FEHR PEERS

OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding reporter for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BC3). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

TABLE OF CONTENTS

Inglewood Basketball and Entertainment Center EIR

	<u>Page</u>
Summary	S-1
Chapter 1, Introduction	1-1
1.1 Background	1-1
1.2 Purpose and Use of this EIR	1-4
1.3 Recent Relevant Legislation	1-4
1.4 Environmental Review	1-7
1.5 Document Organization	1-10
Chapter 2, Project Description	2-1
2.1 Introduction	2-1
2.2 Project Location	2-1
2.3 Project Objectives	2-4
2.4 Project Site Existing Conditions	2-6
2.5 Project Elements	2-17
2.6 Actions	2-88
Chapter 3, Environmental Setting, Impacts, and Mitigation Measures	3-1
3.0 Introduction to the Analysis	3-1
3.1 Aesthetics	3.1-1
3.2 Air Quality	3.2-1
3.3 Biological Resources	3.3-1
3.4 Cultural and Tribal Cultural Resources	3.4-1
3.5 Energy Demand and Conservation	3.5-1
3.6 Geology and Soils	3.6-1
3.7 Greenhouse Gas Emissions	3.7-1
3.8 Hazards and Hazardous Materials	3.8-1
3.9 Hydrology and Water Quality	3.9-1
3.10 Land Use and Planning	3.10-1
3.11 Noise and Vibration	3.11-1
3.12 Population, Employment, and Housing	3.12-1
3.13 Public Services	3.13-1
3.14 Transportation and Circulation	3.14-1
3.15 Utilities and Service Systems	3.15-1

	<u>Page</u>
Chapter 4, Other CEQA-Required Considerations.....	4-1
4.1 Introduction	4-1
4.2 Significant Environmental Effects That Cannot Be Avoided if the Proposed Project Is Implemented.....	4-1
4.3 Significant Irreversible Environmental Changes That Would Be Caused by the Proposed Project Should It Be Implemented.....	4-6
4.4 Growth-Inducing Effects.....	4-10
4.5 Urban Decay	4-16
Chapter 5, Project Variants.....	5-1
5.1 Introduction	5-1
5.2 West Century Boulevard Pedestrian Bridge Variant	5-2
5.3 Alternate Prairie Access Variant.....	5-12
Chapter 6, Project Alternatives	6-1
6.1 Overview	6-1
6.2 Factors in the Selection of Alternatives	6-3
6.3 Alternatives Considered but Dismissed from Further Evaluation.....	6-12
6.4 Alternatives Selected for Further Consideration.....	6-18
6.5 Environmental Evaluation of the Alternatives	6-19
6.6 Alternatives Comparison and Environmentally Superior Alternative.....	6-96
Chapter 7, List of Preparers and Persons Consulted.....	7-1
7.1 Report Authors.....	7-1
7.2 Persons Consulted.....	7-7
Appendices	
A. Notice of Preparation (NOP)	A-1
B. NOP Comments	B-1
C. Light and Glare.....	C-1
D. Air Quality	D-1
E. Biological Resources.....	E-1
F. Cultural Resources.....	F-1
G. Energy and Greenhouse Gas Emissions Data	G-1
H. Geotechnical Report.....	H-1
I. Paleontological Resources Report.....	I-1
J. Noise Data.....	J-1
K. Transportation Data.....	K-1
K.1 Technical Memoranda	K.1-1
K.2 Peak Hour Graphics	K.2-1
K.3 Technical Calculations.....	K.3-1
K.4 Event Transportation Management Plan.....	K.4-1
K.5 Congestion Management Program (CMP) Analysis	K.5-1
L. Sewer Area Study Plan	L-1
M. Water Supply Assessment	M-1
N. AB 987 / PRC Section 21168.6.8.....	N-1
O. Hazardous Materials	O-1
P. Airspace Hazards	P-1
Q. Hydrology Data.....	Q-1
R. Analysis of Future Events.....	R-1
S. Displacement Study	S-1

SUMMARY

Inglewood Basketball and Entertainment Center Draft EIR

Introduction

This Environmental Impact Report (EIR) has been prepared by the City of Inglewood pursuant to the requirements of the California Environmental Quality Act (CEQA) to inform the public and decision-makers about the environmental consequences of the proposed Inglewood Basketball and Entertainment Center (IBEC, or the Proposed Project).

The EIR describes the existing environmental resources in the vicinity of the Project Site, analyzes potential impacts on those resources as a result of construction and operation of the Proposed Project, as well as other reasonably anticipated baseline projects and related cumulative development. Where significant impacts could occur the EIR describes mitigation measures that could avoid or reduce the magnitude of those significant impacts. The environmental impacts evaluated in the EIR address environmental resources areas subject to evaluation under CEQA, including aesthetics; air quality; biological resources; cultural and tribal cultural resources; energy demand and conservation; geology and soils; greenhouse gas emissions; hazards and hazardous materials; hydrology and water quality; land use and planning; noise and vibration; population, employment, and housing; public services; transportation and circulation; utilities and service systems; and the potential for growth and urban decay effects.

The EIR also evaluates a range of alternatives to the Proposed Project. These alternatives include a reduced amount of development at the Project Site, as well as different locations for the proposed IBEC within and outside of the City of Inglewood. The EIR also identifies alternatives considered, but not carried forward for detailed analysis in this Draft EIR.

This EIR is being published as a Draft EIR. The Draft EIR will be subject to review and comment by the public, as well as responsible agencies, federal agencies, and other interested jurisdictions, agencies, and organizations for a period beginning December 27, 2019, and concluding at 5:00 PM on February 10, 2020. During the public review period, the public may comment on the EIR by providing written comments at any time during the public review period.

The Draft EIR can be accessed at the following locations:

City of Inglewood Website

<https://www.cityofinglewood.org/1036/Murphys-Bowl-Proposed-NBA-Arena>

Project Website

www.IBECProject.com

Printed copies of the Draft EIR will be available at the following locations:

City of Inglewood Main Library

101 West Manchester Boulevard, Inglewood, CA 90301

Inglewood Crenshaw-Imperial Branch Library

11141 South Crenshaw Boulevard, Inglewood, CA 90303

City of Inglewood Economic and Community Development Department

One West Manchester Boulevard, 4th Floor, Inglewood, CA 90301

During the review and comment period, written comments (including email) regarding the Draft EIR may be submitted to the City at the address below.

Mindy Wilcox, AICP, Planning Manager
City of Inglewood, Planning Division
One West Manchester Boulevard, 4th Floor
Inglewood, CA 90301
E-Mail: ibecproject@cityofinglewood.org

Following the public review period, written responses will be prepared to all comments received on the Draft EIR raising significant environmental issues. Those written responses, and any other changes to the EIR, will be included in a Final EIR that, along with the Draft EIR, will be provided to the City of Inglewood City Council for its consideration as part of the certification action on this EIR. If the City Council decides to certify the EIR and to approve the Proposed Project, the Council would also consider adoption of CEQA Findings pertaining to this EIR, a Statement of Overriding Considerations, and a Mitigation Monitoring and Reporting Plan.

Project Description

As required under CEQA Guidelines section 15124, the Project Description (Chapter 2) presents information regarding the respective objectives established by the City and the project applicant for the Proposed Project, the site where the Proposed Project would be located (Project Site), the physical and operational components and characteristics of the Proposed Project, and the discretionary approvals from the City and other agencies that would be required for its implementation.

The Project Site is comprised of approximately 28.1 acres of land encompassing four distinct subareas (see **Figure S-1**):

- *Arena Site*: The approximately 17-acre Arena Site is the central part of the Project Site and is bounded by West Century Boulevard on the north, South Prairie Avenue on the west, South

Doty Avenue on the east, and an imaginary straight line extending east from West 103rd Street to South Doty Avenue to the south. The Arena Site includes an approximately 900-foot portion of West 102nd Street;

- *West Parking Garage Site:* The approximately 5-acre West Parking Garage Site is located across South Prairie Avenue from the Arena Site, bounded by West Century Boulevard to the north, hotel and residential uses to the west, South Prairie Avenue to the east, and West 102nd Street to the south. The West Parking Garage Site includes an approximately 300-foot portion of West 101st Street;
- *East Transportation and Hotel Site:* The approximately 5-acre East Transportation and Hotel Site is located 650 feet east of the Arena Site and is bounded by West Century Boulevard to the north, industrial and commercial uses to the east and west, and West 102nd Street to the south; and
- *Well Relocation Site:* The approximately 0.7-acre Well Relocation Site is located on the south side of West 102nd Street, approximately 100 feet east of the Arena Site, and is bounded by vacant land to the west and south and residential uses to the east.

All but six of the parcels (approximately 23 acres) that make up the Project Site are currently vacant or undeveloped. The vacant or undeveloped parcels were acquired and cleared by the City between the mid-1980s and the early 2000s with the support of grants issued by the Federal Aviation Administration (FAA) to the City of Inglewood as part of the Noise Control/Land Use Compatibility Program for Los Angeles Airport (LAX).

The six developed parcels, approximately 54,098 square feet (sf) (2.9 acres) all within the Arena Site, include a fast food restaurant (on a privately owned parcel), a motel (on a privately owned parcel), a warehouse and light manufacturing facilities (on two privately owned parcels), a commercial catering business (on a privately owned parcel), and a groundwater well and related facilities (on a City-owned parcel). Another 1.5 acres consists of street segments to be vacated and incorporated into the Project Site.

The Proposed Project would develop the following key elements (see **Table S-1** and **Figure S-2**):

- An 18,000-fixed-seat arena (Arena Structure or Arena) suitable for National Basketball Association (NBA) games, with up to 500 additional temporary seats for other sports or entertainment events, comprised of approximately 915,000 sf of space including the main performance and seating bowl, food service and retail space, and concourse areas. The Arena Structure would include an integrated approximately 85,000 sf team practice and training facility, an approximately 25,000 sf sports medicine clinic, and approximately 71,000 sf of space that would accommodate the Los Angeles (LA) Clippers team offices.

Contiguous to the Arena Structure would be a 650-space parking garage for premium ticket holders, VIPs, and certain team personnel.

