and magnitude to that of the Proposed Project, and thus these changes would not be substantial. As a result, the Alternate Prairie Access Variant would not change the analysis or conclusions discussed in Section 3.1 related to visual character.

Impacts related to light and glare discussed in Section 3.1, Aesthetics, would be reduced with implementation of the Alternate Prairie Access Variant. Under this variant, the two properties located at 10204 South Prairie Avenue and 10226 South Prairie Avenue would be acquired by the applicant, the existing structures demolished, and the properties cleared and developed with hardscape and landscaping. As discussed in Section 3.1, 10204 South Prairie Avenue and 10226 South Prairie Avenue are identified respectively as light-sensitive receptors SR 1 and SR 2 in the

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 5-2
Alternate Prairie Avenue Access Variant

lighting analysis report prepared for the Proposed Project by Lighting Design Alliance and included as Appendix C of this EIR. The lighting analysis report identified seven sensitive receptors (SR 1 through SR 7) where lighting from the Proposed Project could potentially exceed significance thresholds. The residential properties in the vicinity of the Project Site that would experience increases in nighttime light generated by the Proposed Project and the identified sensitive receptors are shown on Figure 3.1-13 in Section 3.1.

Mitigation Measure 3.1-2(b) in Section 3.1, Aesthetics, requires the project applicant to provide to the City a lighting design plan that demonstrates that project-contributed lighting would not result in lighting intensity or glare onto light-impacted residential properties, including 10204 South Prairie Avenue (SR 1) and 10226 South Prairie Avenue (SR 2). Because the two properties located at 10204 South Prairie Avenue and 10226 South Prairie Avenue would be acquired, cleared, and developed with hardscape and landscaping under the Alternate Prairie Access Variant, the number of properties in which lighting from the Proposed Project could potentially exceed significance thresholds and subject to mitigation would be reduced with implementation of this variant. In addition, development of these-former residential properties with hardscape and landscaping would not add lighting or structures that can produce light and glare. Consequently, impacts related to light and glare discussed in Section 3.1, would be reduced with implementation of the Alternate Prairie Access Variant.

Air Quality

Air quality impacts related to the Prairie Access Variant would be the same as those addressed for the Proposed Project in Section 3.2, Air Quality, because the variant would not result in operational emissions. The only exception to the analysis in Section 3.2 are impacts related to dust and emissions during construction. The Prairie Access Variant would result in dust from demolition and ground disturbance activities on the additional 0.2 acres of property added to the Project Site, and emissions of ozone precursors (VOC and NO_x), particulate matter, and TACs from construction equipment and haul trucks; thus the overall amount of criteria air pollutant emissions, particulate matter, and TACs generated by the Proposed Project during construction would increase a minor amount. Given the small size of the additional area to be disturbed (0.2 acres or 8,400 sf), the additional construction-related emissions associated with this variant, when combined with the Proposed Project's construction related emissions, would not be substantial enough to exceed SCAQMD thresholds for criteria air pollutants, localized particulate matter emissions, and cancer risk significance and chronic hazard thresholds. As a result, the Prairie Access Variant would not change the analysis or conclusions discussed in Section 3.2 or the mitigation measures identified to limit these impacts.

Biological Resources

Impacts to biological resources under the Prairie Access Variant would be essentially the same as those addressed in Section 3.3, Biological Resources, for the Proposed Project, as no suitable habitats for special-status species occur within the area, including the site of the variant. The only way in which the analysis in Section 3.3 would change relates to impacts from the removal of

nesting habitat for resident or migratory bird species and the loss of protected trees. Construction of the Prairie Access Variant would result in the removal on one tree located at 10204 South Prairie Avenue and three trees on the property located at 10226 South Prairie Avenue. As a result, compared to the Proposed Project, this variant would remove slightly more marginal nesting habitat for resident or migratory avian species. In addition, the construction of the Prairie Access Variant would result in the loss of additional trees that are protected under Inglewood Municipal Code Chapter 12, Article 32. These impacts are the same in scope and magnitude to those of the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts to these resources. As a result, the Prairie Access Variant would not change the analysis or conclusions discussed in Section 3.3 or the mitigation measures identified to limit these impacts.

Cultural and Tribal Cultural Resources

Because the Prairie Access Variant would involve the demolition of structures and disturbance of soils that would not be affected by the Proposed Project, impacts to cultural resources under this variant would be different as those addressed in Section 3.4, Cultural and Tribal Cultural Resources, for the Proposed Project. These impacts are further described below.

There are two buildings located at 10204 South Prairie Avenue (Parcel No. 4032-008-002), both of which were constructed in 1952.¹ The first building is a single-story triplex. Entrances for the residences appear to be on the north and south sides of the main building with a secondary (side) façade fronting South Prairie Avenue. The triplex has an irregular footprint and a cross-hipped roof that is clad in composite shingles. The exterior walls are clad in stucco. Windows and doors are modern replacements and there are no distinct architectural details. The second building is a detached, double garage. The garage has an L-shaped footprint and a flat roof. Modern roll up garage doors are located on the west façade. It is also clad in stucco and devoid of architectural detailing.

A single family home currently occupies 10226 South Prairie Avenue (parcel 4032-008-006). Assessor's records indicate that the residence was constructed in 1928. The residence appears to have been rectangular in plan originally. A large addition on the south side is visible from the right-of-way. A small addition is visible on aerial photographs. The front gabled roof projects out over a porch that runs the full length of the original, west (primary) façade. The west façade is asymmetrical and includes a single pedestrian door and two aluminum slider windows. The exterior is clad in stucco. Security bars cover many of the windows. No permits were on file with the City, however, there are a number of obvious additions and alterations including the large addition to the south façade, the smaller addition on the east (rear) façade at the southeast corner, replacement of the windows and front door, and the addition of security bars over the window and door openings.

The buildings at 10212 South Prairie Avenue, 10204 South Prairie Avenue, and 10226 South Prairie Avenue were evaluated for eligibility and are not recommended eligible for listing in the National Register or California Register. As such, they do not meet the definition historical

¹ City of Inglewood Building Permit Application #03226.

resources as outlined in CEQA Guidelines section 15064.5(a)(1) or (2). For this reason, the Proposed Project, including the Alternate Prairie Access Variant, would not have a direct impact on historical resources.

Although the likelihood of encountering prehistoric and/or historic-period archaeological deposits, tribal cultural resources, and unknown human remains is low, like with the remainder of the Project Site it is possible that the construction of the Prairie Access Variant could accidentally disturb such resources during ground disturbing activities. These impacts would be the same in scope and magnitude to those described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts to these resources or require additional or changed mitigation measures.

In summary, impacts related to cultural and tribal cultural resources under the Alternate Prairie Access Variant would not change the analysis or conclusions in Section 3.4, Cultural and Tribal Cultural Resources, or the mitigation measures identified to limit these impacts.

Energy Demand and Conservation

Impacts related to energy demand and conservation under the Prairie Access Variant would be essentially the same as those addressed in Section 3.5, Energy Demand and Conservation, for the Proposed Project, as the variant would only add hardscape and landscaping to the Project Site, and thus would not demand energy during operation. The only way in which the impacts of this variant would differ from the analysis in Section 3.5 involve impacts related to energy demand during construction. Demolition of the structures located at 10204 South Prairie Avenue and 10226 South Prairie Avenue and the grading of each site would slightly increase the overall amount of energy demanded by the Proposed Project during the demolition and grading phases of the project construction. Given the small size of properties added under the Prairie Access Variant (0.2 acres) compared to the overall size of the Proposed Project (28 acres), an increase of less than 1 percent, and the fact that the new development would be the same as under the Proposed Project, the increase in energy demand during construction would not be substantial enough to change the analysis or conclusions discussed in Section 3.5.

Geology and Soils

Impacts related to geology and soils under the Alternate Prairie Access Variant would be essentially the same as those addressed in Section 3.6, Geology and Soils, for the Proposed Project. Because this variant would not involve the construction of any additional or different structures, and because the geological, soils, and seismic characteristics of the additional properties are the same as those of the Project Site, this variant would not expose people or structures to potential substantial adverse effects involving seismic hazards, unstable soils, and/or expansive soils.

The only ways in which the analysis in Section 3.6 would differ under this variant involve impacts related to erosion and the disturbance of paleontological resources during ground disturbing activities. Construction of the Prairie Access Variant would expose an additional

8,400 sf of soil to water- and/or wind-driven erosion. In addition, although the likelihood of encountering a unique paleontological resource is low, it is possible that the disturbance of an additional 8,400 sf of soil associated with the Alternate Prairie Access Variant could disturb these resources. Because these properties would add less than 1 percent to the size of the Project Site, these impacts are the same in scope and magnitude to those described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to geology and soils, and would not require any changes to mitigation measures described in Section 3.6. As a result, the variant would not change the analysis or conclusions discussed in Section 3.6 or the mitigation measures identified to limit these impacts.

Greenhouse Gas Emissions

Impacts related to GHG emissions under the Prairie Access Variant would be essentially the same as those addressed in Section 3.7, Greenhouse Gas Emissions, for the Proposed Project, as the variant would add hardscape and landscaping to the Project Site, and thus would not involve uses that would generate GHG emissions during operation. The only way in which the analysis would differ from that presented in Section 3.7 involves impacts related to GHG emissions during construction. Demolition, grading, and construction on the Prairie Access Variant properties would result in minor increases in GHG emissions from construction equipment and haul trucks, and would slightly increase the overall amount of GHG emissions generated by the Proposed Project during construction. Given the small increase in the GHG emissions from the Prairie Access Variant compared to the overall GHG emissions of the Proposed Project, the increase in GHG emissions associated with the variant would not be substantial enough to change the analysis or conclusions discussed in Section 3.7, and no new or different mitigation measures would be required.

Hazards and Hazardous Materials

Impacts related to hazards and hazardous materials under the Prairie Access Variant would be essentially the same as those addressed in Section 3.8, Hazards and Hazardous Materials, for the Proposed Project, because this variant would not increase or change the use of hazardous materials during operation, and thus would not create significant hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials, or through reasonably foreseeable upset and accident conditions, during operation. In addition, the Prairie Access Variant would not result in hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school during operation for the same reasons and would not result in a risk a risk to flight operations at LAX as the variant would not change the size of, or materially change the location of structures constructed under the Proposed Project. The only way in which the analysis in Section 3.8 would differ would involve impacts related to the use hazardous materials during construction and the accidental release of hazardous materials due to existing site contamination. These impacts are discussed further below.

Because the Prairie Access Variant site would be slightly larger than under the Proposed Project, this variant would require a slightly greater use of limited quantities of hazardous materials such as fuels, oils, and lubricants for construction equipment; paints and thinners; and solvents and cleaners, and construction of the variant could increase opportunities for the accidental release of hazardous materials, thereby slightly increasing the risk of exposure to site occupants. However, like the Proposed Project, construction of the Prairie Access Variant would be required to adhere to numerous laws and regulations that govern the transportation and management of hazardous materials that would reduce potential hazards.

In addition, while the properties located at 10204 South Prairie Avenue and 10226 South Prairie Avenue are not located on a government database of known hazardous materials sites, the property located across the street at 10223 South Prairie Avenue is located on a government database of known hazardous materials sites. Records show the site contained one 2,000-gallon underground storage tank (UST) and two 4,000-gallon USTs for storage of “product.” The available records do not indicate releases to the subsurface, and no soil or groundwater data are available for this site. In the event that contamination occurred at 10223 South Prairie Avenue and migrated to the east to the variant properties, construction workers involved in grading on the properties located at 10204 South Prairie Avenue and 10226 South Prairie Avenue potentially could be exposed to unknown contamination. The impacts described above are the same in scope and magnitude to those described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project’s impacts with respect to hazards and hazardous materials. As a result, the variant would not change the analysis or conclusions discussed in Section 3.8, Hazards and Hazardous Materials, or the mitigation measures identified to limit these impacts.

Hydrology and Water Quality

Although under this variant the Project Site would be slightly larger (less than 1 percent), impacts on hydrology and water quality under the Prairie Access Variant would be essentially the same as those addressed in Section 3.9, Hydrology and Water Quality, for the Proposed Project, since the runoff from the variant would be managed in accordance with existing regulations, and thus would not result in an impact to water quality during operation. In addition, while the Prairie Access Variant would add a minor amount of impervious surfaces (less than 8,400 sf), the underlying, predominantly clayey soils at the Project Site, including the two parcels, have low permeability and provide very little groundwater recharge through percolation of soils. For this reason, despite the slight increase in impervious surface under this variant, it would not significantly impact ground water recharge. Finally, while the Prairie Access Variant would alter the existing drainage pattern of the two parcels, development of the sites with hardscape and landscaping would comply NPDES regulations, which in turn would reduce associated erosion, sedimentation, and/or flooding on and off the parcels. The only exception to the analysis in Section 3.9 are impacts related to water quality during construction, which is discussed below.

The use of additional pieces of construction equipment and other vehicles under the Prairie Access Alternative could increase opportunities for spills of oil, grease, gasoline, brake fluid, antifreeze, or other vehicle-related fluids and pollutants on the Project Site. In addition,

construction would expose an additional 8,400 sf of soil to erosion, and thus could degrade quality of storm water leaving the Project Site. Finally, the slight increase in impervious surface on the overall Project Site would further alter the drainage pattern on the Arena Site, and thus would increase slightly the amount of stormwater leaving the site. Nevertheless, impacts described above would be the same in scope and magnitude to those described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to hydrology and water quality.

In summary, impacts related to hydrology and water quality under the Prairie Access Variant would not change the analysis or conclusions in Section 3.9, Hydrology and Water Quality, or the mitigation measures identified to limit these impacts.

Land Use and Planning

Impacts related to land use and planning under the Alternate Prairie Access Variant would be the same as those addressed in Section 3.10, Land Use and Planning, for the Proposed Project, as the addition of the two properties under this variant would not physically divide an established community. In addition, as the hardscape and landscaping proposed on the two parcels would not change the function and size of the land uses proposed under the Proposed Project, the variant would not result in conflicts with regional and local land plans adopted for the purpose of avoiding or mitigating an environmental effect. In particular, Land Use Element Goal states that the City should “[f]oster the revitalization or, if necessary, the recycling of residential areas which cannot provide a decent living environment because of jet noise impact.” The properties at 10204 and 10226 South Prairie Avenue are currently located in the 65–70 dBA noise aircraft noise contour from LAX. Further, as disclosed in Section 3.11, Noise and Vibration, the current roadway noise measured at the site on South Prairie Avenue is between 68.9 and 70.8 dBA. Thus, the removal of the current residences would not be inconsistent with the goals and objectives of the Land Use Element.

The two properties located at 10204 South Prairie Avenue and 10226 South Prairie Avenue are currently designated Commercial in the City of Inglewood General Plan and are zoned C-2A, Airport Commercial, and these land use designations would not change under the Prairie Access Variant. The C-2A zone is intended for commercial uses with special allowance for airport-related uses such as hotels and motels, and auto rental uses. While residential uses are not explicitly prohibited in the C-2A zone, new or expanded residential uses are prohibited.² Under the Prairie Access Variant, the land uses on the parcels would change from residential to hardscape and landscaping integrated into the Proposed Project Arena development, and thus would be compatible with surrounding land uses. As a result, the variant would not change the analysis or conclusions discussed in Section 3.10, Land Use and Planning.

² City of Inglewood Municipal Code Chapter 12, Article 7.1, section 12-24.14.

Noise and Vibration

Since this variant would not generate noise or vibration during operation, impacts related to noise and vibration under the Prairie Access Variant would be improved compared to those addressed for the Proposed Project and described in Section 3.11, Noise and Vibration. The only area in which the impacts described in Section 3.11 would be increased are impacts related to noise and vibration during construction, which is discussed below.

Construction of the Prairie Access Variant would cause temporary construction noise and vibration, and would occur at the same time as the other structures along South Prairie Avenue are being demolished. In addition, construction of the variant would only occur during the daytime hours; no nighttime demolition and grading is expected. The noise and vibration levels from the pieces of equipment that would be used during the construction of the Prairie Access Variant would be the same as the noise and vibration levels generated by the construction of the Proposed Project. In addition, several sensitive receptors are located in the vicinity of the variant site. The closest sensitive receptors are a single-story religious facility (R7), located approximately 90 feet to the west of and across South Prairie Avenue from the two properties, and another religious facility (R17) located directly adjacent to the south of the property located at 10226 South Prairie Avenue; these sensitive receptors are also located the same distance from the Project Site.

The noise increase at R7 during construction of the Proposed Project would be 2.0 dBA over base ambient noise levels while the noise increase at R17 during construction of the Proposed Project would be 54 dBA over base ambient noise levels. While the increase in noise during construction at R7 would not be substantial, the increase in noise during construction at R17 would exceed the threshold of 20 dBA Lmax increase over base ambient noise levels. In addition, the vibration level at R7 during construction of the Proposed Project is expected to be up to 0.010 PPV in/sec (68.2 VdB) while the vibration level at R17 during construction of the Proposed Project is expected to be up to 0.012 PPV in/sec (69.6 VdB). However, these vibration levels would not be enough to exceed the 0.3 PPV in/sec threshold for structural damage and the 72 VdB threshold for human annoyance.

As the properties located at 10204 South Prairie Avenue and 10226 South Prairie Avenue are located the same distance away from the sensitive receptors discussed above as the Proposed Project, demolition and grading on these parcels would result in the same levels of construction noise and vibration at these receptors. As a result, the Alternate Prairie Access Variant would not change the analysis or conclusions discussed in Section 3.11, Noise and Vibration, or the mitigation measures identified to limit these impacts.

The removal of the 10204 and 10226 South Prairie Avenue residential properties would eliminate existing adverse noise conditions and would avoid significant impacts described under the Proposed Project scenario. The Prairie Access Variant would remove 4 housing units that are currently in the 65–70 dBA LAX aircraft noise contour. Further, it would eliminate exposure of residents at these properties to significant impacts to these same properties from noise generated

by amplified noise from plaza events and from event-related traffic conditions on South Prairie Avenue during the Weekday Post-Event period. As such, the impacts of noise generated by Proposed Project operations would be less than described in Section 3.11.

Population, Employment, and Housing

Most of the impacts related to population, employment, and housing under the Prairie Access Variant would be the same as those addressed in Section 3.12, Population, Employment, and Housing, for the Proposed Project, because compared to the Proposed Project this variant would not require additional construction workers, and would not add additional employees and visitors to the Project Site over the long-term. As a result, the Alternate Prairie Access Variant would not induce substantial unplanned population growth in the area.

However, unlike the Proposed Project, this variant would result in the removal of 4 housing units. The structures located at 10204 South Prairie Avenue and 10226 South Prairie Avenue are residential uses and are currently occupied by renters. Based on an average household size of 3.0 people per unit in the City of Inglewood,³ it is assumed that approximately nine residents occupy the triplex located at 10204 South Prairie Avenue and three residents occupy the single-family home at 10226 South Prairie. As a result, implementation of the variant would result in the loss of 4 rental housing units and relocation a total of 12 residents.

As described in Section 3.12, under CEQA, a significant impact would occur where there would be displacement of a substantial number of existing people or housing units necessitating the construction of replacement housing elsewhere. In this case, the loss of 4 housing units, with an estimated 12 residents, could not be considered significant because the units represent such a small percentage of the City's housing stock. With an existing housing stock of 38,691 under Adjusted Baseline conditions, the loss of units under this variant would represent a decrease in the City's housing stock of approximately 0.01 percent. In addition, under cumulative conditions an additional 6,713 units would be added to the City's housing stock (see Section 3.0, Introduction to the Analysis).

With such a small reduction in the number of units in the City, and in light of the current cumulative expectation of construction of more than 6,700 future units in the City, it is highly unlikely that the loss of 4 units as a result of this variant would result in the construction of replacement housing elsewhere. Therefore, this impact would be considered less than significant.

Transportation and Circulation

The Prairie Access Variant would not alter in any way the trip generation or travel demand characteristics that are described for the Proposed Project in Section 3.14, Transportation and Circulation. As described above, the implementation of this variant would make minor alterations in the alignment of the South Prairie Avenue access to the Project Site, moving the access approximately 75 feet south to better align with the existing intersection of 103rd Street and

³ U.S. Census, 2017. *American Community Survey 1-Year Estimates Table B25032 Tenure by Units in Structure.*

South Prairie Avenue. This shift to the south would also result in a straight east–west alignment for the southernmost access road within the Project Site. However, the overall circulation plan for the Project Site would not materially change.

As proposed in the Proposed Project, the South Parking Garage driveway onto South Prairie Avenue would be restricted to inbound and outbound right-turns at all times. This design in part was related to the relatively short distance between the driveway location and the South Prairie Avenue/West 103rd Street intersection. With the Prairie Access Variant, the driveway would be located across from West 103rd Street, potentially allowing left-turns to occur at the driveway without interfering with left-turns at West 103rd Street during non-event periods (with the variant, the driveway would still be restricted to right-turns only during event periods as part of the Project’s TMP so as to not interfere with event access to and from the West Parking Garage). Therefore, this variant would improve access to the South Parking Garage during non-event periods. Also, the resultant straight east–west alignment of the southernmost access road within the Project site would improve circulation within the Project site.

The Prairie Access Variant would not materially change the analysis or conclusions discussed in Section 3.14, Transportation and Circulation, or the mitigation measures identified to limit those impacts.

Utilities and Service Systems

Impacts related to utilities and service systems under the Prairie Access Variant would be the same as those addressed in Section 3.15, Utilities and Service Systems, for the Proposed Project, as the variant would not add employees and visitors to the Project Site and, thus, would not create additional demand for water supply, generation of wastewater and solid waste service over the long term. In fact, the removal of 4 units on the two parcels would marginally reduce operational demand for water supplies and generation of wastewater, and solid waste service that originate from the subject properties. The only differences in the analysis presented in Section 3.13, Public Services involve impacts related to water supply and solid waste service during construction and storm drain capacity during operation. These impacts are discussed further below.

Construction of the Prairie Access Variant would require the use of water on site for various purposes including dust control, concrete mixing, and sanitation. In addition, construction of the variant would result in the generation of various construction wastes including recyclable and non-recyclable demolition wastes. As discussed above, the Proposed Project would apply for LEED certification and would adopt a LEED approach in order to capture site-wide strategies such as those related to solid waste management. In addition to complying with State requirements to divert a minimum of 50 percent of construction wastes to a certified recycling processor, construction of the Prairie Access Variant would adhere to LEED Gold standards to minimize the total volume of construction waste that would be landfilled, similar to the Proposed Project.

The slight increase in impervious surface on the overall Project Site as a result of the variant would slightly increase the amount of stormwater leaving the site. However, given that the Prairie

Access Variant would increase the overall size of the Project Site by less than 1 percent (0.2 acres), the increase in stormwater associated with the variant would not be substantial enough to require additional drainage capacity.

These impacts are the same in scope and magnitude to the impact described for the Proposed Project, and thus would not increase the overall severity of the Proposed Project's impacts with respect to utilities and service systems. As a result, the Alternative Prairie Access Variant would not change the analysis or conclusions discussed in Section 3.15, Utilities and Service Systems, or the mitigation measures identified to limit these impacts.

Other Topics

Impacts associated with public services would not change as, compared to the Proposed Project, the Prairie Access Variant would not add employees and visitors to the Project Site, and thus would not place increased demands on police service, fire and emergency medical service, schools, and parks during operation. In addition, the demolition of the structures located at 10204 South Prairie Avenue and 10226 South Prairie Avenue and the subsequent grading of the parcels would occur over a relatively short period of time (1–2 days), and thus would not substantially increase calls for service from local first responders during construction.

5.3.4 Conclusion – Alternate Prairie Access Variant

As described above, implementation of the Prairie Access Variant would result in the same or similar significant impacts as those described in Chapter 3 of this Draft EIR. No new significant impacts would be generated under this Variant. Although there would be removal of 4 existing residential units in commercial zones along South Prairie Avenue, the Alternate Prairie Access Variant would generate beneficial effects and avoid significant impacts related noise exposure to residents of the affected housing units and would improve circulation to and from the Project Site from South Prairie Avenue.

5.3.5 Combined Impacts of Variants

The West Century Boulevard Pedestrian Bridge and the Alternate Prairie Access Variants are, as noted above, not mutually exclusive. Thus, both variants could be included in the Proposed Project.

The variants adjust different parts of the project site, and address different concerns. For this reason, the combined effects of the variants, in the event both are implemented, consist of their arithmetic sum; there are no impacts where the combined effects would be greater than this sum. No new or substantially more severe impacts would occur. The same mitigation measures would apply.

CHAPTER 6

Project Alternatives

6.1 Overview

This chapter presents the alternatives analysis for the Proposed Project on the Project Site as required by the California Environmental Quality Act (CEQA). The discussion includes an explanation of the methodology used to select alternatives to the Proposed Project, with the intent of identifying potentially feasible alternatives that could avoid or substantially lessen the significant impacts identified for the Proposed Project while still meeting most of the basic project objectives (as described in Chapter 2, Project Description). The chapter identifies a reasonable range of alternatives that meet these criteria, and these alternatives are evaluated for their comparative merits with respect to minimizing adverse environmental effects. It describes other alternatives and alternative concepts that were considered but eliminated from detailed consideration and reasons for their elimination. For the alternatives selected for analysis, the chapter evaluates the impacts of the alternatives against baseline environmental conditions and compares the potential impacts of the alternatives with those of the Proposed Project. Finally, as required under CEQA Guidelines section 15126.6(e), based on this analysis, this chapter then discusses the Environmentally Superior Alternative.

6.1.1 CEQA Requirements for Alternatives Analysis

CEQA, the CEQA Guidelines, and the case law on the subject have established a comprehensive framework for the identification and analysis of alternatives to the Proposed Project in an EIR. CEQA Guidelines section 15126.6(a) states that an EIR must describe and evaluate a reasonable range of alternatives to the Proposed Project that would feasibly attain most of the project's basic objectives, but that would avoid or substantially lessen any identified significant adverse environmental effects of the project. An EIR is not required to consider every conceivable alternative to a Proposed Project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation.

Under CEQA, the feasibility of alternatives can be based on a range of factors and influences. CEQA Guidelines section 15364 defines "feasibility" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." CEQA Guidelines section 15126.6(f)(1) states that the factors that may be taken into account when addressing the feasibility of alternatives include site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a

regionally significant impact should consider the regional context), and whether the project applicant can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned or controlled by the project applicant).

CEQA Guidelines section 15126.6(e) states that, “The specific alternative of ‘no project’ shall also be evaluated along with its impact.” CEQA Guidelines section 15126.6(e)(3)(B) further states that when the Proposed Project is “a development project on identifiable property, the ‘no project’ alternative is the circumstance under which the project does not proceed.” This is the case for the Proposed Project addressed in this EIR.

The EIR must evaluate the comparative merits of the alternatives and include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project. Specifically, the CEQA Guidelines set forth the following criteria for selecting and evaluating alternatives:

- An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly accomplish most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives which are infeasible (see CEQA Guidelines section 15126.6(a)).
- [T]he discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly (see CEQA Guidelines section 15126.6(b)).
- The range of potential alternatives shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. The EIR should also identify any alternatives that were considered by the lead agency, but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the determination (see CEQA Guidelines section 15126.6(c)).
- The specific alternative of “no project” shall also be evaluated along with its impact (see CEQA Guidelines section 15126.6(f)(1)).
- The range of alternatives is to be governed by the “rule of reason.” CEQA requires that only those alternatives necessary to “permit a reasoned choice” be included, and that the range shall be limited to alternatives that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project. The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision-making (see CEQA Guidelines section 15126.6(f)).
- Alternative locations for the project are to be considered where any of the significant effects of the project could be avoided or substantially lessened by putting the project in another location (see CEQA Guidelines section 15126.6(f)(2)(A)).
- Finally, an EIR need not consider alternatives for which the environmental effects cannot be reasonably ascertained and for which implementation is remote and speculative (see CEQA Guidelines section 15126.6(f)(3)).

6.1.2 Organization of this Chapter

Following this introductory section, Section 6.2 describes the basis for selecting the alternatives analyzed in this Draft EIR; it reviews the project objectives, summarizes the significant impacts of the project that were identified in Chapter 3, and describes the alternatives screening and selection process. Section 6.3 includes a description of those alternatives that were considered by the City but dismissed from further evaluation. Section 6.4 provides an overview of the alternatives selected for further consideration, and Section 6.5 presents a detailed description of each of the selected alternatives, followed by an evaluation of its environmental impacts compared to those of the Proposed Project, and a description of its ability to meet the project objectives. Section 6.6 compares the impacts of the alternatives to the impacts of the Proposed Project and to one another, and it identifies the environmentally superior alternative.

6.2 Factors in the Selection of Alternatives

This section describes the basis for determining the range of CEQA alternatives and identifies the specific alternatives that are analyzed in this Draft EIR.

6.2.1 Project Objectives

As stated above, pursuant to CEQA Guidelines section 15126.6(a), the reasonable range of alternatives considered in this EIR must be capable of achieving “most of the basic objectives of the project,” while avoiding or lessening one or more of the significant impacts that would result from the project as proposed. Thus, the objectives of the Proposed Project are restated below.

The following are the City’s stated objectives for the Proposed Project:

1. Support the revitalization of the City of Inglewood, promote the City as a premier regional sports and entertainment center recognized at the local, regional, national, and international levels, and support its City of Champions identity by bringing back an NBA franchise to the City.
2. Facilitate a project that promotes the City’s objectives related to economic development, and that enhances the general economic health and welfare of the City by encouraging viable development, stimulating new business and economic activity, and increasing City revenue (property, sales, admissions and transient occupancy taxes).
3. Expand the opportunities for the City’s residents and visitors to participate in a wide range of sporting, cultural, civic and business events.
4. Strengthen the community by providing public and youth-oriented space, outdoor community gathering space, and outdoor plazas.
5. Transform vacant or underutilized land within the City into compatible land uses within aircraft noise contours generated by operations at LAX, in compliance with Federal Aviation Administration (FAA) grants to the City.
6. Encourage sustainable, modern, integrated development that includes coordinated traffic event management strategies, encourages public transit opportunities to the Project Site, provides safe and adequate pedestrian circulation, and reflects a high level of architectural design quality and landscape amenities.

7. Create employment and construction-related employment opportunities in the City of Inglewood.
8. Cause the construction (with private funds) of a public assembly and related uses that are geographically desirable and accessible to the general public to host sporting, cultural, business, and community events along with myriad youth- and community- oriented programs.
9. Cause the construction (with private funds) of a project that provides substantial public benefits, including jobs, property and sales taxes, admissions taxes, and transient occupancy taxes.
10. Achieve the objectives described above in an expeditious and environmentally conscious manner.

The following are the project applicant's stated objectives for the Proposed Project:

- 1. Build the long-term home of the LA Clippers NBA basketball team.**
 - a. Construct a state-of-the-art multi-purpose basketball and entertainment center with a capacity of up to 18,000 fixed seats to host LA Clippers home games beginning in the 2024–2025 NBA season.
 - b. Locate a basketball and entertainment center on a site that is geographically desirable and accessible to the LA Clippers' current and anticipated fan base.
 - c. Consolidate LA Clippers team operations and facilities in a single location that includes practice facilities, team executive and management offices, a sports medicine clinic, and adequate parking for both events and daily operations.
 - d. Design and develop the basketball and entertainment center to accommodate up to 18,500 attendees for other entertainment, cultural, sporting, business and community events when not in use for LA Clippers home games.
 - e. Create a lively, visitor- and community-serving environment year-round for patrons, employees, community members, and visitors to the surrounding neighborhood and nearby sports and entertainment venues by providing complementary on-site retail, dining, and/or community spaces.
 - f. Contribute to the economic and social well-being of the surrounding community by providing public benefits such as opportunities for youth- and community-oriented programs, and increasing revenues generated by property and sales taxes, admissions taxes, and potential transient occupancy taxes.
- 2. Develop a financially viable public/private Project that is constructed and operated from private funding sources.**
 - a. Locate the Proposed Project on a site that can be readily assembled and entitled to enable the feasible development of the Proposed Project to host the LA Clippers home basketball games in the 2024–2025 NBA season.
 - b. Create a unique visitor experience that is competitive with other new major event venues, including state-of-the-art media, sound, and lighting systems; patron amenities; and other features.

- c. Enhance the future success of the Proposed Project by providing signage, naming rights, and sponsorship opportunities to assist in the private financing of the Proposed Project.
- d. Support the financial viability of the Proposed Project by developing sufficient complementary on-site uses to enhance the productive use of the site on event and non-event days, including retail, dining, and potential hotel uses.

3. Design a Project that is synergistic with nearby existing and proposed uses and incorporates state-of-the-art urban design and venue design principles.

- a. Locate the Proposed Project on a site near other existing and planned mixed-use development to create a dynamic, year-round sports and entertainment district destination.
- b. Develop the basketball and entertainment center with features that enhance the Proposed Project's sense of place as a major urban sports and entertainment venue, including gathering spaces, signage, and other amenities.
- c. Create inviting and appropriately-scaled pedestrian environments to facilitate the movement of pedestrians and create safe and secure assembly areas for fans and visitors.
- d. Develop the Proposed Project to meet high-quality urban design and sustainability standards.
- e. Design the Proposed Project to take advantage of existing and planned public transit, and incorporate appropriate vehicular, pedestrian, and bicycle access and amenities that encourage sustainable transportation options.
- f. Increase walkability and improve the pedestrian experience on adjacent public rights-of-way near the Project Site, and enhance the streetscape appearance by providing perimeter and interior landscaping.

6.2.2 Significant Effects of the Proposed Project

The following project-specific and cumulative potentially significant impacts have been identified for the Proposed Project, as discussed in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures.

Significant and Unavoidable Impacts

The Proposed Project was determined to have the following significant and unavoidable impacts, with feasible mitigation imposed, as described in detail in Chapter 3 of this Draft EIR.

Air Quality

Impact 3.2-1: Construction and operation of the Proposed Project would conflict with implementation of the applicable air quality plan.

Impact 3.2-2: Construction and operation of the Proposed Project would result in a cumulatively considerable net increase in NO_x emissions during construction, and a cumulatively considerable net increase in VOC, NO_x, CO, PM₁₀, and PM_{2.5} during operation of the Proposed Project.

Impact 3.2-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in inconsistencies with implementation of applicable air quality plans.

Impact 3.2-6: Construction and operation Proposed Project, in conjunction with other cumulative development, would result in cumulative increases in short-term (construction) and long-term (operational) emissions.