**TABLE S-1
IBEC PROPOSED USES**

Project Component	Proposed Uses	Size
Arena Site		
Arena	Premium and general seating, concessions	18,000 fixed seats with 500 temporary floor seats (approximately 915,000 square feet [sf])
LA Clippers Office Space	Offices, conference areas, kitchens, maintenance, and janitorial storage	71,000 sf
LA Clippers Team Practice and Training Facility	Team locker room, showers, and support spaces; video room; training and treatment; auxiliary locker rooms, basketball support and security, administrative offices	85,000 sf
Sports Medicine Clinic	Medical offices, medical treatment and rehabilitation areas, waiting areas, maintenance, and janitorial storage for team and potential general public use	25,000 sf
Community Space	Exhibition, educational, and event space for community and youth-oriented uses	up to 15,000 sf
Commercial Uses	Retail shops, full service and quick service restaurants, kitchens, bars, and food service	48,000 sf
	<i>Full-Service Restaurant/Bar^a</i>	<i>15,000 sf</i>
	<i>Coffee Shop</i>	<i>5,000 sf</i>
	<i>Quick Service Restaurant</i>	<i>4,000 sf</i>
	<i>LA Clippers Team Store</i>	<i>7,000 sf</i>
	<i>Other LA Clippers Experience/General Retail</i>	<i>17,000 sf</i>
Outdoor Plaza	Outdoor community gathering space and landscaping	80,000 sf (surface area)
Parking Garage	Parking for premium ticket holders, VIPs, and certain team personnel	650 spaces
West Parking Garage Site		
Parking Garage	Parking for arena and retail visitors and employees	3,110 spaces
East Transportation and Hotel Site		
Parking Garage	Parking for arena and retail visitors and employees	365 spaces
Bus Staging and Transportation Network Company Drop-Off	Private and charter bus staging, taxi queuing, and rideshare pick-up/drop off	182 car (TNC) spaces 20 coach/bus spaces 23 mini bus spaces
Hotel	Hotel rooms, lobby area, administration offices, support areas, and parking	Up to 150 guest rooms
Well Relocation Site		
Water Well	City of Inglewood Groundwater Well #8	n/a

NOTE:

^a This use may be developed as two or more spaces on the Arena Site. Uses could include indoor, outdoor, patio, and/or rooftop restaurant, bar, or lounge space, totaling not more than 15,000 sf.

Inglewood Basketball and Entertainment Center

Figure S-1
Project Elements

The Arena Structure would be a multi-faceted, ellipsoid structure that would rise no higher than 150 feet above ground level. The exterior of the building would be comprised of a grid-like façade and roof that would be highly visible, distinctive, and instantly recognizable due to a design unique in the City and the region, especially at night when it would be accentuated by distinctive lighting and signage. The façade and roof would be comprised of a range of textures and materials, including metal and glass, with integrated solar panels that would reduce event day peak loads.

The Arena Structure would open onto an approximately 1.8-acre plaza that would serve as a gathering and pedestrian area for arena attendees. The plaza would include a number of two-story structures that would provide 48,000 sf of commercial uses including retail shops, and food and drink establishments, and up to 15,000 sf of flexible community space for educational and youth-oriented uses. The plaza and plaza structures would be directly connected to the West Parking Garage by an elevated pedestrian bridge that would span South Prairie Avenue at an elevation of approximately 17 feet from roadway surface to bottom of the pedestrian bridge.

- The West Parking Garage Site includes development of a six-story, 3,110-space parking garage with entrances and exits on West Century Boulevard and South Prairie Avenue. The West Parking Garage would include a new publicly accessible access road that would connect West 101st Street and West Century Boulevard on the western property boundary of the West Parking Garage Site.
- The East Transportation and Hotel Site includes development of a three-story structure on the south side of West Century Boulevard, east of the Arena Site. The first level of this structure would serve as a transportation hub, with bus staging for 20 coach/buses, 23 mini buses, and 182 car spaces for Transportation Network Company (TNC) drop-off/pick-up and queuing. The second and third levels of the structure would provide 365 parking spaces for arena and retail visitors and employees. An up to 150-room limited service hotel and associated parking would be developed east of the Parking and Transportation Hub Structure.¹
- The Well Relocation Site includes the existing Inglewood Water Well #6, which would be removed and replaced with a new Water Well #8 within the Project Site, on a separate parcel further to the east along the south side of West 102nd Street. A City-owned and -operated potable water well would be developed on this site and would replace the City-owned well that currently exists on the Arena Site and would be demolished in order to accommodate the development of the Arena Structure.

It is projected that the proposed Arena would accommodate as many as 243 event days each year. Of these events, it is estimated that 62 of them would attract 10,000 or more attendees, and the remainder would be smaller events, with 100 events with attendance of 2,000 or less.

The Proposed Project would be designed and constructed to meet the US Green Building Council's Leadership in Energy and Environmental Design (LEED®) Gold certification requirements. Some of the sustainable characteristics would be related to the Project Site, and others would be related to the project design and construction methods.

¹ The East Transportation and Hotel Site could accommodate pick-ups and drop-offs of employees and attendees using private buses, charter buses, microtransit, TNCs, taxis, or other private vehicles. It would not be used as a connection point for public transportation options such as Metro buses.

Adjusted Baseline

CEQA Guidelines section 15125 provides that an EIR must include a description of the physical environmental conditions in the project vicinity. It also allows for a lead agency to define existing conditions as those conditions expected when the project becomes operational, when supported by substantial evidence. The Proposed Project is expected to be complete and operational in mid-2024. As described in Section 3.0, Introduction to the Analysis, the City of Inglewood has approved construction plans or issued building permits for, and construction has commenced on, significant portions of the Hollywood Park Specific Plan (HPSP), referred to as the HPSP Adjusted Baseline projects, located immediately north of the Project Site. The HPSP Adjusted Baseline projects include the 70,000-seat NFL Stadium, a 6,000-seat performance venue, nearly 1 million sf of office and retail development, 314 residential units, and the approximately 12-acre Lake Park. According to the HPSP construction schedule, the HPSP Adjusted Baseline projects will be built and operational by 2021 when construction of the Proposed Project is expected to be initiated, and prior to 2024 when operation of the Proposed Project would start.

Construction and operation of the HPSP Adjusted Baseline projects will change the physical conditions that currently exist in the vicinity of the Proposed Project for many of the environmental topics addressed in this EIR. Because of current and anticipated construction schedules, the City is reasonably certain that the HPSP Adjusted Baseline projects will be built and operational between summer 2020 and September 2021 when construction of the Proposed Project is expected to be underway, and prior to 2024 when operation of the Proposed Project would start. Thus, the City has determined that assuming the HPSP Adjusted Baseline projects as part of the baseline conditions provides the most accurate picture of the Proposed Project's impacts, and that it would be misleading to disregard the HPSP Adjusted Baseline projects in the environmental baseline. Accordingly, the changes associated with HPSP Adjusted Baseline projects are considered as the baseline against which the Proposed Project's potential impacts are measured. How these changes affect the environmental setting is further described in each topical section under the heading Adjusted Baseline Environmental Setting.

Cumulative Conditions

As required under CEQA, the EIR evaluates the potential for the Proposed Project to contribute to significant cumulative impacts. The cumulative analysis varies for each impact depending on the relevant cumulative context for that impact. For cumulative impacts that are regional in nature, the cumulative analyses account for regional growth projections from the Southern California Association of Governments (SCAG), Metro, and other regional agencies. For cumulative impacts that are more local in nature, the City, in consultation with other surrounding jurisdictions, assembled a list of 145 known past, present, and reasonably foreseeable cumulative projects in the vicinity of the Project Site. Projects on the list consist of development projects within the City or other identified surrounding jurisdictions that have a pending development application, are approved, or are under construction, and transit and related infrastructure improvement projects that have been approved or proposed and under review. In total the 145

projects account for anticipated development of 1,903,815 sf of retail/commercial space, 8,675,487 sf of office space, 2,070,210 sf of industrial/warehouse/data center space, 9,315 residential units or beds, approximately 2,430 hotel rooms, and new or expanded schools to accommodate 6,401 students.

Project Variants

The Proposed Project includes two variants to circulation infrastructure; the West Century Boulevard Pedestrian Bridge Variant and the Alternate Prairie Access Variant. These Project Variants are proposed in order to provide flexibility to allow the City to approve them as part of the Proposed Project, if desired.

Each Project Variant would include the same land use program, parking/loading, mechanical equipment, vehicular circulation, streetscape improvements, and sustainability features as the Proposed Project. The variants are not mutually exclusive – the City potentially could approve either or both. The Project Variants are summarized below.

West Century Boulevard Pedestrian Bridge Variant

The West Century Boulevard Pedestrian Bridge Variant would result in the construction of a pedestrian bridge across West Century Boulevard, connecting a retail portion of the Arena Site to the HPSP area to the north. The pedestrian bridge would provide a vertical clearance of approximately 17 feet over West Century Boulevard. The pedestrian bridge would connect the retail building with retail uses on the north side of West Century Boulevard. The pedestrian bridge would be constructed of materials similar to the Proposed Project's retail building in the plaza or the Arena Structure. The West Century Boulevard Pedestrian Bridge Variant could be incorporated into the development of either the Proposed Project or the Alternate Prairie Access Variant.

Alternate Prairie Access Variant

The Alternate Prairie Access Variant would expand the boundary of the Arena Site portion of the Project Site by adding two additional properties to the Proposed Project: 10204 South Prairie Avenue and 10226 South Prairie Avenue. These two properties currently contain a residential triplex and a single-family home, respectively. Under this variant, the properties would be acquired through voluntary sales by the property owners to the project applicant. If this variant were implemented, the residential uses on these two properties would be acquired and removed, allowing for a different configuration of the access to the Arena Site from South Prairie Avenue. As part of the Alternate Prairie Access Variant, the vehicular access to/from South Prairie Avenue would be moved 75 feet to the south, and this shift would result in a straight east–west alignment for the southernmost access road with West 103rd Street. The pickup/drop-off area would be reconfigured, and two new driveways to/from South Prairie Avenue to the pickup/drop-off area would be provided. However, the overall circulation plan for the Project Site would not change.

Assembly Bill 987/Public Resources Code 21168.6.8

Assembly Bill (AB) 987 was signed by Governor Jerry Brown on September 30, 2018. The bill added section 21168.6.8 to the Public Resources Code (PRC section 21168.6.8) and provides for expedited judicial review in the event that the certification of this EIR or the granting of project approvals are challenged, so long as certain requirements are met. The provisions of PRC section 21168.6.8 are similar to the provisions of the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900; PRC sections 21178 through 21189.3), which established expedited judicial review of certified Environmental Leadership Development Projects.

In order to qualify for expedited judicial review under AB 987, the Proposed Project must (1) receive LEED Gold certification, (2) implement a Transportation Demand Management (TDM) program that will achieve a reduction in vehicle trips (7.5 percent reduction by the end of the first NBA season for which an NBA team has played at the arena, and 15 percent reduction by 2030) as compared to operations absent implementation of the TDM program, (3) be located on an infill site, and (4) be consistent with the SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). In addition, the Proposed Project is required to have a construction cost of at least \$100 million, create high-skilled jobs that pay prevailing and living wages, not result in any net additional greenhouse gas emissions, comply with the State's solid waste and recycling requirements, include all mitigation measures and AB 987 requirements as conditions of approval that are enforceable by the City of Inglewood, pay all costs of preparing the CEQA record of proceedings, and pay any additional costs incurred by the courts in any case subject to AB 987. Additionally, as a condition of approval of the Proposed Project, the City must require the project applicant to implement measures that will achieve reductions of specified amounts of certain criteria pollutants (NO_x and PM_{2.5}) and toxic air contaminants.²

Pursuant to PRC section 21168.6.8, on the date of the release of this Draft EIR, the City must make the Draft EIR and all other documents submitted to or relied upon by the City in preparing the Draft EIR readily accessible in electronic format. Further, any document that is prepared by or submitted to the City that will be part of the record of proceedings must be made available in a readily accessible electronic format within 5 days of release or receipt by the City. Comments on the project that are received by the City must be made available in an electronic format within 5 days if received electronically, and within 14 business days if received in a non-electronic format. Finally, if the project is approved, the City must certify the final record of proceedings within 5 days of filing a Notice of Determination.

Issues Raised by Agencies and the Public

Pursuant to CEQA Guidelines section 15123, an EIR Summary must include areas of controversy known to the lead agency, including issues raised by agencies and the public, as well as issues to be resolved including the choice among alternatives and whether or how to mitigate the

² Office of the Governor, 2018. Assembly Bill 987 Signing Message. September 30. A copy of PRC section 21168.6.8 is contained in Appendix N of this Draft EIR.

significant impacts. During the public comment period on the Notice of Preparation (NOP), February 20, 2018, through March 22, 2018, the City of Inglewood received 76 written comment letters regarding the Proposed Project (see Appendix B for the NOP and Comment Letters). The City also held a Scoping Meeting on March 12, 2018, at which is provided information about the Proposed Project and the EIR process, and received comments on the EIR scope. The comment letters and Scoping Meeting comments addressed a number of issues pertaining to the Proposed Project and the scope of the EIR. The comments requested that the EIR address:

- Vehicular traffic management, particularly along freeways and local streets, and the effects of increased traffic congestion on those streets, intersections, and cumulative traffic with surrounding venues, events, and land uses;
- Use of Vehicle Miles Traveled (VMT), TDM, site access, and Intelligent Transportation System (ITS) when evaluating transportation impacts;
- Compliance with AB 52 and Senate Bill 18 Tribal Consultation requirements, including consideration of potential impacts to previously undiscovered archeological and/or Native American artifacts on the Project Site;
- Supply and availability of on-site and/or off-site parking;
- Potential for air quality degradation and increase in greenhouse gases as a result of the Proposed Project's construction activities and operational activities;
- The effect on existing, increased use of and/or demand for light rail and bus transit services and facilities, pedestrian connections, and bicycle facilities;
- Change in demand for public utilities services and/or infrastructure including potential impacts to electricity demand, potential need for additional or relocated electrical infrastructure, and potential impacts to water, storm drainage, and wastewater collection and treatment facilities,
- Potential economic stimulation and/or urban decay impacts on the surrounding area that could occur from the Proposed Project's provision of entertainment, retail, office, residential, and hotel uses, as well as indirect economic effects as a result of loss of parking or increased congestion;
- Proximity to Inglewood-Newport Earthquake Fault;
- Consistency of the Proposed Project with the City's affordable housing needs, impacts to housing stock, and displacement of people and housing;
- Employment generation and employment opportunities for the local community;
- Noise impacts as a result of the Proposed Project's construction and operational activities;
- Potential light impacts of proposed on-site signage on surrounding areas;
- Existing hazards and hazardous materials transportation;
- Demand for public services including law enforcement, fire protection, emergency response, and solid waste services; and

- Alternative site locations for the proposed development.

The issues raised in these comments are addressed as appropriate in the EIR under the applicable environmental topic.

Environmental Effects of the Proposed Project

This Draft EIR considers and discloses effects of the Proposed Project on a wide range of environmental resources and topics. The issues addressed include the effects on natural resources, like biology, geology, water quality and hydrology, hazards and hazardous materials; on transportation and a range of effects that result largely from transportation sources, such as air pollutant emissions, greenhouse gas emissions, noise, and emergency response considerations; on cultural resources, including archaeological, historic, and tribal cultural resources; on the provision of public services and utilities, including police and fire protection services, public parks and schools; on the provision of public infrastructure for water supply, wastewater conveyance and treatment, stormwater drainage, and solid waste management; and on a range of planning issues, including land use, aesthetics, population and housing, growth inducement and socioeconomic effects.

The following discussion provides an overview of the key environmental effects of the Proposed Project. This overview does not constitute a summary of every project-specific or cumulative effect of the Proposed Project described in the EIR, but rather it contains a description of those impacts that the City considers the principal environmental impacts of the Proposed Project. At the end of this chapter, **Table S-2, Summary Table**, includes a complete summary of all of the impacts and mitigation measures, including significance before and after implementation of mitigation measures, described in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, of the EIR.

Aesthetics

The Arena Structure would be an ellipsoid-shaped structure that would rise no higher than 150 feet, with a grid-like, multi-faceted façade and roof that would be a distinctive, highly visible, iconic building instantly recognizable due to a design and scale unique in the City. The Arena Structure would be especially visible at night when it would be accentuated by distinctive lighting and signage. The visual character of the Project Site would undergo a transformation as existing vacant parcels and lower, smaller scale development would be redeveloped into a large sports and mixed-use entertainment center with distinctive buildings and open spaces. The addition of the Arena Structure, plaza and retail, restaurant, community, and commercial buildings, parking structures, surface parking and hotel uses would change the visual nature of the Project Site, as the site would become higher density in scale. The changes in visual character caused by the Proposed Project would be prominent in views along West Century Boulevard, South Prairie Avenue, and West 102nd Street.

The Proposed Project would result in a material change in the existing visual character and quality of public views of and to the Project Site and its surroundings. The Proposed Project would increase the visual density of a part of Inglewood that currently has the visual character of an underutilized light industrial/commercial district. In light of the already urbanized character of the project area, including the intense level of development occurring to the north in the HPSP Adjusted Baseline projects, the impact of the Proposed Project on views would be less than significant.

Lighting during construction, as well as new lighting of buildings and plazas, along with signage around the Project Site during project operations, would increase the amount of ambient nighttime light and could create light spillover that could adversely affect nearby residential uses. Lighting from the Project Site would be visible during construction. Once the Proposed Project is built and in operations, the majority of the intense lighting would be focused internally on the plaza and arena entrances. Nevertheless, lighting and signage from the Proposed Project could exceed thresholds for nighttime light at sensitive receptors near the arena along South Prairie Avenue, and at homes north of West 101st Street immediately west of the West Parking Garage.

Under both construction and operational conditions, the potential exists for significant levels of light to spill over to adjacent properties. A range of mitigation measures would be required to offset such potential spillover light. During construction, contractors would be required to shield lights or to direct them away from nearby light-sensitive uses. Over the long-term, operational spillover light impacts would be mitigated by implementing a range of measures that would ensure that lighting would be reduced at any residential property to no more than 2 foot-candles, an amount that would typically not disturb sleep or other interior activities.

Air Quality

The analysis of air quality impacts addresses the emission of air pollutants during construction and operation of the Proposed Project. It considers emissions of criteria pollutants, those pollutants regulated under federal and State laws intended to protect public health, including ozone and ozone precursors (nitrogen oxides, or NO_x, and volatile organic compounds, or VOCs), particulate matter, carbon monoxide and others. The analysis also addresses the potential health risks and other effects of human exposure to these criteria pollutants and toxic air contaminants that would be emitted during project operations and construction. The analysis considers both air pollutant emissions at the Project Site, and project-generated air pollutant emission in the region as a result of vehicles traveling to and from the Project Site.

Emissions Thresholds

Because of its size, the fact that the arena would attract over one million event attendees each year, and based on the distances that people drive in the Los Angeles region, construction and operation of the Proposed Project would generate emissions of ozone precursors (VOCs and NO_x), carbon monoxide (CO), and fine and ultrafine particulate matter (PM₁₀ and PM_{2.5}, respectively) that would exceed the mass emissions thresholds of significance established by the South Coast Air Quality Management District (SCAQMD). The exceedance of mass emissions

thresholds is common on large projects because the SCAQMD thresholds are set at low levels to ensure that all projects of substantial size implement feasible air quality mitigation.

Construction of the Proposed Project has the potential to temporarily emit air pollutants through the use of heavy-duty construction equipment, through vehicle trips generated from workers and haul trucks traveling to and from the Project Site, from demolition and various soil-handling activities, and from the use of diesel powered on-and off-road vehicles and equipment. In addition, fugitive dust emissions would result. Because of the size and number of overlapping construction activities, even with implementation of construction project design features, such as use of off-road diesel-powered construction equipment that meets or exceeds Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 horsepower or greater, dust control measures, and maximizing the use of electric-powered construction equipment, construction-related daily emissions would exceed the SCAQMD significance threshold for NO_x.

The type and magnitude of the significance threshold exceedances as a result of project operations would depend on the type of event-day at the Proposed Project. On event days when a plaza event or a civic or corporate event takes place at the Project Site, there would be no exceedances of regional daily significance thresholds. Similarly, there would be no exceedances of these thresholds on non-event days, with the exception of two non-event days per month when the Proposed Project backup generators would be tested. The testing of these generators, in combination with the Proposed Project emissions associated with a non-event day, would result in an exceedance of the threshold for NO_x, an ozone and nitrogen dioxide (NO₂) precursor. On the less frequent days with larger events additional thresholds would be exceeded; on days with NBA basketball games or major concerts (approximately 62 per year), the thresholds for VOC, NO_x, CO, PM₁₀, and PM_{2.5} would be exceeded.

A detailed analysis of the health effects of the increases in ozone precursors and PM_{2.5} was undertaken using the best available tools designed to predict the health effects of changes in air basin-wide emissions. On a percentage basis, the increased emissions from the Proposed Project would be extremely small in the context of the South Coast Air Basin. The analysis finds that no statistically significant changes in health conditions would occur, and that no meaningful conclusion can be drawn with respect to potential health effects from the criteria pollutant emissions of the Proposed Project.

The vast majority of air pollutant emissions are generated by the operation of vehicles and off-road equipment, including passenger cars and light trucks, delivery trucks and service vehicles, and construction equipment in varying degrees throughout the construction and operational phases. As proposed, the Proposed Project would implement all feasible construction emissions reduction measures, including use of off-road diesel-powered construction equipment that meets or exceeds Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 horsepower or greater, use of electric and alternative-fueled construction equipment where possible, regular application of water to areas where soil is disturbed or on roads, and stoppage of emission generating construction activity during State 2 smog alerts. Mitigation of operational

emissions is focused on decreasing use of private vehicles for travel to and from the Proposed Project. As described in further detail below, under Transportation, the mitigation measure for operational emissions requires a comprehensive TDM program that support increased use of transit, carpool and vanpool, and other alternative modes of transportation, thereby reducing the motor vehicle emissions associated with the Proposed Project.