Noise

Impact 3.11-1: Construction of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact 3.11-2: Operation of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact 3.11-3: Construction of the Proposed Project would generate excessive groundborne vibration levels.

Impact 3.11-5: Construction of the Proposed Project, in conjunction with other cumulative development, would result in cumulative temporary increases in ambient noise levels.

Impact 3.11-6: Operation of the Proposed Project, in conjunction with other cumulative development, would result in cumulative permanent increases in ambient noise levels.

Impact 3.11-7: Construction of the Proposed Project, in conjunction with other cumulative development, would generate excessive groundborne vibration.

Transportation and Circulation

Impact 3.14-1: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-2: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-3: Major events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-4: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-5: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-6: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-8: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-9: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-10: Certain components of the Proposed Project would generate VMT in excess of applicable thresholds.

Impact 3.14-11: Operation of the Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions.

Impact 3.14 15: The Proposed Project would substantially affect circulation for a substantial duration of construction under Adjusted Baseline conditions.

Impact 3.14-16: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-17: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-18: Major events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-19: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-20: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-21: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-23: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-24: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-25: The Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions.

Impact 3.14-27: The Proposed Project would substantially affect circulation for a substantial duration of construction under cumulative conditions.

Impact 3.14-28: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-29: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-30: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions.

Impact 3.14-31: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under Adjusted Baseline conditions.

Impact 3.14-32: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under Adjusted Baseline conditions.

Impact 3.14-33: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-34: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-35: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions.

Impact 3.14-36: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under cumulative conditions.

Impact 3.14-37: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under cumulative conditions.

Significant Impacts that can be Mitigated to Less than Significant

The Proposed Project was determined to have the following significant impacts, all of which could be mitigated to a less-than-significant level with implementation of identified mitigation measures, as described in detail in Chapter 3 of this Draft EIR. The impact statements are written for the pre-mitigation condition, so the reader should not assume that the phrases “could” or

“could have the potential to” mean that the impacts have not been determined to be less than significant after mitigation.

Aesthetics

Impact 3.1-2: Construction and operation of the Proposed Project could create a new source of substantial light or glare which could adversely affect day or nighttime views in the area.

Impact 3.1-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could cumulatively create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

Biological Resources

Impact 3.3-2: Construction of the Proposed Project could have the potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Impact 3.3-3: Construction of the Proposed Project could have the potential to conflict with local policies or ordinances protecting biological resource, such as a tree preservation policy or ordinance.

Cultural and Tribal Cultural Resources

Impact 3.4-1: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of a historical resource pursuant to section 15064.5.

Impact 3.4-2: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5.

Impact 3.4-3: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of a Tribal Cultural Resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:

- i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k).
- ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.

Impact 3.4-4: Construction of the Proposed Project could have the potential to disturb human remains including those interred outside of dedicated cemeteries.

Impact 3.4-5: Construction of the Proposed Project, in conjunction with construction of other cumulative projects, could have the potential to result in cumulatively considerable impacts to historical resources.

Impact 3.4-6: Construction of the Proposed Project, in conjunction with construction of other cumulative projects, could have the potential to contribute to cumulative impacts on archaeological resources.

Impact 3.4-7: Construction of the Proposed Project, in conjunction with construction of other cumulative development, could have the potential to contribute to cumulative impacts on the significance of a Tribal Cultural Resource, defined in Public Resources Code section 21074.

Impact 3.4-8: Construction of the Proposed Project, in conjunction with construction of other cumulative projects, could have the potential to contribute to cumulative impacts on human remains including those interred outside of dedicated cemeteries.

Geology and Soils

Impact 3.6-1: Construction and operation of the Proposed Project could have the potential to result in the substantial erosion or the loss of topsoil.

Impact 3.6-2: Construction of the Proposed Project could have the potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Impact 3.6-3: Construction and operation of the Proposed Project in conjunction with other cumulative development, could have the potential to result in substantial erosion or loss of topsoil.

Impact 3.6-4: Construction of the Proposed Project, in conjunction with other cumulative development, could have the potential to contribute to cumulative impacts on paleontological resources.

Greenhouse Gas Emissions

Impact 3.7-1: Construction and operation of the Proposed Project could generate “net new” GHG emissions, either directly or indirectly, that could have a significant impact on the environment.

Impact 3.7-2: Construction and operation of the Proposed Project could be inconsistent with applicable plans, policies and regulations adopted for the purpose of reducing the emissions of GHGs.

Hazards and Hazardous Materials

Impact 3.8-4: Construction and operation of the Proposed Project would be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, could have the potential to create a significant hazard to the public or the environment.

Impact 3.8-5: Construction and operation of the Proposed Project would be located within an airport land use plan area and could result in a safety hazard or excessive noise for people residing or working in the project area or could create a hazard to navigable airspace and/or operations at a public airport.

Hydrology and Water Quality

Impact 3.9-1: Construction and operation of the Proposed Project could have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality, or conflict with or obstruct implementation of a water quality control plan.

Impact 3.9-3: Construction and operation of the Proposed Project could have the potential to substantially alter the existing drainage patterns of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which has the potential to: result in substantial erosion or siltation on or off site; substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.

Impact 3.9-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development within the Dominguez Channel Watershed, could have the potential to cumulatively violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality or conflict with or obstruct implementation of a water quality control plan.

Impact 3.9-6: Construction and operation of the Proposed Project, in conjunction with other cumulative development in the Dominguez Channel Watershed, could have the potential to cumulatively alter the drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site; substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow.

Land Use and Planning

No significant impacts under Land Use and Planning.

Population, Employment and Housing

No significant impacts under Population, Employment and Housing.

Public Services

No significant impacts under Public Services.

Transportation and Circulation

Impact 3.14-13: The Proposed Project could have the potential to adversely affect existing or planned pedestrian facilities, or fail to adequately provide for access by pedestrians.

Impact 3.14-14: The Proposed Project could have the potential to result in inadequate emergency access under Adjusted Baseline conditions.

Impact 3.14-26: The Proposed Project could have the potential to result in inadequate emergency access under cumulative conditions.

Utilities and Service Systems

Impact 3.15-9: Construction and operation of the Proposed Project could have the potential to require or result in the relocation or construction of new or expanded storm water drainage facilities or expansion of existing facilities, the construction or relocation of which could have the potential to cause significant environmental effects.

Impact 3.15-10: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could have the potential to result in the relocation or construction of new storm water drainage facilities or expansion of existing facilities, the construction or relocation of which could have the potential to cause significant environmental effects.

6.3 Alternatives Considered but Dismissed from Further Evaluation

As required pursuant to CEQA Guidelines section 15126.6(c), in the scoping process that resulted in the selection of alternatives for analysis in this Draft EIR, consideration was given to alternatives that could avoid or substantially lessen potentially significant impacts resulting from the Proposed Project. In response to the NOP, several comments suggested alternatives for consideration in the EIR, and those NOP comments are addressed below.

Certain impacts that are identified as being significant under the Proposed Project are due primarily to intensifying development activity in an area that is currently underutilized; such intensity-related impacts include increased traffic congestion, air emissions, nighttime lighting, and the like. These impacts potentially could be substantially lessened by limiting the size of the project. Other impacts are specific to the location of the Project Site, including but not limited to traffic impacts on South Prairie Avenue, West Century Boulevard, and other major and minor streets in the vicinity of the Project Site, as well as construction and operational noise impacts on nearby residences and other sensitive receptors. Such impacts are largely unavoidable at the Project Site but it may be possible to avoid or substantially lessen these impacts by constructing a version of the Proposed Project at a different location. For these reasons, alternatives that reduce the intensity of development on the Project Site or change the location of the Project Site are addressed in this chapter.

The following alternatives were considered but dismissed from further analysis because they would not fulfill most of the basic objectives of the project, would not avoid or substantially lessen significant environmental impacts, and/or would otherwise be infeasible.

6.3.1 Entertainment Venue

Under this alternative the Project Site would be developed with retail, restaurants, an entertainment center, and a major hotel. The purpose of the alternative would be to create a unique destination that would complement planned uses located within the Hollywood Park Specific Plan (HPSP) and the existing venue at The Forum. The alternative would be patterned and sized similar to other entertainment venues within the Southern California region including Downtown Disney in Anaheim (20 acres), Universal Citywalk in Universal City (23 acres), The Grove in Los Angeles (17.5 acres), and Great Wolf Lodge in Garden Grove (13 acres).

This alternative was dismissed from further consideration because the Project Site is fragmented, does not provide a single parcel of sufficient size on which to develop a thoughtfully arranged entertainment district. This alternative was also dismissed because it could draw business away from similar land uses approved for development within the neighboring HPSP, and thus could negatively affect the City's economic development goals for the HPSP area. Finally, this alternative would fail to meet most of the basic objectives of the Proposed Project, including the City's objective to establish a world class basketball and event center and to bring an NBA franchise back to Inglewood (City Objective 1), and the Applicant's goals to build the long-term home of the LA Clippers NBA basketball team (project applicant Objectives 1a–1f).

6.3.2 Substantially Reduced Arena

Under this alternative the size of the arena on the Project Site would be materially reduced sufficiently to substantially lessen the significant transportation and related air quality impacts of the Proposed Project. In order to achieve such a lessening, in this alternative the capacity of the arena would have to be reduced by 50 percent or more, leading to a maximum capacity of no more than 9,000 attendees. This alternative would result in fewer people visiting the site and thus fewer trips being generated on the local and regional transportation system. In turn, this alternative would reduce impacts associated with traffic and traffic-related air pollutant emissions and noise.

This alternative was dismissed from further consideration because the material reduction in the size of the arena (e.g., 50 percent reduction in seats) that would be needed to substantially lessen traffic-related impacts would not meet the NBA's sizing requirements for the arena. The smallest recently-constructed NBA arenas include those built in Sacramento (Golden 1 Center, opened in 2016) and Milwaukee (Fiserv Forum, opened in 2018) which were built with an NBA game capacity of approximately 17,500. The smallest arena that is home to an NBA team is the Smoothie King Center in New Orleans, built in 1999 with a capacity of 16,867. An arena that would meet NBA standards and is of a size comparable to the recently-opened arenas in Sacramento and Milwaukee is discussed below under Alternative 2.

Because this alternative would be below the capacity required by the NBA, it would fail to meet most of the basic objectives of the Proposed Project, including the City's objective to establish a world class basketball and event center and to bring an NBA franchise back to Inglewood (City Objective 1), and the Applicant's goals to build the long-term home of the LA Clippers NBA basketball team (project applicant Objectives 1a–1f).

6.3.3 Housing

A comment on the Notice of Preparation (NOP) suggested consideration of an alternative consisting of the development of housing on the Project Site, consistent with the R-3 zone that existed on the project site prior to 1980 (see Appendix B). Under this alternative the Project Site would be developed with a variety of housing types, including single-family, condominium/townhome, and multi-family uses.

This alternative was eliminated from further consideration because of inconsistency with the existing and anticipated noise environment associated with Los Angeles International Airport (LAX). The Project Site is located approximately 2 miles east of LAX, along the extended centerlines of Runways 25R and 25L. As such, the Project Site is located within the planning boundary/airport influence area (AIA) established for LAX in the Los Angeles County Airport Land Use Plan (ALUP). According to the Los Angeles County Airport ALUP, the Project Site is located in areas exposed to noise levels ranging from CNEL 65–70dB, and from CNEL 70–75 dB. Consistent with ALUP Policies G-1 and N-3, the compatibility of proposed land uses is determined by consulting the land use compatibility table provided in Section V of the ALUP, and according to the table, residential land uses located in areas exposed to noise levels of CNEL 65–70 dB must be reviewed for noise insulation needs while residential land uses in areas exposed to noise levels of CNEL 70–75 dB are to be avoided unless they are related to airport services.

Moreover, between the 1980s and the early 2000s, the City engaged in a property purchase program, supported by FAA noise mitigation funds, to remove residential uses within these noise contours. This alternative would consist of reversing this program, and constructing new housing on the site. The FAA has stated that residential development of these noise-impacted properties is “inherently inconsistent with the intent of the City's land acquisition/noise mitigation program, approved and funded by the FAA,” and that residential use of the properties “may be inconsistent with Grant Assurance #21, Compatible Land Use; and Grant Assurance 31, Disposal of Land.”¹ For these reasons, and in light of the noise environment at the Project Site, this alternative was dismissed from further consideration.

In addition, this alternative was eliminated from further consideration because it would fail to meet most of the basic objectives of the Proposed Project, including the City's objective to promote the City as a premier regional sports and entertainment center and to establish a world class basketball and event center and to bring an NBA franchise back to Inglewood (City

¹ David F. Cushing, Manager, Los Angeles Airports District Office, U.S. Department of Transportation, Federal Aviation Administration, August 26, 2019.

Objective 1); to establish a world class basketball and event center that increases sports and entertainment and construction-related employment opportunities; to expand opportunities for City residents and visitors to participate in sporting, cultural and civic events (City Objective 3); and to transform the Project Site to uses compatible with the aircraft noise contours generated by operations at LAX and in compliance with the FAA grants to the City (City Objective 5).

Further, development of a housing alternative would not meet the Applicant's objectives to build the long-term home of the LA Clippers NBA basketball team (project applicant Objectives 1a–1e); to contribute to the economic and social well-being of the surrounding community by providing public benefits such as opportunities for youth- and community-oriented programs, and increasing revenues generated by property and sales taxes, admissions taxes, and potential transient occupancy taxes (project applicant Objective 1f); to create a unique visitor experience that is competitive with other new major event venues, including state-of-the-art media, sound, and lighting systems; patron amenities; and other features (project applicant Objective 2b); and to develop a basketball and entertainment center with features that enhance the Project's sense of place as a major urban sports and entertainment venue, including gathering spaces, signage, and other amenities (project applicant Objective 3b).

6.3.4 Employment Center/Business Park

As requested by several comments on the NOP and consistent with the Inglewood International Business Park (IIBP) Specific Plan, the City considered an alternative under which the Project Site would be developed with employment generating uses such as a business park or light industrial uses. This alternative was dismissed from further consideration because since the approval of the IIBP Specific Plan in 1993 the City has sought to attract businesses to the Project Site, but has not been able to generate momentum or build interest in the site from private sector business park developers. The inability to construct a business park on the site, despite decades-long City efforts to encourage such uses, indicates that a business park is economically infeasible at this location. In addition, a very substantial amount of commercial office space is planned in the neighboring HPSP, including 466,000 square feet (sf) in the Adjusted Baseline projects and another 3,567,314 square feet under cumulative conditions (see Section 3.0, subsections 3.0.6 and 3.0.7). Development of this amount of commercial office space would meet demand for office and employment generating uses in the area, and accomplish the City's goals for job generation.

Also, this alternative was eliminated from further consideration because it would fail to meet most of the basic objectives of the Proposed Project, including the City's objective to promote the City as a premier regional sports and entertainment center and to establish a world class basketball and event center and to bring an NBA franchise back to Inglewood (City Objective 1); to expand opportunities for City residents and visitors to participate in sporting, cultural and civic events (City Objective 3); and to create employment and construction-related employment opportunities in the City of Inglewood (City Objective 7).

Further, development of a housing alternative would not meet the Applicant's objectives to build the long-term home of the LA Clippers NBA basketball team (project applicant Objectives 1a–

le); to contribute to the economic and social well-being of the surrounding community by providing public benefits such as opportunities for youth- and community-oriented programs, and increasing revenues generated by property and sales taxes, admissions taxes, and potential transient occupancy taxes (project applicant Objective 1f); to create a unique visitor experience that is competitive with other new major event venues, including state-of-the-art media, sound, and lighting systems; patron amenities; and other features (project applicant Objective 2b); and to develop a basketball and entertainment center with features that enhance the Project's sense of place as a major urban sports and entertainment venue, including gathering spaces, signage, and other amenities (project applicant Objective 3b).

6.3.5 Alternative Locations in the City of Inglewood

The City has identified three sites within the City that are potentially feasible and which merit further evaluation in Section 6.5 below: Alternative 3, the City Services Center Alternative Site; Alternative 6, Hollywood Park Specific Plan Alternative Site; and Alternative 7, The Forum Alternative Site. The City has also considered whether there are other sites in the City that are potentially feasible. As set forth below, the City considered one additional alternative site, and determined that it was infeasible, would not meet most of the City's or applicant's basic project objectives, or would not avoid or substantially lessen the significant environmental effects of the Proposed Project.

Imperial/Crenshaw Commercial Center

The City considered the Imperial/Crenshaw Commercial Center as a potentially feasible alternative location. This site is approximately 10.5 acres and is located at the southeast corner of the intersection of Imperial Highway and Crenshaw Boulevard, approximately 1.5 miles southeast of the Project Site. The Center is made up of an approximately 210,000 sf set of one-story commercial buildings containing retail and service businesses, a six-story, approximately 96,000 sf office building, an approximately 5,000 sf retail outparcel containing a fast-food restaurant, and approximately 7.7 acres of surface parking lot.

Although not as large as the Project Site, this site was deemed of sufficient size to accommodate the arena structure and a limited amount of parking and complementary uses. It had certain advantages including proximity to the LA Metro Green Line Crenshaw Station, only 0.5 miles south on Crenshaw, near I-105, and similar close access to the I-105 freeway. The site is located only approximately 0.4 miles from the end of the runway at Hawthorne Airport, but is outside of any limiting airport safety zones or noise contours.

This alternative would fail to meet several of the City's basic objectives of the Proposed Project. Although the site is located within the City, this site would not meet certain of the City's objectives. This alternative would not transform vacant or underutilized land within the City into compatible land uses within aircraft noise contours generated by operations at LAX, in compliance with Federal Aviation Administration (FAA) grants to the City, and would not strengthen the community by providing public and youth-oriented space, outdoor community

gathering space, and outdoor plazas. Because of its small size, this site would fail to meet the applicant's goal of consolidating LA Clipper team operations and facilities in a single location (1c), and due to its distance from the NFL Stadium and The Forum, it would not respond to applicant objective 1(e) which calls for the creation of a lively, visitor- and community-serving environment year-round for patrons, employees, community members, and visitors to the surrounding neighborhood and nearby sports and entertainment venues.

The majority of the buildings are occupied by current tenants and the property owners have recently invested in an upgrade and expansion of the Center. The site is not underutilized or vacant, and is well maintained. The site is not currently for sale or reasonably considered available for development. For all of these reasons, the City eliminated this site from further consideration.

6.3.6 Alternative Locations Considered by the Project Applicant

With its lease at Staples Center expiring at the end of the 2023–2024 NBA season, the LA Clippers organization began exploring options for a new arena in the Los Angeles area in late 2014/early 2015. The LA Clippers engaged a team of experienced professionals to identify sites in the greater Los Angeles area that could accommodate a new, state-of-the-art NBA arena, relocated LA Clippers team facilities, and supporting, ancillary commercial, retail, and community uses.

The process of identifying potential sites involved consideration of key preliminary site criteria such as adequate site size and configuration (with specifics varying depending on site conditions and parking arrangements), proximity to existing and anticipated future fan base, access to existing and planned transportation and parking facilities, environmental conditions, site acquisition and development cost (including tenant relocation considerations), and an ability to assemble and control the site within the timeframe needed to open a new arena by the 2024- 2025 NBA season.

The following is a summary of some of the main sites that were identified and considered in preliminary site analyses.

Numerous sites in and around downtown Los Angeles were identified and considered. They were ultimately not selected due to site assembly and/or relocation issues: (a) the Piggyback site and UPS Site along the Los Angeles River near the intersection of Highway 101 and the I-5 Freeway; (b) Civic Center East near Little Tokyo and Union Station; (c) the BOS Yard in Boyle Heights at East 7th Street and South Mission Road, just east of the Los Angeles River and west of the I-10 Freeway; and (d) 8th and Alameda, just west of the Los Angeles River and north of the I-10 Freeway.

Sites on the west side of Los Angeles, in closer proximity to the existing and anticipated future fan bases, were preliminarily identified, but while under consideration by the LA Clippers these sites or portions thereof were sold to other developers and/or development commenced on those sites or portions thereof: (a) Fairfax DWP at South Fairfax Avenue and the I-10 Freeway; (b) Howard Hughes Center; and (c) Centinela Avenue and Jefferson Boulevard.

The preliminary site analysis also considered sites south of Inglewood, and as far south as Long Beach. Of those, the District at South Bay site, located in Carson west of the San Diego Freeway (I-405) and south of Del Amo Boulevard, was outside of but closest to the preferred west side fan base location. This site is analyzed as Alternative 5, in Section 6.5 below.

On the west side of Los Angeles, in addition to Inglewood, the team considered the Marlton Square area in Baldwin Hills. The team first considered a development site to the south and west of the intersection of Marlton Avenue and Martin Luther King Jr. Boulevard. While that site was being analyzed, the immediately adjacent Kaiser Permanente Baldwin Hills-Crenshaw Medical Center along Santa Rosalia Drive was under construction, and it was determined that it would be infeasible to develop the arena and provide necessary access to the arena and the Kaiser facility on the remainder of the site from either Marlton Avenue or Martin Luther King Jr. Boulevard. The team conducted a preliminary analysis of the Baldwin Hills Crenshaw Plaza Mall site east of Marlton Avenue and identified site assembly and entitlement challenges. The Baldwin Hills Crenshaw Plaza mall site is analyzed as Alternative 4, in Section 6.5 below.

In Inglewood, the LA Clippers also had some contact with the ownership of both the Hollywood Park Specific Plan (HPSP) site and The Forum site. These two sites are described and analyzed as Alternatives 6 and 7, respectively, in Section 6.5 below.

The LA Clippers determined that the site at West Century Boulevard and South Prairie Avenue in the City of Inglewood would best meet the site criteria, given the proximity to existing and anticipated future fan bases, the potential for timely site assemblage and control with a substantial amount of vacant municipal-owned land, and the unique opportunity to be part of a world-class sports and entertainment district.

6.4 Alternatives Selected for Further Consideration

The City selected a reasonable range of alternatives to the Proposed Project for further consideration and analysis in this Draft EIR. Consistent with CEQA, the selection of the range of alternatives considered in this Draft EIR was governed by the rule of reason. As is stated in CEQA Guideline section 15126.6(a):

An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives which are infeasible.

In identifying a range of alternatives for consideration in this Draft EIR, the City focused on avoiding or substantially lessening one or more significant impacts of the Proposed Project, while achieving most of the basic objectives of the project, including construction and operation of a new entertainment and sports facility sufficient to serve as the home of the NBA LA Clippers. The selection of alternatives for this EIR is constrained by several factors, including the NBA requirements for the size of an arena, the proximity of the Project Site to other major sports and entertainment facilities, and access to major transportation corridors and freeways. As such, the

focus of several of the selected alternatives is on an evaluation of the comparative environmental effects of alternative locations for development of the Proposed Project. In addition, the City has considered a project of reduced size on the same site, while still providing an arena sufficient to meet the NBA's requirements.

The alternatives to the Proposed Project analyzed in this Draft EIR are:

- Alternative 1: No Project Alternative;
- Alternative 2: Reduced Project Size Alternative;
- Alternative 3: City Services Center Alternative Site;
- Alternative 4: Baldwin Hills Alternative Site;
- Alternative 5: The District at South Bay Alternative Site;
- Alternative 6: Hollywood Park Specific Plan Alternative Site; and
- Alternative 7: The Forum Alternative Site

Table 6-1 summarizes the development assumptions for each of the alternatives, and **Figure 6-1** shows the geographic location of each alternative site. Each of the alternatives is described in more detail and analyzed in the following subsections.

6.5 Environmental Evaluation of the Alternatives

The following discussion provides a comparative evaluation of the environmental consequences of the alternatives selected for further consideration in this EIR. Consistent with the requirements of CEQA Guidelines section 15126.6(d), the discussion includes “sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.” The discussion of the comparative environmental impacts of each alternative is presented in a way to assist the reader in readily understanding which environmental impacts of an alternative would be the same or similar as, less severe than, or more severe than those of the Proposed Project. As provided for under CEQA, where an alternative would cause a significant impact that would not otherwise be caused by the Proposed Project, the significant impact of the alternative is discussed, but in less detail than the significant impacts of the Proposed Project that are presented in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. In some cases, there may be a topic area (e.g., Transportation) where certain impacts are the same as or similar to the Proposed Project, while others are less severe or more severe than the Proposed Project. In these cases, the alternative analysis splits up the topic area and presents information to assist the reader in understanding how the individual impacts within the topic area compare to the Proposed Project, and the reader will see, for example, some Transportation impacts discussed in the “same as or similar to” category, and some in the “less severe” category.

In order to assist comparison of the impacts of the Proposed Project and the Alternatives, **Table 6-2**, at the end of this chapter, indicates for each significant impact, whether the impacts of the project alternatives are equal to, less, or more severe than those of the Proposed Project.

**TABLE 6-1
PROJECT ALTERNATIVES SUMMARY**

Project Elements	Proposed Project	Alternative 1: No Project	Alternative 2: Reduced Project Size Alternative	Alternative 3: City Services Center Alternative Site	Alternative 4: Baldwin Hills Alternative Site	Alternative 5: The District at South Bay Alternative Site	Alternative 6: HPSP Alternative Site	Alternative 7: The Forum Alternative Site
Arena size (sf / seats)	915,000 / 18,000	0 / 0	915,000 / 17,500	915,000 / 18,000	915,000 / 18,000	915,000 / 18,000	915,000 / 18,000	915,000 / 18,000

Figure 6-1
Alternative Locations

6.5.1 Alternative 1: No Project Alternative

Description

Under CEQA, the No Project Alternative must consider the effects of not approving the project. The No Project Alternative describes the environmental conditions that exist at the time that the environmental analysis commences, as well as what would reasonably be expected to occur in the foreseeable future if the project were not approved (CEQA Guidelines section 15126.6(e)(2)). In the case of the Proposed Project, the Project Site is partially developed, so continuation of existing conditions would involve continued operation of businesses and re-tenanting of current developed land uses on the Project Site. Existing conditions are described in the Environmental Settings of each section within Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, of this Draft EIR.

Under the No Project Alternative, the City Council would not approve any project on the Project Site, and none of the mitigation measures identified within this Draft EIR would be implemented. No demolition would occur under the No Project Alternative, because the existing structures on the site would be retained. The vacant parcels on the Project Site would continue to be vacant. The developed parcels on the Project Site would continue to be used, existing uses would continue, and those buildings that are currently vacant would be re-tenanted.

CEQA Guidelines section 15126.6(e)(3)(B) states that “[i]f disapproval of the project under consideration would result in predictable actions by others, such as the proposal of some other project, this ‘no project’ consequence should be discussed.” In this case, the Project Site is partially located within the IIBP Specific Plan, which calls for the development of light industrial and general commercial uses. The City adopted the IIBP Specific Plan in 1993. During the intervening 26 years, the development envisioned in the IIBP has not occurred. In light of the lack of development activity within the IIBP Specific Plan area over nearly three decades, it is not foreseeable that “predictable actions by others” would lead to development of the vacant parcels for uses consistent with the IIBP Specific Plan. Because these parcels have remained vacant for such a long time, and the City has not received any development applications for the vacant parcels, it is a reasonable assumption that no development of currently vacant parcels on the Project Site would occur within the foreseeable future. Although the IIBP would remain in place, development as contemplated by the IIBP would not occur.

Under the No Project Alternative, it is assumed that for the foreseeable future the LA Clippers would continue playing at the Staples Center in Downtown Los Angeles, and the LA Clippers’ team offices would continue to be located on Flower Street, within two blocks of Staples Center. In addition, the LA Clippers would continue to use its practice and training facility in the Playa Vista neighborhood within Los Angeles. It is also reasonable to assume that the LA Clippers would either remain at Staples Center or seek an alternate location for the development of a new arena. While there is currently no identified alternate location under consideration, the discussion under Section 6.3.6 provides a description of the evaluation process previously undertaken by the LA Clippers, and the discussion under Alternatives 3 through 7 provides a description of the

comparative environmental effects of development of the Proposed Project at five alternative locations in the region, including three other sites in the City of Inglewood.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 1. Because no new development would occur at the Project Site, the effects of the No Project Alternative would be a continuation of the existing conditions described in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. Because the Proposed Project would not be constructed or operated at the Project Site under this alternative, none of the impacts identified for the Proposed Project would occur under the No Project alternative.

The Arena Site contains two developed parcels that are currently unoccupied. One unoccupied building is a two-story warehouse/light manufacturing facility located on the north side of West 102nd Street. The other unoccupied building is a one- and two-story concrete commercial building with an access driveway and small parking area located at 3838 West 102nd Street. Under Alternative 1, it is foreseeable that these buildings would be leased to new tenants, and warehouse/light industrial/commercial activities in those buildings would resume. These activities would foreseeably be similar in nature and scope to those activities that have occurred in the past.

The effects of continued use of Staples Center for LA Clippers games would continue to create a range of environmental effects in and around downtown Los Angeles and the region, including the generation of vehicle miles travel (VMT) and associated congestion during pre- and post-event hours, and generation of criteria air pollutants including ozone precursors and small particulate matter. Because these effects are ongoing, they are considered part of the regional environmental setting and would not be subject to mitigation through the CEQA process.

Relationship to Project Objectives

Under the No Project Alternative none of the City's or applicant's objectives for the Proposed Project would be achieved.

6.5.2 Alternative 2: Reduced Project Size Alternative

Description

Under Alternative 2, the Proposed Project would be reduced in size to the maximum extent potentially feasible so as to avoid or substantially lessen impacts that would be associated with the intensity of development on the Project Site. Alternative 2 examines the impacts of a project that would still provide an arena sized consistent with the smallest recently-constructed NBA arenas, while eliminating all other uses that are not absolutely essential to the construction and operation of the arena itself. In this fashion, Alternative 2 would eliminate all uses other than the arena itself, the plaza that supports arena entry and exit, and the infrastructure (primarily parking) necessary to serve the arena. Further downsizing the arena is considered infeasible because an

arena with further reduced capacity would be smaller than any other recently constructed arenas serving an NBA franchise.

An alternative that eliminates the arena, or includes an arena smaller than the minimum size required for an NBA franchise, would not meet a basic project objective. Alternative 2 would meet this basic project objective, while minimizing, to the extent feasible, impacts in the immediate vicinity of the Project Site. As such, under this alternative only the Arena, pedestrian plaza, and South Parking Garage would be constructed on the Arena Site. None of the other Proposed Project elements (i.e., team practice facility, sports medical clinic, and team administrative offices, retail shops and restaurants, outdoor plaza stage, and community-type uses) would be constructed. The LA Clippers' team offices would continue to be located on Flower Street within two blocks of Staples Center, while the LA Clippers would continue to use their practice and training facility in the Playa Vista neighborhood of Los Angeles. It should be noted that the environmental impacts of operation of these facilities in their current locations are included in the existing conditions, and would continue into the future under Alternative 2.

Under this alternative, the seating capacity of the arena would be reduced by approximately 3 percent to approximately 17,500 (up to 18,000 attendees in certain concert configurations), consistent with the seating capacity of the most recently built NBA arena (i.e., Fiserv Forum in Milwaukee, Wisconsin).² Without inclusion of team practice facility, sports medical clinic, and team offices, the arena structure would be further reduced in size. Furthermore, elimination of retail and community uses would mean that the pedestrian plaza would also be larger under this alternative as compared to the Proposed Project.

Parking provided under Alternative 2 would comply with parking supply requirements established in Inglewood Municipal Code section 12-47, which require provision of parking spaces at a ratio of 1 space per 5 attendees. With a total capacity of 18,000 attendees at the arena, this alternative would require a minimum of 3,600 parking spaces. Alternative 2 would provide 3,775 on-site parking spaces, slightly more than required by the Municipal Code, compared to the 4,125 on-site parking spaces provided by the Proposed Project. The West Parking Garage would be constructed with 3,110 spaces across six stories, the same as under the Proposed Project. In addition, the proposed South Prairie Avenue pedestrian bridge linking the West Parking Structure to the plaza on the Arena Site would still be included. Similar to the Proposed Project, the South Parking Garage would be located immediately to the south of the arena on the Arena Site, providing 625 parking spaces across three stories, a small decrease from 650 spaces on three floors under the Proposed Project.

Under Alternative 2, on the East Transportation and Hotel Site, no parking structure nor public parking use would be provided; the site would only serve buses, Transportation Network Company (TNC) vehicles and taxis via a surface parking and pickup/drop-off lot. Further, under

² Wikipedia, List of National Basketball Association arenas, accessed July 7, 2019, https://en.wikipedia.org/wiki/List_of_National_Basketball_Association_arenas.

this alternative no hotel would be constructed on the Hotel Site, a decrease in the size of the Project Site of 1.25 acres, or about 4.5 percent.

Finally, construction of the proposed replacement well on the Well Relocation Site would take place under Alternative 2.

Under Alternative 2, employment on the Project Site would be reduced because the LA Clippers would not move their team offices and practice facility to the Project Site, and the sports medicine, hotel, retail/restaurant, and community uses would be eliminated. In total, this would reduce the non-event employment on the Project Site from 768 under the Proposed Project to 75 under Alternative 2. Event-related employment would remain the same as under the Proposed Project.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 2.

Impacts Identified as Being the Same or Similar to the Proposed Project

Aesthetics

Although a number of uses would be removed from the Proposed Project, many of the impacts of the Proposed Project on environmental resources affected by the size and location of the Project Site would be either the same, or nearly so. Alternative 2 would include the Arena Structure and West Parking Garage essentially as proposed under the Proposed Project, including the South Prairie Avenue pedestrian bridge. As such, aesthetic impacts to views north and south on South Prairie Avenue would remain unchanged. There would be a modest reduction in the amount of development visible to motorists on West Century Boulevard due to the elimination of the hotel development on the East Transportation Site and the elimination of the plaza development on the Arena Site, however the larger structures that would remain, including the Arena Structure and the West Parking Garage, would continue to be visually present in views east and west on West Century Boulevard (Impact 3.1-1). Finally, impacts related to spillover lighting at nearby residential structures would remain essentially the same as under the Proposed Project (Impacts 3.1-2 and 3.1-5), with the same required mitigation measures.

Biological Resources

Because the same tree removal would occur under Alternative 2 as under the Proposed Project, impacts related to disturbance to nesting raptors or migratory birds (Impact 3.3-2) and loss of protected trees (Impacts 3.3-3) would be identical to those described for the Proposed Project, with the same required mitigation measures.