Exposure to Pollutants

Health concerns are raised when people are exposed to substantial concentrations of some air pollutants. The analysis in the EIR evaluated the exposure of people to a range of specific pollutants, including CO and NO₂, both of which can contribute to breathing disorders and compromised lung function. In all cases, the concentrations of these pollutants, even when combined with existing ambient concentrations and the effects of increased activity in the vicinity from future off-site projects, are below the State and federal health-based thresholds. In addition, concentrations of small particulate matter would be less than the allowable incremental increase thresholds established by the SCAQMD.

The analysis also examined the potential for sensitive receptors (residents, workers, school children, and day-care children) in the vicinity of the Project Site to be exposed to toxic air contaminants which are known to cause health risks, including cancer. The analyses concluded that there would be no exposures of any receptors to contaminants that would increase cancer or non-carcinogenic risks above established thresholds.

Biological Resources

The Project Site is either currently developed, or was developed in the past and cleared in response to aircraft noise. No native or original habitats exist on the Project Site. Biological resources that would be affected by development at the Project Site are limited to a number of trees that are on the site. None of the trees are native or considered to be rare, endangered, or sensitive species, but 72 are protected trees in accordance with the City of Inglewood Tree Protection Ordinance (Inglewood Municipal Code Chapter 12, Article 32), and these or others could serve as nesting habitat for migratory or other protected bird species. The removal of these trees could create impacts, especially if the trees are removed during the bird nesting season. These impacts would be mitigated to a less-than-significant level through the conduct of preconstruction surveys prior to any nesting season tree removal, protection of trees with active nest sites during construction, through obtaining necessary City permits to remove existing trees, and through protection or replacement of removed trees at a ratio to be determined by the City.

Cultural and Tribal Cultural Resources

The Project Site is located in an historically urbanized part of the City of Inglewood, and much of the Project Site was cleared of prior development between the 1980s and 2000s in order to mitigate effects of aviation noise that resulted from LAX aircraft operations. The Project Site is located in a part of Inglewood known to contain historic-age buildings, which include the Rodeway Inn & Suites (formerly the Turf and Sky Motel) located at 3940 West Century

Boulevard, and other buildings at 10212 South Prairie Avenue. Both of these buildings were constructed more than 45 years ago and therefore meet the general age threshold to potentially qualify as historical resources. The criteria for buildings to be considered historical resources are set in federal and State laws and regulations. The buildings were evaluated and were found to not be historical resources eligible for inclusion in either the National Register of Historic Places and the California Register of Historical Resources.

During archaeological surveys of the Project Site, two artifacts were identified: one historic-period isolate (EAN-1) and one shell of undetermined age (WSN-1). The artifacts were isolated from any other historical materials and lack clear cultural context, and thus EAN-1 and WSN-1 are not eligible for listing in the California Register and do not otherwise qualify as historical or unique archaeological resources pursuant to CEQA.

Off site, but in the vicinity of the Project Site, The Forum is the nearest register-listed historic resource, having been listed on both the National Register and the California Register. As a result of the distance between the Project Site and The Forum, the Proposed Project would not materially impair any of the character-defining features of The Forum, and The Forum would continue to retain all aspects of integrity and would remain eligible for listing in the National and California registers.

Based on literature research and site surveys, the overall sensitivity of the Project Site with respect to archaeological resources is considered to be low. However, the potential remains for an unexpected discovery of historic or pre-historic archaeological resources, including human remains, during site grading and excavation. Such a discovery would be mitigated through the implementation of a program involving cultural resources sensitivity training of construction personnel and monitoring by a qualified archaeologist and/or county coroner. Additionally, Native American monitors would be required to be present during grading or excavation of previously undisturbed soils. In the event of discovery, construction activity would be required to cease in the vicinity of the discovery, and the project applicant would be required to undertake evaluation and recovery of any important resources.

The City engaged in consultations with Native American Tribes, specifically the Gabrieleño Band of Mission Indians Kizh Nation, pursuant to AB 52. Maps provided by the Tribe reflect the historical presence of a Native American village site several miles to the north, but do not indicate the presence of any known Tribal cultural resources within the Project Site or the immediate vicinity. As a result of consultation through the AB 52 process, the City has included a requirement that the applicant retain a Native American monitor during excavation or grading of previously undisturbed soils.

Energy Demand and Conservation

As required under CEQA, the Draft EIR includes an analysis of the potential demand for energy created by construction and operation of the Proposed Project. The analysis addresses increased

demand for electricity, natural gas, and fuels for transportation and operation of construction equipment.

The analysis in the EIR describes that during construction, the Proposed Project would generate a demand for 671 megawatt hours of electricity, 396,836 gallons of gasoline, 294,173 gallons of diesel fuel, and a decrease of 1,405 million British thermal units of natural gas each year during construction taking into account the removal of the existing on-site uses. The Energy analysis examines two different assumptions regarding the number of events at other existing venues that would replace events relocated or market-shifted to the Proposed Project: a Partial Backfill Scenario and a Full Backfill Scenario. Average annual energy demand from project operations would be 14,317 megawatt hours of electricity, 18,392 million British thermal units of natural gas, 1,011,301 gallons of gasoline, and 66,983 gallons of diesel fuel. These amounts would range from 0.002 percent to 0.028 percent of LA County energy consumption. Because the Proposed Project would be designed and constructed to meet LEED Gold certification requirements, support statewide efforts to improve transportation efficiency, comply with the CALGreen building code, and comply with other State and local plans and policies, the energy consumption from the Proposed Project would not be wasteful, inefficient or unnecessary, and would thus be less than significant.

Geology and Soils

The analysis of impacts related to geology, soils, and paleontological resources as a result of construction and operation of the Proposed Project were based on a thorough review of the existing conditions and geotechnical and paleontological resources assessment reports prepared for the Project Site, and data from the US Geological Survey, California Geological Survey, and Southern California Earthquake Data Center.

The Proposed Project would be constructed consistent with the requirements of the California Building Code. The Project Site is in a relatively level area with soils made up of artificial fill overlying native alluvial and older alluvial deposits, is not on or adjacent to an active fault, liquefaction zone area, or within areas designated as having the potential for seismically induced landslides, and is not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Proposed Project. For these reasons, there would be no impacts related to these issues.

Construction of the Proposed Project would involve substantial grading and excavation that could leave soils exposed for periods of time and susceptible to erosion. This potential impact would be mitigated through the preparation of a Stormwater Pollution Prevention Plan (SWPPP), which would describe best management practices (BMPs) to ensure the Proposed Project would not result in substantial erosion or loss of topsoil.

As mentioned above, the Project Site is known to be underlain by artificial fill atop undisturbed alluvial soils and geological formations in which Ice Age fossils have been found within several miles of the Project Site and that are considered paleontologically sensitive. Thus, it is possible

that previously unknown buried paleontological resources within the Project Site could be impacted during construction. To mitigate this impact to insignificance, a qualified paleontologist would be required to develop a program for monitoring of certain ground disturbing activities, and for handling of paleontological materials if discovered.

Greenhouse Gas Emissions

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation and storms. Greenhouse gases (GHGs) are compounds in the Earth's atmosphere that play a critical role in determining temperature near the Earth's surface. Global climate change attributable to anthropogenic (human-caused) GHG emissions is currently one of the most important and widely debated scientific, economic and political issues in the United States and the world. In California, a range of State laws, Governors' executive orders, and regional and local plans have established short- and long-term goals for the reduction of GHGs from existing and future activities, including development projects, with an aim to limit year 2050 GHG emissions in the State to a level 80 percent below GHG emissions in 1990.

Development projects, like the Proposed Project, have the potential to generate GHG emissions through a variety of direct and indirect activities, including travel of people (employees and patrons) to and from the Project Site, and emissions from construction and building operations. GHG emissions and global climate change are a result of cumulative impacts from human activities and development projects locally, regionally, statewide, nationally, and worldwide. GHG emissions from all of these sources cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and its associated environmental impacts. Because of the cumulative nature of GHG emissions leading to global climate change, and in light of the State's goals for reductions in GHG emissions, for this EIR the City has established that a significant impact would occur if the Proposed Project would generate net new GHG emissions over the 30-year anticipated life of the building.

The GHG analysis examines two different assumptions regarding the number of events at other existing venues that would replace events relocated or market-shifted to the Proposed Project: a Partial Backfill Scenario and a Full Backfill Scenario. The analysis presents that the Project, as Proposed and without implementation of feasible mitigation, would generate over a 30-year period a net increase ranging from approximately 496,745 MTCO_{2e} of GHG under the Full Backfill Scenario to 357,635 MTCO_{2e} of GHG under the Partial Backfill Scenario. The analysis concludes, however, that under either scenario, the emissions from the Proposed Project can be reduced to "no net new" through the implementation of a range of feasible mitigation measures, including enhanced TDM; energy, water, solid waste, and other related conservation measures necessary to achieve LEED Gold certification; and other on-site and off-site GHG reduction

measures, including the purchase of carbon offsets, if necessary. The mitigation measures would be implemented over the 30-year life of the Proposed Project, and would include annual monitoring and verification. The analysis also concludes that these same mitigation measures would avoid any inconsistencies with State and local plans and policies to achieve Statewide goals for GHG reduction, including Governor's Executive Order S-3-05, the California Air Resources Board 2017 Scoping Plan, SCAG's 2016 RTP/SCS, and the City's Energy and Climate Action Plan.

Hazards and Hazardous Materials

The Hazards and Hazardous Materials section addresses potential effects of the Proposed Project that could result in exposure of people to hazards or hazardous materials that may be present in or on the Project Site or as a result of construction or operation of the Proposed Project. Based on searches of environmental database and collection of on-site soil and soil gas samples, the Project Site is located in an area that includes a number of former land uses with a history of hazardous materials uses and some instances of unauthorized releases. Soil sampling undertaken for this Draft EIR confirms the potential for encountering contaminants of concern that could result in adverse health effects if not handled appropriately. In addition, structures on the Project Site that would be demolished prior to construction of the Proposed Project could contain hazardous building materials that would require appropriate identification, handling and disposal. The potential exposure of construction workers or nearby residents and workers to these existing hazards would be mitigated through compliance with existing State and federal laws and regulations, and through implementation of a Soil Management Plan approved by the Los Angeles County Health Hazardous Materials Division prior to initiating any demolition or ground disturbing activities on the Project Site.

The Project Site is located within the planning boundary/Airport Influence Area for LAX, but not for Hawthorne Municipal Airport. The exceptions that the height of the Arena Structure (up to 150 feet above grade) and the arena construction cranes (up to approximately 290 feet above mean sea level) would penetrate imaginary surfaces that are used by the FAA to ensure the safety of aircraft operations at the two airports. The EIR includes mitigation that would require the applicant to submit a Notice of Proposed Construction or Alteration to the FAA, after which the FAA would conduct an aeronautical study to determine whether the Proposed Project would include obstructions to the airspace that would constitute a hazard to air navigation. The Proposed Project would be required to implement all FAA requirements, and to provide the City with a copy of the FAA "Determination of No Hazard to Air Navigation", and a consistency determination by the Airport Land Use Commission prior to the issuance of building permits. Because the Proposed Project would be constructed to be consistent with the requirements of the FAA, the impact on aviation hazards would be less than significant.

Hydrology and Water Quality

The Hydrology and Water Quality section describes impacts of the Proposed Project on flooding and ground- and surface-water quality. The existing storm drainage facilities in the vicinity of the

Project Site lead to the Los Angeles River and do not flood during intense storms. The Proposed Project's drainage systems have not yet been designed, and it is possible that the Proposed Project could exacerbate existing conditions. Mitigation measures requiring the Proposed Project stormwater systems to be designed consistent with local regulations and ensuring that runoff from the Project Site entering the City's drainage systems would not exceed current peak flows would reduce this potential impact to insignificance.

During construction of the Proposed Project, the use of construction equipment and vehicles could result in spills of oil, grease, gasoline, brake fluid, antifreeze, or other vehicle-related fluids and pollutants. The Proposed Project would be required to comply with federal, State and local regulations designed to reduce or eliminate construction-related water quality effects, including the National Pollutant Discharge Elimination System General Construction Permit and the City's Municipal Code section 10-208 (Low Impact Development Requirements). Before the onset of any construction activities, an application for coverage under the General Construction Permit would be submitted to the Los Angeles Regional Water Quality Control Board (RWQCB). In addition, in compliance with Municipal Code section 10-208, the project applicant would be required to prepare and submit to the City a Low Impact Development Plan. These mitigation measures would reduce this impact to less than significant.

The existing condition of the Project Site is either developed with impervious surfaces or has low infiltration and groundwater recharge, therefore the net change of groundwater recharge at the Project Site would be negligible. The Proposed Project, including the new municipal water well that would replace the existing Municipal Well #6 that would be removed to accommodate the proposed Arena, would be designed and operated pursuant to State and local requirements and managed pursuant to the Water Replenishment District's Groundwater Management Program so as to protect aquifers and water sources through the bio-filtration treatment of runoff, preventing the contamination or overdrafting of groundwater.

Land Use and Planning

The Land Use and Planning section of the Draft EIR focuses on the potential for the Proposed Project to physically divide an existing community, and consistency of the Proposed Project with land use plans and policies that were adopted for the purposes of avoiding or mitigating environmental impacts. The majority of the 28-acre Project Site is vacant and underutilized within an existing, surrounding urbanized area that contains a mix of uses including low to medium-density residential, commercial, entertainment, industrial, office and parking uses.

Previously developed with residential and other commercial uses, the currently vacant parcels were acquired and cleared between the mid-1980s and early 2000s as part of the noise mitigation program funded by the FAA. They are currently secured with fencing and do not permit public access. Thus, under existing conditions, vacant parcels located within the Project Site do not allow for the connectivity of people in the existing community.

The design of the Proposed Project would not include additional physical barriers or obstacles to circulation that would restrict existing patterns of movement between the Project Site and the surrounding neighborhoods. The Proposed Project would involve the vacation of sections of West 102nd Street, east of South Prairie Avenue, and West 101st Street, west of South Prairie Avenue, and would alter the location of crosswalks at South Prairie Avenue and West 102nd Street. While the Proposed Project would somewhat increase the distance to travel between the neighborhoods east and west of South Prairie Avenue, it would not physically divide the existing community because numerous nearby alternative routes are available.

The goals and policies of land use plans adopted by SCAG, LAX, and the City of Inglewood were reviewed; no potential inconsistencies with plans and policies that were adopted for the purposes of avoiding or mitigating environmental impacts were identified. Therefore, the Proposed Project would not conflict with goals, objectives, or policies adopted for the purpose of mitigating environmental impacts.

Noise and Vibration

The Noise and Vibration section of the Draft EIR describes potential impacts of the Proposed Project on the existing noise environment. The analysis identifies receptors that are sensitive to noise and vibration, and addresses noise and vibration created during construction and operation of the Proposed Project. Due to the nature of the Proposed Project, the analysis addresses noise that would occur during construction. The analysis also addresses noise generated during operations, including noise due to traffic travelling to and from the site, amplified sound that would emanate from the Arena Structure, and amplified sound from public events in the plaza areas.

Construction Noise

The Proposed Project would generate noise during construction, primarily as a result of the use of construction equipment on the Project Site. Over the course of the construction schedule, construction activities are anticipated to occur during both daytime hours (7:00 AM to 8:00 PM) as well as during nighttime hours (8:00 PM to 7:00 AM) during certain phases of construction activities. Construction activity during nighttime hours is expected to occur at the Arena Site and the Well Relocation Site during certain phases of construction, such as foundation concrete pours and delivery and erection of major components of the Arena Structure, and drilling the new water well. Nighttime construction is not anticipated at the West Parking Garage Site or the East Transportation and Hotel Site.

Daytime construction would generate considerable noise on the Project Site at various points throughout the construction period, especially at the Arena Site where major activity like deep excavation, steel building erection, and related construction activities would take place. Like in many cities, daytime construction noise is not regulated by the City of Inglewood. In this case, because of the unique size and scale of construction activities and the proximity of a number of noise sensitive receptors to the Project Site, the Draft EIR studied daytime construction noise levels in relation to a project-specific noise construction threshold, and determined that project

construction would result in significant daytime construction noise impacts to noise sensitive receptors near the Project Site.

The Proposed Project also would involve periodic nighttime construction, and because construction at night is prohibited in the City unless allowed subject to a special permit, nighttime noise effects were also studied and compared to the project-specific construction noise threshold. The area around the Project Site is subject to considerable nighttime noise, largely due to truck traffic on major arterials and overflights of aircraft attributable to LAX. Despite this already noisy nighttime environment, the additional periodic noise from the Proposed Project's nighttime construction activities was determined to be significant.

Finally, the Draft EIR studied the potential increase in road noise caused by heavy-duty construction vehicles traveling along potential haul routes associated with construction of the Proposed Project, and determined that, depending on the haul routes selected, the construction truck trip traffic noise from the Proposed Project could cause a significant impact to noise-sensitive receptors along those haul routes.

In order to mitigate the Proposed Project daytime and nighttime construction noise and heavy-duty construction vehicle noise, the Draft EIR establishes the mitigation requirement for a Construction Noise Reduction Plan that could include, but would not be limited to, such actions as establishment of minimum buffers between certain noisy equipment and noise sensitive receptors, use of haul routes that limit exposure to Proposed Project construction trucks, use of construction equipment with best available noise control technologies, use of hydraulic or electric impact tools with external noise jackets, construction of permanent and temporary noise barriers (already proposed as project design features of the Proposed Project), use of quiet pile driving technology, and designation of a Community Affairs Liaison responsible for responding to local complaints about construction. This mitigation program would include feasible measures to reduce construction noise exposures, but the impact would remain significant.

Operational Noise

In the vicinity of the Project Site, increased noise from operation of the Proposed Project would occur largely within the Arena Site, including amplified sound and crowd noise escaping the Arena Structure when doors are open, amplified sound from live performances in the plaza area, crowd noise in the plaza and on sidewalks in the vicinity, truck loading and unloading, testing of emergency generators, and the like. The Proposed Project would include sound barriers and buildings that would shield adjacent uses from significant increases in noise levels. This increased noise associated with a major event in the Proposed Project arena and a plaza event using amplified sound in the pre-event or post-event hours would exceed the applicable threshold and result in significant impacts to noise sensitive receptors located immediately northwest and southwest of the Arena plaza. The EIR has identified a range of measures to reduce significant noise increases, including enclosing mechanical equipment and placing it as far away from receptors as possible and designing the outdoor stage and sound amplification system to limit amplified sound levels leaving the Project Site. However, because it is uncertain whether these

measures could fully mitigate noise levels at nearby sensitive receptors, this impact is considered significant and unavoidable.

While noise generated by non-event day traffic would be less than significant, operation of the Proposed Project would result in significant noise increases generated by project traffic on roads carrying event traffic. The Draft EIR identifies a feasible mitigation measure for operational traffic noise that requires implementation of a TDM Program that would reduce vehicle trips on roads in the area studied in the analysis. The TDM Program is described further under Transportation and Circulation, below. While these measures would result in material reductions in noise levels at sensitive receptors, these operational noise impacts would be significant and unavoidable.

Vibration

Groundborne vibration can be generated by trucks and buses on rough roads, and construction activities that involve the use of heavy equipment. The effects of groundborne vibration include movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. Vibration can cause annoyance to affected residences and businesses, and in extreme cases, can cause damage to buildings. There are a number of vibration sensitive receptors around the Project Site and along construction haul truck routes, including residences, commercial buildings, hotels, and a church and pre-school.

Construction of the Proposed Project would potentially create significant vibration impacts at buildings and uses adjacent to the Arena Site, the West Parking Garage Site, the East Transportation Hub site, and the Well Relocation Site. Further, operation of construction haul trucks would be well below the thresholds for building damage, but could create annoyance to residents and businesses along the designated haul routes. Construction of the hotel would not create significant vibration impacts.

The EIR recommends a comprehensive program of setbacks and other measures to reduce the potential for human annoyance and building damage, and to ensure that any damage to adjacent buildings would be monitored and repaired by the project applicant, reducing impacts to buildings to less than significant. However, there are no feasible measures to eliminate the potential for vibration-caused human annoyance at levels above established thresholds, and thus these impacts would remain significant at sensitive receptors around the Project Site and along construction truck haul routes.

Population, Employment, and Housing

The assessment of effects on existing population, employment, and housing is based on existing documented estimates of the City's population, employment, and housing stock compared to future growth projections of applicable local and regional plans. Sources of population, employment, and housing data and related planning documents include the United States Census,

the California Department of Finance, SCAG RTP/SCS and Regional Housing Needs Assessment, and the City of Inglewood General Plan Housing Element.

The Proposed Project would generate temporary employment opportunities for construction workers during the Proposed Project's construction phase and permanent employment associated with the operations of the Arena and other uses included in the Proposed Project. Construction-related jobs generated by the Proposed Project would likely be filled by employees within the construction industry within the City of Inglewood and the greater Los Angeles County region. Employment associated with the operations of the Proposed Project would not result in substantial population growth in the City that would exceed projected or planned growth. SCAG's employment projections were developed in consideration of the very slow economic period in 2012 and by 2017 the City's level of employment had already exceeded SCAG's employment projections through 2040. While the Proposed Project's anticipated employment generation of 768 non-event jobs and up to 1,200 event-related jobs (319 full time equivalents) would contribute to employment growth in the City beyond that projected by SCAG, the additional jobs would not in and of themselves cause physical environmental impacts that are not otherwise addressed in the Draft EIR.