Cultural and Tribal Cultural Resources

Because the Project Site would be essentially the same as under the Proposed Project, the construction impacts of Alternative 2 that are related to demolition, ground-disturbance and excavation would be similar to the Proposed Project although lessened by approximately 4.5 percent as there would be no ground disturbance associated with the planned hotel on

1.25 acres of the East Transportation Site under Alternative 2. Therefore, damage to unknown historical resources, archaeological resources, or tribal cultural resources (Impacts 3.4-1, 3.4-2, 3.4-3, 3.4-5, 3.4-6, and 3.4-7), and/or unknown human remains (Impacts 3.4-4 and 3.4-8) would be reduced, but would still require mitigation.

Geology and Soils

Impacts related to geology and soils conditions and hazards, including paleontological resources would be similar to those described for the Proposed Project. Because Alternative 2 would occur on the same Project Site as the Proposed Project, the same geological and soils conditions that would be encountered in construction of Alternative 2 would be the same as with the Proposed Project. Because there would be less ground-disturbing activity because of the reduced amount of development in Alternative 2, the potential for erosion and accidental discovery of paleontological resources would be correspondingly decreased (Impacts 3.6-2 and 3.6-4). However, these impacts would continue to be potentially significant under Alternative 2 and would require the same mitigation measures as identified for the Proposed Project in order to reduce the impact to less than significant.

Hazards and Hazardous Materials

Impacts related to the transport, handling, and disposal of hazardous materials would remain essentially the same as under the Proposed Project (Impact 3.8-1), with adherence to the same federal, State and local regulations. There would be a decrease in the numbers and types of businesses on the Project Site under Alternative 2, but these decreases would be insufficient to change the conclusions about significance or the requirement for adherence to federal, State and local regulations. In addition, exposure to contaminated soils (Impact 3.8-4) under Alternative 2 would be reduced by approximately 4.5 percent as there would be no ground disturbance associated with the planned hotel on 1.25 acres of the East Transportation Site, but mitigation would still be required. Finally, hazards to air navigation (Impact 3.8-5) under Alternative 2 would be the same as the Arena Structure and the construction cranes required to construct the arena would be the same height as with the Proposed Project, and thus would penetrate imaginary airspace surfaces set by the FAA for LAX; the same mitigation would be required.

Hydrology and Water Quality

Impacts of Alternative 2 associated with soil erosion during construction and storm water drainage post-construction would also be similar to the Proposed Project but somewhat lessened as the planned hotel on the East Transportation and Hotel Site would not be constructed under Alternative 2. As a result of the site being reduced in size by about 1.25 acres, impacts related to degradation of water quality during construction and post-construction (Impacts 3.6-1, 3.6-3, 3.9-1 and 3.9-4) and inadequate site drainage (Impacts 3.9-3 and 3.9-6) would be reduced by about 4.5 percent, but would still require mitigation.

Land Use and Planning

Like the Proposed Project, Alternative 2 would have less-than significant-impacts related to land use and planning (Impacts 3.10-1 through 3.10-4).

Noise

Traffic noise impacts of Alternative 2 would be essentially unchanged under Alternative 2. Under normal conditions, a doubling of traffic generates an increase in ambient noise of about 3 dB. Reciprocally, it would take a reduction of about 50 percent to result in a noticeable change in the noise impacts of the project. As reported below, this alternative would result in a reduction in traffic of about 3 percent. Thus, traffic noise effects of Alternative 2 would be the same as those of the Proposed Project (Impacts 3.11-2 and 3.11-6).

Like the Proposed Project, Alternative 2 would not expose people within portions of the Project Site where there is an expectation of quiet to excessive noise levels from aircraft operations at nearby LAX as the hotel and team medical clinic would not be constructed on the Project Site. For this reason, noise impacts associated with aircraft operations (Impacts 3.11-4 and 3.11-8) would be avoided, as with the Proposed Project.

Public Services

Because impacts of the Proposed Project on public services, including fire and police protection, and parks and recreation facilities would be largely driven by event activity at the proposed arena, these impacts would remain largely unchanged and would continue to be less than significant (see Impacts 3.13-1 through 3.13-10), under Alternative 2.

Transportation and Circulation

Under Alternative 2, the slightly reduced capacity of the arena would reduce vehicle trip generation in the pre-event and post-event peak hours for major events in the weekday and weekend evenings by approximately 3 percent. This slight reduction in trips would not materially reduce the significant impacts found for the Proposed Project on intersections, neighborhood streets, and freeway facilities under either Adjusted Baseline or Cumulative conditions with or without concurrent events at The Forum or the NFL Stadium (Impacts 3.14-1 through 3.14-9, Impacts 3.14-16 through 3.14-24, Impacts 3.14-28 and 3.14-29, and Impacts 3.14-33 and 3.14-34).

Similar to the Proposed Project, Alternative 2 has the potential to impact on-time performance for buses operating in the vicinity because of congestion associated with event arrival and departure traffic (Impacts 3.14-11, 3.14-25, 3.14-30, and 3.14-35).

Construction impacts on traffic were determined to be significant for the Proposed Project due to temporary lane closures along the Project frontages on South Prairie Avenue and West Century Boulevard. Construction of the arena and West Parking Garage under Alternative 2 would likely involve the same temporary lane closures. Therefore, construction impacts for Alternative 2 would be similar to those for the Proposed Project.

Although Project-related congestion would be slightly less than under the Proposed Project, the potential impact on emergency access to the CHMC would be essentially the same, and would require mitigation to be less than significant, as under the Proposed Project.

Utilities and Service Systems

Because the amount of impervious surfaces in Alternative 2 would be very similar to those under the Proposed Project, impacts related to storm drainage system capacity (Impacts 3.15-9 and 3.15-10) would be essentially the same as under the Proposed Project, with the same required mitigation measures.

Impacts Identified as Being Less Severe than the Proposed Project

Air Quality and Greenhouse Gas Emissions

Air Quality and GHG emissions during construction and operation under Alternative 2 would be similar to the Proposed Project but the reduced seating capacity of the arena and elimination of the other proposed ancillary uses (i.e., retail shops, outdoor stage, team practice facility, sports medical clinic, team offices) on the Arena Site and the hotel on the planned hotel on the East Transportation Site would reduce the amount of construction, and would reduce the overall amount of associated traffic by 3 percent. There would be a corresponding decrease in criteria pollutant emissions, localized maximum daily operational emissions (NO₂), and GHG emissions. Therefore, similar to the Proposed Project, Alternative 2 would conflict with implementation of the applicable air quality plans, as operational emissions associated with the alternative, though reduced, would still exceed thresholds established by the SCAQMD for criteria air pollutants (Impact 3.2-1 and 3.2-5).

Impacts associated with the emission of criteria air pollutants (Impacts 3.2-2 and 3.2-6), localized maximum daily operational emissions (NO₂) (Impacts 3.2-3 and 3.2-7), and GHG emissions (Impact 3.7-1) would be reduced by approximately 3 percent, but would still require the implementation of Mitigation Measure 3.2-2(a), which would require the implementation of a Transportation Demand Management (TDM) program (Mitigation Measure 3.14-2(b)), Mitigation Measure 3.2-2(b), which would require the testing of the emergency generators and fire pump generators on non-event days, Mitigation Measure 3.2-2(c), which would require preparation and implementation of a Construction Emissions Minimization Plan, Mitigation Measure 3.2-2(d), which would require the project applicant to encourage the use of zero- and near-zero emissions vendor and delivery trucks, Mitigation Measure 3.7-1(a), which would require the implementation of a GHG reduction plan, and Mitigation Measure 3.7-1(b), which would require the preparation of an annual GHG verification report to determine the number of GHG offsets required to bring the project below the no net new GHG emissions threshold of significance.

Energy Demand and Conservation

Energy demand during construction and operation under Alternative 2 would be similar to the Proposed Project but lessened because the capacity of the arena would be reduced by 3 percent. This alternative would not include additional team facilities (i.e., team practice facility, sports medical clinic, and team offices) at the Project site, although the team offices and practice facility would continue to be used in their current sites. The planned hotel on the East Transportation Site would not be included, and thus would reduce the amount of energy demanded (Impacts 3.5-2 and 3.5-4).

Noise and Vibration

Noise levels under Alternative 2 would be similar to the Proposed Project but lessened as the seating capacity of the arena would be reduced by 3 percent and none of the other proposed facilities (i.e., retail shops, outdoor stage, team practice facility, sports medical clinic, and team offices) on the Arena Site and the hotel on the planned hotel on the East Transportation Site would be constructed. Therefore, impacts associated with a temporary increase in noise during construction and a permanent increase in noise during operation (Impacts 3.11-1, 3.11-2, 3.11-5 and 3.11-6) would be reduced as the duration of construction noise would be shorter (due to less building space) and the amount of traffic would decrease (due to fewer trips). In addition, vibration levels under Alternative 2 would also be similar to the Proposed Project but lessened for the same reasons. As a result, vibration impacts with respect to structural damage and human annoyance (Impacts 3.11-3 and 3.11-7) would be reduced, but would still require the implementation of Mitigation Measures 3.11-3(a) through (c), which requires minimum distances of construction equipment from sensitive receptors and the designation of a construction relations officer to field vibration-related complaints.

Population, Employment and Housing

Impacts related to Population, Employment and Housing (Impacts 3.12-1 through 3.12-4) would remain less than significant under Alternative 2, although non-event-related employment generation on the Project Site would be reduced by about 90 percent. Because under Alternative 2 non-event-related employment on the Project Site would be reduced by about 90 percent, impacts on public schools (Impacts 3.13-11 and 3.13-12), already less than significant for the Proposed Project, would be further reduced under Alternative 2. The arena under Alternative 2 would be expected to generate a total of 35 new school students, a reduction of 15 students compared to the 50 students under the Proposed Project as described in Table 3.13-9.

Transportation and Circulation

The elimination of the ancillary uses in Alternative 2 would avoid the significant impacts identified for the Proposed Project's ancillary uses and hotel at intersections and neighborhood streets (Impacts 3.14-1 through 3.14-6, Impacts 3.14-16 through 3.14-21, Impacts 3.14-28, and 3.14-33).

The slight reduction in venue capacity would reduce the significant VMT impacts identified for events at the venue, but not to a less than significant level. The elimination of the ancillary uses and hotel would avoid the significant VMT impacts identified for the Proposed Project hotel use (Impact 3.14-10).

Utilities and Service Systems

Under Alternative 2, utility demands would be proportionately decreased as a result of the decreased capacity of the arena, and elimination of the practice facility, team offices, and sports medicine clinic in the Arena Structure, as well as the retail/restaurant, community, and hotel uses. Water demand of Alternative 2 would be approximately 48 percent lower than under the Proposed Project. Wastewater generation of Alternative 2 would be about 31 percent lower than

under the Proposed Project. Solid waste generation of Alternative 2 would be approximately about 37 percent lower than under the Proposed Project.³ As a result, impacts with respect to water supply (Impacts 3.15-2 and 3.15-4), wastewater treatment capacity (3.15-5, 3.15-7), and solid waste disposal capacity (3.15-11 and 3.15-13) would be less than significant under both the Proposed Project and Alternative 2.

Impacts Identified as Being More Severe than the Proposed Project

Noise

The impact of event-related noise on nearby sensitive receptors would be exacerbated under the Reduced Project Size Alternative. Plaza events that utilize amplified sound, including pre- or post-game concerts, would be more exposed due to the lack of intervening structures in the plaza meaning that more noise would escape the Project Site, and would travel greater distances, affecting more sensitive receptors. As such, affected sensitive receptors, especially those located to the northwest of the intersection of South Prairie Avenue and West Century Boulevard, as well as homes that are located south and west of the Arena, west of South Prairie Avenue and south of West 102nd Street, as well as the hotel use at 3900 West Century Boulevard would all be exposed to substantially higher levels of noise than disclosed for the Proposed Project (Impacts 3.11-2 and 3.11-6). Mitigation of these effects would either involve (1) reductions in the level of amplification for plaza events, or (2) construction of intervening walls or structures to obstruct line-of-sight between the plaza and nearby sensitive receptors.

Transportation and Circulation

Although few of the impacts of the Reduced Project Size Alternative would be more severe than those of the Proposed Project, it is notable that Alternative 2 would fail to respond to several policies of the City of Inglewood General Plan which encourage the development of employment-generating uses in the City. Further, by eliminating the potential to consolidate LA Clippers team uses, including the arena, practice facility, sports medicine and treatment facilities, and team offices in a single location, Alternative 2 would likely increase the amount of travel between these uses that are currently located disparately throughout the region. The result of this would be increased trip-making and increased VMT. Further, the elimination of complementary ancillary uses on the Project Site would likely increase trip-making and VMT for both regular daytime employees as well as for event attendees who would have to travel to other locations for food and drink, hotels, and other activities (Impact 3.14-10). These effects would tend to exacerbate the generation of air pollutants, GHG emissions, congestion, and other such effects at a regional level.

Relationship to Project Objectives

The Reduced Project Size Alternative would meet some, but not all of the City's objectives for the project. The City objectives to promote economic development, the economic health and welfare, and City revenues (City Objective 2); to strengthen the community by providing public and youth-oriented space (City Objective 4); and to create employment and construction-related employment opportunities in the City of Inglewood (City Objective 7) would only be partially

³ Memorandum – IBEC Alternative 2 – Wastewater & Solid Waste Generation, July 18, 2019.

met under this alternative as no retail use, team practice facility, sports medical clinic or team offices would be included. Further, the elimination of the team practice facility, sports medical clinic, and team office means that the LA Clippers would continue to generate VMT and associated air pollutants and GHG emissions during commute trips between these uses located around the Los Angeles basin. As such, Alternative 2 would be less responsive to City Objective 10 because it would be less environmentally conscious than the Proposed Project.

The Reduced Project Size Alternative would also meet some but not all of the project applicant's objectives for the Proposed Project. Under this alternative the arena would have 500 fewer seats than identified in project applicant Objectives 1a and 1d. In addition, the project applicant's goal of consolidating team facilities (project applicant Objective 1c) and providing complementary retail (project applicant Objective 1e) would also not be met under the Reduced Project Size Alternative, as no team facilities and retail development would be provided. The elimination of retail and hotel uses under this alternative would be less responsive to meeting the intent of project applicant Objective 1f related to providing public benefits such as opportunities for youth- and community-oriented programs and increasing revenues by property and sales taxes and potential transient occupancy taxes. Finally, the absence of a complementary uses such as a team practice facility, sports medical clinic, team offices, retail and public uses under this alternative would fail to meet project applicant Objectives 2 and 2d.

6.5.3 Alternative 3: City Services Center Alternative Site

Description

Under Alternative 3, key elements of the Proposed Project would be developed on a site in Downtown Inglewood, located approximately 1.5 miles northwest of the Project Site (see **Figure 6-2**). The focus of this alternative is to identify the impacts that would occur if the arena and as much of the other elements of the Proposed Project as feasible are developed at another site within the City of Inglewood that is not as proximate to The Forum and the NFL Stadium, as a means of avoiding or lessening the traffic and related impacts of concurrent events at these facilities. The City determined that there is one such site that may meet these criteria and provides sufficient land to accommodate the arena, some parking, and plaza uses potentially available.

Specifically, Alternative 3 would be located on an approximately 9.7-acre site that encompasses the majority of a block bound by West Beach Avenue on the north, West Ivy Avenue on the east, Cable Place and the future Crenshaw/LAX light rail right-of-way on the south, and North Eucalyptus Avenue on the west. The Alternative 3 site is presently occupied by a City-owned corporation yard, known as the Inglewood City Services Center, and a firefighter training academy owned and operated by El Camino College. One existing building on the Alternative 3 site includes ground-level maintenance bays for vehicle and equipment maintenance, uncovered parking and a fuel island on the second floor accessible from Cable Place to the south of the site, and three floors of office space. Uncovered parking and material stockpiles and storage areas are also present in the City Services Center. Facilities on the firefighter training academy portion of the site include a classroom building, practice tower, and a "burn" building.

SOURCE: Google, 2018; ESA, 2019

Inglewood Basketball and Entertainment Center

Figure 6-2
Alternative 3: City Services Center Alternative Site

Regional access to the Alternative 3 site is provided by the San Diego Freeway (I-405), located approximately 0.6 miles to the west, and the Glenn Anderson Freeway & Transitway (I-105), located 2.3 miles to the south. Interstate 405 is located about 0.7 miles closer to the City Services Center Alternative site than to the Project Site, while I-105 is located about three times as far from the City Services Center Alternative site (2.4 miles) than from the Project Site (0.8 miles). Local access to the City Services Center Alternative site is provided by several major arterials, including Florence Avenue and La Brea Avenue, which serve the area near the City Services Center site. Transit access to the City Services Center Alternative site is provided by several bus lines and the future Crenshaw/LAX light rail line. The closest bus stop to the City Services Center Alternative site is a block north along North La Brea Avenue, and the nearest light rail station to the City Services Center Alternative site is about 0.25 miles to the east along Florence Avenue. The Alternative 3 site is located approximately 1.5 miles northwest of The Forum, and approximately 2 miles northwest of the site of the NFL Stadium.

Uses in the immediate vicinity of the City Services Center Alternative site include the Marvin Engineering Company industrial complex north and adjacent to the City Services Center site, manufacturing and single family residential uses to the north across West Beach Avenue and manufacturing and warehouse uses to the east across Ivy Avenue. There are also churches to the west of the site across North Eucalyptus Avenue. With the exception of a three-story structure along West Beach Avenue, all of the remaining uses to the north and east of the site are located in one-story structures, including three single family homes on the north side of West Beach Avenue, east of West Hazel Street. An electrical substation is located across the future Crenshaw/LAX light rail line right-of-way to the south and a single-story commercial wholesale building is located to the south across Cable Place. The City's Sanford M. Anderson Water Treatment Plant is located to the west across North Eucalyptus Avenue.

The City Services Center Alternative site and the surrounding area are designated Downtown Transit-Oriented Development (TOD) in the City of Inglewood General Plan. The City Services Center Alternative site and the area to the north, east, and south of the site is zoned MU-2, TOD Mixed Use 2, while the area to the west of the site is zoned O-S, Open Space.

Alternative 3 would involve the demolition of the facilities that presently occupy the City Services Center and firefighter training academy areas and the construction of an arena and parking structures that would open to a pedestrian plaza that would include an outdoor stage (see Figure 6-2). Similar to the Proposed Project, the arena under this alternative would have a capacity of 18,000 attendees in an NBA basketball configuration, and up to 18,500 in certain concert configurations. The arena would be located on the southeast portion of the site while Parking Structure A would be situated on the southwestern portion of the site and Parking Structures B and C would be situated on the northeastern portion of the site. Access to the arena would be provided on West Beach and North Eucalyptus avenues via a pedestrian plaza. Parking Structure A would be accessed from North Eucalyptus Avenue while Parking Structures B and C would be accessed from West Beach Avenue. In addition, approximately 48,000 square feet of

ground floor retail oriented towards the pedestrian plaza would be provided on the lower level of Parking Garages A and B and along the northwestern border of the site.

The proposed parking structures on the City Services Center Alternative site would include 4,215 parking spaces, which is the same amount of parking provided by the Proposed Project. In addition, off-site parking for events at the arena would be provided by an existing parking structure owned and operated by the Faith Central Bible Church. The existing structure is located approximately 800 feet to the southwest of the Project Site along Florence Avenue and would provide up to 860 additional parking spaces.

At 9.7 acres, the Alternative 3 site would be approximately 35 percent of the size of the Project Site. As a result, none of the other team facilities proposed by the Proposed Project (e.g., team practice facility, sports medical clinic, and team offices) would be constructed under Alternative 3 as the site is not of sufficient size to accommodate the additional square footage. The LA Clippers' team offices would continue to be located on Flower Street within two blocks of Staples Center while the LA Clippers would continue to use their practice and training facility in the Playa Vista neighborhood of Los Angeles. In addition, this alternative would not include a hotel or a new potable water well because existing uses would remain in their existing locations on the Project Site.

Finally, under Alternative 3, all of the uses that presently occupy the City Services Center and the firefighter training academy would be relocated to the Arena Site along West Century Boulevard. Unlike the Proposed Project, the relocation of these uses would not require the vacation of either West 101st Street or West 102nd Street. In addition, these uses would only require approximately 10 acres of the Arena Site.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 3. In addition, the comparative analysis of environmental effects provided below was informed by the Downtown Inglewood and Fairview Heights Transit Oriented Development (TOD) Plan Program EIR⁴, which provided information relating to existing conditions in and around the City Services Center site.

Impacts Identified as Being the Same or Similar to the Proposed Project

Although the size of the City Services Center Alternative site is only about 35 percent of the size of the Project Site, Alternative 3 also involves relocation of uses from the City Services Center Alternative site to the Project Site, and thus a number of impacts would be similarly likely to occur despite the reduced size of the site for the construction of the Proposed Project.

⁴ City of Inglewood, 2016. *Downtown Inglewood and Fairview Heights Transit Oriented Development Plan Program EIR*. November 1, 2016.

Aesthetics

Like the Proposed Project developed at the Project Site, Alternative 3 would introduce more intensive and dense uses than current development at the City Services Center site. At this location, there are limited long-range views to be affected by the larger structures that would be developed under this alternative (Impact 3.1-1). Like at the Project Site, there are a few residences in close proximity to the City Services Center site. As a result of the rather low intensity of use along West Beach Avenue, it is likely that nighttime light levels at the existing homes that are across the street from this site are less than two foot-candles at the property line. With the addition of Alternative 3 at this location, the potential exists for outdoor lighting, building façade lighting, and illuminated signage on the arena and/or parking structures that would face the residences to result in light levels in excess of the significance threshold (Impacts 3.1-2 and 3.1-5). This would be similar to the impacts of the Proposed Project on adjacent sensitive receptors, and would be mitigated through implementation of Mitigation Measures 3.1-2(a) and (b).

Biological Resources

A number of trees are located on and/or adjacent to the City Services Center site. In addition, as discussed in Section 3.3, Biological Resources, a number of trees are also located on and/or adjacent to the Arena Site where the City Services Center and fire academy would be relocated. As a result, Alternative 3 could disturb nesting raptors or migratory birds (Impact 3.3-2) and result in the loss of protected trees (Impact 3.3-3). Mitigation Measures 3.3-2 and 3.3-3 would reduce these impacts by requiring that steps be taken to protect these resources during construction. As a result, impacts on nesting raptors or migratory birds and protected trees would be similar to those described for the Proposed Project.

Cultural and Tribal Cultural Resources

Like the Project Site, there are no known archaeological or historical resources located on the City Services Center site. However, according to the TOD EIR, it is likely that development in Downtown Inglewood, including on the City Services Center site, could disturb buried archaeological resources,⁵ and disturb unknown human remains.⁶ In addition, as discussed in Section 3.4, Cultural and Tribal Cultural Resources, unknown archaeological resources, and human remains may also be located on the Arena Site where the City Services Center and fire academy would be relocated. For these reasons, it is possible that, like with the Proposed Project, implementation of Alternative 3 could cause a substantial adverse change in the significance of unknown historic, archaeological, or tribal cultural resources (Impacts 3.4-1, 3.4-2, 3.4-3, 3.4-5, 3.4-6, and 3.4-7), and/or unknown human remains (Impacts 3.4-4 and 3.4-8). Mitigation Measures 3.4-1 and 3.4-4 would reduce these impacts by requiring that work stop if such resources are uncovered, and that the resources be appropriately evaluated and treated. Therefore, impacts on archaeological resources and human remains would be similar to the Proposed Project.

⁵ City of Inglewood, 2016. *Downtown Inglewood and Fairview Heights Transit Oriented Development Plan Program EIR*. November 1, 2016. p. 4.D-14.

⁶ City of Inglewood, 2016. *Downtown Inglewood and Fairview Heights Transit Oriented Development Plan Program EIR*. November 1, 2016. p. 4.D-18.

Geology and Soils

Impacts related to geology and soils conditions and hazards, including paleontological resources would be similar to those described for the Proposed Project (see Section 3.6, Geology and Soils). Because Alternative 3 would occur approximately 1.7 miles from the Project Site, the geological and soils conditions that would be encountered in construction of Alternative 3 would be essentially the same as with the Proposed Project. The proximity of the City Services Center Alternative site to the historic Centinela Creek and nearby seismic faults could indicate the potential for unstable soils, but any impacts would be avoided by required compliance with the California Building Code. According to the TOD EIR, it is likely that development in Downtown Inglewood, including on the City Services Center site, could disturb previously unknown unique paleontological resources,⁷ but because there would be less ground-disturbing activity because of the reduced amount of development in Alternative 3, the potential for erosion and accidental discovery of paleontological resources would be correspondingly decreased (Impacts 3.6-2 and 3.6-4). However, these impacts would continue to be potentially significant under Alternative 3 and would require the same mitigation measures as identified for the Proposed Project in order to reduce the impact to less than significant.

Hazards and Hazardous Materials

A known Leaking Underground Storage Tank (LUST) is located approximately 0.14 miles to the southwest of the City Services Center Alternative site and a petroleum spill occurred approximately 100 feet to the south of the site.⁸ It is possible that releases from these sites may have migrated to the City Services Center site. In addition, the presence of a fuel island and ongoing vehicle and equipment maintenance activities in the service bays could indicate that unknown soil contamination may be present on the City Services Center site. Furthermore, as discussed in Section 3.8, Hazards and Hazardous Materials, unknown soil contamination may be present on the Arena Site given its land used history and the results of soil testing. As a result of these conditions at the City Services Center site, under Alternative 3, as with the Proposed Project, it is possible that construction workers could be exposed to contamination during ground disturbing activities (Impact 3.8-4). Mitigation Measure 3.8-4 would require the preparation and approval of the Soil Management Plan prior to initiating earthwork activities, which would reduce the potential for worker exposures. For this reason, impacts related to on-site contamination would be similar to those described for the Proposed Project.

Hydrology and Water Quality

The City Services Center Alternative site is fully developed with impervious surfaces; pervious surfaces on the site are minimal and include ornamental landscaping. Sheet flow stormwater runoff on the City Services Center Alternative site is managed by an existing system of storm drains. Further, the site is bisected, east-to-west, by a drainage that is encased in a below-grade culvert and would be required to be relocated as part of development of the site. In addition, as

⁷ City of Inglewood, 2016. *Downtown Inglewood and Fairview Heights Transit Oriented Development Plan Program EIR*. November 1, 2016. p. 4.D-16.

⁸ State Water Resources Control Board, 2019. GeoTracker database. Accessed: May 9, 2019.

discussed in Section 3.9, Hydrology and Water Quality, the Arena Site is partially developed with large portions of previously development but now vacant land.

As a result, it is possible that construction and operation of Alternative 3 could cause water quality discharges that are not consistent with SWRCB objectives and could degrade the quality of the water that is discharged from the City Services Center Alternative site (due to arena development) and the Arena Site (due to the relocation of the City Services Center land uses) (Impacts 3.6-1, 3.6-3, 3.9-1, and 3.9-4). Altered drainage patterns during both construction and operation on both sites, including the realignment of the below-grade drainage culvert bisecting the City Services Center site, would also have the potential to result in erosion, sedimentation, and/or flooding on or off site by redirecting or concentrating flows (Impact 3.9-3 and 3.9-6). In order to lessen the significance of these impacts for Alternative 3, like the Proposed Project, Mitigation Measure 3.9-1(a) would require the project to comply with a number of regulations governing water quality and drainage while Mitigation Measure 3.9-1(b) would require the periodic sweeping parking lots during operation to remove contaminants. As a result, impacts related to water quality and drainage would be similar to the Proposed Project.

Land Use and Planning

Like the Proposed Project, Alternative 3 would not result in the division of an established community, nor would it be inconsistent with plans or policies that have been adopted for the purposes of environmental mitigation, and thus Alternative 3 would have less-than significant-impacts related to land use and planning (Impacts 3.10-1 through 3.10-4).

Public Services

Because impacts of the Proposed Project on public services, including fire and police protection, parks and recreation facilities, and public schools would be largely driven by event activity at the proposed arena, these impacts would remain largely unchanged and would continue to be less than significant (see Impacts 3.13-1 through 3.13-12) under Alternative 3.

Transportation and Circulation

Under Alternative 3, the ability to walk to the Crenshaw/LAX light rail line Downtown Inglewood Station without the need for shuttling would increase the attractiveness of rail transit, although this effect could be partially offset since only one rail line would be thus accessible. As such, it is anticipated that vehicle trip generation for major events in the arena at the City Services Center Alternative site would be similar to that for the Proposed Project.

This alternative would therefore be expected to have intersection, neighborhood street, and freeway facility impacts for major events at a similar level as the Proposed Project (Impacts 3.14-1 through 3.14-9, Impacts 3.14-16 through 3.14-24, Impacts 3.14-29 and 3.14-29, and Impacts 3.14-33 and 3.14-34), although distributed across the transportation system differently. Although the City Services Center Alternative site is closer to the I-405 freeway (0.6 miles) than is the Proposed Project (1.3 miles), it is farther from the I-110 and I-105 freeways; thus, regional trips would not be distributed as evenly and freeway impacts would be concentrated on the I-405. Furthermore,

although Florence Avenue and La Brea Avenue (designated as major arterials in the City of Inglewood General Plan) serve the area near the site, the street grid system breaks down in the north part of Inglewood surrounding the City Services Center Alternative site, with curvier streets, less arterial capacity, and discontinuous streets in the vicinity.

Eucalyptus Avenue and Beach Avenue both travel through residential neighborhoods to the north of the City Services Center Alternative site. Since both of these streets would provide direct access to parking garages for the arena, neighborhood street impacts would be expected on these streets (Impacts 3.14-4 through 3.14-6, and Impacts 3.14-19 through 3.14-21).

The amount of on-site parking under this alternative would be similar to that for the Proposed Project, meaning that a substantial amount of parking (roughly 3,700 to 4,100 spaces for a major event) would still need to be provided off site. Some could be accommodated in parking garages in the downtown Inglewood area and in the nearby Faithful Central Bible Church parking structure, but shuttling would be required to off-site parking, presumably at Hollywood Park, to avoid spillover parking into residential neighborhoods.

Similar to the Proposed Project, Alternative 3 has the potential to impact on-time performance for buses operating in the vicinity because of congestion associated with event arrival and departure traffic (Impacts 3.14-11, 3.14-25, 3.14-30, and 3.14-35).

Construction impacts on traffic were determined to be significant for the Proposed Project due to temporary lane closures along the Project frontages on South Prairie Avenue and West Century Boulevard. Construction of the Project at the Alternative 3 site would likely involve temporary lane closures along the Eucalyptus Avenue frontage of the site for construction of a parking garage. Therefore, construction impacts for Alternative 3 would be in a different location, but would be similar in magnitude to those described for the Proposed Project.

Utilities and Service Systems

The existing storm drain system in the area of the City Services Center Alternative and Arena sites may not have sufficient capacity to handle post-construction stormwater runoff from each site (Impacts 3.15-9 and 3.15-10). In order to lessen the significance of these impacts for Alternative 3, like the Proposed Project, Mitigation Measures 3.15-9 and 3.15-10 would require the project to comply with a number of regulations governing water quality and drainage (Mitigation Measure 3.9-1(a)). As a result, impacts related to stormwater drainage would be similar to the Proposed Project.

Impacts Identified as Being Less Severe than the Proposed Project

Because Alternative 3 would be located away from the busy West Century Boulevard and South Prairie Avenue corridors, and because the amount of development in Alternative 3 is less than under the Proposed Project, a number of significant impacts of the Proposed Project would be lessened or avoided.

Aesthetics

Although the aesthetic impacts of the Proposed Project to views and visual character would be less than significant with mitigation, none of the effects described near the Project Site would occur under Alternative 3. There would be development on the Arena Site, but it would be low in scale other than the fire academy tower, and would not be large in scale. Because the streets surrounding the City Services Center Alternative site are narrower and not straight for extended distances, views are relatively constrained, and as such there would be less potential for disruption of long-range views under Alternative 3 (Impact 3.1-1). Further, the significant impacts of increased light at sensitive receptors around the Project Site, including the residences at 10226 and 10204 South Prairie Avenue, as well as residences on the west side of the West Parking Garage Site, would not occur under Alternative 3 as development would not be lit at night (Impacts 3.1-2 and 3.1-5).

Air Quality and GHG Emissions

Air Quality and GHG emissions during construction and operation under Alternative 3 would be similar to the Proposed Project but lessened because this alternative would disturb slightly less soil (i.e., 9.7 acres on the City Services Center Alternative site and approximately 10 acres on the Arena Site) and would not include additional team facilities (i.e., team practice facility, sports medical clinic, and team offices), the planned hotel on the East Transportation Site, or a new potable water well, and thus, the duration of construction would be shorter and fewer trips would be generated during operation. In addition, as discussed under Transportation, below, the elimination of the office, practice facility, sports medicine clinic, and hotel uses in Alternative 3 and the ability to walk to rail transit would reduce weekday peak hour trip generation by the ancillary uses by more than half from that estimated for the Proposed Project, with corresponding decreases in both criteria air pollution and GHG emissions directly from the Proposed Project. However, the lack of consolidation of the LA Clippers uses on a single site would tend to offset some of these reductions as a result of increased amounts of travel between the Arena Structure, team offices currently located in downtown Los Angeles, and practice facility in Playa Vista.

Therefore, similar to the Proposed Project, Alternative 3 would conflict with implementation of the applicable air quality plans, as operational emissions associated with the alternative, though reduced, would still exceed thresholds established by the SCAQMD for criteria air pollutants (Impact 3.2-1 and 3.2-5). In addition, impacts associated with the emission of criteria air pollutants (Impacts 3.2-2 and 3.2-6), localized maximum daily operational emissions (NO₂) (Impacts 3.2-3 and 3.2-7), and GHG emissions (Impacts 3.7-1 and 3.7-2) would be reduced, but would still require the implementation of Mitigation Measure 3.2-2(a), which would require the implementation of a transportation demand management (TDM) program (Mitigation Measure 3.14-2(b)), Mitigation Measure 3.2-2(b), which would require testing of the emergency generators and fire pump generators on non-event days, Mitigation Measure 3.2-2(c), which would require preparation and implementation of a Construction Emissions Minimization Plan, Mitigation Measure 3.2-2(d), which would require the project applicant to encourage the use of zero- and near-zero emissions vendor and delivery trucks, Mitigation Measure 3.7-1(a), which would require the implementation of a GHG reduction plan, and Mitigation Measure 3.7-1(b),

which would require the preparation of an annual GHG verification report to determine the number of GHG offsets required to bring the project below the no net new GHG emissions threshold of significance.