The Project Site is currently developed with a fast-food restaurant, a motel, a light manufacturing/warehouse facility, a warehouse, and a groundwater well and related facilities. The Project Site does not contain any residences and or existing residential population. Thus the Proposed Project would not directly displace substantial numbers of existing people or housing units necessitating the construction of new housing elsewhere.

Further, in response to comments on the NOP, the City undertook a study to determine the potential for the Proposed Project to stimulate economic activity and increase land values and housing costs in a way that could indirectly result in the displacement of substantial numbers of people or housing units necessitating construction of new housing elsewhere. Based on an extensive review of the literature on the subject of the economic effects of construction of new sports and entertainment venues, there is no evidence to support a conclusion that such indirect effects would be caused by the Proposed Project. In the cumulative context, while the City's study documented increases in housing costs in Inglewood over recent years, the City remains among the more affordable housing markets in Los Angeles County and the evidence does not support a conclusion that the Proposed Project would contribute to indirect displacement of a substantial number of housing units or residents in a way that would result in the construction of new housing units. These impacts were determined to be less than significant.

Public Services

The evaluation of public services effects of the Proposed Project considers the physical environmental impacts related to the provision of fire and police protection services, potential adverse effects on local parks and recreation facilities, and impacts resulting from increased enrollment in public schools.

Fire Protection

Fire protection would be provided by the Los Angeles County Fire Department which provides fire protection services on a regional basis from a multitude of fire stations, the closest of which are Stations 170, 18, and 173. While the Proposed Project would increase call volumes to the Los Angeles County Fire Department, sufficient capacity exists among the stations in the vicinity to meet the increased demand. The construction and operation of a new fire station, or other improvements that would result in physical environmental effects, would not be required to meet demands for fire protection created by the Proposed Project.

Police Protection

The City of Inglewood Police Department would provide police protection at the Project Site. According to the Inglewood Police Department, because of the Department's long history of providing service to major entertainment and sports events in Inglewood, no new facilities or personnel would be required to provide service to the Proposed Project; because there would be no need for new facilities, there would be no significant adverse physical impacts on the environment.

Parks and Recreation Facilities

The Proposed Project would include an outdoor plaza, new pedestrian networks, landscaping and edge treatment, and other sidewalk and pavement improvements that would be designed to facilitate pedestrian movement and activities. While the Proposed Project could generate some increase in the use of City parks and recreational facilities, this increase would be limited and short-term in the hours prior to events. Most of the events would occur during evening hours when most City and other publicly accessible parks are closed for operation, including Center Park and the future Lake Park in the Hollywood Park Specific Plan area. As such, event attendees, project customers, hotel patrons, and/or project employees would not create a substantial demand on local parks or recreation facilities, and would not contribute to substantial deterioration of existing parks and/or recreational facilities in the City.

Public Schools

The Project Site is served by four Inglewood Unified School District (IUSD) schools: Worthington Elementary School, Woodworth (Clyde) Elementary School, and Monroe (Albert F.) Middle School, and Morningside High School. The Proposed Project does not include residential uses and would not increase the residential population served by the IUSD. There could be a very limited number of new students as a result of project employees exercising their right to request to enroll their children in IUSD schools. The IUSD has been experiencing a decrease in school enrollment, which is predicted to continue in the coming years. Under baseline and cumulative conditions, these schools have adequate capacity to serve the limited enrollment that could be generated as a result of the Proposed Project.

Transportation and Circulation

Study Scope and Breadth

The analysis of Transportation and Circulation describes the Proposed Project's anticipated travel characteristics, and presents the impacts of the Proposed Project on the roadway, bicycle, pedestrian, and transit systems in the study area under Adjusted Baseline and Cumulative conditions. The traffic analysis evaluated a total of 114 study intersections and 28 neighborhood street segments within an approximately 20-square-mile study area that includes the corridors connecting to the major freeways that would provide regional access to the Proposed Project, and extends generally westerly to Interstate 405 (I-405), southerly to I-105, easterly to I-110, and northerly to Centinela Avenue and Florence Avenue, but with several outlying intersections even further north.

The traffic analysis also studied 53 discrete mainline segments and collector roads of the three nearby freeways: I-405 between La Tijera Boulevard and I-105, I-105 between Vermont Avenue and I-405, and I-110 between 76th Street and I-105. In addition to the freeways themselves, the analysis evaluated operations of 10 freeway off-ramps anticipated to be used to a significant degree by project trips, including the I-405 southbound off-ramps at La Cienega Boulevard (north and south of West Century Boulevard) and West Century Boulevard (northbound); and the I-105 off-ramps at Hawthorne Boulevard (westbound), South Prairie Avenue (east and westbound off-ramp), Crenshaw Avenue (westbound), and 120th Street (eastbound); and the I-110 off-ramps at West Century Boulevard (southbound) and Manchester Boulevard (north and southbound).

For traffic impacts, the analysis studied 65 different permutations of type of event or non-event conditions (NBA basketball games, concerts, and other types of events presented in Table 2-3 in the Project Description), days of the week (weekday and weekend), peak hours (traditional AM and PM peaks, as well as pre- and post-event peak hours), background conditions (existing, Adjusted Baseline and cumulative), as well as concurrent or overlapping events between those at the Proposed Project and events that may occur nearby at The Forum (up to 17,500 seats) and/or NFL Stadium (up to 70,240 seats).

Travel Characteristics

Evaluation of a project that includes a combination of ancillary uses that would operate on a daily basis and a special event venue that has unique operational schedules and peaking characteristics, such as the Proposed Project, requires calculation of trip generation under a variety of scenarios. At the Proposed Project, the ancillary land uses that would operate on a daily basis would generate approximately 4,706 net new daily vehicle trips, with 294 occurring during the AM peak hour and 409 occurring during the PM peak hour. The analysis is customized to reflect the arrival and departure patterns of attendees to events. In most cases, attendees arrive at events more gradually than they depart, with 68 percent of basketball fans arriving in the pre-event peak hour, and approximately 88 percent leaving in the first hour after the event. For days in which the Proposed Project would host a major event like a sold-out NBA basketball game or major concert at the Proposed Project, there would be from about 18,840 to 19,960 daily inbound and outbound vehicle

trips, including from about 16,334 to 17,822 for event attendees, approximately 6,000 vehicle trips during the pre-event peak hours, and over 8,000 vehicle trips during post-event peak hours.

While there are some minor variations in mode split depending on the day and time of the event, between approximately 83 and 85 percent of people attending major events would travel to and from the event in a private vehicle, and another 10 percent are predicted to arrive via a TNC (e.g., Uber, Lyft, etc.). Based on surveys of travel patterns of LA Clippers game attendees at Staples Center but considering the differences in transit service levels at the new site, it is estimated that approximately 5 percent of NBA basketball attendees would take rail transit and another 1 percent would take buses to and from events at the Proposed Project.

Based on LA Clippers game attendees survey data, private vehicles traveling to and from events are predicted to carry an average of 2.27 persons. As a result, parking demand for major events at the Proposed Project would range from approximately 7,700 spaces for a basketball game to approximately 8,100 spaces for a major concert. To accommodate the day-to-day parking needs and much of the event day demand, the Proposed Project would provide 3,110 parking spaces in the West Parking Garage, 365 spaces in the East Parking Garage, and 650 spaces in the South Parking Garage (with 100 of those spaces being reserved for players and key team employees). To accommodate the remaining parking demand for major events, between 3,700 and 4,100 vehicles would park in lots or structures within the Hollywood Park Specific Plan area including new parking lots or structures to be constructed for the NFL Stadium and the Hollywood Park Casino garage (located north of West Century Boulevard and east of South Prairie Avenue).

Impact Analysis

As noted above, the analysis in the Transportation and Circulation section analyzed 65 different permutations of types of events, days of the week, and times of the day. For each event-related analysis, the maximum anticipated attendance was evaluated.

Ancillary Uses

The most common scenario involves the daily operation of the ancillary uses, without an event in the proposed Arena. The traffic from these uses would occur on a daily basis. Under this scenario, the Adjusted Baseline analysis revealed that there would be significant impacts at three local intersections in the PM peak hour, and one neighborhood street segment; there would be no significant intersection impacts in the AM peak hour. Further, the daily operation of the ancillary uses would not result in significant impacts on freeway mainline segments or off-ramps.

Under cumulative conditions, the analysis of daily operation of the ancillary uses revealed that there would be significant impacts at one additional local intersection in the AM peak hour and one additional local intersection in the PM peak hour, and two additional neighborhood street segments. Further, the daily operation of the ancillary uses in the cumulative condition would not result in significant impacts on freeway mainline segments or off-ramps.

There would be no significant impacts on the local transit system or pedestrian system as a result of daily operation of the ancillary uses.

Key conclusions regarding the transportation impacts of the Ancillary Uses can be found in Tables 3.14-15 through 3.14-18 for the Adjusted Baseline scenarios, and Tables 3.14-44 through 3.14-47 for the Cumulative scenarios.

Daytime Events

The next most frequent scenario would involve the operation of the ancillary uses and the conduct of a corporate or civic event at the Proposed Project. This scenario is anticipated to occur up to 100 times per year. These types of events could be attended by up to 2,000 people (average of 300 attendees). The next most frequent type of smaller events that could occur during the day would be Other Sporting Events or Gatherings. These types of events are expected to occur about 35 times per year, and only some of those would be weekday matinees, and could be attended by up to 7,500 persons. Thus, in total, smaller daytime arena events could occur approximately 135 times per year. Corporate or civic events could start as early as 8:00 AM or 9:00 AM, thus those events were evaluated for impacts in the AM peak hour; family show matinees typically start in the early-to-mid afternoon and end in the late afternoon, and thus those events were studied for impacts in the PM peak hour. Because the daytime events that were studied for the PM peak hour were assumed to be more than four times larger than morning-starting events, the analysis tends to reflect more impacts of daytime events in the PM peak hour.

Based on the Adjusted Baseline analysis, daytime events at the Proposed Project, added onto the traffic from ancillary uses, would result in significant impacts at 9 intersections during the AM peak hour, and at 46 intersections in the PM peak hour. The daytime events would also result in significant impacts to two neighborhood street segments. Daytime events at the proposed Arena were also predicted to result in significant impacts on up to 15 freeway mainline segments in a single peak hour on I-405, I-105, and I-110.

Under cumulative conditions, daytime events at the Proposed Project, added onto the traffic from ancillary uses, would result in significant impacts at 17 intersections during the AM peak hour, and at 59 intersections in the PM peak hour. The daytime events would also result in significant impacts to three neighborhood street segments and up to 14 freeway components in a single peak hour on I-405, I-105, and I-110.

There would be no significant impacts on the local transit system or pedestrian system as a result of daytime events at the Proposed Project.

Key conclusions regarding the transportation impacts of the daytime events can be found in Tables 3.14-22A through 3.14-25 for the Adjusted Baseline scenarios, and Tables 3.14-48A through 3.14-51 for the Cumulative scenarios.

Major Events

Major events at the Proposed Project would include LA Clippers basketball games along with highly attended concerts. As shown on Table 2-3, in Chapter 2, Project Description, the combination of 49 LA Clippers games and 13 concerts over 10,000 in size means that major events would take place at the Proposed Project up to 62 times each year. The most frequent time for major events would be in the weekday and weekend evenings, with LA Clippers games occurring throughout the week, and major concerts primarily occurring on weekend evenings. Thus, the analysis evaluates weekday and weekend pre-event peak hour conditions for a sold-out (18,000 persons) NBA basketball game, and weekday post-event condition for a sold-out (18,500 persons) concert. These periods were selected for evaluation because they represent the most concentrated estimated arrival and departure patterns for major events at the Proposed Project.

Based on the analysis under the Adjusted Baseline scenario, major events at the Proposed Project, added onto the traffic from ancillary uses, would result in significant impacts at 42 intersections during the weekday pre-event peak hour, 11 intersections in the weekday post-event peak hour, and 26 intersections in the weekend pre-event peak hour. The major events would also result in significant impacts to four neighborhood street segments. Major events at the proposed arena were also predicted to result in significant impacts on up to six freeway components in a single peak hour on I-405 and on I-105, and queuing impacts on three freeway off-ramps.

Under the cumulative conditions the number of impacts of major events at the Proposed Project, added onto the traffic from ancillary uses, would increase, resulting in significant impacts at 61 intersections during the weekday pre-event peak hour, 21 intersections in the weekday post-event peak hour, and 40 intersections in the weekend pre-event peak hour. The major events under cumulative conditions would also result in significant impacts to six neighborhood street segments. Major events at the Proposed Project were also predicted to result in significant impacts on up to eight freeway components in a single peak hour on I-405 and I-105, and queuing impacts on three freeway off-ramps.

Traffic congestion from major events could significantly impact the on-time performance of local buses during pre- and post-event periods. However, while the capacity of local bus routes and the Green Line could be exceeded in the post-event period, because the effects would be limited to increased wait time and not involve safety or operational issues, those would not be considered to be significant impacts.

The local pedestrian system, made up of sidewalks and crosswalks that would connect the proposed arena and plaza to nearby parking and other businesses would be heavily used before and after a major event at the Proposed Project. Based on the analysis, all aspects of the pedestrian system would operate acceptably, except for where there could be substantial crowding on the West Century Boulevard south sidewalk, between the proposed arena plaza and South Doty Avenue, as well as on the east leg crosswalk at West Century Boulevard and South Prairie Avenue, and the south leg crosswalk at West Century Boulevard and South Doty Avenue.

Crowding on the east leg crosswalk at West Century Boulevard and South Prairie Avenue would be considered a significant impact.

Traffic congestion from major events could have a significant impact on emergency access by resulting in slower travel times for emergency vehicles and other persons in private vehicles to access the emergency room at the Centinela Hospital Medical Center during pre- and post-event periods. The EIR includes a mitigation measure requiring the Proposed Project to develop and implement a Local Hospital Access Plan, and specific components thereof, to ensure that safe and timely routes to the hospital are provided in all pre- and post-event scenarios. These include, but are not limited to, a system of wayfinding signs and other communications to direct drivers to alternative routes to Centinela Hospital, and ongoing coordination between the City, Centinela Hospital, and the Proposed Project arena operator.

Key conclusions regarding the transportation impacts of major events can be found in Tables 3.14-31 through 3.14-34 for the Adjusted Baseline scenarios, and Tables 3.14-52 through 3.14-55 for the Cumulative scenarios.

Concurrent Events

One of the unique aspects of the Proposed Project is the proximity of the Project Site to other major sports and entertainment venues: the NFL Stadium being constructed in the HPSP area, and The Forum located near the intersection of South Prairie Avenue and Manchester Boulevard. In other cities, where NBA arenas are located in close proximity to NFL stadiums, the NBA and NFL avoid scheduling basketball games on the same day as NFL games. However, it cannot be assumed that such coordination would take place between concert promoters and at other times circumstances could result in overlapping or concurrent events. While the overlap of NBA and NFL games would occur extremely rarely, if ever, in order to account for the possibility of such conditions, the Draft EIR analyzes the Proposed Project assuming that one or more events at the nearby NFL Stadium and/or the Forum would occur on the same day as a major event at the proposed Arena.

The analysis addresses five concurrent or overlapping event scenarios, including a major event at the Proposed Project and (1) a sold out concert at The Forum on a weekday or weekend evening; (2) a sold out NFL football game at the NFL Stadium on a weekend day; (3) a 25,000 attendee event at the NFL Stadium on a weekday evening; (4) a sold out concert at The Forum and a 25,000 attendee event at the NFL Stadium on a weekday evening; and (5) a sold out concert at The Forum and a sold out NFL football game at the NFL Stadium on a weekend day.

The results of analyses of each of these concurrent and overlapping event scenarios are presented in the Transportation section. Key findings from the study of the Proposed Project effects when combined with other major events at the NFL Stadium and/or The Forum include:

With respect to intersections:

- Proposed Project significant intersection impacts would be more frequent during the weekday pre-event peak hour than during the other two study periods regardless of other types of events or conditions.
- The number of intersections significantly impacted by the Proposed Project would increase substantially (from 42 to 61 during the weekday pre-event peak hour, from 11 to 45 during the weekday post-event peak hour, and from 26 to 41 during the weekend pre-event peak hour) when the background condition includes an event at The Forum.
- The number of intersections significantly impacted by the Proposed Project during the weekday pre-event and post-event peak hours would be less when the background condition consists of a mid-sized weekday event at the NFL Stadium versus an event at The Forum. This is because the mid-sized event at the NFL Stadium would utilize all of the surrounding parking in the HPSP area. The result would be that a greater number of project attendees would be required to park remotely and be shuttled to the Proposed Project, thereby adding fewer trips in the immediate vicinity of the Project Site and the NFL Stadium and causing fewer impacts.
- The overall operation of the street system in the study area would be substantially worse under each concurrent event scenario than for the Proposed Project alone.

With respect to freeway facilities:

- Generally, the Proposed Project would generate more extensive significant impacts on freeway segments during the weekday pre-event peak hour than during either the weekday post-event or weekend pre-event peak hour, regardless of which concurrent event condition is being studied (the exception being the weekday post-event hour with concurrent events at both The Forum and the NFL Stadium).

With respect to freeway off-ramp queuing:

- Off-ramp queues longer than the applicable standard are expected at three off-ramps during the weekday pre-event hour and at two off-ramps during the weekend pre-event hour with the Proposed Project but without events at the other two venues. The estimated queues would be longer with each added concurrent event. Off-ramp queues would be projected to exceed the applicable standard at up to two additional off-ramps depending on the concurrent event.

Key conclusions regarding the transportation impacts related to concurrent events can be found in Tables 3.14-31 through 3.14-34 for the Adjusted Baseline scenarios, and Tables 3.14-64 through 3.14-69 for the Cumulative scenarios.

Vehicle Miles Traveled

VMT is a measure of the total miles traveled by all of the trips associated with a particular project, measured as travel distance from the origin of the trip to the Proposed Project, and back again. It can be measured in total miles or in miles per capita (resident, employee, attendee, etc.). In recent years, VMT has been recognized as an important metric to understand the environmental consequences of driving, because often a longer trip has greater environmental impact than a shorter trip.

VMT impacts of the office, practice facility, and sports medicine clinic components of the Proposed Project would be considered less than significant because the daily work VMT per employee is estimated at 15.0, less than the 15.8 threshold (15 percent less than the regional daily work VMT value of 18.6). Since the regional patronage associated with events is considered as part of the event VMT impacts, the VMT from restaurant uses are considered to be less than significant. However, VMT from the proposed hotel would be considered significant as it would generate a net increase in daily VMT.

For NBA games at the Proposed Project there would be a net increase of 4.4 to 4.9 VMT per attendee compared to the per attendee VMT for games at Staples Center, and for major concerts at the Proposed Project there would be a net increase of VMT of 4.8 to 5.3 miles per attendee compared to a similar concert elsewhere in the region. For sold out events, this would result in an increase of approximately 80,000 to 90,000 VMT per NBA game, and 90,000 to 100,000 VMT per major concert. These impacts are considered significant.

Key conclusions regarding the VMT impacts of the Proposed Project can be found in Tables 3.14-40 through 3.14-43.

Mitigation Measures

The evaluation in the Draft EIR identifies a broad number of significant impacts at intersections, on neighborhood streets, on freeways, and on freeway off-ramps. It also identifies a limited number of significant impacts on transit systems, and pedestrian sidewalk and crosswalk facilities. Further, it identifies impacts related to increases in total and per attendee VMT. As required under CEQA, where significant impacts are identified, the EIR must describe potentially feasible mitigation measures that can substantially lessen or avoid those impacts.

The Draft EIR describes a variety of feasible mitigation measures, each of which falls into one of the following four categories:

- **Physical Improvements** – The majority of the study area is developed, which limits the locations, magnitude, and type of physical improvements that could be constructed on surface streets. However, in some instances, minor improvements are possible through restriping, converting medians to turn lanes, and widening (particularly on freeway off-ramps). Where such improvements are being proposed, the mitigation measure discusses the extent to which additional right-of-way may be necessary and the agency responsible for approving the physical improvement.
- **Signal Timing Improvements** – Some, but not all, of the signalized intersections along study corridors currently feature coordinated operations that enable large platoons of vehicles to progress from one intersection to the next with minimal stopping. Further, few, if any, signals operate with special event signal timings, which provide increased green time to high-volume movements. The preferred means for accomplishing signal timing improvements is through the Citywide ITS program versus an isolated, intersection by intersection approach. ITS would provide a fully responsive traffic signal system based on real time traffic conditions that can provide instantaneous traffic information and predictive time information to users

along access corridors. Additionally, this would enable the City to better accommodate event-related traffic.

- TDM Strategies – Another form of mitigation is to implement a comprehensive TDM program that includes strategies to reduce vehicle trips and encourage other modes of travel (see Mitigation Measure 3.14-2(b)).