Energy Demand and Conservation

Energy demand during construction and operation under Alternative 3 would be similar to the Proposed Project but lessened because this alternative would not include additional team facilities (i.e., team practice facility, sports medical clinic, and team offices), the planned hotel on the East Transportation Site, or a new potable water well, and thus would reduce the amount of energy demanded (Impacts 3.5-2 and 3.5-4).

Hazards and Hazardous Material

Alternative 3 would not result in an air navigation hazard as the City Services Center Alternative site as it is not located within an airport land use area plan. For this reason, hazards impacts associated with air navigation (Impacts 3.8-5) would be avoided under this alternative and Mitigation Measure 3.8-5 would not be required.

Noise and Vibration

As described above, there are three residential homes that are considered sensitive receptors immediately across West Beach Avenue. Construction noise levels under Alternative 3 would also be similar to the Proposed Project but lessened in duration as this alternative would not include additional team facilities (i.e., team practice facility, sports medical clinic, and team offices), the planned hotel on the East Transportation Site, or a new potable water well, and thus the construction period would be shorter and fewer vehicle trips would be generated during operation. Like with the Proposed Project, operational sound from outdoor plaza events from amplification systems would result in significant impacts at sensitive receptors proximate to the City Services Center site, but because compared to the Proposed Project there are fewer sensitive receptors that are in close proximity to the City Services Center site, this impact would be less severe than under the Proposed Project. Therefore, impacts associated with a temporary increase in noise during construction and a permanent increase in noise during operation (Impacts 3.11-1, 3.11-2, 3.11-5, and 3.11-6) would be reduced, but would still require implementation of Mitigation Measure 3.11-1, which would require the implementation of measures and controls to reduce noise during construction, Mitigation Measure 3.11-2(a), which would require the preparation of a noise reduction plan major events, and Mitigation Measure 3.11-2(b), which would require the implementation of a transportation demand management (TDM) program (Mitigation Measure 3.14-2(b)).

Vibration levels under Alternative 3 would also be similar to the Proposed Project but lessened as the duration of construction would be shorter. As a result, vibration impacts with respect to structural damage and human annoyance (Impacts 3.11-3 and 3.11-6) would be reduced, but would still require the implementation of Mitigation Measures 3.11-3(a) through (c), which requires minimum distances of construction equipment from sensitive receptors and the designation of a construction relations officer to field vibration-related complaints.

Unlike the Proposed Project, Alternative 3 would not result in the construction of the hotel and team medical clinic and the City Services Center Alternative site is located entirely outside the 65 dBA contour for aircraft operations from LAX. Thus, Alternative 3 would not expose sensitive receptors within the Project Site to excessive noise levels from aircraft operations, and impacts related to exposure to aircraft noise would be less than significant, like with the Proposed Project.

Population, Employment and Housing

Impacts related to Population, Employment and Housing (Impacts 3.12-1 through 3.12-4) would remain less than significant under Alternative 3, although non-event-related employment generation on the City Services Center Alternative site would be reduced by about 62 percent. Because non-event-related employment on the City Services Center Alternative site would be reduced by about 62 percent under Alternative 3, impacts on public schools (Impacts 3.13-11 and 3.13-12), already less than significant for the Proposed Project, would be further reduced under Alternative 3. The arena and commercial uses under Alternative 3 would be expected to generate a total of 38 new school students, a reduction of 12 students compared to the 50 students under the Proposed Project as described in Table 3.13-9.

Transportation and Circulation

The elimination of the office, practice facility, and sports medicine clinic uses in Alternative 3 and the ability to walk to rail transit would reduce weekday peak hour trip generation by the ancillary uses by more than half from that estimated for the Proposed Project, substantially reducing or possibly even avoiding the significant impacts of the ancillary uses at intersections and neighborhood streets (Impacts 3.14-1, 3.14-4, 3.14-16, and 3.14-19).

The elimination of the hotel use would avoid the significant VMT impact identified for the Proposed Project hotel use (Impact 3.14-10).

Pedestrian impacts could be lessened since event attendees parking off site at Hollywood Park would be shuttled to the off-site locations and would not have to cross arterial streets to access the off-site parking (Impact 3.14-13).

The nearest emergency room to the Alternative 3 site is located at the Centinela Hospital Medical Center, approximately 1.1 miles from the site. Given that large events at the Alternative 3 site would directly impact La Brea Avenue and Eucalyptus Avenue, two of the primary north-south routes across the future Metro Crenshaw/LAX light rail line within the City of Inglewood, Project-related congestion could impact emergency access to the CHMC from northern portions of the City. This impact would be less severe than emergency access impacts of the Proposed Project, but could nonetheless be require mitigation to result in a less than significant impact.

Given the location of the City Services Center Alternative site relative to The Forum and the NFL Stadium, Project impacts on intersections, neighborhood streets, freeway facilities, and public transit during concurrent events at The Forum and/or the NFL Stadium would be shifted and somewhat lessened from those for the Proposed Project during concurrent events (Impacts 3.14-28 and 3.14-29 and Impacts 3.14-33 and 3.14-34).

Utilities and Service Systems

Under Alternative 3, utility demands would be proportionately decreased as a result of the elimination of the practice facility, team offices, and sports medicine clinic in the Arena Structure and hotel uses. As described above, these uses would continue to exist and operate in their current locations. Water demand of Alternative 3 would be approximately 31 to 35 percent lower than under the Proposed Project. Wastewater generation of Alternative 3 would be about 22 percent lower than under the Proposed Project. Solid waste generation of Alternative 3 would be approximately about 22 percent lower than under the Proposed Project.⁹ As a result, impacts with respect to water supply (Impacts 3.15-2 and 3.15-4), wastewater treatment capacity (3.15-5, 3.15-7), and solid waste disposal capacity (3.15-11 and 3.15-13) would be less than significant under both the Proposed Project and Alternative 3.

Impacts Identified as Being More Severe than the Proposed Project

Although the amount of development included in the City Services Center Site Alternative is less than under the Proposed Project, the specific aspects of the site create the potential for impacts that would be more severe than under the Proposed Project.

Aesthetics

Because of the narrowness of the surrounding streets and the presence of residential uses immediately across West Beach Avenue, the potential for spillover lighting effects on residential uses is greater than under the Proposed Project (Impacts 3.1-2 and 3.1-5). In addition, the location of the residences to the northeast of the Arena Structure and 8-story Parking Structure B and 7-story Parking Structure C that would be located across the street would create the potential for shadows to be cast on the homes in afternoons in the winter (Impact 3.1-3). Due to the over 400-foot length and east-west alignment of the two parking structures, such effects would be longer lasting than shadow effects on homes under the Proposed Project and it is likely that these impacts would be significant. If such shadows were significant, mitigation would involve reducing the height of the West Beach Avenue parking structures, which could also materially reduce the available parking on the City Services Center Alternative Site.

Transportation and Circulation

Of the streets immediately bordering the City Services Center Alternative site, Eucalyptus Avenue is designated as a minor arterial, Beach Avenue and Ivy Avenue are designated as collector streets, and Cable Place is a local street. Each of these streets currently provide only one traffic lane in each direction in the vicinity of the alternative site, and Eucalyptus Avenue and Ivy Avenue will have at-grade crossings with the Crenshaw/LAX light rail line. As such, the ability of Eucalyptus Avenue to adequately accommodate peak event flows into and out of Parking Structure A and of West Beach Avenue to adequately accommodate peak event flows into and out of Parking Structures B and C would result in significant street and site access impacts (Impacts 3.14-4 through 3.14-6, and Impacts 3.14-19 through 3.14-21).

⁹ Memorandum – IBEC Alternative 3 – Wastewater & Solid Waste Generation, July 18, 2019.

Relationship to Project Objectives

The City Services Center Alternative would meet some of City's objectives for the project. In particular, the project would meet the City's goals of becoming a regional sports and entertainment center (City Objective 1) and stimulating economic development (City Objective 2). In addition, given the location of the site near the future Crenshaw/LAX light rail line, the project would also meet the City's goal of encouraging public transit opportunities (City Objective 6).

However, although Alternative 3 would include relocation of current City Services Center and the firefighter training academy uses to the Arena Site portion of the Project Site, it would result in a less intensive use of the Project Site than the Proposed Project. Because City Objective 5 is to "[t]ransform vacant or underutilized land within the City into compatible land uses within aircraft noise contours generated by operations at LAX, in compliance with Federal Aviation Administration (FAA) grants to the City," Alternative 3 would not be as responsive to this objective as the Proposed Project. In addition, the elimination of the team practice facility, sports medical clinic, and team offices means that the LA Clippers would continue to generate VMT and associated air pollutants and GHG emissions during commute trips between these uses located around the Los Angeles basin. As such, Alternative 3 would be less responsive to City Objective 10 because it would be less environmentally conscious than the Proposed Project.

The City Services Center Alternative would also meet some, but not all, of the project applicant's objectives for the project. Because constructing on the City Services Center Alternative site would first require designing and constructing replacement uses on the Project Site, it is uncertain if this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024–2025 season, and thus could be unable to meet project applicant Objective 1a. The project under this alternative would not meet the project applicant's goal of consolidating team facilities on one site (project applicant Objective 1b) as the team practice facility, sports medical clinic, and team offices would continue to be located in Downtown Los Angeles and Playa Vista, respectively.

In addition, the project would only partially meet the project applicant's goal of contributing to the economic and social well-being of the community as the elimination of the hotel under the City Services Center Alternative would result in the loss of revenue from transient occupancy taxes (project applicant Objective 1f). Next, as the City Services Center Alternative site would be approximately 35 percent of the size of the Project Site, and thus would provide fewer amenities, the project would not be as competitive with other major entertainment venues as it would be on the Project Site, and it would not provide sufficient complementary on-site uses to sustain the project on non-event days (project applicant Objectives 2b and 2d). Finally, the project would not be located on a site near other similar uses (i.e., the future stadium) within the HPSP area under the City Services Center Alternative. As a result, the Proposed Project would not combine with the future stadium to create a dynamic, year-round sports and entertainment district destination in the southwestern portion of the City (project applicant Objective 3a).

6.5.4 Alternative 4: Baldwin Hills Alternative Site

Description

Under Alternative 4, the Proposed Project would be developed at the site of the existing Baldwin Hills Crenshaw Plaza shopping mall, located approximately 4.5 miles north of the Project Site in the Baldwin Hills neighborhood of the City of Los Angeles (see **Figure 6-3**). The focus of this alternative is to identify the impacts that would occur if the arena and related development were to be constructed and operated at another site that is located, if not within the City of Inglewood, then in the same general vicinity within the region, but not as proximate to The Forum and the NFL Stadium, as a means of avoiding or lessening the traffic and related impacts of concurrent events at these facilities. Because the vicinity around Inglewood is largely developed, available sites that may meet these criteria and be of sufficient size to accommodate the arena and other project elements are limited. The City determined that there is such a site located in the vicinity of Baldwin Hills neighborhood.

The Baldwin Hills Crenshaw Plaza shopping mall is approximately 43 acres in size and is bounded by West 39th Street on the north, Crenshaw Boulevard on the east, Stocker Street on the southeast, Santa Rosalia Drive on the southwest, and Marlton Avenue on the west. The mall is also bisected into two parcels by Martin Luther King Jr. (MLK) Boulevard: a northern parcel consisting of approximately 11 acres and a southern parcel consisting of 32 acres. The Baldwin Hills Alternative site is located on a large portion of the 32-acre southern parcel of the mall.

Under existing conditions, the Baldwin Hills Alternative site includes approximately 791,650 square feet of commercial retail, restaurant, and entertainment uses. These uses include anchor stores such as Sears; mall stores; restaurants; a theater; a bank; and two parking structures. The existing Cinemark Theaters and mall stores on the site would remain. All other uses, including the Sears store and automotive center would be demolished and cleared for construction of the Alternative 4 uses. None of the uses on the northern parcel would be disrupted, and the viaduct that crosses West Martin Luther King Jr. Boulevard would remain.

In general, regional highway facilities are located further from the Baldwin Hills Alternative Site than the regional highway facilities that serve the Project Site. Regional access to the Baldwin Hills Alternative site is provided by the Santa Monica Freeway (I-10), located approximately 1.6 miles to the north, the Harbor Freeway (I-110), located about 3.1 miles to the east, and the San Diego Freeway (I-405), located approximately 3.5 miles to the west. Local access to the Baldwin Hills Alternative site is provided by Crenshaw Boulevard and West Martin Luther King Jr. Boulevard. The Baldwin Hills Alternative site is also accessible by transit via bus and the future Crenshaw/LAX light rail line. The closest bus stop to the Baldwin Hills Alternative site will be located immediately adjacent to the site, at the intersection of Crenshaw Boulevard and MLK Boulevard, while the nearest light rail station is located immediately adjacent to the site along the west side of Crenshaw Boulevard, south of MLK Boulevard.

SOURCE: Google, 2018; ESA, 2019

Inglewood Basketball and Entertainment Center

Figure 6-3
Alternative 4: Baldwin Hills Alternative Site

The Baldwin Hills Alternative site is located adjacent to the Crenshaw Commercial Corridor and is mostly surrounded by commercial uses with low and medium density residential uses located to the southwest, south, and east. Land uses to the north consist of retail uses located across MLK Boulevard on the mall's 11-acre northern parcel while land uses to the east include single-story commercial uses and associated parking. To the east, along Crenshaw Boulevard between West MLK Jr. Boulevard and West Stocker Street, land uses are commercial for one parcel deep, and then single family residential further east. Land uses to the southeast across Stocker Street include single-story commercial uses, two-story multifamily uses, and one-story single family residential uses. Land uses to the southwest along Santa Rosalia Drive include various mid-rise residential and office uses including a four-story medical office building, six-story condominium building, a church and preparatory academy, and a community recreational facility (YMCA). Land uses to the west along Marlton Avenue include a large three-story Kaiser Permanente medical office building surrounded by parking.

The Baldwin Hills Alternative Site is designated Regional Commercial Center, and is located in the West Adams-Baldwin Hills-Leimert Community Plan area. Land uses surrounding the Baldwin Hills Alternative site within the City of Los Angeles are designated by the West Adams-Baldwin Hills-Leimert Community Plan as Regional Commercial Center to the north, Community Commercial and Neighborhood Commercial to the east, Community Commercial to the southeast, and Regional Center Commercial to the west. With respect to zoning, the Baldwin Hills Alternative site is designated Commercial (C2). Land uses surrounding the Baldwin Hills alternative site within the City of Los Angeles are zoned as Commercial (C2) to the north; Limited Commercial (C1) to the east; Commercial (C2) to the southwest; and Commercial (C2) to the west. Land uses within unincorporated Los Angeles County to the southeast are zoned Multiple Dwelling Unit Residential (R3).

A plan to modernize and redevelop the existing Baldwin Hills Crenshaw Plaza shopping mall was approved by the City of Los Angeles in 2018. The plan calls for the demolition of approximately 13,400 square feet of retail/restaurant space and the construction of about 44,200 square feet of retail/restaurant space, a 400-room hotel, and 410 apartment units on the Baldwin Hills Alternative site; the existing mall buildings and theater would remain. The project has yet to be developed.

Alternative 4 would involve the demolition of the Sears store, the east parking structure along Crenshaw Boulevard, and smaller commercial and retail outbuildings along Stocker Street, Santa Rosalia Drive, and Marlton Avenue. The former Walmart store at the corner of Crenshaw Boulevard and West MLK Jr. Boulevard, the main mall structure (including bridge structure), and Cinemark movie theater would remain. In addition, the west parking structure along Marlton Avenue would either be expanded or replaced under this alternative.

Similar to the Proposed Project, the arena under Alternative 4 would have a capacity of 18,000 attendees in an NBA basketball configuration, and up to 18,500 in certain concert configurations. In addition, a team practice facility, sports medical clinic, team offices, and retail uses would be included under this alternative. The square footage of each of these uses would remain the same

as under the Proposed Project. This alternative would not include a hotel or a new potable water well because such uses would not be removed in order to accommodate the Arena Structure. Approximately 4,060 on-site parking spaces would be provided in two parking structures, slightly less than the 4,125 on-site parking spaces that would be provided in the Proposed Project. On-site parking would be provided in the expanded or new four-level 2,100-space Parking Structure A that would be accessed from Marlton Avenue and a new four-level, 1,960-space Parking Structure B would be constructed along Stocker Street.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 4. The comparative analysis of environmental effects provided below was informed by the 2016 Baldwin Hills Crenshaw Plaza Master Plan Project EIR (Master Plan EIR),¹⁰ that contained information relating to existing conditions in and around the Baldwin Hills Alternative Site, and the environmental impacts of redevelopment of the site.

Impacts Identified as Being the Same or Similar to the Proposed Project

Because the size of the arena and the amount of development would be essentially the same as the development in the Proposed Project, many of the impacts of the Proposed Project that are affected by the intensity of development would remain the same or very similar at the Baldwin Hills Alternative Site.

Aesthetics

The aesthetic conditions around the Baldwin Hills Alternative site are different in specifics than at the Project Site, but similar in character. The site is adjacent to a major commercial corridor, in this case Crenshaw Boulevard, with other commercial lined streets backed by residential neighborhoods on several sides. Long range views are of urbanized Los Angeles, and while the proposed arena and associated uses at this site would be clearly identifiable, the aesthetic change of the site from a regional shopping mall with major parking resources to an arena with parking resources would not be material (Impact 3.1-1). Most of the immediately adjacent uses that would be potentially affected by shadows created by the larger structures are commercial in nature, and given the 4-story profile of the perimeter parking structures, it is unlikely that significant shadow impacts would affect nearby residential uses (Impact 3.1-3).

Although they would affect light sensitive receptors at a different location, the spillover lighting effects of Alternative 4 would be of similar magnitude as those of the Proposed Project. Adjacent to the Baldwin Hills Alternative site there are light sensitive residences across Stocker Street and Santa Rosalia Drive. Illuminated signage on retail buildings and parking structures, plaza lighting, and arena façade lighting could spillover these streets and result in light in excess of City of Los Angeles standards on residential properties. While many of these current light sensitive receptors are in proximity to the existing Baldwin Hills mall uses, the increased height, signage, and area lighting from the proposed type of development could exacerbate existing light levels

¹⁰ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016.

and create significant impacts (Impacts 3.1-2 and 3.1-5). Like the Proposed Project, Alternative 4 would require implementation of Mitigation Measure 3.1-2(a) and (b).

Biological Resources

A number of trees are located on and/or adjacent to the Baldwin Hills Alternative site so it is likely that tree loss or other construction activities that would occur with Alternative 4 could disturb nesting raptors or migratory birds (Impact 3.3-2). Mitigation Measure 3.3-2 would reduce these impacts by requiring that steps be taken to protect this resource during construction. As a result, impacts to nesting raptors or migratory birds would be similar to the Proposed Project.

Geology and Soils

Impacts of the Baldwin Hills Alternative Site related to geology and soils conditions and hazards, including paleontological resources would be similar to those described for the Proposed Project. Because Alternative 4 would occur approximately 4.5 miles north of the Project Site, the geological and soils conditions that would be encountered in construction of Alternative 3 would be similar to those with the Proposed Project. Because the amount of ground-disturbing activity under Alternative 4 would be essentially the same as with the Proposed Project, the potential for erosion and accidental discovery of paleontological resources would be correspondingly similar (Impacts 3.6-2 and 3.6-4). These impacts would continue to be potentially significant under Alternative 4 and would require the same mitigation measures as identified for the Proposed Project in order to reduce the impact to less than significant.

Hazards and Hazardous Materials

Past soil contamination on the Baldwin Hills Alternative site has either been remediated or does not pose a concern to individuals and/or the environment.¹¹ However, it is possible that previously contaminated soils may still remain on the Baldwin Hills Alternative site, and thus, as with the Proposed Project, construction workers could be exposed to contamination during ground disturbing activities (Impact 3.8-4). Mitigation Measure 3.8-4 would require the preparation and approval of the Soil Management Plan prior to initiating earthwork activities, which would reduce the potential for worker exposures. For this reason, impacts related to on-site contamination would be similar to the Proposed Project.

Hydrology and Water Quality

The Baldwin Hills Alternative site is fully developed with impervious surfaces; pervious surfaces on the site are minimal and include ornamental landscaping. Surface water runoff from the Baldwin Hills Alternative site is directed into an extensive storm drain collection system that serves the area. Similar to the Proposed Project, it is possible that construction and operation of Alternative 4 could degrade the quality of the water that is discharged from the Baldwin Hills Alternative site (Impacts 3.6-1, 3.6-3, 3.9-1 and 3.9-4). In addition, as with the Proposed Project, altered drainage patterns on the Baldwin Hills Alternative site during both construction and operation have the potential to result in erosion, sedimentation, and/or flooding on or off site by

¹¹ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. p. IV.F-10.

redirecting or concentrating flows (Impact 3.9-3 and 3.9-6). Mitigation Measure 3.9-1(a) would require the project at the Baldwin Hills Alternative site to comply with a number of regulations governing water quality and drainage while Mitigation Measure 3.9-1(b) would require the periodic sweeping of parking lots during operation to remove contaminants. As a result, impacts related to water quality and drainage would be similar to those described for the Proposed Project.

Land Use and Planning

Like the Proposed Project, Alternative 4 would not result in the division of an established community, as the arena and other uses would be located entirely within the southern parcel of the Baldwin Hills-Crenshaw Plaza mall; the vacation of streets would not be required. Alternative 4 would likely require an amendment to West Adams-Baldwin Hills-Leimert Community Plan. With the amendment, Alternative 4 would be consistent with plans or policies that have been adopted for the purposes of environmental mitigation, and thus it would have less-than significant-impacts related to land use and planning (Impacts 3.10-1 through 3.10-4).

Noise and Vibration

Construction vibration levels under Alternative 4 would be similar to the Proposed Project due to the use of similar amounts of equipment and construction methods. As a result, vibration impacts with respect to structural damage and human annoyance (Impacts 3.11-3 and 3.11-6) would be the same and would still require the implementation of Mitigation Measures 3.11-3(a) through (c), which requires minimum distances of construction equipment from sensitive receptors and the designation of a construction relations officer to field vibration-related complaints.

Like the Proposed Project (Impacts 3.11-4 and 3.11-8), Alternative 4 would not expose people residing or working within the Baldwin Hills Alternative site to excessive noise levels from aircraft as the site is not located within 2 miles of a public airport or public use airport.

Population, Employment and Housing

According to the Master Plan EIR, development under the Baldwin Hills Crenshaw Plaza Master Plan would result in a net increase of 1,760 employees on the site. However, these new jobs would be accommodated by unemployed workers in the area.¹² Similar to the Proposed Project, Alternative 4 would add 768 non-event employees to the Baldwin Hills Alternative site, which is less than half the number that would be added under the Master Plan. As a result, these new jobs would also be accommodated by unemployed workers in the area. In addition, as no housing is located on the Baldwin Hills Alternative site, Alternative 4 would not result in the displacement of substantial numbers of people or housing. For these reasons, impacts related to population, employment, and housing (Impacts 3.12-1 through 3.12-4) under Alternative 4 would be similar in magnitude to the Proposed Project.

Public Services

Fire protection services at the Baldwin Hills Alternative site is provided by the City of Los Angeles Fire Department (LAFD) and police protection services are provided by the Los Angeles

¹² City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. p. IV.J-11.

Police Department (LAPD). There are multiple fire stations that provide service to the project site, including Station Nos. 94, 34, and 66, which the LAFD has indicated that the response times and distances to the Project Site from Station 94 and Station 34 currently meet LAFD standards.¹³ The Baldwin Hills Alternative Site is located within the LAPD's South Bureau, and is served by the Southwest Community Police Station, located at 1546 West Martin Luther King Jr. Boulevard.¹⁴ With the implementation of a series of Regulatory Compliance Measures and Project Design Features required of new projects in the City of Los Angeles, the Proposed Project built and operated at the Baldwin Hills Alternative site would have a less than significant impact on the provision of fire and police protection services (Impacts 3.13-1 through 3.13-4). This impact would be similar in magnitude to the impact at the Project Site.

Because the Proposed Project does not include residential uses, it would not adversely affect City of Los Angeles parks and recreation facilities or Los Angeles Unified School District elementary, middle, and high schools (Impacts 3.13-5 through 3.13-12). Thus, these impacts would be the same as with the Proposed Project.

Transportation and Circulation

Under Alternative 4, the ability to walk to the Crenshaw/LAX light rail line Martin Luther King Jr. Station without the need for shuttling would increase the attractiveness of rail transit, although this effect could be partially offset since only one rail line would be thus accessible. The removal of a portion of the retail uses at Baldwin Hills Crenshaw Plaza shopping mall to accommodate the Project at the Baldwin Hills Alternative site would reduce the net vehicle trip increase generated by the project at this site. Although the net new trips generated by major events at the arena would be reduced somewhat, a substantial reduction in the level of intersection, neighborhood street, or freeway facility impacts would not be expected (Impacts 3.14-1 through 3.14-9, Impacts 3.14-16 through 3.14-24, Impacts 3.14-28 and 3.14-39, and Impacts 3.14-33 and 3.14-34).

In general, regional highway facilities are located further from the Baldwin Hills Alternative site than the regional highway facilities that serve the Project site. Regional access to the Baldwin Hills Alternative site is provided by the I-10 freeway, located approximately 1.6 miles to the north, the I-110 freeway, located about 3.1 miles to the east, and the I-405 freeway, located approximately 3.5 miles to the west. Local access to the Baldwin Hills Alternative site is provided by Crenshaw Boulevard and Martin Luther King Jr. Boulevard, both of which are designated as Avenue I arterial streets in the City of Los Angeles *Mobility Plan 2035*, and Stocker Street, a Boulevard II arterial street in the *Mobility Plan 2035*.¹⁵ Each of the streets bordering the Baldwin Hills Alternative site provide multiple traffic lanes.

¹³ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. p. IV.K.1-2.

¹⁴ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. p. IV.K.2-2.

¹⁵ City of Los Angeles, *Mobility Plan 2035, An Element of the General Plan*, Adopted January 2016.

Similar to the Proposed Project, Alternative 4 has the potential to impact on-time performance for buses operating in the vicinity because of congestion associated with event arrival and departure traffic (Impacts 3.14-11, 3.14-25, 3.14-30, and 3.14-35).

Pedestrian impacts could be similar since not all parking would be provided on the Baldwin Hills Alternative site and pedestrians could be crossing arterial streets to access off-site parking (Impact 3.14-13).

Construction impacts on traffic were determined to be significant for the Proposed Project due to temporary lane closures along the Project frontages on South Prairie Avenue and West Century Boulevard. Construction of the Project at the Alternative 4 site would likely involve temporary lane closures along the Stocker Street frontage of the site for construction of a parking garage. Therefore, construction impacts for Alternative 4 would be in a different location but could be similar in magnitude to those for the Proposed Project.

Utilities and Service Systems

Similar to the Proposed Project, Alternative 4 would demand approximately 103 acre-feet per year (AFY) with the implementation of baseline water conservation measures and about 63 AFY with LEED Gold certification. Water service to the Baldwin Hills Alternative site is provided by the Los Angeles Department of Water and Power (LADWP). In accordance with the requirements of Senate Bill 610 and California Water Code section 10912(a), LADWP, as the designated water supplier, prepared a Water Supply Assessment (WSA) for development proposed under the Baldwin Hills Crenshaw Plaza Master Plan. The WSA concluded that the anticipated additional 332.5 AFY of annual water demand under the Master Plan falls within the City's projected water supplies for normal, single-dry, and multiple-dry years through the year 2030 and falls within the City's 25-year water demand growth projection.¹⁶ As Alternative 4 would demand substantially less water than the Baldwin Hills Crenshaw Plaza Master Plan, LADWP would also have sufficient supply to serve development under Alternative 4. This impact would be the same as the Proposed Project.

In addition, like with the Proposed Project, the existing storm drain system in the vicinity of the Baldwin Hills Alternative site may have insufficient capacity to accommodate post-construction stormwater runoff from the Alternative 4 development (Impacts 3.15-9 and 3.15-10). Mitigation Measures 3.15-9 and 3.15-10 would require the project to comply with a number of regulations governing water quality and drainage (Mitigation Measure 3.9-1(a)). As a result, impacts related to stormwater capacity would be similar to those described for the Proposed Project.

Impacts Identified as Being Less Severe than the Proposed Project

Air Quality and GHG Emissions

Air Quality and GHG emissions during construction and operation under Alternative 4 would be similar to the Proposed Project but slightly lessened as this alternative would not include the

¹⁶ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. pp. IV.M.2-11 to IV.M.2-12.

planned hotel on the East Transportation Site or a new potable water well. Therefore, similar to the Proposed Project, Alternative 4 would conflict with implementation of the applicable air quality plans, as operational emissions associated with the alternative, though somewhat reduced, would still exceed thresholds established by the SCAQMD for criteria air pollutants (Impacts 3.2-1 and 3.2-5).

Impacts associated with the emission of criteria air pollutants (Impacts 3.2-2 and 3.2-6), localized maximum daily operational emissions (NO₂) (Impacts 3.2-3 and 3.2-7), and GHG emissions (Impact 3.7-1 and 3.7-2) would be slightly reduced, but would still require the implementation of Mitigation Measure 3.2-2(a), which would require the implementation of a transportation demand management (TDM) program (Mitigation Measure 3.14-2(b)), Mitigation Measure 3.2-2(b), which would require the testing of the emergency generators and fire pump generators on non-event days, Mitigation Measure 3.2-2(c), which would require preparation and implementation of a Construction Emissions Minimization Plan, Mitigation Measure 3.2-2(d), which would require the project applicant to encourage the use of zero- and near-zero emissions vendor and delivery trucks, Mitigation Measure 3.7-1(a), which would require the implementation of a GHG reduction plan, and Mitigation Measure 3.7-1(b), which would require the preparation of an annual GHG verification report to determine the number of GHG offsets required to bring the project below the no net new GHG emissions threshold of significance.

Biological Resources

None of the trees listed in the City of Los Angeles Protective Tree Ordinance occur on the Baldwin Hills Alternative site.¹⁷ As a result, Alternative 4 would not result in the loss of protected trees (3.3-3). Mitigation Measure 3.3-3 to reduce this impact would not be required. As a result, impacts to protected trees would be avoided under this alternative.

Energy Demand and Conservation

Energy demand during construction and operation under Alternative 4 would be similar to the Proposed Project but slightly lessened as this alternative would not include the planned hotel on the East Transportation Site or a new potable water well Impacts 3.5-2 and 3.5-4.

Hazards and Hazardous Materials

Alternative 4 would not result in an air navigation hazard as the Baldwin Hills Alternative site is not located within an airport land use area plan. For this reason, hazards impacts associated with air navigation (Impact 3.8-5) would be avoided under this alternative and Mitigation Measure 3.8-5 would not be required.

Transportation and Circulation

The removal of a portion of the existing retail uses at Baldwin Hills Crenshaw Plaza shopping mall to accommodate the Project at the Baldwin Hills Alternative site would reduce the net vehicle trip increase generated by the project at this site. Net new trips generated by the ancillary

¹⁷ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. Appendix A, Initial Study, p. 5.

uses would be reduced to the extent that intersection and street impacts are unlikely for the ancillary uses (Impacts 3.14-1, 3.14-4, 3.14-16, and 3.14-19). Net new trips generated by daytime events uses would be reduced because of both the removal of a portion of the existing uses and the ability to walk to rail transit, reducing intersection, neighborhood street, and freeway facility impacts for daytime events (Impacts 3.14-2, 3.14-5, 3.14-8, 3.14-17, 3.14-20, and 3.14-23).

Average trip lengths for attendees of events at the Baldwin Hills Alternative site would likely be shorter than those for events at the Proposed Project given the site's location closer to the regional center, reducing the significant VMT impacts identified for events at the Proposed Project, but not to a level that is less than significant. The elimination of the hotel use would avoid the significant VMT impact identified for the Proposed Project's hotel use (Impact 3.14-10).

The nearest emergency rooms to the Alternative 4 site are located at the Kaiser Permanente West Los Angeles Medical Center, approximately 2.7 miles from the site, and the Southern California at Culver City, approximately, 3.3 miles from the site. Given the distance from the site, impacts on emergency access would not be expected to be significant, and would not require mitigation.

Given that the location of the Baldwin Hills Alternative site is over 3 miles from The Forum and the NFL Stadium, the level of additional project-related impact on intersections, neighborhood streets, freeway facilities, and public transit during concurrent events at The Forum and/or the NFL Stadium would be substantially reduced from that for the Proposed Project during concurrent events (Impacts 3.14-28 and 3.14-29, Impact 3.14-30, Impacts 3.14-33 through 3.14-35).

Impacts Identified as Being More Severe than the Proposed Project

Cultural Resources

According to Master Plan EIR, two known archaeological sites are located on the Baldwin Hills Alternative site. Archaeological site survey records indicate the presence of archaeological burial remains and artifacts including abalone shells, mollusk shells, chipped stone points, and other unidentified material that were identified and recorded in 1946 during construction of the Broadway Building on the northern mall parcel and again in 1951 during excavation for the basement store.¹⁸ In addition, the younger quaternary alluvium deposits underneath the Baldwin Hills Alternative site typically do not contain significant fossil vertebrate remains; however, older, deeper deposits underneath the site may contain significant vertebrate fossils.¹⁹

For these reasons, similar to the Project Site, it is possible that the Baldwin Hills Alternative site may contain unknown historical, archaeological, or tribal cultural resources (Impacts 3.4-1, 3.4-2, 3.4-3, 3.4-5, 3.4-6, and 3.4-7), and/or unknown human remains (Impacts 3.4-4 and 3.4-8). As noted above, the Master Plan EIR identified that there are two known archaeological sites within the Project Site, and City of Los Angeles Historic-Cultural Monument No. 487 (Sanchez Ranch) is located within 500 feet of the Project Site. Both archaeological resource sites 19-000080 and 19-001336, and City of Los Angeles Cultural Monument No. 487, have recorded the existence of

¹⁸ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. p. IV.D.2-9.

¹⁹ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. p. IV.D.2-6.

Native American burial remains and other artifacts including abalone shells, mollusk shells, and chipped stone points. Due to the proximate location of the proposed grading areas and these sites, potential to disturb other undiscovered Native American remains that may exist beneath the Project Site is considered moderate to high. Because of the potential for accidental discovery of such resources occur during construction, this impact would be potentially significant and considered more severe than that described for the Proposed Project.

Mitigation Measures 3.4-1 and 3.4-4 would reduce these impacts by requiring that work stop if such resources are uncovered, and that the resources be appropriately evaluated and treated. Nevertheless, because of the known presence of Native American archaeological resources, including human remains and burial artifacts on and near the Baldwin Hills Alternative Site, impacts on archaeological resources, and human remains would be more severe than for the Proposed Project.

Noise and Vibration

Ambient noise levels at locations around the Baldwin Hills Alternative site are similar, but somewhat lower than those in the vicinity of the Project Site. Noise levels along perimeter streets range from about 61 to 69 dBA Leq at the Baldwin Hills Alternative site,²⁰ compared to a range of approximately 64 to 71 dBA Leq at the Project Site (see Table 3.11-1). While traffic noise generators are similar in character, the Baldwin Hills Alternative site area lacks proximity to aircraft noise as is the case at the Project Site.

Noise levels under generated by construction and operation of Alternative 4 would be similar to the Proposed Project and sensitive receptors along Stocker Street to the south, across Crenshaw Boulevard to the east, across Santa Rosalia Drive to the west-southwest, and across West MLK Jr. Boulevard to the northwest of the Baldwin Hills Alternative site would be subjected to the same noise levels as sensitive receptors near the Project Site during construction and operation; these receptors would be located similar distances as sensitive receptors near the Project Site from construction activity, nearby roadways, and arena plaza activities. Therefore, while temporary increases in noise during construction and permanent increases in noise during operation (Impacts 3.11-1, 3.11-2, 3.11-5, and 3.11-6) would be of similar magnitude, the fact that the Baldwin Hills Alternative site area is generally quieter than the Project Site vicinity would result in more severe impacts with Alternative 4 than under the Proposed Project. Development under Alternative 4 would still be required to implement Mitigation Measure 3.11-1, which requires the implementation of measures and controls to reduce noise during construction, Mitigation Measure 3.11-2(a), which would require the preparation of a noise reduction plan major events, and Mitigation Measure 3.11-2(b), which requires the implementation of a transportation demand management (TDM) program (Mitigation Measure 3.14-2(b)).

²⁰ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. Table IV.I-3, p. IV.I-7.

Transportation and Circulation

The amount of on-site parking under Alternative 4 would be similar to that for the Proposed Project, meaning that a substantial amount of parking (roughly 3,700 to 4,100 spaces for a major event) would still need to be provided off site. Some could potentially be accommodated in the evenings in the parking lot for the medical office building across Marlton Avenue to the northwest or in other small lots in the area. However, this is likely to be insufficient, and event spillover parking onto nearby residential streets could be a significant impact.

Three of the streets surrounding the Alternative 4 site are identified in the City of Los Angeles *Mobility Plan 2035* for future bicycle improvements: Crenshaw Boulevard is on the Bicycle Lane Network identified for Tier 2 Bicycle Lanes, Martin Luther King, Jr. Boulevard is on the Bicycle Enhanced Network identified for Tier 1 Protected Bicycle Lanes, and Santa Rosalia Drive is on the Neighborhood Enhanced Network. As such, depending on the location of parking access and shuttle bus pull-outs, construction and operation of the Project could adversely affect planned bicycle facilities. Strategic placement of Traffic Control Officers could potentially mitigate any such impacts.

Utilities and Service Systems

At the Project Site, wastewater flows could be accommodated with several limited off-site improvements to increase capacity in local lines. At the Baldwin Hills Alternative site, the 12-inch sewer line under Marlton Avenue has a remaining flow capacity of 0.28 MGD; the capacity of the sewer under Crenshaw Boulevard is unknown.²¹ The estimated peak wastewater flow from the Proposed Project development would be approximately 0.70 MGD, more than double the known capacity of lines serving the site. Thus, infrastructure upgrades would be needed to allow the local wastewater infrastructure adjacent to the Project Site to serve the Proposed Project at the Baldwin Hills Alternative site. The construction of these infrastructure improvements could cause noise, traffic disruption, and other environmental effects associated with sewer line upgrades. This impact would be more severe than at the Project Site.

Relationship to Project Objectives

The City of Inglewood's basic objectives for the Proposed Project involve economic development, revitalization, and enhancing the welfare of the City and its residents, transforming underutilized property in the City, enhancing the identity of the City, and creating jobs in Inglewood. Because the Baldwin Hills Alternative Site is located in the City of Los Angeles and not in the City of Inglewood, none of the City of Inglewood's objectives for the Project would be met under Alternative 4.

The Baldwin Hills Alternative Site would meet most but not all of the project applicant's objectives for the project. Because the Baldwin Hills Alternative site would first require acquiring the site, and then designing and approving the project through the City of Los Angeles, it is

²¹ City of Los Angeles, 2016. *Baldwin Hills Crenshaw Plaza Master Plan Project EIR*. November 2016. Table IV.I-3, p. IV.M.1-11.

uncertain if this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024–2025 season, and thus could be unable to meet project applicant Objective 1a. While a state-of-the-art multi-purpose basketball and entertainment center (project applicant Objective 1a) along with team facilities (project applicant Objective 1c) and retail uses (project applicant Objective 1e) would be constructed under the Baldwin Hills Alternative, it would not combine with the future NFL Stadium to create a dynamic, year-round sports and entertainment district destination in the southwestern portion of Inglewood (project applicant Objective 3a).

6.5.5 Alternative 5: The District at South Bay Alternative Site Description

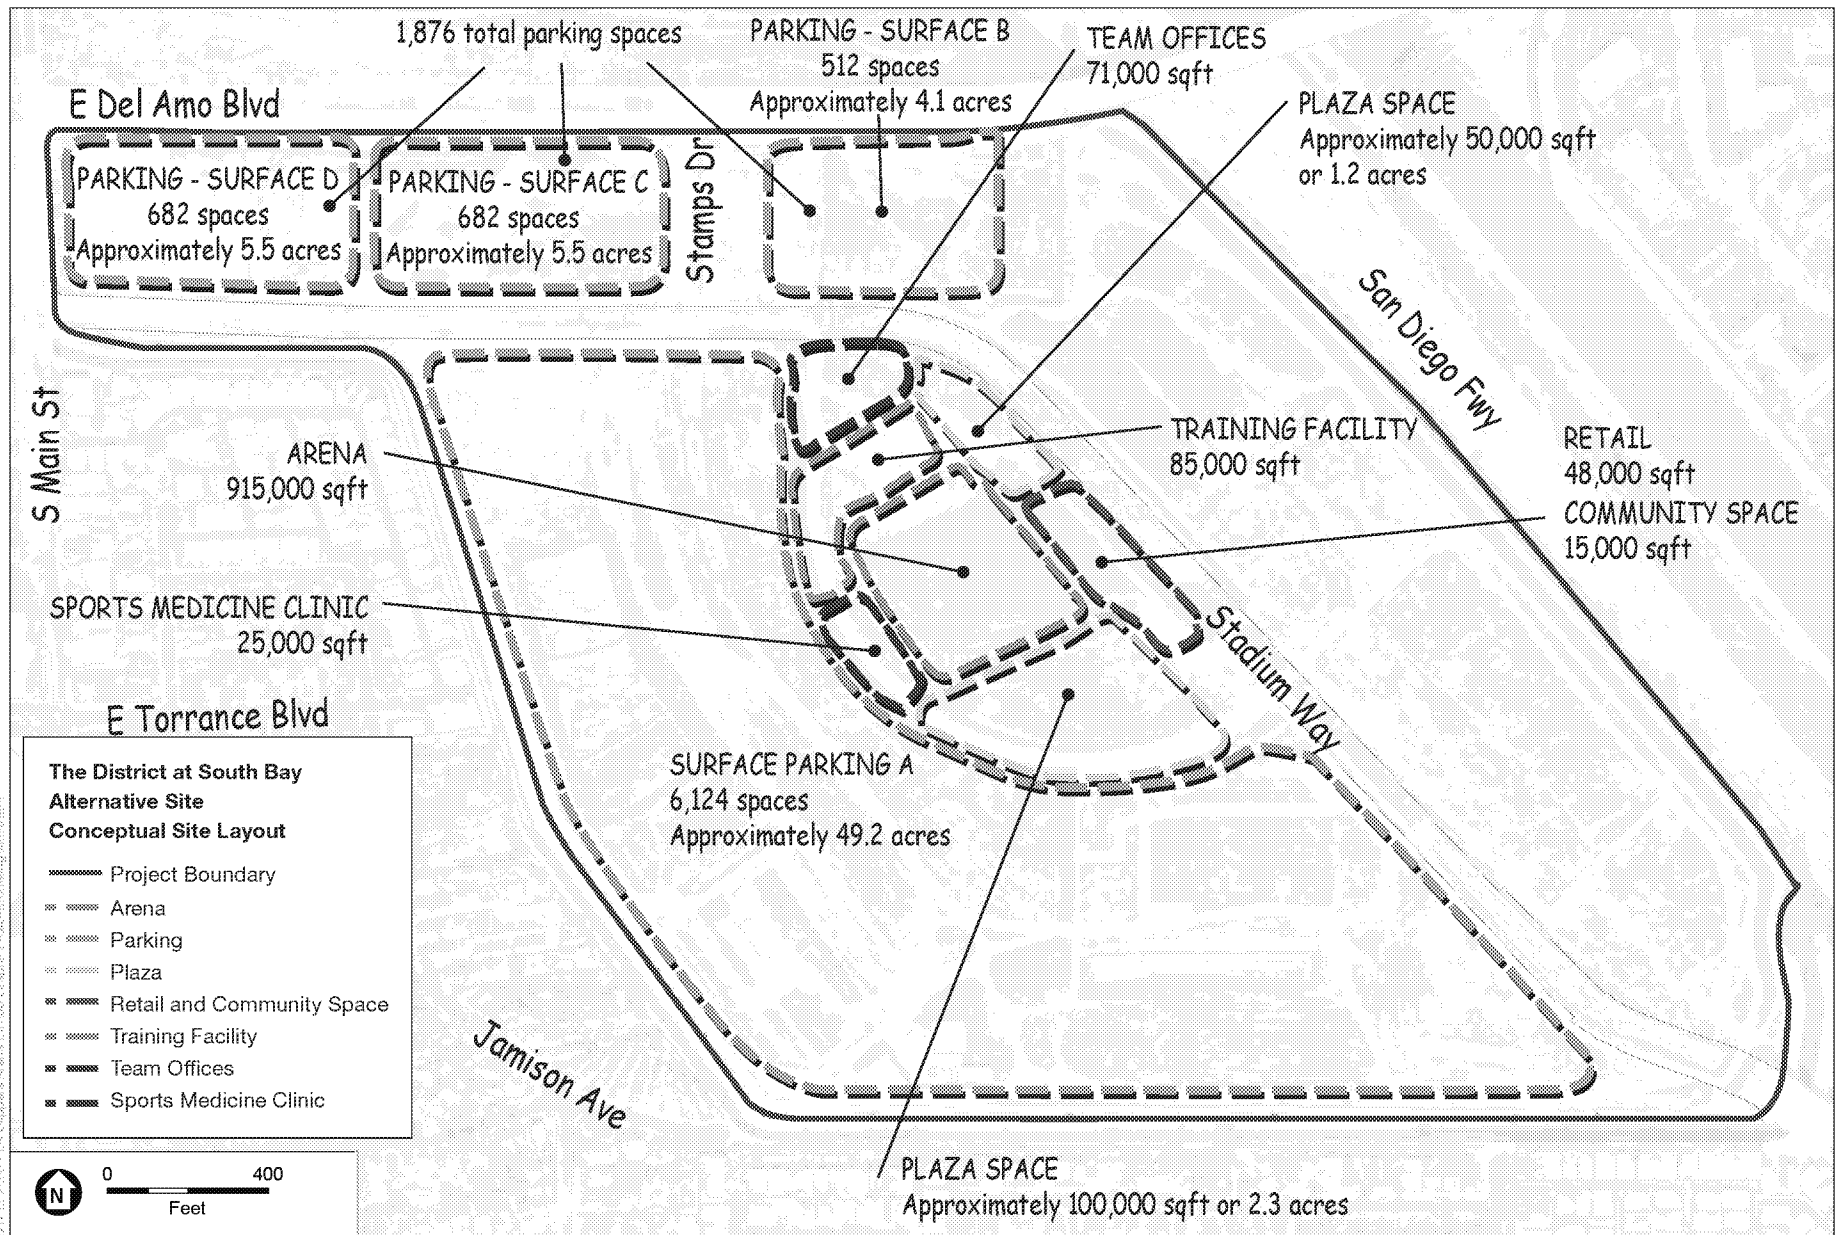

Under Alternative 5, the Proposed Project would be developed at a site in the City of Carson approximately 8 miles southeast of the Project Site (see **Figure 6-4**). The focus of this alternative is to identify the impacts that would occur if the arena and related development are located at another site that is, if not proximate to the City, then at a site that has previously been considered for a sports and entertainment facility. The City has determined that there is such a site located in the City of Carson. One key aim of this alternative is to determine whether such a site exists that

would locate the arena at a site that is not as proximate to The Forum and the NFL stadium, as a means of avoiding or lessening the traffic and related impacts of concurrent events at these facilities. The City has determined that Alternative 5 may meet these criteria. There is some question regarding whether this site would meet the project applicant’s objective to “[l]ocate a basketball and entertainment center on a site that is geographically desirable and accessible to the LA Clippers’ current and anticipated fan base.” Based on available information, however, this alternative appears to be potentially feasible.

Specifically, the Proposed Project would be located on a portion of a 157-acre site known as The District at South Bay, located west of the San Diego Freeway (I-405) and south of Del Amo Boulevard. The site is a former Class II landfill that is currently undergoing remediation and closure. The site is mostly vacant and is covered with nonnative grasses with the exception of the eastern portion of the site adjacent to the I-405, where a 711,500-square-foot regional commercial center is presently being constructed. Other existing facilities on the site include groundwater and landfill gas treatment facilities, and subsurface facilities to assist with dispersion of landfill gases. Construction trailers and equipment are also located in the northwestern portion of the site; soil and material stockpiles and construction materials are stored in various locations on the site.²²

Regional access to the site would be provided by the San Diego Freeway (I-405), immediately adjacent to the east, Harbor Freeway (I-110 Freeway), approximately 0.5 miles to the west, Artesia Freeway (SR-91 Freeway), about 1.9 miles to the north, and Long Beach Freeway (I-710 Freeway), approximately 3.4 miles to the east. Overall, these regional highway facilities are located closer to the Alternative 5 site than the regional highway facilities that serve the Proposed

²² City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018, p. II-8.

SOURCE: Google, 2018; ESA, 2019

Inglewood Basketball and Entertainment Center

Figure 6-4
Alternative 5: The District at South Bay Alternative Site

Project. Local access to the site is provided by Del Amo Boulevard, Avalon Boulevard, and Main Street. Transit at the Alternative 5 site includes bus service provided by the City of Carson's bus system, Carson Circuit, which provides connections to the Metro Blue Line and regional bus services from Torrance Transit, the MTA, Long Beach Transit and Gardena Municipal Bus Lines. The nearest bus stop is located at the intersection of Del Amo Boulevard and Main Street, located adjacent to the northwest corner of the project site, and multiple bus lines running north-south along Avalon Boulevard. The nearest light rail station is the Metro Blue Line station at Del Amo Boulevard, about 3.5 miles east of the site.

The Alternative 5 site is surrounded by multiple land uses. Uses to the east across the I-405 include residential neighborhoods and regional retail, most notably the South Bay Pavilion at Carson. To the north of the site is the Porsche Experience Center, a 6.5-kilometre test and development auto racetrack, a racing car exhibition, and a restaurant. To the northeast is the Victoria Golf Course. Residential areas, consisting of one- and two-story detached residences and manufactured homes, are located to the south and west. The residences are separated from the Alternative 5 site by the Torrance Lateral Flood Control Channel (Torrance Lateral), a concrete-lined drainage channel which parallels the southern and western border of the site. To the west of the site, extending away from the site on West Torrance Boulevard and Del Amo Boulevard, are low-rise commercial and light industrial uses.

The site is designated Mixed Use – Residential in the City of Carson General Plan and designated Mixed-Use Marketplace (MU-M) and Commercial Marketplace (CM) in The District at South Bay Specific Plan. Land uses surrounding the project site are designated by the City of Carson General Plan as Mixed Use – Residential and Mixed Use – Business Park to the north, Regional Commercial to the east, Low Density Residential and High Density Residential to the south, and Low Density Residential to the west. With respect to zoning, land uses surrounding the project site are zoned regional commercial to the north and east, and single-family and multi-family residential to the south and west.

In 2006, the City of Carson adopted the Carson Marketplace Specific Plan, which proposed constructing a 1,995,125-sf mixed-use commercial project (retail, 300 hotel rooms, and entertainment uses) and 1,550 residential units. In 2011, the specific plan was amended and renamed "The Boulevards at South Bay Specific Plan." In 2015, the specific plan area was proposed for the development of an NFL Stadium that would have served as the home for the San Diego Chargers and Oakland Raiders franchises. Ultimately this site was not selected, and the Chargers relocated to Los Angeles with the intent to play games at the new NFL Stadium under construction in Inglewood, and the Raiders decided to relocate to a new stadium currently under development in Las Vegas.

In 2018, the specific plan was further amended to allow for regional commercial uses and renamed "The District at South Bay Specific Plan." Under the current proposal, the 157-acre site would be developed with a total of 1,250 residential units and 1,834,833 square feet of commercial uses including approximately 711,500 square feet of regional commercial uses,

including outlet and restaurant uses, and 890,000 square feet of regional retail center, neighborhood-serving commercial, restaurant, and commercial recreation/entertainment uses, as well as 350 rooms total in two hotels. As discussed above, the 711,500-square-foot regional commercial center (Los Angeles Premium Outlets) is under construction on the approximately 30-acre eastern portion of the specific plan area, adjacent to the I-405.

As with the Proposed Project, the Alternative 5 arena would have a capacity of 18,000 attendees in an NBA basketball configuration, and up to 18,500 in certain concert configurations. In addition, this alternative would include a team practice facility, sports medical clinic, team offices, and retail uses. The square footage of each of these uses would remain the same as under the Proposed Project. Approximately 8,000 surface parking spaces would be provided on the site; no parking structures would be constructed. The amount of parking is almost twice as much parking as is provided by the Proposed Project, and would respond to the relative lack of access to transit (3.5 miles to the Metro Blue Line Del Amo Station) and lack of substantial parking resources in the vicinity of the Alternative 5 site.

The design of the arena would change in response to the conditions on the District at South Bay Alternative site. Investigation of and planning for remediation of the former landfill started in the late 1970s, and continued for about 40 years. The DTSC Remedial Action Plan for the former landfill requires the creation of an impervious cap underlain by clean fill.²³ Thus, in order to avoid substantial changes to those earlier plans that would be associated with substantial excavation, instead of excavating to a depth of up to 35 feet and removing approximately 376,000 cubic yards of earth and former landfill materials from the site to accommodate the arena bowl, under Alternative 5, the arena would be constructed on a pad that would require the import of a similar amount of soil in order to build up the land area around the arena to avoid disturbing the buried landfill materials on the site.

This alternative would not include a hotel or a new municipal water well.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 5. In addition, the comparative analysis of environmental effects provided below was informed by The District at South Bay Specific Plan EIR,²⁴ which provided information relating to existing conditions in and around the Carson Alternative Site.

Impacts Identified as Being the Same or Similar to the Proposed Project

Aesthetics

Like the Project Site, the District at South Bay Alternative site is located in an urbanized area. The area in the vicinity of the Carson site does not contain notable features that would be

²³ City of Carson, *Carson Marketplace Addendum to the Final Environmental Impact Report*, State Clearinghouse Number 20050510059, July 2009, pp. 15–16.

²⁴ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018.

considered unique geologic features or scenic resources located near a scenic highway, and does not have any scenic vistas. The site is adjacent to the San Diego Freeway which is not designated as a state scenic highway. As such, like the Proposed Project, the project built and operated at the District at South Bay Alternative site would not substantially damage any scenic resources within a state scenic highway. Because of the setting and location of adjacent uses, there would be no significant impacts related to shadowing of residences or other sensitive uses (Impact 3.1-3). These impacts would be of the same magnitude as under the Proposed Project. Finally, the spillover lighting effects of Alternative 5 would be of similar magnitude as those of the Proposed Project (Impacts 3.1-2 and 3.1-5). Adjacent to the District at South Bay Alternative site are light sensitive residences to the south and west across the Torrance Lateral Channel. Lighting in the parking lots surrounding the arena could spill over to these areas and result in light in excess of City of Carson standards on residential properties. Like the Proposed Project, Alternative 4 would require implementation of Mitigation Measures 3.1-2(a) and (b).

Geology and Soils

As described above, the Alternative 5 site is a former Class II landfill that is currently undergoing remediation and closure, and which is underlain by former landfill waste materials, which have been compacted through a densification process known as Deep Dynamic Compaction (DDC). In addition, the District at South Bay Alternative site is largely located within an area designated by the City of Carson General Plan Safety Element and the State of California Seismic Hazard Maps as a CGS Liquefaction Hazard Zone.²⁵ The Alternative 5 site is outside of any established Alquist-Priolo Earthquake Fault Zone for fault rupture hazards, and no active or potentially active faults are known to pass directly under the site. Compliance with the most recent State Building Code and the City of Carson's Building Code seismic design standards and site evaluation requirements would reduce the risk of exposure of the Project's occupants and structures to ground shaking, liquefaction, differential settlement, or other geologic hazards. Thus, although geologic and seismic impacts would be greater at the District at South Bay Alternative site, impacts related to geology and soils would, as mitigated, be less than significant, and similar to those described for the Proposed Project.

Hazards and Hazardous Materials

Hazardous materials impacts related to the former landfill uses on the site are discussed further below. However, impacts related to exposure of workers or residents to accidental spills or other operational hazards would be the same at the District at South Bay Alternative site as described for the Proposed Project (Impacts 3.8-1 through 3.8-3).

Land Use and Planning

Like the Proposed Project, Alternative 5 would not result in the division of an established community, as the arena and other uses would be located entirely within the boundaries of the District at South Bay Alternative site; the vacation of streets would not be required. Alternative 5 would likely require an amendment to the City of Carson General Plan. With the amendment,

²⁵ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. IV.E-7

Alternative 5 would be consistent with plans or policies that have been adopted for the purposes of environmental mitigation, and thus it would have less-than significant-impacts related to land use and planning (Impacts 3.10-1 through 3.10-4).

Population, Employment and Housing

According to The District at South Bay Specific Plan EIR, development under The District at South Bay Specific Plan could support a population increase of approximately 4,550 persons. However, this population growth would be within the Southern California Association of Governments' (SCAG) forecasted short- and long-term growth within the South Bay Cities Subregion.²⁶ Similar to the Proposed Project, Alternative 5 would add 768 non-event employees to the District at South Bay Alternative site, which is well below the total persons added under the Specific Plan. As a result, the employees added under Alternative 5 would also be within SCAG's forecasted short- and long-term growth within the South Bay Cities Subregion. In addition, as no housing is located on the District at South Bay Alternative site, Alternative 5 would not result in the displacement of substantial numbers of people or housing. For these reasons, impacts related to population, employment, and housing (Impacts 3.12-1 through 3.12-4) under Alternative 5 would be similar in magnitude to the Proposed Project.

Public Services

Fire protection services at the District at South Bay Alternative site is provided by the Los Angeles County Fire Department (LACFD) and police protection services are provided by the Los Angeles County Sheriff's Department (LACSD). There are multiple fire stations that provide service to the project site, including Station No. 36 which is the closest to the site.²⁷ The District at South Bay Alternative site is served by the Carson Sheriff Station located at 21356 South Avalon.²⁸ With the implementation of a series of design-related mitigation measures required of new projects in the City, and including the provision of space for use by the Sheriff's Department in the arena, the Proposed Project built and operated at the District at South Bay Alternative site would have a less than significant impact on the provision of fire and police protection services (Impacts 3.13-1 through 3.13-4). This impact would be similar in magnitude to the impact at the Project Site.

Because the Proposed Project does not include residential uses, it would not adversely affect City of Carson parks and recreation facilities or Los Angeles Unified School District elementary, middle, and high schools (Impacts 3.13-5 through 3.13-12). Thus, these impacts would be the same as with the Proposed Project.

Transportation and Circulation

Similar to the Proposed Project, Alternative 5 has the potential to impact on-time performance for buses operating in the vicinity because of congestion associated with event arrival and departure traffic (Impact 3.14-11).

²⁶ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-16.

²⁷ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-17.

²⁸ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-20.

Utilities and Service Systems

Similar to the Proposed Project, Alternative 5 would demand approximately 103 AFY with the implementation of baseline water conservation measures and about 63 AFY with LEED Gold certification. Water service to the District at South Bay Alternative site is provided by the California Water Service Company (Cal Water). In accordance with the requirements of Senate Bill 610 and California Water Code section 10912(a), Cal Water, as the designated water supplier, prepared a WSA for development proposed under the Boulevards at South Bay Specific Plan, which found that Cal Water did have adequate water supplies to meet the projected demands of the project in addition to those of its existing customers and other anticipated future water users in the Dominguez District for the 20-year period under all conditions. A separate analysis was also conducted to determine if further analysis of water supply and demand was required in connection with The District at South Bay Specific Plan, which modified the Boulevards at South Bay Specific Plan. The District at South Bay Specific Plan was projected to have an estimated annual demand of 705 AFY, and the separate analysis found that this demand would be less than previously projected for the Boulevards at South Bay Specific Plan, and thus The District at South Bay Specific Plan did not trigger the necessity to prepare a new WSA under California Water Code section 10910(h).²⁹ As Alternative 5 would demand substantially less water than The District at South Bay Specific Plan, it also would not trigger the need to prepare a new WSA, and Cal Water would have sufficient supply from existing supplies and resources to serve development under Alternative 5.

Storm drainage infrastructure serving the District at South Bay Alternative site has been sized to accommodate intense development planned under the various versions of the specific plan that regulate development of the site. In addition, development under Alternative 5 would be required to implement drainage control features in accordance with the City's drainage control regulations as well as 2009 SUSMP requirements.³⁰ As a result, there would be no need for new or expanded storm drainage facilities (Impacts 3.15-9 and 3.15-10). These impacts would be similar to those described for the Proposed Project.

Impacts Identified as Being Less Severe than the Proposed Project

Biological Resources

The District at South Bay Alternative site has been completely disturbed and no vegetation, including trees, or habitat is present to support nesting raptors or migratory birds. As a result, Alternative 5 would not disturb nesting raptors or migratory birds (Impact 3.3-2) and would not result in the loss of protected trees (Impact 3.3-3).³¹ Mitigation Measures 3.3-2 and 3.3-3 to reduce these impact would not be required. As a result, unlike the Proposed Project, no impacts to nesting raptors or migratory birds and protected trees would occur under this alternative.

²⁹ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. pp. VI-28 to VI-31.

³⁰ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-13.

³¹ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-4.

Cultural and Tribal Cultural Resources

The District at South Bay Alternative site is a former landfill with no existing buildings or other structures. As a result, there is no potential for the development of the Proposed Project at this site to have a significant impact on unknown historical, archaeological, or tribal resources (Impacts 3.4-1, 3.4-2, 3.4-3, 3.4-5, 3.4-6, and 3.4-7), and/or unknown human remains (Impacts 3.4-4 and 3.4-8).³² Mitigation Measures 3.4-1 and 3.4-4 to reduce these impacts would not be required. Therefore, under Alternative 5, impacts on cultural resources, including archaeological resources, tribal cultural resources, and human remains would be less severe than under the Proposed Project.

Geology and Soils

As described above, because the District at South Bay site a former landfill, and ground disturbing activities would occur in soils that are clean fill and compacted former landfill materials, there would be no potential to discover unknown paleontological resources (Impacts 3.6-2 and 3.6-4). Therefore, these impacts would be less than significant under Alternative 5 and would not require the mitigation measure as identified for the Proposed Project in order to reduce the impact to less than significant.

Hazards and Hazardous Materials

Impacts related to proximity to nearby airports would be less severe for the District at South Bay Alternative site than for the Proposed Project, which is under the flight path of LAX and within 2 miles of Hawthorne Airport (HHR). The closest public airport to the District at South Bay Alternative site is the Compton Airport, which is located approximately 3.25 miles to the north. Alternative 5 would not result in an air navigation hazard as the District at South Bay Alternative site is not located within an airport land use area plan. For this reason, hazards impacts associated with air navigation (Impacts 3.8-5 and 3.8-11) would be avoided under this alternative and Mitigation Measure 3.8-5 would not be required.

Hydrology and Water Quality

Development under Alternative 5 would not degrade the quality of the water that is discharged from the District at South Bay Alternative site (Impacts 3.6-1, 3.6-3, 3.9-1 and 3.9-4). Construction on the District at South Bay Alternative site would be required to adhere to best management practices listed the NPDES General Construction Permit to reduce potential adverse effects with regard to water quality. During operation, the proposed arena and other facilities would be subject to the drainage control requirements of the County's 2009 Standard Urban Stormwater Mitigation Plan (SUSMP) permit and the City's Storm Water Pollution Control Measures for New Development Projects.³³ In addition, any alterations to existing drainage patterns as a result of Alternative 5 would not be of a sufficient magnitude so as to result in substantial erosion or siltation or flooding on or off site (Impact 3.9-3 and 3.9-6).³⁴ As a result, Mitigation Measures 3.9-1(a) and 3.9-1(b) to reduce impacts related to water quality and drainage

³² City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-6.

³³ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-11.

³⁴ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. VI-12.

would not be required. For this reason, impacts related to on-site contamination would be less than those described for the Proposed Project.

Noise and Vibration

Noise levels under Alternative 5 would be similar to the Proposed Project but lessened as sensitive receptors to the west and south of the District at South Bay Alternative site are located further away from construction activity and roadways than sensitive receptors under the Proposed Project. The nearest sensitive residential receptors that may be affected by the Proposed Project at the District at South Bay Alternative site are one- and two-story detached residences and mobile homes that are located across the Torrance Lateral Channel to the south and west of the site. Future residential uses have been approved across Del Amo Boulevard from the area of the District at South Bay Alternative site. In addition, the San Diego Freeway is a substantial noise source to the east of the District at South Bay Alternative Site, and the Porsche Experience, located across Del Amo Boulevard immediately north of the recently approved residences, is an entertainment use that already creates substantial noise in the area. Ambient noise levels measured at the site range from about 50 to 78 dBA across the site, generally in a west-to-east configuration with higher noise levels near the San Diego Freeway, and lower levels near the residential uses south and west of the site.³⁵ This is a much wider range of noise levels than at the Project Site. Because the noise levels produced by the Proposed Project constructed at the District at South Bay Alternative site would be similar to those predicted for the Proposed Project, it is possible that the impacts would be less severe on the eastern side of the property, near the San Diego Freeway, and potentially more severe on the south and western side of the site, adjacent to current residential uses.

Therefore, impacts associated with a temporary increase in noise during construction and a permanent increase in noise during operation (Impacts 3.11-1, 3.11-2, 3.11-5, and 3.11-6) would be reduced, but would still require implementation of Mitigation Measure 3.11-1, which would require the implementation of measures and controls to reduce noise during construction, Mitigation Measure 3.11-2(a), which would require the preparation of a noise reduction plan major events, and Mitigation Measure 3.11-2(b), which would require the implementation of a transportation demand management (TDM) program (Mitigation Measure 3.14-2(b)). In addition, vibration levels under Alternative 5 would also be similar to the Proposed Project but lessened for the same reasons. As a result, vibration impacts with respect to structural damage and human annoyance (Impacts 3.11-3 and 3.11-7) would be reduced, but would still require the implementation of Mitigation Measures 3.11-3(a) through (c), which requires minimum distances of construction equipment from sensitive receptors and the designation of a construction relations officer to field vibration-related complaints.

Transportation and Circulation

The District at South Bay Alternative site is located approximately 3.5 miles from the Metro Blue Line station at Del Amo Boulevard, approximately 1.5 miles from the Metro Silver Line station on the I-110 freeway at Carson Street, and approximately 1.8 miles from the Harbor Gateway Transit

³⁵ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. Table IV.H-1, p. IV.H-6.

Center. As such, it is assumed that the Project at this location would provide shuttle service to the Blue Line and Silver Line similar to the shuttle service to the Crenshaw/LAX and Green Lines to be provided as part of the Proposed Project. Although the Silver Line is an express bus service with lower capacity than a light rail line, bus service can be readily increased if needed and the Silver Line provides one-seat service to the Metro Red/Purple Lines and Union Station in downtown Los Angeles. As such, it is anticipated that vehicle trip generation for events in the arena at the District at South Bay Alternative site would be similar to that for the Proposed Project.

Regional access to the District at South Bay Alternative site would be provided by the I-405 freeway (immediately adjacent to the east), the I-110 freeway (approximately 0.5 miles to the west), the SR-91 freeway (about 1.9 miles to the north), and the I-710 freeway (approximately 3.4 miles to the east). Overall, these regional highway facilities are located closer to the District at South Bay Alternative site than the regional highway facilities that serve the Proposed Project are to the Proposed Project site, including direct access to the I-405 freeway via the Avalon Boulevard interchange located immediately adjacent to the site (Impacts 3.14-7 through 3.14-9, Impacts 3.14-22 through 3.14-24, and Impacts 3.14-29 and 3.14-34). Direct access to the site is provided by three streets designated as major highways in the City of Carson General Plan: Del Amo Boulevard (six lanes), Avalon Boulevard (six lanes), and Main Street (four lanes). There are no direct street connections across the Torrance Lateral Flood Control Channel connecting to the residential neighborhoods to the south and west. For all of these reasons, locating the Project on the District at South Bay Alternative site would likely impact a lesser number of intersections and neighborhood streets than the Proposed Project (Impacts 3.14-1 through 3.14-6 and Impacts 3.14-16 through 3.14-21).

Since all parking would be provided on site under Alternative 5, pedestrian impacts would be lessened since impacts associated with pedestrians crossing arterial streets would not be expected to be significant (Impact 3.14-13). This could also potentially lessen eventgoer confusion regarding where they should park and reduce local circulation.

The elimination of the hotel use would avoid the significant VMT impact identified for the Proposed Project's hotel use (Impact 3.14-10).

The nearest emergency room to the Alternative 5 site is located at the Harbor-UCLA Medical Center, approximately 1.1 miles from the site. Given the distance from the site and that the Harbor-UCLA Medical Center is located on the far side of the Harbor Freeway and served by different major arterials (Carson Street, Vermont Avenue, and Normandie Avenue) than those serving the site, impacts on emergency access would not be expected to be significant, and likely would not require mitigation (Impact 3.14-14, 3.14-26, 3.14-31, and 3.14-36).

Construction impacts on traffic were determined to be significant for the Proposed Project due to temporary lane closures along the Project frontages on South Prairie Avenue and West Century Boulevard. Construction of the Project at the Alternative 5 site would be generally internal to the

site and would likely not involve temporary lane closures along arterial streets. Therefore, construction impacts for Alternative 5 would be less than those for the Proposed Project.

Given that the location of the District at South Bay Alternative site is over 8 miles from The Forum and the NFL Stadium, the Project at this site would not be likely to have additional significant impacts on intersections, neighborhood streets, freeway facilities, and public transit during concurrent events at The Forum and/or the NFL Stadium (Impacts 3.14-28 and 3.14-29 and Impacts 3.14-33 and 3.14-34).

Impacts Identified as Being More Severe than the Proposed Project

Air Quality and GHG Emissions

Air Quality and GHG emissions during construction under Alternative 5 would be similar to the Proposed Project but slightly lessened as this alternative would not include the planned hotel on the East Transportation Site and no parking structures would be constructed. However, operational air pollutant and GHG emissions would be increased compared to the Proposed Project because the project developed at the District at South Bay Alternative site would have less accessibility to transit and therefore higher automobile trip generation. In addition, because of its increased distance from Staples Center, VMT would be increased due to increased trip lengths. The combination of increased trips and increased trip lengths means that transportation-related emissions of criteria air pollutants and GHGs would be increased compared to the Proposed Project. Therefore, similar to the Proposed Project, Alternative 5 would conflict with implementation of the applicable air quality plans, however operational emissions associated with the alternative would exceed thresholds established by the SCAQMD for criteria air pollutants by a greater amount than under the Proposed Project (Impact 3.2-1 and 3.2-5).

Impacts associated with the emission of criteria air pollutants (Impacts 3.2-2 and 3.2-6), localized maximum daily operational emissions (NO₂) (Impacts 3.2-3 and 3.2-7), and GHG emissions (Impact 3.7-1 and 3.7-2) would be increased, and would still require the implementation of Mitigation Measure 3.2-2(a), which would require the implementation of a transportation demand management (TDM) program (Mitigation Measure 3.14-2(b)), Mitigation Measure 3.2-2(b), which would require the testing of the emergency generators and fire pump generators on non-event days, Mitigation Measure 3.2-2(c), which would require preparation and implementation of a Construction Emissions Minimization Plan, Mitigation Measure 3.2-2(d), which would require the project applicant to encourage the use of zero- and near-zero emissions vendor and delivery trucks, Mitigation Measure 3.7-1(a), which would require the implementation of a GHG reduction plan, and Mitigation Measure 3.7-1(b), which would require the preparation of an annual GHG verification report to determine the number of GHG offsets required to bring the project below the no net new GHG emissions threshold of significance. It is very likely that the required GHG offsets would be materially greater than under the Proposed Project.

Energy Demand and Conservation

Impacts related to Energy Demand and Conservation would be greater for the District at South Bay Alternative than those of the Proposed Project. Like for the Proposed Project, it is assumed

that the Alternative 5 project would be built to comply with the requirements of LEED Gold certification. Because the project at the District at South Bay Alternative site would not include construction of either the hotel or the parking structures, energy required for construction would tend to be less than under the Proposed Project. However, due to increased trip making and VMT, operational transportation energy would be increased compared to the Proposed Project. Construction impacts, which may be decreased compared to the Proposed Project, are one-time events and relatively short in duration, compared to operational impacts which occur on a continual basis over a 30-year or more period. Thus, on balance, energy effects of the project at the District at South Bay Alternative site would be more severe than those of the Proposed Project (Impacts 3.5-2 and 3.5-4).

Hazards and Hazardous Materials

The initial investigations of contamination at the District at South Bay Alternative site go back to the late 1970s. As a result of contamination discovered on and adjacent to the District at South Bay Alternative site, the site was listed as a hazardous substances site by the California Department of Toxic Substances Control (DTSC) in the 1980s and a remedial action order requiring implementation of remedial activities was issued for the site in 1988.³⁶ Remediation of the District at South Bay Alternative site was divided by the DTSC into two operable units (OU). A remedial action plan (RAP) for the Upper OU was approved in 1995, which was modified by an Explanation of Significant Differences (ESD) in 2009. A separate RAP for the Lower OU was prepared in 2005. The purpose of the Upper OU RAP was to make the District at South Bay Alternative site safe for future development. The purpose of the Lower OU RAP was to protect groundwater resources and was not required to make the District at South Bay Alternative site safe for future resources.³⁷

The Upper OU RAP requires the installation, operation, and maintenance of (1) a landfill cap designed to encapsulate the waste and create a barrier between future improvements and buried waste, (2) an active gas collection and treatment system designed to remove landfill gases from under the landfill cap, and (3) a groundwater collection and treatment system designed to contain a groundwater plume underneath the site and treat the extracted groundwater prior to discharge.³⁸ Development under Alternative 5 would be required to adhere to these requirements. The arena foundation would need to be supported by a pile system, with individual piles driven to the bearing soil beneath the waste. Given the density of the pile system to support a building of the scale of the proposed arena, and the nature of the extensive landfill gas collection system, it is likely that material changes to the landfill gas collection system may be required, and it is possible that construction workers could be exposed to contamination during ground disturbing and foundation construction activities. These impacts would be more severe than those described for the Proposed Project in Impact 3.8-4. Mitigation Measure 3.8-4 would require the preparation and approval of the Soil Management Plan prior to initiating earthwork activities, which would reduce the potential for worker exposures. This measure would be required to be expanded to include coordination with the

³⁶ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. II-13.

³⁷ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. II-14.

³⁸ City of Carson, 2018. *The District at South Bay Specific Plan EIR*. March 2018. p. II-14.

State Department of Toxic Substance Control (DTSC), and implementation of any required amendments or updates to the RAP for the site. For this reason, impacts related to on-site contamination would be more severe than those described for the Proposed Project.

Transportation and Circulation

Three of the streets surrounding or within the Alternative 5 site are identified in the City of Carson *Master Plan of Bikeways*³⁹ for future bicycle improvements: colored buffered bike lanes on Del Amo Boulevard, buffered bike lanes on New Stamps Road, and a bike path along Lenardo Drive (shown as Stadium Way on Figure 6-4) from the east end of the site to Avalon Boulevard. As such, depending on the location of parking access and shuttle bus pull-outs, construction and operation of the Project could adversely affect planned bicycle facilities. Strategic placement of Traffic Control Officers could potentially mitigate any such impacts.

Average trip lengths for attendees of events at the District at South Bay Alternative site would likely be longer than those for events at the Proposed Project given the site's location farther from the regional center, increasing the level of the significant VMT impacts identified for events at the Proposed Project (Impact 3.14-10).

Relationship to Project Objectives

The City of Inglewood's basic objectives for the Proposed Project involve economic development, revitalization, and enhancing the welfare of the City and its residents, transforming underutilized property in the City, enhancing the identity of the City, and creating jobs in Inglewood. Because the District at South Bay Alternative is located in the City of Carson and not in the City of Inglewood, none of the City of Inglewood's objectives for the project would be met under Alternative 5.

The District at South Bay Alternative would meet most but not all of the project applicant's objectives for the project. Because the District at South Bay Alternative site would first require acquiring the site, and then designing and approving the project through the City of Carson, it is uncertain if this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024–2025 season, and thus could be unable to meet project applicant Objective 1a. While a state-of-the-art multi-purpose basketball and entertainment center (Objective 1a) along with team facilities (Objective 1c) and retail uses (Objective 1e) would be constructed under the District at South Bay Alternative, it would not combine with the future stadium to create a dynamic, year-round sports and entertainment district destination in the southwestern portion of the City of Inglewood (Objective 3a).

Alternative 5 may not meet one of the applicant's basic objectives for the project. Objective 1(b) states: "Locate a basketball and entertainment center on a site that is geographically desirable and accessible to the LA Clippers' current and anticipated fan base." The District at South Bay Alternative site is located approximately 11 miles southeast of the Project Site. As such, the site is

³⁹ City of Carson, 2013. *Carson Master Plan of Bikeways*. August 2013.

located 11 miles further away from the Clippers' current home at Staples Arena in downtown Los Angeles. For this reason, it is unclear whether this location would achieve project applicant Objective 1(b).

6.5.6 Alternative 6: Hollywood Park Specific Plan Alternative Site

Description

Under Alternative 6, elements of the Proposed Project would be developed on an approximately 12-acre site near the NFL Stadium currently under construction within the Hollywood Park Specific Plan (HPSP) area to the north of the Project Site across West Century Boulevard (see **Figure 6-5**). As with the Proposed Project, Alternative 6 would involve the construction of a new multi-purpose arena to serve as the home of the LA Clippers NBA basketball team in the City of Inglewood and as much of the related development included in the Proposed Project as feasible, including the relocation of the LA Clippers team offices and team practice and athletic training facility.

The focus of this alternative is to identify the impacts that would occur if the arena and related uses, including the ancillary plaza uses, would be developed on a site (the HPSP Alternative site) within the HPSP area to potentially avoid or lessen the transportation-related impacts associated with concurrent events at the NFL Stadium and the Proposed Project. As a means of avoiding or lessening these impacts, Alternative 6 assumes that the arena and NFL Stadium operators would be able to reach a mutually agreed schedule coordinating events at the two venues. The analysis also focuses on whether locating the Proposed Project on the Alternative 6 site would otherwise avoid or reduce one or more significant environmental impacts of the Proposed Project.

Alternative 6 would include sufficient land to potentially accommodate the uses included in the Proposed Project, provided the property would become available and could be acquired by the project applicant.

The HPSP area includes development under the Stadium Alternative of the HPSP. This analysis assumes the completion of development of certain components referred to as the HPSP Adjusted Baseline projects in Section 3.0.5, which include the construction of a 70,000-seat open air NFL Stadium, a 6,000-seat performance venue, 518,077 square feet of retail and restaurant uses, 466,000 square feet of office space, 314 residential units, an 11.89-acre park with a large water feature, a 4-acre civic use, and approximately 9,900 parking spaces within the HPSP area. Although the retail, dining, and multi-purpose space for community programming could potentially be incorporated into the previously planned and approved development at Hollywood Park, the evaluation of this Alternative 6 for the purposes of this analysis conservatively assumes that such development would be additive to the HPSP development included in the Adjusted Baseline together with approved future development within the HPSP area. In other words, under this alternative, the uses proposed as part of the Proposed Project would not supplant development authorized under the HPSP, but would be added atop the development authorized under the HPSP.

SOURCE: Google, 2018; ESA, 2019

Inglewood Basketball and Entertainment Center

Figure 6-5
Alternative 6: Hollywood Park Specific Plan Alternative Site

Alternative 6 would involve the development of the Proposed Project within the HPSP area on an approximately 12-acre site to the south of the NFL Stadium currently under construction. This evaluation of Alternative 6 assumes the completion of the proposed development described as the HPSP Adjusted Baseline Projects in Section 3.0.5. The Alternative 6 site is comprised of parcels currently approved for future development in the HPSP, as discussed in Section 3.0.6 (Cumulative Assumptions). The Alternative 6 site would be approximately 75 percent of the size of the Arena Site (and approximately 47 percent of the total Project Site, including the parking parcels), but would accommodate many of the uses proposed by the Proposed Project (e.g., the athletic training and practice facility, LA Clippers team offices, and sports medicine clinic).

Uses in the vicinity of the Alternative 6 site include the HPSP Adjusted Baseline Projects, including retail, park, residential, commercial office, stadium, hotel and ancillary uses. The area to the north of the HPSP area is zoned C-R Commercial Recreation and includes the historic Forum concert venue and associated surface parking. The area to the east of the HPSP area is zoned R-2 Residential Limited Multi Family, Open Space, R-1 Residential Single Family, and C-R Commercial Recreation. The area to the south of the HPSP area is zoned C-2A Airport Commercial and M-1 Light Manufacturing. The area to the west of the HPSP area is zoned C-2A Airport Commercial and C-2 General Commercial.

Similar to the Proposed Project, development under Alternative 6 would include the Arena Structure, including an approximately 915,000 sf arena to host LA Clippers NBA games and other events, the LA Clippers team offices (71,000 sf), the LA Clippers practice and training facilities (85,000 sf) and a sports medicine clinic (25,000 sf). Seating capacity of the arena would remain at 18,000 attendees for LA Clippers NBA basketball games and a maximum capacity of up to 18,500 attendees for concert events. The overall design of the Arena Structure under Alternative 6 would be identical to the Proposed Project, with the modification that the parking structure adjacent to the Arena Structure in the Proposed Project would not be constructed. Access to the arena would be provided from a landscaped pedestrian plaza in the HPSP area, along the southern edge of Lake Park, and lead directly into the main lobby of the arena.

Although the retail development within the HPSP area described in the Adjusted Baseline would be located directly adjacent to the Alternative 6 site, and the ancillary retail, dining, and multi-purpose space for community programming uses included in the Proposed Project could potentially be located within that development, this evaluation of Alternative 6 assumes that the total 63,000 sf of ancillary uses would be additional to the development within the HPSP area analyzed in the Adjusted Baseline and Cumulative analyses described in Section 3.0. Thus, as with the Proposed Project, Alternative 6 would include the development of 24,000 sf of food and drink uses, 24,000 sf of retail uses, including a 7,000 sf LA Clippers team store, and 15,000 sf of multi-purpose space for community programming. Alternative 6 would not include the construction of a new hotel or removal of an existing municipal water well and construction of a new replacement well. The proposed West Parking Structure and East Parking Structure and Transportation Hub components of the Proposed Project would not be constructed under Alternative 6.

Primary access to the area around the HPSP IBEC Site would be from West Century Boulevard and South Prairie Avenue to the internal access roads within the HPSP Area. Development of Alternative 6 would require modification of the alignment of a proposed internal roadway along the Alternative 6 site and accompanying utilities to the south to accommodate the arena and ancillary development.

Regional access to the Alternative 6 site is essentially the same as for the Project Site and is provided by the San Diego Freeway (I-405), located approximately 2.6 miles to the west, and the Glenn Anderson Freeway & Transitway (I-105), located 1.6 miles to the south. Local access to the Alternative 6 would be slightly different from the Proposed Project, provided by several major arterials, including South Prairie Avenue and West Century Boulevard with alternative connections to Hawthorne Boulevard, Crenshaw Boulevard and Arbor Vitae Street.

Transit access to the HPSP site is provided by several bus lines and the future Crenshaw/LAX light rail line. The closest bus stop, at the intersection of South Prairie Avenue and Hardy Street, is about one-third of a mile from the Alternative 6 site, and the nearest light rail station is approximately 1.5 miles away. Similar to the Proposed Project, development of the Alternative 6 would include shuttle service to and from existing nearby rail transit stations and a shuttle drop-off and pick-up area near the arena to accommodate the shuttle service.

A total of 1,045 additional parking spaces would be developed within surface parking areas and subterranean parking structures located within the Alternative 6 site, as shown on Figure 6-5. The parking structures and surface parking areas would be accessed from the internal street network within the HPSP area, with primary access from South Prairie Avenue and Pincay Drive, with access to certain premium parking areas from the proposed Stadium Drive accessed from West Century Boulevard.

The HPSP requires that “no less than nine thousand (9,000) spaces located throughout the HPSP area shall be made available” for the NFL Stadium. As described in Section 3.0.5, the Adjusted Baseline includes approximately 9,900 spaces located within the HPSP area based on information included in plans submitted to the City of Inglewood. This analysis assumes that the development of an arena under Alternative 6 would include an agreement between the operators of the NBA arena and the NFL Stadium to coordinate events and shared parking. The remaining parking demand for events at the arena developed under Alternative 6 would be provided through the parking facilities within the HPSP area through coordination between the NFL Stadium and parking facility operators and the operator of the arena. Such coordination is anticipated to include location of the TNC loading areas and other transportation facilities such as charter bus and microtransit staging and loading areas sufficient to serve Alternative 6.

The parcels included in the Alternative 6 site are designated Mixed-Use (MU) within the current HPSP which permits athletic, social, entertainment, dining recreation and leisure uses. The area immediately to the north of the Alternative 6 site would continue be developed as Lake Park, an open space area with a large water feature. The total permitted development as described in the

HPSP would continue to be permitted. Thus, the uses within the MU zone that might have otherwise been developed at the Alternative 6 site would be developed elsewhere within the HPSP. The HPSP contains sufficient land to accommodate the relocation of these uses.

If Alternative 6 were developed, it is anticipated that the ownership of the properties within the Proposed Project Site would not change, private property would not need to be acquired for development of the proposed uses, and none of the uses that presently occupy the Project Site would be relocated. Similarly, the vacation of either West 101st Street or West 102nd Street would not be required. Potentially, a portion of the properties within the Project Site owned by the City and or the Successor Agency could be used for construction staging under Alternative 6. However, the revitalized development of the Project Site would not occur as part of Alternative 6.

The HPSP area is a privately-owned property subject to a detailed specific plan (the Hollywood Park Specific Plan), as well as a Development Agreement between the City and the HPSP developer. Development authorized under the HPSP is currently being implemented. There is, therefore, substantial uncertainty regarding site control and the feasibility of this alternative. The development of Alternative 6 would potentially require amendments to the HPSP, which would require the consent of the landowner and approval of the City pursuant to the terms of the Development Agreement between the City and the property owner.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 6. The comparative analysis of environmental effects provided below was informed by the 2009 Hollywood Park Redevelopment Project EIR (HPRP EIR),⁴⁰ which contains information relating to conditions in and around the HPSP Alternative site, and the environmental impacts of redevelopment of the site.

Impacts Identified as Being the Same or Similar to the Proposed Project

Because the size of the Proposed arena and the amount of ancillary development would be the same as the development in the Proposed Project, many of the impacts of the Proposed Project that are affected by the intensity of development would remain the same or very similar at the HPSP Alternative Site.

Aesthetics

HPSP Alternative site, along with the entirety of the HPSP area, is located in an urbanized community that is currently undergoing development. The area in the vicinity of the HPSP Alternative site does not have any scenic vistas or unique visual characteristics. Visual impacts associated with Alternative 6 would be similar to the Proposed Project (Impacts 3.1-1 and 3.1-4) although limited views along South Prairie Avenue due to the proposed pedestrian bridge would not occur under this alternative.

⁴⁰ City of Inglewood, 2009. *Hollywood Park Redevelopment Project EIR*. July 2009.

The nearest shadow sensitive uses are existing residences located approximately 2,100 feet to the east and residences located about 1,100 feet to the west, as well as new residences being constructed under the Adjusted Baseline about 750 feet to the west, and under cumulative conditions about 750 feet to the east. Given these distances, like with the Proposed Project, there would be no significant impacts related to shadowing of residences or other sensitive uses (Impact 3.1-3). For these reasons, impacts related to views, and shadow would be similar to those of the Proposed Project.

Cultural Resources

Like the Project Site, there are no known archaeological or historical resources located on the HPSP Alternative site. According to the HPRP EIR, it is possible that development on the HPSP site could disturb buried archaeological resources,⁴¹ and disturb unknown human remains.⁴² Since the preparation of the HPRP EIR, substantial ground disturbing earthwork has taken place on the HPSP site, and thus surface soils have been highly disturbed to prepare the property for development. However, like at the Project Site, the Proposed Arena would require excavation to a depth of approximately 35 feet, which is below the area that has been recently disturbed. Therefore, like with the Proposed Project, it is possible that implementation of Alternative 6 could cause a substantial adverse change in the significance of unknown historic, archaeological, or tribal cultural resources (Impacts 3.4-1, 3.4-2, 3.4-3, 3.4-5, 3.4-6, and 3.4-7), and/or unknown human remains (Impacts 3.4-4 and 3.4-8). Mitigation Measures 3.4-1 and 3.4-4 would reduce these impacts by requiring that work stop if such resources are uncovered, and that the resources be appropriately evaluated and treated. Therefore, impacts on archaeological resources and human remains would be similar to the Proposed Project.

Geology and Soils

Impacts related to geology and soils conditions and hazards, including paleontological resources would be similar to those described for the Proposed Project. Because Alternative 6 would occur less than one-half mile from Project Site, the same geological and soils conditions that would be encountered in construction of Alternative 6 would be essentially the same as with the Proposed Project. The Potrero Fault, which is approximately 0.5 miles from the Project Site, is closer to the Forum Alternative site, approximately 0.4 miles to the east; however, compliance with the California Building Code would avoid the creation of seismic hazards. According to the HPRP EIR, it is possible that development on the HPSP site could disturb previous unknown unique paleontological resources,⁴³ but because there would be less ground-disturbing activity because of the reduced amount of development in Alternative 6, the potential for erosion and accidental discovery of paleontological resources would be correspondingly decreased (Impacts 3.6-2 and 3.6-4). However, these impacts would continue to be potentially significant under Alternative 6 and would require the same mitigation measures as identified for the Proposed Project in order to reduce the impact to less than significant.

⁴¹ City of Inglewood, 2009. *Hollywood Park Redevelopment Project EIR*. July 2009. p. IV.E-28.

⁴² City of Inglewood, 2009. *Hollywood Park Redevelopment Project EIR*. July 2009. p. IV.E-28.

⁴³ City of Inglewood, 2009. *Hollywood Park Redevelopment Project EIR*. July 2009. p. IV.E-29.

Hazards and Hazardous Materials

As discussed above, the HPSP Alternative site has been mass graded as part of HPSP development activities, and as part of these activities sites within the HPSP Alternative site containing soil contamination have been remediated. However, it is possible that previously contaminated soils may still remain on the HPSP Alternative site, and thus, as with the Proposed Project, construction workers could be exposed to contamination during ground disturbing activities (Impact 3.8-4). Mitigation Measure 3.8-4 would require the preparation and approval of the Soil Management Plan prior to initiating earthwork activities, which would reduce the potential for worker exposures. For this reason, impacts related to on-site contamination would be similar to the Proposed Project.

Hydrology and Water Quality

Similar to the Proposed Project, it is possible that construction and operation of Alternative 6 could degrade the quality of the water that is discharged from the HPSP Alternative site (Impacts 3.6-1, 3.6-3, 3.9-1 and 3.9-4). In addition, as with the Proposed Project, altered drainage patterns on the HPSP Alternative site during both construction and operation have the potential to result in erosion, sedimentation, and/or flooding on or off site by redirecting or concentrating flows (Impact 3.9-3 and 3.9-6). Although it is not yet designed, it is likely that the drainage system for Alternative 6 would be tied into the comprehensive drainage and water quality treatment system being constructed in the HPSP area, including the adjacent Lake Park. Mitigation Measure 3.9-1(a) would require the project at the HPSP Alternative site to comply with a number of regulations governing water quality and drainage while Mitigation Measure 3.9-1(b) would require the periodic sweeping of parking lots during operation to remove contaminants. As a result, impacts related to water quality and drainage would be similar to those described for the Proposed Project.

Land Use and Planning

Like the Proposed Project, Alternative 6 would not result in the division of an established community, as the arena and other uses would be located entirely within the HPSP area; the vacation of streets would not be required. Alternative 6 would potentially require approval of amendments to the HPSP, and related entitlement documents. With the approval of such amendments, Alternative 6 would be consistent with plans or policies that have been adopted for the purposes of environmental mitigation, and thus it would have less-than significant-impacts related to land use and planning (Impacts 3.10-1 through 3.10-4).

Noise and Vibration

Vibration sensitive receptors within the HPSP area, including commercial retail buildings that will be constructed under the Adjusted Baseline, are located in close proximity to the HPSP Alternative site. Construction vibration levels under Alternative 6 would be similar to the Proposed Project due to the use of similar amounts of equipment and construction methods. As a result, vibration impacts with respect to structural damage and human annoyance (Impacts 3.11-3 and 3.11-7) would be the same, and would still require implementation of Mitigation Measures 3.11-3(a) through (c), which

requires minimum distances of construction equipment from sensitive receptors and the designation of a construction relations officer to field vibration-related complaints.

Population, Employment and Housing

Impacts related to Population, Employment and Housing (Impacts 3.12-1 through 3.12-4) would remain less than significant under Alternative 6. However, employment generation on the HPSP Alternative site would be reduced by about 7 percent as no hotel would be constructed.

Public Services

Because Alternative 6 would have the same type and amount of development (other than the elimination of the hotel and water well), and the same event profile as the Proposed Project, under Alternative 6 impacts of the Proposed Project on public services, including fire and police protection, parks and recreation facilities, would remain similar and would continue to be less than significant (see Impacts 3.13-1 through 3.13-12). Because employment on the Alternative 6 site would be reduced by about 7 percent under Alternative 6, impacts on public schools (Impacts 3.13-11 and 3.13-12), already less than significant for the Proposed Project, would be further reduced slightly under Alternative 6. The arena and commercial uses under Alternative 6 would be expected to generate a total of 49 new school students, a reduction of 1 student compared to the 50 students under the Proposed Project as described in Table 3.13-9.

Transportation and Circulation

Under Alternative 6, the Project would be of similar size to the Proposed Project, with a similar level of access to rail transit via shuttles for major events. As such, it is anticipated that vehicle trip generation for arena events and the ancillary uses at the Alternative 6 site would be similar to that for the Proposed Project. Given the proximity of the Alternative 6 site to restaurant and retail uses proposed as part of the HPSP, arrival and departure times before and after events could spread somewhat to the extent that these uses attract additional eventgoers. However, a material reduction in the level of intersection or freeway facility impacts would not be expected.

Because the Alternative 6 site is across the West Century Boulevard from the Project Site, the VMT characteristics of Alternative 6 would be essentially the same as for the Proposed Project. The event and retail components of Alternative 6 would have significant VMT impacts similar to those for the Proposed Project. The office, practice facility, sports medicine, and restaurant components of Alternative 6 would have less than significant VMT impacts similar to those for the Proposed Project.

Similar to the Proposed Project, Alternative 6 has the potential to impact on-time performance for buses operating in the vicinity because of congestion associated with event arrival and departure traffic.

The Alternative 6 site is located approximately 0.5 miles from the Centinela Hospital Medical Center. Impacts of the Proposed Project-related congestion on emergency access would be similar to those for the Proposed Project.

Impacts Identified as Being Less Severe than the Proposed Project

Aesthetics

The nearest light sensitive uses are existing residences located approximately 2,100 feet to the east and residences located about 1,100 feet to the west, as well as new residences being constructed under the Adjusted Baseline about 750 feet to the west, and residences that would be developed under cumulative conditions about 750 feet to the east. Given these distances there would be no significant spillover lighting effects (Impacts 3.1-2 and 3.1-5), and Mitigation Measures 3.1-2(a) through (c) would not be required. For these reasons, impacts related to spillover lighting would be less than described for the Proposed Project.

Air Quality and GHG

Air Quality and GHG emissions during construction and operation under Alternative 6 would be similar to the Proposed Project but slightly lessened because Alternative 6 would not include the planned hotel on the East Transportation and Hotel Site or a new potable water well. Therefore, similar to the Proposed Project, Alternative 6 would conflict with implementation of the applicable air quality plans, as construction and operational emissions associated with the alternative, though somewhat reduced, would still exceed thresholds established by the SCAQMD for criteria air pollutants (Impact 3.2-1 and 3.2-5).

Impacts associated with the emission of criteria air pollutants (Impacts 3.2-2 and 3.2-6) and GHG emissions (Impact 3.7-1 and 3.7-2) would be slightly reduced, but would still require the implementation of Mitigation Measure 3.2-2(a), which would require the implementation of a Transportation Demand Management (TDM) program (Mitigation Measure 3.14-2(b); Mitigation Measure 3.2-2(b), which would require the testing of the emergency generators and fire pump generators on non-event days; Mitigation Measure 3.2-2(c), which would require the preparation and implementation of a Construction Emissions Minimization Plan; Mitigation Measure 3.2-2(d), which would require the project applicant to encourage the use of zero- and near-zero emissions vendor and delivery trucks; Mitigation Measure 3.7-1(a), which would require the implementation of a GHG reduction plan; and Mitigation Measure 3.7-1(b), which would require the preparation of an annual GHG verification report to determine the number of GHG offsets required to bring the project below the no net new GHG emissions threshold of significance.

Biological Resources

The HPSP Alternative site has been mass graded and completely disturbed. No vegetation, including trees, or other habitat is present to support nesting raptors or migratory birds. As a result, Alternative 6 would not disturb nesting raptors or migratory birds (Impact 3.3-2) and would not result in the loss of protected trees (Impact 3.3-3). Mitigation Measures 3.3-2 and 3.3-3 to reduce these impacts would not be required. As a result, unlike the Proposed Project, no impacts to nesting raptors or migratory birds and protected trees would occur under this alternative.

Energy Demand and Conservation

Energy demand during construction and operation under Alternative 6 would be similar to the Proposed Project but slightly lessened as this alternative would not include the construction and

operation of a hotel on the East Transportation and Hotel Site or a new replacement potable water well (Impacts 3.5-2 and 3.5-4).

Hazards and Hazardous Materials

Unlike the Project Site, the HPSP Alternative site is located in between the approach flight paths for the primary runways at LAX, and is not located within the planning boundary/airport influence area (AIA) established for LAX in the Los Angeles County Airport Land Use Plan (ALUP). Further, compared to the Project Site, the additional distance between the Alternative 6 site and the Hawthorne Airport (HHR) would mean that the arena structure at the Alternative 6 site would not penetrate the HHR horizontal imaginary surface, but construction cranes for the arena would continue to penetrate the HHR horizontal surface. In addition, the arena construction cranes would penetrate both the HHR horizontal surface and notification surface. As a result, while there would be no significant impact related to penetration of the LAX obstacle clearance surface (Impact 3.8-5) under Alternative 6, this alternative would still require the implementation of Mitigation Measure 3.8-5.

Noise and Vibration

Under the Adjusted Baseline, noise sensitive receptors within the HPSP area would be located approximately 750 feet to the west of the HPSP Alternative site. Under cumulative conditions, additional noise sensitive receptors would be located approximately 750 to the east within the HPSP area. These noise sensitive receptors would be substantially further from the Alternative 6 site than the sensitive receptors that are located immediately adjacent to the Project Site.

Construction noise levels generated under Alternative 6 would be similar to the Proposed Project due to the use of similar amounts of equipment and construction methods. Because noise sensitive receptors would be further from the Alternative 6 site than the Project Site, impacts associated with a temporary increase in noise during construction (Impacts 3.11-1 and 3.11-5) would be less severe than under the Proposed Project, but would still require the implementation of measures and controls to reduce noise during construction (Mitigation Measure 3.11-1) and would remain significant and unavoidable.

Traffic generated under Alternative 6 would use much of the same roadway network as the Proposed Project. However, traffic under Alternative 6 would be shifted away from noise sensitive receptors south of West Century Boulevard, and thus would not negatively affect as many sensitive receptors as the Proposed Project. In addition, operational sound from outdoor plaza events would be reduced as noise sensitive receptors would be located much farther away from amplified noise than under the Proposed Project and, due to the positioning of the stage, the amplified noise would be directed northwest across the lake and not in the direction of sensitive receptors located to the west and east. Thus, impacts associated with a permanent increase in noise during operation (Impacts 3.11-2 and 3.11-6) would be reduced, but would still require the implementation of Mitigation Measure 3.11-2(a), which would require the preparation of a noise reduction plan major events, and Mitigation Measure 3.11-2(b), which would require the implementation of a Transportation Demand Management (TDM) program (Mitigation Measure

3.14-2(b)); in total, operational noise impacts would remain significant and unavoidable, although likely reduced from the Proposed Project.

Transportation and Circulation

Given the location of the site within HPSP, the Project at this location could have a reduced level of impacts on existing neighborhood streets. That is because a grid network of residential streets only exists to the west of South Prairie Avenue and south of West Century Boulevard and not to the east or north of the site. For this reason, those traveling to or from the Alternative 6 site would be less likely to travel on existing neighborhood streets than they would at the Proposed Project site. The potential for such impacts would still exist, and the same mitigation measures would apply, which would reduce but not eliminate the significant and unavoidable neighborhood street impacts.

The elimination of the hotel use would avoid the significant VMT impact identified for the Proposed Project's hotel use.

Since all parking would be provided either on site or in HPSP parking lots near to the site under Alternative 6, pedestrian impacts would be lessened since impacts associated with pedestrians crossing arterial streets would not be expected to be significant. This could also potentially lessen eventgoer confusion regarding where they should park and reduce local circulation.

Construction impacts on traffic were determined to be significant for the Proposed Project due to temporary lane closures along the Project frontages on South Prairie Avenue and West Century Boulevard. Construction of the Project at the Alternative 6 site would be internal to the HPSP area and would not involve temporary lane closures along arterial streets. Therefore, construction impacts for Alternative 6 would be less severe than those for the Proposed Project.

Under Alternative 6, it is anticipated that events at the NFL Stadium and the Proposed Project would be subject to a mutually-agreed schedule to reduce transportation impacts. Concurrent Event Scenario 2 (major event at Proposed Project and Football Game at NFL Stadium) and Scenario 5 (major events at Proposed Project and The Forum and Football Game at NFL Stadium) as analyzed in Section 3.14, Transportation and Circulation, may still occur, as those scenarios envisioned a football game on a weekend afternoon and events at the Proposed Project and The Forum during a weekend evening. Impacts associated with these scenarios would not be reduced. Concurrent Event Scenario 3 (major event at Proposed Project and Midsize Event at NFL Stadium) and Scenario 4 (major events at Proposed Project and The Forum and Midsize Event at NFL Stadium), however, would not occur as those scenarios envision events in the NFL Stadium and at the Proposed Project at the same time with concurrent arrival and departure patterns. The impacts associated with these scenarios would not occur and alternative off-site remote parking would not be required for the Proposed Project. If concurrent events were to occur in the separate 6,000-seat performance venue under construction at HPSP, impacts on the transportation system would be reduced from those anticipated for Concurrent Event Scenarios 3 and 4. Although concurrent events transportation impacts may be reduced based on an enhanced level of schedule coordination between the operators of the NFL Stadium and the Alternative 6 arena, discussed above, concurrent events between those

two venues could take place and concurrent events with The Forum would still occur, and therefore the identified concurrent event significant and unavoidable impacts for the Proposed Project would remain so under Alternative 6.

Because the frequency with which concurrent events occurs would be reduced, the likelihood of impacts to emergency access during concurrent events would be correspondingly reduced, but would remain significant and unavoidable during concurrent events.

Utilities and Service Systems

Under Alternative 6, utility demands on the HPSP Alternative site would decrease as the hotel use would be eliminated. Due to the elimination of the hotel, water demand of Alternative 6 would be approximately 20 percent lower than under the Proposed Project. Wastewater generation of Alternative 6 would be about 3 percent lower than under the Proposed Project. Solid waste generation of Alternative 6 would be approximately about 4 percent lower than under the Proposed Project.⁴⁴ As a result, impacts with respect to water supply (Impacts 3.15-2 and 3.15-4), wastewater treatment capacity (3.15-5, 3.15-7), and solid waste disposal capacity (3.15-11 and 3.15-13) would be less than significant under both the Proposed Project and Alternative 6.

The existing off-site storm drain system in the area of the HPSP Alternative site has been planned with major infrastructure to accommodate development throughout the 238-acre HPSP area. This is contrasted with the Project Site, which may not have sufficient capacity to handle post-construction stormwater runoff from the Proposed Project (Impacts 3.15-9 and 3.15-10). Thus, the impacts related to stormwater drainage and runoff would potentially be less than significant, but Alternative 6 would still require implementation of Mitigation Measures 3.15-9 and 3.15-10. Impacts related to stormwater drainage would likely be less severe than those described for the Proposed Project, but would still require mitigation.

Impacts Identified as Being More Severe than the Proposed Project

There are no impacts of Alternative 6 that were identified which would be more severe than those described for the Proposed Project.

Relationship to Project Objectives

The HPSP Alternative would meet some of City's objectives for the Proposed Project. In particular, the HPSP Alternative would meet the City's goals of becoming a regional sports and entertainment center (City Objective 1) and stimulating economic development (City Objective 2). The HPSP site has an approved specific plan that is currently being implemented. As such, although portions of the HPSP area are currently vacant, they are planned for development, and development is proceeding. Thus, the HPSP area is not underutilized to the same degree as the Project Site. Because City objective 5 is to "[t]ransform vacant or underutilized land within the City into compatible land uses within aircraft noise contours generated by operations at LAX, in compliance with Federal Aviation

⁴⁴ Memorandum – IBEC Alternative 6 – Wastewater & Solid Waste Generation, August 23, 2019.

Administration (FAA) grants to the City,” Alternative 6 would not be as responsive to this objective as the Proposed Project.

The HPSP Alternative would meet most but not all of the project applicant’s objectives for the project. Because the HPSP Alternative would first require feasibly acquiring the site, potentially amending the existing HPSP and its implementing documents, including a Development Agreement, it is uncertain if Alternative 6 would allow the applicant to begin hosting LA Clippers home games in the 2024–2025 season. For this reason, the HPSP Alternative could be unable to meet project applicant Objective 1a.

6.5.7 Alternative 7: The Forum Alternative Site

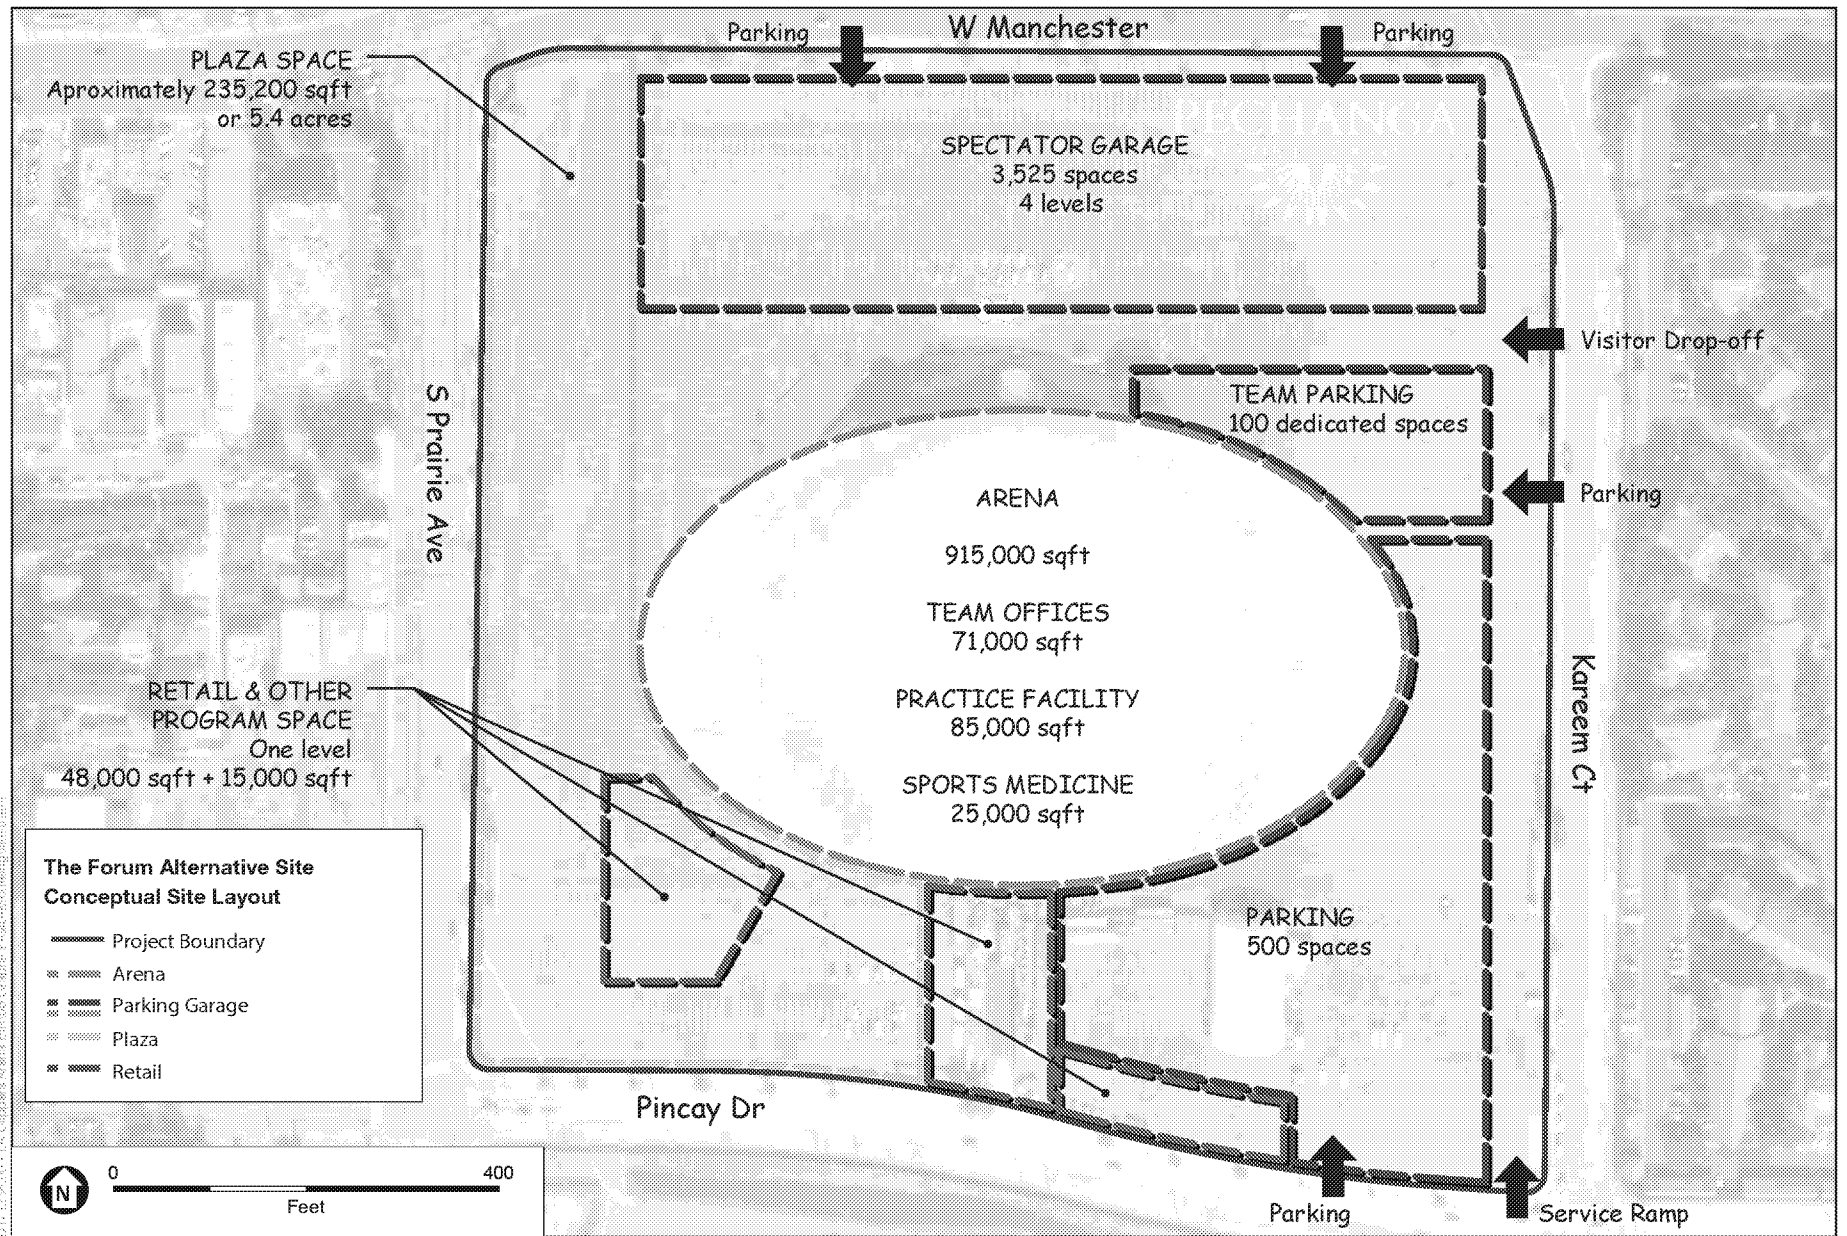

Description

Under Alternative 7, elements of the Proposed Project would be developed on an approximately 28-acre site currently occupied by the historic Forum concert and event venue (the Forum Alternative site), located approximately 0.8 miles north of the Project Site at 3900 West Manchester Boulevard in the City of Inglewood (see **Figure 6-6**). As with the Proposed Project, Alternative 7 would involve the construction of a new multi-purpose arena to serve as the home of the NBA LA Clippers basketball team and as much of the related development included in the Proposed Project as feasible, including the relocation of the LA Clippers team offices and team practice and athletic training facility.

The focus of this alternative is to identify the impacts that would occur if the arena and related uses, including the ancillary plaza uses and the same amount of on-site parking, are developed on the Forum Alternative site to potentially avoid or substantially lessen one or more significant environmental impacts of the Proposed Project, including the transportation-related impacts associated with concurrent events at the existing Forum venue and the Proposed Project.

The Forum Alternative site is currently developed with an historic concert venue known as The Forum, which has hosted sporting and entertainment events in the City since 1967 and is listed on both the National Register of Historic Places (National Register) and the California Register of Historical Resources (California Register). As discussed further in this section below, the development of a modern arena that meets NBA standards on the Forum Alternative site would require that the Forum Alternative site would be available and could be acquired by the project applicant, and the demolition of the existing Forum building. If the existing Forum building were to be demolished, Alternative 7 would include sufficient land to potentially accommodate the uses included in the Proposed Project.

Alternative 7 would involve the development of the same or substantially similar components of the Proposed Project on approximately 28 acres currently occupied by the historic Forum concert and event venue and ancillary structures and surface parking. The Forum Alternative site would be approximately 68 percent larger than the Proposed Project Arena Site (and approximately the same size as the total Project Site). As such, the Forum Alternative site could accommodate a program of

SOURCE: Google, 2018; ESA, 2019

Inglewood Basketball and Entertainment Center

Figure 6-6
Alternative 7: The Forum Alternative Site

development similar to the Proposed Project, although the hotel and well relocation components would not be included and the ancillary uses and parking would be configured differently.

The Forum Alternative site is currently zoned C-R Commercial Recreation. Areas to the east and west of the Forum site are zoned R-2 Residential Limited Multi Family, Open Space, R-1 Residential Single Family, and C-R Commercial Recreation. Uses in the immediate vicinity of the Forum site include the Inglewood Park Cemetery to the north, residential and commercial uses to the west across South Prairie Avenue, and the residential community known as Carlton Square to the east across Kareem Court. The HPSP area is located immediately to the south of the Forum Alternative site, across Pincay Drive.

Existing Forum Building

The Forum Alternative site is currently developed with the historic Forum concert and event venue. The Forum is an approximately 350,000 sf arena that opened in 1967 and until 1999 was the home of the NBA Los Angeles Lakers, the NHL Los Angeles Kings, and the WNBA Los Angeles Sparks, and hosted other major sporting events and other athletic competitions, concerts, and events. In 1999 and 2000, all three professional sports teams left Inglewood and moved to the then-new Staples Center in downtown Los Angeles.

The Forum was acquired in 2000 by the Faithful Central Bible Church, which used it for occasional church services and leased it for sporting events, concerts and other events. In 2012, the Forum was purchased by Madison Square Garden Company and underwent comprehensive renovation and rehabilitation that included structural, aesthetic, and amenity improvements completed in 2014 to convert the Forum into a world-class concert and event venue. On September 24, 2014, the Forum was listed on the National Register of Historic Places and the California Register of Historic Resources as an architecturally significant historic place worthy of preservation. The renovation of the Forum was funded in part by federal tax credits for its restoration as a National Register-listed building and an \$18 million loan from the City of Inglewood for the restoration and rehabilitation of the structure.

The Forum, as renovated to function as a concert and event venue and listed on the National Register and the California Register, is substantially smaller than, and does not include the features and amenities provided in, modern NBA arenas. Constructed in 1967, The Forum structure stands at approximately 350,000 sf. By comparison, current NBA arenas range in size from approximately 586,000 sf to over 1 million sf, with the average of the three most recently-constructed arenas exceeding 700,000 sf.⁴⁵ The relatively small size of The Forum would make the use of the structure to serve as the home arena of an NBA team infeasible because the structure lacks sufficient space

⁴⁵ The three most-recently constructed home NBA arenas include the Golden 1 Center in Sacramento, approximately 675,000 sf with a capacity of approximately 17,500; the Fiserv Forum in Milwaukee, approximately 724,000 sf with a capacity of approximately 17,500; and the Chase Center in San Francisco, approximately 750,000 sf with a capacity of approximately 18,000 seats.

for the range of vendors, food and drink establishments, luxury boxes and loge seating options, and other amenities required for a contemporary NBA home arena.

A conversion of The Forum from a concert and event venue to a modern home arena for an NBA team with related facilities would require extensive alterations to the historic structure, and a substantial increase in size.⁴⁶ At a minimum, required modifications would likely include, but not be limited to, the demolition and expansion of exterior walls and the roof of The Forum structure to accommodate the facilities and amenities required for a contemporary NBA arena such as a modern scoreboard, standard and premium seating, and sufficient concourse areas, clubs and locker rooms, food and beverage preparation and service areas, and other facilities. Even assuming such alterations were structurally feasible and any part of the original structure could be retained or repurposed, these changes would remove or substantially alter the character defining features of The Forum that make it eligible for listing on the National Register and California Register.

In addition, the other components of the Proposed Project, including the team office space, team practice and athletic training facility, sports medicine clinic, and the ancillary retail, dining, and community uses would likely not be feasible to accommodate within the Forum structure. Therefore, additional structures around the Forum would be required to accommodate those uses, obscuring or altering views of the Forum. These alterations would materially and adversely alter the "central location on an open site with high visibility from adjacent streets and properties" of The Forum, which is one of the character defining features for which the building is listed on the National Register and California Register.

In summary, it does not appear that the renovation, rehabilitation, or expansion of The Forum to function as a modern NBA arena would be feasible. Even if it were, it could not be accomplished without a significant adverse effect on an historic resource. Thus, Alternative 7 evaluates the demolition of The Forum and the redevelopment of the site with the components of the Proposed Project. While demolition of the Forum building is the only feasible manner to accommodate the development of a modern NBA arena and other components of the Proposed Project on the Forum Alternative site, were the site to become feasibly available for acquisition by the project applicant, the effects of removal of The Forum would be subject to a policy determination for decision makers.

Forum Alternative Characteristics

Similar to the Proposed Project, development under Alternative 7 would include the Arena Structure, including an approximately 915,000 sf arena to host LA Clippers NBA games and other events, the LA Clippers team offices (71,000 sf), the LA Clippers practice and training

⁴⁶ An example of the renovation of an historic arena in Seattle for the purpose of hosting professional sports home team games suggest that such a conversion of The Forum could require at least a doubling in size of the arena structure. In that case, the former Key Arena is being renovated to become the Arena at Seattle Center, increasing in square footage from approximately 410,000 sf to approximately 670,000 sf, with projected seating capacity of 18,350. While Key Arena was built in the early 1960s, the only part of the building that was listed on the National Register was the iconic modern roof of the structure. The current renovation of that structure involves the complete preservation of the historic roof structure while excavating under and around the current arena footprint to add sufficient square footage. Such an expansion to increase the size of The Forum without altering its historic façade and building design would be infeasible.

facilities (85,000 sf) and a sports medicine clinic (25,000 sf). Seating capacity of the arena under Alternative 7 would remain at 18,000 attendees for LA Clippers basketball games and a maximum capacity of up to 18,500 attendees for concert events.

The overall design of the main Arena Structure under Alternative 7 would be substantially similar to the Proposed Project, though oriented differently, with the main arena lobby entrance opening to the south onto a pedestrian plaza located at the corner of South Prairie Avenue and Pincay Drive with portions extending to the corner of South Prairie Avenue and Manchester Boulevard, as shown in Figure 6-6. As in the design included in the Proposed Project, the height of the main Arena Structure and appurtenances would extend up to 150 feet above grade, with the event level of the arena at approximately 30 to 35 feet below grade. The pedestrian plaza would be bound to the west by the arena structure and structured parking. The ancillary retail, dining, and multipurpose space for community programming uses would be included in separate structures within the plaza.

Similar to the Proposed Project, a total of 4,125 parking spaces as required by the City of Inglewood Municipal Code would be provided within the Forum site. As shown in Figure 6-6, these majority of the on-site parking spaces would be provided in a 3,525-space parking structure to the north of the main Arena Structure, with the remaining spaces provided in surface parking around the main Arena Structure and a limited amount of subterranean structured parking. Alternative 7 would not include a hotel or a construction of a new municipal water well to replace the well within the Project Site.

Access to the Forum Alternative site would utilize some of the existing access points to the site, including those from West Manchester Boulevard, South Prairie Avenue, Pincay Drive and Kareem Court. The on-site parking structure would be accessed from South Prairie Avenue and West Manchester Boulevard, with access to surface parking provided from Pincay Drive.

Regional access to the Forum Alternative site would be similar to but slightly different than access to the Project Site. Access to the Forum Alternative site is provided by the San Diego Freeway (I-405), located approximately 1.7 miles to the west, and the Glenn Anderson Freeway & Transitway (I-105), approximately 1.8 miles to the south, and the Harbor Freeway (I-110), approximately 3.4 miles to the east. Local access to the Forum Alternative site would be similar to access to the existing concert and event venue provided by several major arterials, including South Prairie Avenue and Manchester Boulevard with alternative connections to Florence Avenue, Hawthorne Boulevard, Crenshaw Boulevard and Arbor Vitae Street.

Transit access to the Forum Alternative site is provided by several bus lines and the future Crenshaw/LAX light rail line. The closest public transit stops are bus service stops located along the West Manchester Boulevard frontage of the Forum Alternative site, including a stop serving the Metro 115 bus line, and a bus stop located at the southwest corner of South Prairie Avenue and West Manchester Boulevard serving the Metro 115, 211, and 442 lines. The nearest rail transit stop that would serve the Forum Alternative site would be the Crenshaw/LAX light rail line Downtown Inglewood station currently under construction approximately 1.3 miles away by surface streets.

If Alternative 7 were developed, it is anticipated that the ownership of the properties within the Project Site would not change, private property would not need to be acquired for development of the proposed uses, and none of the uses that presently occupy the Project Site would be relocated. Similarly, the vacation of West 101st Street and West 102nd Street would not be required.

The Forum Alternative is a privately-owned property subject to a Development Agreement between the City and The Forum property owner. There is, therefore, substantial uncertainty regarding site control and the feasibility of this alternative. The development of Alternative 7 could require amendments to the Commercial Recreation zoning and land use designations to accommodate the Alternative 7 development within the site.

Comparative Analysis of Environmental Effects

Table 6-2 at the end of this chapter provides an impact-by-impact comparison of the significant impacts of the Proposed Project and Alternative 7.

Impacts Identified as Being the Same or Similar to the Proposed Project

Because the type and amount of development as well as the size of the arena would be essentially the same as the development in the Proposed Project, many of the impacts of the Proposed Project that would be affected by the intensity of development would remain the same or would be very similar at the Forum Alternative site.

Aesthetics

The nearest shadow sensitive uses are residences located across Kareem Court, approximately 75 feet to the east, and residences located on East Nutwood Street, across South Prairie Avenue about 190 feet to the west. With the addition of Alternative 7 at this location, the height of proposed structures and the distance between those structures and nearby shadow sensitive receptors would result in shadows affecting adjacent properties to the east in afternoons in December that would not exceed the threshold of three hours of new shadow. Morning shadows, to the west, would not reach the shadow sensitive receptors across South Prairie Avenue. Therefore, like the Proposed Project, the shadow impacts (Impact 3.1-3) of Alternative 7 would be less than significant.

Biological Resources

A number of mature landscape trees are located around the Forum structure, and street trees are present in the landscape strip along South Prairie Avenue, West Manchester Boulevard, and Kareem Court, adjacent to the Forum Alternative site. As a result, like the Proposed Project, Alternative 7 could disturb nesting raptors or migratory birds (Impact 3.3-2) and result in the loss of protected trees (Impact 3.3-3). Mitigation Measures 3.3-2 and 3.3-3 would be required to reduce these impacts by protecting these resources during construction. As a result, impacts on nesting raptors or migratory birds and protected trees would be similar to those described for the Proposed Project.

Cultural Resources

The Forum was originally developed in 1966–67, before State and federal laws that protect historic and archaeological resources were in force.⁴⁷ Like the Project Site, there are no known archaeological resources located on the Forum Alternative site. However, it is possible that development on the Forum Alternative site could disturb buried archaeological resources and unknown human remains. Therefore, it is possible that, like with the Proposed Project, implementation of Alternative 7 could cause a substantial adverse change in the significance of unknown historic, archaeological, or tribal cultural resources (Impacts 3.4-1, 3.4-2, 3.4-3, 3.4-5, 3.4-6, and 3.4-7), and/or unknown human remains (Impacts 3.4-4 and 3.4-8). Mitigation Measures 3.4-1 and 3.4-4 would reduce these impacts by requiring that work stop if such resources are uncovered, and that the resources be appropriately evaluated and treated. Therefore, impacts on archaeological resources, and human remains would be similar to the Proposed Project.

Geology and Soils

Impacts related to geology and soils conditions and hazards, including paleontological resources would be similar to those described for the Proposed Project. Because The Forum Alternative would occur less than one-half mile from Project Site, the geological and soils conditions that would be encountered in construction of the Forum Alternative would be essentially the same as with the Proposed Project. The Potrero Fault, which is approximately one-half mile from the Project Site, is closer to the Forum Alternative site, approximately one-quarter mile to the east; however, compliance with the California Building Code would avoid the creation of seismic hazards. Because there would be a similar amount of ground-disturbing activity in Alternative 7, the potential for erosion and accidental discovery of paleontological resources would be correspondingly similar (Impacts 3.6-2 and 3.6-4). These impacts would continue to be potentially significant under the Forum Alternative and would require the same mitigation measures as identified for the Proposed Project in order to reduce the impact to less than significant.

Hazards and Hazardous Materials

The Forum Alternative site is listed twice on the GeoTracker database maintained by the State Water Resources Control Board for releases of diesel found in subsurface soil. Both cases involved leaking underground storage tanks, one reported in 1986 and the other reported in 2004; both cases have been subsequently closed.⁴⁸ However, it is possible that previously contaminated soils may still remain on the Forum Alternative site, and thus, as with the Proposed Project, construction workers could be exposed to contamination during ground disturbing activities (Impact 3.8-4). Mitigation Measure 3.8-4 would require the preparation and approval of the Soil Management Plan prior to initiating earthwork activities, which would reduce the potential for worker exposures. For this reason, impacts related to on-site contamination would be similar to the Proposed Project.

⁴⁷ The National Historic Preservation Act was enacted in 1966, and related regulations were not adopted and in force at the time of the development of the Forum. CEQA was passed in 1970, and the California Office of Historic Preservation was opened in 1975.

⁴⁸ State Water Resources Control Board, 2019. GeoTracker database. Accessed: May 9, 2019.

Similar to project site, the Forum Alternative site is located within the planning boundary/airport influence area (AIA) established for LAX in the Los Angeles County Airport Land Use Plan (ALUP). Compared to the Project Site, the additional distance between the Alternative 7 site and the Hawthorne Airport (HHR) would mean that the arena structure at the Alternative 7 site would not penetrate the HHR horizontal imaginary surface, but construction cranes for the arena would continue to penetrate the HHR horizontal surface. In addition, the arena construction cranes would penetrate both the HHR horizontal and notification surfaces. As a result, hazards to air navigation (Impact 3.8-5) under Alternative 7 would be the same as the Proposed Project. Mitigation Measure 3.8-5 would reduce this impact by requiring the project applicant to notify the FFA and complete an aeronautical study to determine whether the Proposed Project would constitute a hazard to air navigation, to implement all actions required by the FAA to avoid the creation of a hazard to air navigation, and to submit to the City a consistency determination from the ALUC. As a result, hazards to air navigation would be similar to the Proposed Project.

Hydrology and Water Quality

The Forum Alternative site is fully developed with impervious surfaces; pervious surfaces on the site are minimal and include small planters with ornamental landscaping and street frontage landscape strips. Sheet flow stormwater runoff on the Forum Alternative site is managed by an existing system of storm drains. As a result, it is possible that construction and operation of Alternative 7 could cause water quality discharges that are not consistent with SWRCB objectives and could degrade the quality of the water that is discharged from the Forum Alternative site (Impacts 3.6-1, 3.6-3, 3.9-1 and 3.9-4). Altered drainage patterns during both construction and operation on the site would also have the potential to result in erosion, sedimentation, and/or flooding on or off site by redirecting or concentrating flows (Impact 3.9-3 and 3.9-6). In order to lessen the significance of these impacts for Alternative 7, like the Proposed Project, Mitigation Measure 3.9-1(a) would require the project to comply with a number of regulations governing water quality and drainage while Mitigation Measure 3.9-1(b) would require the periodic sweeping parking lots during operation to remove contaminants. Therefore, impacts related to water quality and drainage would be similar to the Proposed Project.

Land Use and Planning

Like the Proposed Project, Alternative 7 would not result in the division of an established community, as the arena and other uses would be located entirely within the Forum Alternative site; the vacation of streets would not be required (Impacts 3.10-1 and 3.10-3). The City of Inglewood designates the western third of the Forum Alternative site, along South Prairie Avenue, as Commercial/Residential while the remainder of the site is designated as Commercial/Recreation. As described above, the development of Alternative 7 could require amendments to the Commercial Recreation zoning and land use designations to accommodate the Alternative 7 development within the site. With such amendments, Alternative 7 would be consistent with plans or policies that have been adopted for the purposes of environmental mitigation, and thus it would have less-than significant-impacts related to land use and planning (Impacts 3.10-1 through 3.10-4). As a result, impacts related to land use and planning would be similar to the Proposed Project.

Noise and Vibration

Construction noise levels generated under Alternative 7 would be similar to the Proposed Project due to the use of similar amounts of equipment and construction methods. Because noise sensitive receptors would be located similar distances from the Forum Alternative site as the Project Site, impacts associated with a temporary increase in noise during construction (Impacts 3.11-1 and 3.11-5) would be similar to the Proposed Project, and would still require the implementation of measures and controls to reduce noise during construction (Mitigation Measure 3.11-1); construction noise impacts would remain significant and unavoidable. In addition, vibration levels under Alternative 7 would also be similar to the Proposed Project for the same reasons. As a result, vibration impacts with respect to structural damage and human annoyance (Impacts 3.11-3 and 3.11-7) would be similar, and would still require the implementation of Mitigation Measures 3.11-3(a) through (c), which requires minimum distances of construction equipment from sensitive receptors and the designation of a construction relations officer to field vibration-related complaints.

Traffic generated under Alternative 7 would be similar to the Proposed Project, but the location of the Forum Alternative site about 0.8 miles north of the Project Site would distribute these impacts across the transportation system slightly differently. Thus, the impact associated with a permanent increase in noise during operation (Impacts 3.11-2 and 3.11-6) would still require the implementation of Mitigation Measure 3.11-2(b), which would require the implementation of a Transportation Demand Management (TDM) program (Mitigation Measure 3.14-2(b)), and, like with the Proposed Project, would remain significant and unavoidable. As discussed above, the Forum Alternative site is located within the planning boundary/AIA established for LAX in the Los Angeles County ALUP, and the planning boundary/AIA is based in part on the 65 dBA CNEL contour included in the ALUP. Similar to the Proposed Project, the Arena and ancillary uses under Alternative 7 would generally be compatible with uses permitted on the site by the ALUP, and standard building construction practices for commercial structures would typically reduce interior noise levels to acceptable levels although some level of additional insulation may be appropriate, especially for the proposed medical clinic (Impacts 3.11-4 and 3.11-8). As a result, impacts related to aircraft noise would be similar to the Proposed Project.

Population, Employment and Housing

The implementation of Alternative 7 would result in the loss of existing jobs at The Forum, however new event related jobs would be created and could be occupied by current Forum employees. Impacts related to Population, Employment and Housing (Impacts 3.12-1 through 3.12-4) would remain less than significant under Alternative 7, although employment generation on the Forum Alternative site would be reduced as the existing jobs at the Forum would be eliminated and no hotel would be constructed.

Public Services

Because impacts of the Proposed Project on public services, including fire and police protection, parks and recreation facilities, and public schools would be largely driven by event activity at the proposed arena, these impacts would remain largely unchanged and would continue to be less

than significant (see Impacts 3.13-1 through 3.13-12) under Alternative 7. It should be noted that major events already occur at the Forum Alternative site throughout the year. Alternative 7 would likely increase the number of events that take place at the site, somewhat increasing the demands on police, fire, and parks services, because the existing Forum building would be demolished, the total demand for public services would be somewhat lower than under the Proposed Project.

Because employment on the Forum Alternative site would be reduced somewhat under Alternative 7, impacts on public schools (Impacts 3.13-11 and 3.13-12), already less than significant for the Proposed Project, would be slightly further reduced under Alternative 7. The arena and commercial uses under Alternative 7 would be expected to generate a total of 49 new school students, a reduction of 1 elementary school student compared to the 50 students under the Proposed Project as described in Table 3.13-9.

Utilities and Service Systems

The existing storm drain system in the area of the Forum Alternative site may not have sufficient capacity to handle post-construction stormwater runoff from each site (Impacts 3.15-9 and 3.15-10). In order to lessen the significance of these impacts for Alternative 7, like the Proposed Project, Mitigation Measures 3.15-9 and 3.15-10 would require the project to comply with a number of regulations governing water quality and drainage (Mitigation Measure 3.9-1(a)). As a result, impacts related to stormwater drainage would be similar to the Proposed Project.

Transportation and Circulation

Alternative 7 would be of similar size to the Proposed Project, with a similar level of access to rail transit via shuttles for major events. As such, it is anticipated that vehicle trip generation for arena events and ancillary uses at the Alternative 7 site would be similar to that for the Proposed Project. This alternative would therefore be expected to have intersection and freeway facility impacts similar to those described for the Proposed Project, although the location of the Forum Alternative site about 0.8 miles north of the Project Site would distribute these impacts across the transportation system slightly differently. For example, more traffic and greater levels of congestion would occur along the Manchester Boulevard corridor, and less traffic and reduced levels of congestion would occur along the West Century Boulevard corridor.

Given that the Alternative 7 arena would have a capacity of 18,000 for NBA games and 18,500 for concerts and The Forum has a capacity of 17,500, the increased capacity of a sold out event at this location would generate more person trips; however, the implementation of a shuttle system to rail transit (which is not provided for events at The Forum currently) could mean that vehicle trip generation and impacts would be slightly reduced from the trips and impacts generated by existing events currently occurring at The Forum.

The Alternative 7 site is located about 0.8 miles from the Project Site, and thus the VMT characteristics of this alternative would be essentially the same as those of the Proposed Project. The event and retail components of Alternative 7 would have significant VMT impacts similar to those for the Proposed Project. The office, practice facility, sports medicine, and restaurant

components of Alternative 7 would have less than significant VMT impacts similar to those for the Proposed Project.

Similar to the Proposed Project, Alternative 7 has the potential to impact on-time performance for buses operating in the vicinity because of congestion associated with event arrival and departure traffic.

The amount of on-site parking under Alternative 7 would be similar to that for the Proposed Project, meaning that a substantial amount of parking (roughly 3,700 to 4,100 spaces for a major event) would still need to be provided off site, presumably at the HPSP as for the Proposed Project (and as for The Forum currently). As such, impacts associated with pedestrians crossing streets to walk to/from the parking could be similar to the Proposed Project.

The Alternative 7 site is located approximately two-thirds of a mile from the Centinela Hospital Medical Center. Impacts of the Project-related congestion on emergency access would generally be similar to those for the Proposed Project.

Construction impacts on traffic were determined to be significant for the Proposed Project due to temporary lane closures along the Project frontages on South Prairie Avenue and West Century Boulevard. Construction of the Project at the Alternative 7 site would likely involve temporary lane closures along the Manchester Boulevard frontage of the site for construction of a parking garage, and could also involve temporary closure of the lane along the South Prairie Avenue frontage for some portion of the construction period. Therefore, construction impacts for Alternative 7 would be similar to those for the Proposed Project.

Impacts Identified as Being Less Severe than the Proposed Project

Aesthetics

The nearest light or shadow sensitive uses are residences located across Kareem Court, approximately 75 feet to the east, and residences located on East Nutwood Street, across South Prairie Avenue about 190 feet to the west. Under this alternative, the parking uses along Kareem Court would be unlikely to result in significant light impacts in the Carlton Square residences across Kareem Court. With the addition of Alternative 7 at this location, the distance to sensitive receptors to the west, across South Prairie Avenue, reduces the potential for outdoor lighting, building façade lighting, and illuminated signage on the arena and/or parking structures that would face the residences to result in light levels in excess of the significance threshold (Impacts 3.1-2 and 3.1-5). Thus, impacts related to spillover lighting would be less than the impacts of the Proposed Project on adjacent sensitive receptors, and Mitigation Measures 3.1-2(a) through (c) would not be required for Alternative 7.

Air Quality and GHG

Air Quality and GHG emissions during operation under Alternative 7 would decrease as the existing Forum structure would be demolished and planned hotel on the East Transportation and Hotel Site and the new potable water well would be eliminated. In addition, the new arena on the

Forum Alternative site, built to be consistent with current Title 24 requirements, would be more energy efficient than the existing Forum building, which was renovated in 2012 and can be expected to be consistent with prior versions of Title 24. Because the existing Forum building would be demolished, compared to the Proposed Project, fewer of the events that occur at the Alternative 7 arena would be net new; with over 100 events per year occurring at the Forum, and 47 of the anticipated 49 LA Clippers games currently taking place at Staples Center, more than 150 of the events that would occur at the Alternative 7 arena are already taking place in the air basin.

Similar to the Proposed Project, Alternative 7 would conflict with implementation of the applicable air quality plans, as operational emissions associated with the alternative, though reduced compared to the Proposed Project, would still exceed thresholds established by the SCAQMD for criteria air pollutants (Impact 3.2-1 and 3.2-5). Impacts associated with net new emissions of criteria air pollutants (Impacts 3.2-2 and 3.2-6) and GHG emissions (Impact 3.7-1 and 3.7-2) during operation would be reduced compared to the Proposed Project. Nevertheless, Alternative 7 would still require the implementation of Mitigation Measure 3.2-2 (a), which would require the implementation of a Transportation Demand Management (TDM) program (Mitigation Measure 3.14-2(b)); Mitigation Measure 3.2-2(b), which would require the testing of the emergency generators and fire pump generators on non-event days; Mitigation Measure 3.2-2(c), which would require the preparation and implementation of a Construction Emissions Minimization Plan; Mitigation Measure 3.2-2(d), which would require the project applicant to encourage the use of zero- and near-zero emissions vendor and delivery trucks; Mitigation Measure 3.7-1(a), which would require the implementation of a GHG reduction plan; and Mitigation Measure 3.7-1(b), which would require the preparation of an annual GHG verification report to determine the number of GHG offsets required to bring the project below the no net new GHG emissions threshold of significance.

Energy Demand and Conservation

Energy demand during operation under Alternative 7 would be less than the Proposed Project as this alternative would involve demolition of the existing Forum building and would not include the planned hotel on the East Transportation Site or a new potable water well Impacts (3.5-2 and 3.5-4).

Noise and Vibration

Under Alternative 7 the outdoor stage would be positioned between the retail buildings to the south of the Arena. As a result, the impact due to operational sound from outdoor plaza events (Impacts 3.11-2 and 3.11-6) would be reduced as the amplified noise would be channeled by the retail buildings and directed to the south across Pincay Drive toward the NFL stadium and thus away from sensitive receptors to the west and east. Implementation of Mitigation Measure 3.11-2(a), which would require the preparation of a noise reduction plan for major events, would still be required. Taken together, operational noise impacts would remain significant and unavoidable, although likely reduced somewhat from the Proposed Project.

Traffic generated under Alternative 7 would be similar to the Proposed Project, but because there would be a lesser potential for the occurrence of concurrent events, and no overlapping events with the Forum and no potential for concurrent events at The Forum, NFL Stadium, and Proposed Project, Alternative 7 would result in less overall traffic on the local roadway network during the highest peak conditions. Thus, the impact associated with a permanent increase in noise during operation (Impacts 3.11-2 and 3.11-6) would be reduced, would still require the implementation of Mitigation Measure 3.11-2(b), which would require the implementation of a Transportation Demand Management (TDM) program (Mitigation Measure 3.14-2(b)), and would remain significant and unavoidable, like with the Proposed Project.

Transportation and Circulation

The Project at the Alternative 7 site could have a reduced level of impact on existing neighborhood streets since a grid network of residential streets only exists to the west of South Prairie Avenue and not to the east, north, or south of the Forum Alternative site.

The elimination of the hotel use would avoid the significant VMT impact identified for the Proposed Project's hotel use.

Alternative 7 would not be able to accommodate the total number of combined events anticipated to occur at the Proposed Project and all of the events that currently occur at The Forum.

Therefore, there would be a reduction in the net new Project-generated VMT on event days when there would otherwise have been an event at The Forum. To the extent that some existing events at The Forum are displaced and move to other venues in the region, there could be a reduction in regional VMT if such events are moved to a location with higher non-auto mode splits and shorter trip lengths (such as Staples Center) or to locations with a smaller capacity (such as the Hollywood Bowl). The event-related VMT impacts, however, would still be significant.

Under Alternative 7, no concurrent events could occur involving events at the Proposed Project and events at The Forum. Therefore, impacts identified in Section 3.14 for Concurrent Event Scenario 1 (major events at Proposed Project and The Forum), Scenario 4 (major events at Proposed Project and The Forum and Midsize Event at NFL Stadium), and Scenario 5 (major events at Proposed Project and The Forum and Football Game at NFL Stadium) would be avoided. There would be no potential for concurrent events to occur in all three facilities (Proposed Project, The Forum, and NFL Stadium). Although transportation impacts associated with concurrent events would generally be reduced because Alternative 7 would preclude events at the Proposed Project and The Forum from occurring simultaneously, concurrent events with the NFL Stadium would still occur, and therefore the identified concurrent event significant and unavoidable impacts for the Proposed Project would remain so under Alternative 7.

Because the frequency with which concurrent events occur would be reduced because concurrent events at The Forum and at the Proposed Project would no longer occur, the likelihood of impacts to emergency access during concurrent events would be correspondingly reduced, but would remain significant and unavoidable during concurrent events.

Utilities and Service Systems

Under Alternative 7, the existing Forum building would be demolished and the proposed hotel use would be eliminated, reducing the net new energy demand from Alternative 7 compared to the Proposed Project. Due to elimination of the proposed hotel, water demand of Alternative 7 would be approximately 20 percent lower than under the Proposed Project. Wastewater generation of Alternative 7 would be about 3 percent lower than under the Proposed Project. Solid waste generation would be approximately about 4 percent lower than under the Proposed Project.⁴⁹ As a result, impacts with respect to water supply (Impacts 3.15-2 and 3.15-4), wastewater treatment capacity (3.15-5, 3.15-7), and solid waste disposal capacity (3.15-11 and 3.15-13) would be reduced compared to the Proposed Project, and would remain less than significant under both the Proposed Project and Alternative 7.

Impacts Identified as Being More Severe than the Proposed Project

Aesthetics

The Forum Alternative site would be developed with a visually more intensive level of development compared to existing conditions, with a larger arena structure, and other parts of the site which are currently surface parking lots developed with multi-story commercial and parking structures. Like the Project Site, the Forum Alternative site is located in an urbanized area, and the area in the vicinity of the does not have any scenic vistas, and in this regard visual impacts associated with Alternative 7 would be similar to those described for the Proposed Project (Impacts 3.1-1 and 3.1-4), although the changes to views north and south on South Prairie Avenue that would result from the construction of the Proposed Project pedestrian bridge would not occur under this alternative. However, the historic Forum building is a unique visual feature in the area, and its demolition and removal would be considered a significant degradation of the visual character in this part of Inglewood. Mitigation measures to address this impact would be the same as those described under Cultural Resources, below. However, because Alternative 7 necessitates the complete demolition and removal of the historic Forum building, this impact would be significant and unavoidable.

Cultural Resources

As described above, the Forum Alternative site is currently developed with The Forum, a National Register of Historic Places and California Register of Historical Resources-listed concert and event venue. The Forum was opened in 1967 and hosted major sporting events and other athletic competitions, concerts, and events, and until 1999 was the home of the NBA Los Angeles Lakers, the NHL Los Angeles Kings, and the WNBA Los Angeles Sparks, when all three professional sports teams left Inglewood and moved to the then-new Staples Center in downtown Los Angeles.

The Forum underwent comprehensive renovation and rehabilitation, completed in 2014, that included structural improvements to convert The Forum into a world-class concert and event venue. Also in 2014, The Forum was listed on the National Register of Historic Places and the

⁴⁹ Memorandum – IBEC Alternative 7 – Wastewater & Solid Waste Generation, August 23, 2019.

California Register of Historic Resources as an architecturally significant historic property. As such it is an historical resource for the purposes of CEQA.

Under Alternative 7, The Forum would be demolished and elements of the Proposed Project would be developed on the 28-acre site. Demolition of an historical resource is considered a significant impact under CEQA. Demolition of an entire resource cannot be fully mitigated, and the impact would be considered to be significant and unavoidable. CEQA requires that feasible mitigation measures be prescribed. The following feasible mitigation measures would reduce impacts:

- **HABS Documentation** – HABS Documentation shall be completed for The Forum prior to any demolition activities. The work shall be completed by a qualified architectural historian and photographer with experience in HABS Documentation.
- **Display** – The project applicant shall work with the City to develop displays for the new facility that tell the history of The Forum, including text and photographs. The displays shall be installed prior to the new facility being opened to the public.
- **Salvage Plan** – The project applicant shall hire a qualified professional (architectural historian or historic architect) to develop a Salvage Plan. The Salvage Plan shall be approved by the City prior to demolition activities.

Although these measures would lessen the impact of Alternative 7 on historical resources, the impact would not be fully mitigated and would be significant and unavoidable.

Air Quality and GHG Emissions

Air Quality and GHG emissions during construction would increase under Alternative 7 as it would involve a greater amount of demolition (i.e., the existing Forum structure) than the Proposed Project. Therefore, impacts associated with the emission of criteria air pollutants (Impacts 3.2-2 and 3.2-6) and GHG emissions (Impact 3.7-1 and 3.7-2) during construction would increase. As a result, air quality impacts during construction with respect emissions of criteria pollutants would be greater than the Proposed Project Project's significant and unavoidable criteria pollutant emissions impacts.

Relationship to Project Objectives

The Forum Alternative would meet some of City's objectives for the Proposed Project. The Forum Alternative would meet the City's goals of becoming a regional sports and entertainment center (City Objective 1) and stimulating economic development (City Objective 2), however because this alternative would involve demolition of an existing entertainment venue, The Forum, in order to build a new sports and entertainment venue of similar size, it would not achieve these goals to the same extent as the Proposed Project. As explained above, The Forum site is currently developed with a large entertainment venue, and while there are surrounding surface parking lots that can be seen as underdeveloped, the Forum Alternative site is not underutilized to the same degree as the Project Site. Because City Objective 5 is to "[t]ransform vacant or underutilized land within the City into compatible land uses within aircraft noise contours generated by operations at LAX, in compliance with Federal Aviation Administration (FAA) grants to the City," Alternative 7 would not be as responsive to this objective as the Proposed Project. Finally,

because the Forum Alternative would result in a new significant and unavoidable impact as a result of the demolition of the historic Forum building, it would be less responsive than the Proposed Project to City Objective 10, which calls for the project objectives to be achieved “in an expeditious and environmentally conscious manner.”

The Forum Alternative would meet most but not all of the project applicant’s objectives for the project. The Forum Alternative site is privately owned and subject to a Development Agreement between the City and The Forum’s owners. Because the Forum Alternative would first require feasibly acquiring the site, there is substantial uncertainty regarding the feasibility of site control and whether Alternative 7 would allow the applicant to begin hosting LA Clippers home games in the 2024–2025 season. For this reason, the Forum Alternative could be unable to meet project applicant Objective 1a.

6.6 Alternatives Comparison and Environmentally Superior Alternative

In the evaluation of seven alternatives to the Proposed Project, presented in Section 6.5, above, the impacts of each alternative is discussed in comparison to the impacts of the Proposed Project, presented in Chapter 3 of this Draft EIR. **Table 6-2**, below, provides a consolidated comparison of the impacts of the Proposed Project and the Alternatives, indicates for each significant impact, whether the impacts of the project alternatives are equal to, less, or more severe than those of the Proposed Project.

An EIR is required to identify the Environmentally Superior Alternative from among the range of reasonable alternatives that are evaluated. CEQA Guidelines section 15126.6 (e)(2) requires that an environmentally superior alternative be designated and states that if the Environmentally Superior Alternative is the No Project alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

From the alternatives evaluated in this EIR, the Environmentally Superior Alternative would be Alternative 1, No Project Alternative. This alternative would avoid all significant impacts associated with the Proposed Project. The No Project Alternative would, however, fail to achieve any of the City’s or project applicant’s basic objectives of the Proposed Project.

As discussed above, when the No Project Alternative is identified as the Environmentally Superior Alternative, CEQA requires the Lead Agency to select the Environmentally Superior Alternative from among the other alternatives considered in the EIR. As is the situation in this EIR, in the case where the range of alternatives includes a number of alternative sites, the selection of an alternative that is considered environmentally superior often involves trade-offs between alternatives. For example, one alternative may have greater transportation impacts, while another may have lesser transportation impacts but greater cultural resources impacts. In the case of this EIR, each of the alternatives has a set of impacts that are somewhat similar and somewhat different due to the different distances from the current activities at Staples Center, and different physical characteristics

and setting of the particular alternative site. Thus, the identification of the Environmentally Superior Alternative is to a considerable degree inherently subjective and value based.

Alternative 2 would be the environmentally superior of alternatives that would be developed on the Project Site. It would avoid the most frequent of transportation impacts: those that would occur on non-event days. Due to this decreased weekday traffic, annual emissions of criteria air pollutants and GHGs would be correspondingly reduced. Nonetheless, this alternative would not avoid or lessen the impacts of the Proposed Project that would occur during peak conditions, before and after major events in the proposed arena, nor would it avoid or lessen the impacts associated with concurrent or overlapping events at the proposed arena, the NFL Stadium and/or The Forum.

Alternative 3, the City Services Center Alternative site, would lessen impacts related to intensity of development by eliminating some of the ancillary uses and by developing on a smaller site than the Proposed Project. In addition, by being located within walking distance of the LA Metro Crenshaw Line Downtown Inglewood station, it would maximize the opportunity to reduce overall trips through use of transit, avoiding the need for shuttles and TNCs to further congest City streets connecting attendees and employees from the transit system to the proposed arena. Further, it would move some of the most intense vehicular activity associated with arena events away from the most congested part of the City's arterial network along South Prairie Avenue, West Century Boulevard, and Manchester Boulevard, lessening to some extent the overlapping congestion and associated impacts on intersections, neighborhood streets, freeway facilities, and public transit that would be associated with concurrent events at the Proposed Project, NFL Stadium, and The Forum. While the impacts of such overlapping event conditions would be less severe at the Alternative 3 site than at the Project Site, or at the HPSP Alternative or Forum Alternative sites, these impacts would be greater than at the other alternative locations, such as the Baldwin Hills Alternative site or the District at South Bay Alternative site.

Alternative 4, the Baldwin Hills Alternative site, would have similar travel characteristics as the Proposed Project, but would be incrementally further away from the location of concurrent and overlapping events at the NFL Stadium and The Forum, avoiding most of the adverse effects of those conditions. However, due to conditions on and around the Baldwin Hills Alternative site, impacts on cultural and tribal cultural resources, and noise impacts on nearby residences would be greater than at the other alternative locations.

Alternative 5, the District at South Bay Alternative site, due to its greater distance from the Project Site, would avoid any of the transportation or other impacts (such as noise, lighting, cultural and paleontological resources, etc.) that would affect resources on, or uses and streets around, the Project Site to an even greater degree than either Alternatives 3 and 4. However, this greater distance from the Project Site and the current location of LA Clippers games at Staples Center in downtown Los Angeles, would increase impacts associated with travel to and from the proposed arena, increasing VMT compared to the other alternatives, and corresponding to the increased VMT, there would be increased air pollutant and GHG emissions, and increased

transportation energy demand compared to the other alternatives. Lastly, because of its former use as a landfill, there would be potential impacts at the District at South Bay Alternative site that would not occur at any of the other alternative sites or the Project Site.

Alternative 6 would have impacts very similar to the Proposed Project, but would reduce the significance of construction and operational noise, compared to the Proposed Project, due to increased distance from the Alternative 6 site to noise sensitive receptors. In addition, because the development of Alternative 6 would involve increased coordination of events at the NFL Stadium and the Alternative 6 arena, it is even less likely that overlapping events would occur than with the Proposed Project.

Alternative 7 would involve the development of a similar amount of development and the same sized arena as under the Proposed Project, and thus impacts related to the intensity of use would be similar to those of the Proposed Project. Many of the transportation impacts of this Alternative are already occurring on the local street system around the Forum Alternative site, and thus would not be net new impacts resulting from Alternative 7. The demolition of the existing Forum building would eliminate the impacts of the Proposed Project created by scenarios of overlapping and concurrent events at The Forum, NFL Stadium, and Proposed Project arena. Further, because over 100 events per year are already occurring at The Forum, and because the hotel use would be eliminated from Alternative 7, there would be a material decrease in net new VMT, criteria air pollutant emissions, energy demand, water demand, and GHG emissions compared to the Proposed Project. Alternative 7 would, however, result in the demolition of an historic structure that is listed on the National Register and the California Register; impacts to aesthetics and cultural resources that would be significant and unavoidable and which would not occur with the Proposed Project.

As discussed above, each of the sites has unique site-specific characteristics that would result in significant impacts, and the choice of sites would trade off such impacts as construction noise at the Project Site with cultural resources impacts at the Baldwin Hills Alternative Site, hazards impacts at the District at South Bay Alternative site, and historical resources impacts at the Forum Alternative site.

For the reasons discussed above, the City has determined that of the alternatives considered in this EIR, other than the No Project Alternative, the Environmentally Superior Alternative would be Alternative 3, the City Services Center Alternative.

**TABLE 6-2
PROJECT ALTERNATIVES SIGNIFICANT IMPACT COMPARISON**

Impact	Proposed Project	Alternative 1: No Project	Alternative 2: Reduced Project Size Alternative	Alternative 3: City Services Center Alternative Site	Alternative 4: Baldwin Hills Alternative Site	Alternative 5: The District at South Bay Alternative Site	Alternative 6: HPSP Alternative Site	Alternative 7: The Forum Alternative Site
3.1 Aesthetics								
3.1-1: Construction and operation of the Proposed Project could substantially degrade the existing visual character or quality of public views of the site and its surroundings, or could conflict with the City's zoning and regulations governing scenic quality.	LS	NI	LS=	LS=	LS=	LS=	LS=	SU

3.15-10: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could have the potential to result in the relocation or construction of new storm water drainage facilities or expansion of existing facilities, the construction or relocation of which could have the potential to cause significant environmental effects.	LSM	NI	LSM=	LSM=	LSM=	LSM-	LSM-	LSM=
<p>NOTES:</p> <p>NI – No Impact</p> <p>LS – Less than significant</p> <p>LSM – Less than significant after application of feasible mitigation measure(s).</p> <p>SU – Significant and unavoidable and no feasible mitigation is identified</p> <p>SUM – Significant and unavoidable after application of available mitigation measure(s).</p> <p>- : Impact is less severe than under the Proposed Project</p> <p>= : Impact is the same as under, or similar to, the Proposed Project</p> <p>+ : Impact is more severe than under the Proposed Project</p>								

CHAPTER 7

List of Preparers and Persons Consulted

7.1 Report Authors

Lead Agency

The City of Inglewood is the CEQA lead agency for preparation of this Environmental Impact Report (EIR).

City of Inglewood
One West Manchester Boulevard, 4th Floor
Inglewood, CA 90301

Administrative Office

Artie Fields: City Manager

Louis A. Atwell, P.E.: Assistant City Manager/Public Works Department Director

Economic and Community Development Department

Christopher E. Jackson, Sr.: Director, Economic and Community Development Department

Peter Puglese, P.E. T.E.: Principal City Traffic Engineer

Mindy Wilcox, AICP: Planning Division, Planning Manager

Fred Jackson: Planning Division, Senior Planner

Public Works Department

Barmeshwar Rai, P.E.: Principal Water Resources Engineer

Victor Nunez: Transportation Operations Manager

Parks, Recreation, and Community Services Department

Sabrina Barnes: Director

Inglewood Police Department

Mark Fronterotta: Chief of Police

Parking and Enterprise Services

Mario Inga: Parking and Enterprise Services Manager

Environmental Science Associates (ESA)

The following ESA staff contributed to the preparation of the EIR.

Brian D. Boxer, AICP: M.P.A.-U.R.P. Public Affairs and Urban and Regional Planning, B.A. History. 37 years' experience. Project Director. Responsible for oversight of EIR preparation, providing overall technical approach and strategy in the EIR, client and agency coordination, and QA/QC of all work products.

Christina Erwin: B.S. Environmental Policy Analysis and Planning. 19 years' experience. Project Manager. Responsible for EIR preparation, day-to-day project management, oversight of subconsultants, and QA/QC for all work products. Also responsible for the preparation of the Project Description of the EIR.

Addie Farrell: B.A. Natural Resource and Environmental Geography. 15 years' experience. Deputy Project Manager. Responsible for EIR preparation, day-to-day project management, oversight of subconsultants, and QA/QC for all work products.

Greg Ainsworth: M.C.R.P. Environmental Planning, B.S. Environmental Horticulture Science. 17 years' experience. Responsible for QA/QC of the Biological Resources section of the EIR.

Brian Allee: B.S. City and Regional Planning. 14 years' experience. Responsible for the Land Use and Planning and Public Services sections of the EIR.

Blake Barroso: M.S. Civil Engineering, B.S. Environmental Science. 2 years' experience. Responsible for preparation of the health risk modeling and support of the Air Quality section of the EIR.

David Beauchamp: B.A. Environmental Studies, focus on water resources. 14 years' experience. Responsible for Water Supply and Wastewater portion of the Utilities/Service Systems section of the EIR.

Alyssa Bell: Ph.D. Vertebrate Paleontology, M.S. Environmental Microbiology, B.A. Ecology and Systematics. 10 years' experience. Responsible for the Paleontology portion of the Geology and Soils section of the EIR.

Sean Burlingame: B.S. Aviation Management. 11 years' experience. Responsible for aircraft discussions within the Hazards and Hazardous Materials section of the EIR.

Joza Burnam: B.S. Environmental Science. 12 years' experience. Responsible for air quality modeling.

Jeff Caton: B.S. Environmental Engineering. 30 years' experience. Responsible for the Greenhouse Gas Emissions section of the EIR.

Olivia Chan: M.A. Urban and Regional Planning, B.A. Environmental Analysis and Design. 9 years' experience. Responsible for the Air Quality, Energy Demand and Conservation, and Greenhouse Gas Emissions sections of the EIR.

Alta Cunningham: M.A. Historic Preservation, B.A. History. 18 years' experience. Responsible for assisting the project management team and consistency review of the EIR.

Doug DiCarlo: M.B.A., B.S. Airway Science Management. 24 years' experience. Responsible for aviation hazards and associated QA/QC within the Hazards and Hazardous Materials section of the EIR.

Sara Dietler: B.A. Anthropology. 20 years' experience. Responsible for the Archaeology and Tribal Cultural Resources portions of the Cultural Resources section of the EIR, and corresponding technical report.

Janelle Firoozi: M.C.P. Master of City Planning, B.A. Environmental Studies. 5 years' experience. Responsible for the Hydrology and Water Quality, Population, Employment, and Housing, and the Wastewater analysis in the Utilities and Service Systems sections of the EIR.

Amber Grady: M.A. Historic Preservation, B.A. Interior Design. 16 years' experience. Responsible for the Architectural History portion of the Cultural Resources section of the EIR, and corresponding technical report.

Justin Hall: B.A. Environmental Science & Policy, B.A. Environmental Geography. 3 years' experience. Responsible for the preparation of the Introduction, Introduction to the Analysis, and List of Preparers and Persons Consulted sections of the EIR. Also responsible for assisting the project management team throughout the duration of the EIR process and for assisting with the preparation of the administrative record.

Elbert Hsiung: M.P.H, Public Health – Environmental Health Sciences, B.S. Ecology. 2 years' experience. Responsible for air quality and greenhouse gas emissions modeling and support of the Air Quality and Greenhouse Gas Emissions sections of the EIR.

Christopher Jones: J.D., B.A. Sociology. 2 years' experience. Responsible for the aviation hazards portion of the Hazards and Hazardous Materials section of the EIR.

Karen Lancelle: M.L.I.S., B.A. Geology. 6 years' experience. Responsible for the preparation of the administrative record.

May Lau: B.S. Environmental Science. 14 years' experience. Responsible for the preparation of the Biological Resources section of the EIR.

Joel Miller: B.A. Communications. 20 years' experience. Responsible for word processing, copy editing, and preproduction of the EIR.

Leslie Moulton-Post: B.A. Human Biology (Environmental Planning and Marine/Estuarine Science Emphasis). Over 30 years' experience. Responsible for Water Supply portion of Utilities section.

Kristine Olsen: A.S. Natural Science. 18 years' experience. Responsible for managing, coordinating, and ensuring word processing and publication quality control for all elements of document production for the EIR.

Eryn Pimentel: GISP. B.A. Geography, B.A. Art. 11 years' experience. Responsible for GIS analysis and mapping for the EIR.

Anitra Rice: M.A. Urban and Environmental Policy, B.A. Environmental Analysis & Design. 17 years' experience. Responsible for management of the Air Quality, Energy Demand and Conservation, Greenhouse Gas Emissions, and Noise and Vibration sections of the EIR.

Heidi Rous: B.S. Physics. 28 years' experience. Responsible for direction and QA/QC of the Air Quality, Energy Demand and Conservation, Greenhouse Gas Emissions, and Noise and Vibration sections of the EIR.

Alan Sako: B.S. Atmospheric, Oceanic & Environmental Science. 16 years' experience. Responsible for the Air Quality, Energy Demand and Conservation, and Greenhouse Gas Emissions sections of the EIR.

Lily Sam: B.S. Biology. 8 years' experience. Responsible for the preparation of the Biological Resources section of the EIR.

Eric Schniewind: B.A. Geological Sciences. 20 years' experience. Responsible for the Hazards and Hazardous Materials section of the EIR. Also responsible for QA/QC of the Hydrology and Water Quality section of the EIR.

Susumu Shirayama: B.S. Aerospace Studies. 17 years' experience. Responsible for the amplified noise analysis in the Noise and Vibration section of the EIR.

Steve Smith: M.A. History, B.A. History. 19 years' experience. Responsible for preparation of the Aesthetics section of the EIR.

James Songco: B.F.A. Graphic Design, A.A. Studio Art. 19 years' experience. Responsible for the graphics/figures for the EIR.

Paul Stephenson: Master of Planning, B.S. Environmental Policy Analysis and Planning. 15 years' experience. Responsible for the Project Variants and Project Alternatives sections of the EIR.

Michael Stewart: B.S. Chemical Engineering. 6 years' experience. Responsible for health impact assessment.

Monica Strauss: M.A. Archaeology, B.A. Anthropology, A.A. Humanities. 19 years' experience. Responsible for QA/QC of the Cultural and Tribal Cultural Resources sections of the EIR.

Tina Su: Ph.D. Civil Engineering, B.S. Water Supply and Sewerage Engineering. 12 years' experience. Responsible for health impact assessment.

Jon Teofilo: B.S. Environmental Studies. 5 years' experience. Responsible for the Other CEQA Required Considerations section of the EIR.

Joseph Willenborg: B.A. Chemistry. Responsible for the preparation of Air Quality, Energy Demand and Conservation, and Greenhouse Gas Emission sections of the EIR.

Tim Witwer: B.A. Environmental Studies. 5 years' experience. Responsible for preparation of the Energy Demand and Conservation section of the EIR.

Other Consultants

The following other consultants contributed to the preparation of the EIR.

ALH Urban and Regional Economics

Amy L. Herman: M.C.P. Community Planning, B.A. Urban Policy Studies. 37 years' experience in urban economic and real estate analysis. Responsible for writing the Displacement Study Appendix of the EIR

BlueScape Environmental

James A. Westbrook, CCM, CPP: M.S. Environmental Science, B.S. Atmospheric Sciences. 30 years' experience. Project Manager responsible for preparation of the CMAQ Photochemical Modeling Study to Support a Health Impact Analysis technical report for the EIR.

James Wilkinson: Ph.D. Engineering and Public Policy, Ph.D. and M.S. Environmental Engineering. B.S. Petroleum Engineering. 30 years' experience. Responsible for report development and peer review of the CMAQ Photochemical Modeling Study to Support a Health Impact Analysis technical report for the EIR.

EnviroModeling

Francisco Matamala: Civil Engineering in Computer Science Degree. 24 years' experience. Responsible for completing the ozone/PM2.5 photochemical modeling work and report for the CMAQ Photochemical Modeling Study to Support a Health Impact Analysis technical report for the EIR.

Fehr & Peers

Netai Basu: M. Urban and Regional Planning, B.A. History. 25 years' experience. Project Manager. Responsible for day-to-day project management, QA/QC of inputs and findings of the Transportation section of the EIR, and coordination with EIR team and City.

John Gard: M.S. Civil and Environmental Engineering, B.S. Applied Mathematics. 25 years' experience. Responsible for review of documents and QA/QC of inputs and findings, and writing the Transportation section of the EIR.

Tom Gaul: B.S. Civil Engineering. 35 years' experience. Principal-in-Charge. Responsible for overall quality and administration of Transportation section of the EIR, including review of documents and QA/QC of inputs and findings.

Jeremiah LaRose: M. Urban and Regional Planning, B.A. Music. 5 years' experience. Lead planner for traffic simulation portion of the transportation analysis.

Mike Samuelson: M. Urban and Regional Planning, B.A. Geography. 5 years' experience. Responsible for internal team coordination, development of project transportation characteristics, and is the lead planner on transportation analysis.

G Anderson Associates

Gordon Anderson: M.B.A. 40+ years' experience. City management consultant. Responsible for representing the City of Inglewood; coordinating with and facilitating the efforts of various consultants, attorneys, City staff and the project applicant to ensure continued processing of the environmental impact report.

Lighting Alliance Design

Matthew Bates: B.A. Interior Architectural Design. 8 years' experience. Responsible for the preparation of the lighting analysis and survey. Also responsible for the oversight of the photometric site analysis along with brightness analysis of the facades and digital media.

Stone Planning LLC

David Stone: BS Accounting, MBA Finance, Economics, and Strategic Decision Making. 20 years' experience in the entertainment facilities and events industry. Responsible for market analyses related to the share of new and transferred events at the IBEC.

Todd Groundwater

Isis Priestaf, PhD: Ph.D. Geography. President, Todd Groundwater, 35 years' experience. Responsible for oversight of Water Supply Assessment.

Maureen Reilly, PE: M.S. Environmental Engineering. Senior Engineer, Todd Groundwater, 16 years' experience. Responsible for Water Supply Assessment.

Brent Johnson, PG: M.S. Geology. Associate Geologist, Todd Groundwater, 6 years' experience. Responsible for Water Supply Assessment data collection, analysis, and synthesis.

Trifiletti Consulting Inc.

Lisa Trifiletti: Esq. Principal, Trifiletti Consulting, 25 years' experience. Responsible for stakeholder and agency coordination.

Omar Pulido: Senior Project Director, Trifiletti Consulting, 8 years' experience. Agency coordination support.

Perla Solis: Planning Associate, Trifiletti Consulting, 5 years' experience. Agency coordination support.

Catherine Aguilar: Environmental Policy & Planning Associate, 1 year of experience. Agency coordination support.

7.2 Persons Consulted

California Department of Transportation (Caltrans)

Miya Edmonson: Caltrans District 7, Office of Regional Planning IGR/CEQA Branch Chief

City of Gardena – GTrans

Ernie Crespo: General Manager/Transit Director

City of Hawthorne

Alan Leung: Director of Public Works/City Engineer

City of Los Angeles, Department of Transportation (LADOT)

Sean Haeri: LADOT Division Manager, Transportation Planning & Land Use Review West LA/Coastal

City of Redondo Beach – Beach Cities Transit

Joyce Rooney: Transit Operations & Transportation Facilities Manager

City of Santa Monica – Big Blue Bus

Timothy McCormick: Manager of Performance and Planning

Consolidated Disposal Services

Chris Coyle: Sunshine Canyon Landfill

Culver CityBus

Diana Chang: Transportation Planning Manager

Golden State Water Company

Robert Hanford: Water Supply Assessment Review

Nicole Blackburn: Water Supply Assessment Review

Inglewood Unified School District

Yadallittle Preciado: ADA Attendance Clerk

Long Beach Transit

Burner Lee: Executive Director/VP of Service Delivery & Planning

Los Angeles County, Department of Public Works

Kent Tsujii: Associate Civil Engineer

Los Angeles County, Department of Regional Planning, Airport Land Use Commission

Bruce Durbin: Supervising Regional Planner

Alyson Stewart: Senior Regional Planner

Los Angeles County Metropolitan Transportation Authority (LA Metro)

Scott Greene: Transportation Planning Manager, Service Planning & Scheduling Department

Scott Page: Senior Director of Service Performance and Analysis

Los Angeles County Fire Department

Michael Y. Takeshita: Acting Chief, Forestry Division, Prevention Services Bureau

Lorraine Buck: Supervising Planning Analyst, Planning Division

Los Angeles County Sanitation Districts

Naoko Munakata: Planner

Los Angeles World Airports

Pat Tomchek: Senior Transportation Engineer

South Coast Air Quality Management District (SCAQMD)

Sang-Mi Lee, PhD: Program Supervisor, Air Quality Modeling

Lijin Sun, J.D.: Program Supervisor, CEQA IGR

Torrance Transit

Kim Turner: Transit Director