Key elements of the TDM Program include:

- Programs to encourage use of alternative modes of transportation, such as integrated event and transit tickets, bus facility improvements employee transit or vanpool subsidies, etc.
 - Event-day dedicated shuttle services to provide connections with short wait-times from the Proposed Project to existing and future LA Metro Green Line and Crenshaw Line stations.
 - Programs to encourage use of carpools and vanpools, including incentives like preferential parking, reduced parking cost, variable parking pricing based on vehicle occupancy, and an employee vanpool program and vanpool subsidy benefit for employees.
 - Programs to encourage active transportation, such as biking and walking, including bicycle parking, showers and lockers for employees, bike valet, and improved sidewalks and pathways to create safe routes throughout the Project Site.
 - A Park-n-Ride program that would use charter buses to connect the Proposed Project to park-n-ride parking lots at key locations around the region.
 - Information services to inform the public about alternative ways to travel to and from the Proposed Project, including wayfinding, changeable message signs, social media, information kiosks, and the like.
 - Event-day local microtransit service for a limited number of employees and attendees that would provide a microbus with a service range of 6 miles around the Project Site.
- Event Transportation Management Plan (TMP) – In order to manage high levels of traffic on streets in the vicinity of the Proposed Project, and other area parking garages and key travel corridors, an Event TMP would be required. The TMP would implement a series of temporary transportation management strategies to better accommodate all modes of travel. It includes specific elements for vehicles (both private and TNCs), transit/shuttles, pedestrians, bicyclists, paratransit, parking, etc. (see Mitigation Measure 3.14-2(a)).

A Draft Event TMP has been prepared and is included in Appendix K.4 of this Draft EIR. Key elements of the TMP include the use of Traffic Control Officers to manage vehicle flow on City streets; pedestrian flow management; a comprehensive parking plan that includes use of tools to minimize unnecessary vehicular circulation while looking for parking; an adequate supply of bicycle parking; provision for shuttle buses to connect the Project Site to LA Metro rail transit stations and/or remote parking; provisions for Paratransit access on the street frontage; management of ride-hailing vehicles (Uber, Lyft, etc.); development and implementation of a Neighborhood Transportation Management Plan to address impacts on neighborhood streets; development and implementation of a Local Hospital Access Plan to facilitate access to Centinela Hospital Medical Center during pre- and post-event periods; and truck staging plans to accommodate the needs of delivery vehicles but avoiding their parking or idling on street. For concurrent events, the TMP provides for off-site parking and associated shuttles to the Project Site. The Draft Event TMP also includes performance criteria and requirements for ongoing monitoring.

Although these measures, individually and collectively, would provide improved circulation and operation of the local and regional street system, and would reduce Proposed Project travel demand, trip making, and VMT to the extent feasible, the Proposed Project would result in a large number of significant and unavoidable transportation impacts.

Utilities and Service Systems

Water Demand and Supply

Water for drinking, irrigation, and other municipal and industrial purposes is supplied to the City of Inglewood by the City of Inglewood, Golden State Water Company (GSWC) and Cal-America Water Company. The Project Site is located in the northern portion of the GSWC Southwest System. In total, GSWC currently serves an area with more than 50,000 customers and a population of over 275,000 people in southwest Los Angeles County. The GSWC Southwest System meets a demand for over 27,000 acre-feet per year (AFY) and obtains its water supply from three sources: treated imported surface water, local groundwater via GSWC-operated groundwater wells, and recycled water. Imported surface water from the State Water Project and the Colorado River Aqueduct is provided to GSWC from the Metropolitan Water District of Southern California through wholesalers West Basin Municipal Water District and Central Basin Municipal Water District.

Pursuant to the California Water Code (sections 10910–10915), a Water Supply Assessment (WSA) was prepared and reviewed by GSWC. The WSA evaluated the availability of water supplies necessary to meet the demand generated by the Proposed Project, as well as the cumulative demand for in the GSWC Southwest System over the next 20 years, under a range of water conditions including normal, dry and multiple dry year conditions. The WSA estimated annual operational water demand from the Proposed Project to be approximately 103 AFY, and further estimated that with implementation of water conservation measures to achieve LEED Gold certification the demand would decrease by about 40 percent, to 63 AFY. During construction, water demand is conservatively estimated to be approximately 42 AFY.

Between 2015 and 2040 total annual water demand from uses in the GSWC Southwest System is projected to increase by about 7,458 AFY, to a projected 2040 use of 34,789 AFY. Because of its ability to tap different water sources in different types of water years, supply is expected to meet demand each year through 2040. Further, because the future demand projections already incorporate conservation and water use efficiency, the demand estimates for single and multiple-dry year scenarios are the same as for the normal year, and GSWC is not expected to rely on water use cutbacks to meet demand in dry years. Thus, GSWC would have sufficient planned water supplies available to serve the Proposed Project along with other reasonably foreseeable development within the service area in normal, dry, and multiple dry year scenarios during both the construction period and long-term operation.

Wastewater Conveyance and Treatment

Wastewater from the Proposed Project would be conveyed to Los Angeles County Sanitation District (LACSD) facilities through two LACSD trunk sewers and the City of Inglewood local collector sewer lines to the LACSD's Joint Water Pollution Control Plant (JWPCP) in Carson. The Proposed Project would improve existing infrastructure by upsizing the existing West 103rd Street 8-inch sewer line to a 12-inch line extended to the Project Site.

The Proposed Project would contribute sewage flows to the Prairie Avenue Trunk Sewer, the City collector sewer line at South Prairie Avenue and West 102nd Street, the West 102nd Street east sewer line, and the Orange Avenue Trunk Sewer; none of these sewer lines would exceed existing peak flow. According to the LACSD, the JWPCP would have sufficient capacity to treat all wastewater generated from the Proposed Project. All effluent would comply with the wastewater treatment standards of the RWQCB, as wastewater would be transferred to the JWPCP and treated before being discharged to the ocean, avoiding adverse impacts to receiving waters.

Storm Drainage

Storm drainage from the Project Site would be conveyed to adjacent off-site storm drain facilities and ultimately into the City maintained storm drain mains located along all streets surrounding the Project Site. Construction activities and materials would alter the drainage pattern of the Project Site, potentially increasing water flow into the existing drainage system. However, with implementation of BMPs as required in a site-specific SWPPP prepared consistent with the requirements of the City and the RWQCB, runoff discharged from the Project Site would be reduced to levels that would not adversely affect the existing drainage system.

Although operation of the Proposed Project could have the potential to increase flows to the existing system by incrementally increasing the amount of impervious surface, the Proposed Project would include on-site drainage features and infrastructure improvements, such as new stormwater pipelines, storm drains, and storm drain overflow pipes, that would connect to existing storm drains within surrounding streets and would be designed to discharge stormwater at a rate that would be equal to or less than pre-project conditions. As such, the Proposed Project would not increase stormwater flows or contribute to increased flows in the storm drainage system serving the project area.

Solid Waste Disposal

Solid waste from the Project Site and City of Inglewood is served by Consolidated Disposal Services, which transfers solid waste to the Sunshine Canyon Landfill in Sylmar, California. Recyclable construction materials, including concrete, metals, wood, and various other recyclable materials would be diverted to recycling facilities. Operational wastes of the Proposed Project would include retail/commercial, office, hotel, and entertainment and sports center-related wastes. The Sunshine Canyon Landfill currently receives an average of 3 million tons of waste per year, and is permitted to receive a maximum of 4.4 million tons of waste per year. The Proposed Project would comply with federal, State, and local statutes and regulations related to handling

and diversion of solid waste, and would be designed and operated to meet the requirements of LEED Gold certification, which includes higher rates of waste diversion than required under existing regulations. Based on projected solid waste generation from the Proposed Project, there is sufficient landfill capacity to serve the Proposed Project's solid waste disposal needs during construction and operation without materially decreasing the planned life of the landfill.

Growth Inducement and Urban Decay

Growth Inducement

Pursuant to CEQA, the analysis of growth inducement considers the potential for the Proposed Project to remove obstacles to growth or to stimulate additional growth in the region through secondary economic linkages commonly referred to as the multiplier effect. The Proposed Project would be served by transportation and circulation infrastructure and utility systems that already exist or would be subject to improvements to accommodate the Proposed Project demands. The Proposed Project would not provide any additional infrastructure capacity or remove other existing obstacles to growth.

Direct employment includes the employees of the uses in the Proposed Project; indirect employment includes those employees that work in jobs that support the Proposed Project (e.g., vendors or contractors); and induced employment are those jobs that are created by Project employees or businesses spending money in the local economy. It is expected that the Proposed Project's direct net new employment growth of approximately 833 jobs would generate indirect and induced employment growth associated of approximately 550 jobs in the Los Angeles metropolitan regional economy, bringing the total increase in jobs associated with the proposed mixed use development to 1,383 jobs. These additional jobs would occur throughout Los Angeles metropolitan region, and would not be expected to stimulate growth that would have environmental consequences beyond that already addressed in local general plans.

Urban Decay

Under CEQA "urban decay" is defined as physical deterioration of properties or structures that is so prevalent, substantial, and lasting a significant period of time that it impairs the proper utilization of the properties and structures, and the health, safety, and welfare of the surrounding community. The urban decay analysis presented in the Draft EIR considers the supply and demand effects of the arena operations and retail and restaurant uses of the Proposed Project, and further considers the potential of the introduction of the Proposed Project to adversely affect venues and businesses of the Los Angeles area market.

The analysis concludes that there is sufficient supply and demand from the local market area so that event, retail, and restaurant space in the Proposed Project alone would not be projected to result in closure of venues, retail stores, or restaurants. While there could be some decrease in events at other venues during the initial years after opening of the Proposed Project, the City does not anticipate that addition of the Proposed Project to the Los Angeles area market would result in

conditions that would contribute to or cause urban decay of other major sports and entertainment venues in the region.

Further, it is not anticipated that addition of approximately 48,000 sf of commercial space in the Proposed Project would have a substantial impact on market area retailers to the extent that addition of the proposed uses would result in the prolonged closure of market-area businesses. Any closures and ensuing commercial vacancies that may result from competitive market pressures would be anticipated to be temporary and would eventually be filled by other retail or restaurant uses, or by other commercial uses that would be compatible with available space. Further, these uses would be supported by event attendees attracted to the Inglewood area as a result of the Proposed Project. Therefore, the City does not anticipate that the Proposed Project would result in conditions that would contribute to or cause urban decay.

Significant and Unavoidable Environmental Effects

Throughout this EIR, significant environmental impacts have been identified where appropriate, and feasible mitigation measures are described that would eliminate the impacts or decrease them to a less-than-significant level. Similarly, a number of impacts are identified that would be less-than-significant without the need for additional mitigation measures. There are, however, a number of impacts that are identified that cannot be eliminated or cannot be decreased to a level of insignificance even with the implementation of feasible mitigation measures. The key Project-specific unavoidable significant environmental impacts include those listed below.

Project-specific and cumulative impacts that cannot be avoided if the Proposed Project is approved as proposed include:

Project-Specific Significant and Unavoidable Impacts

Impact 3.2-1: Construction and operation of the Proposed Project would conflict with implementation of the applicable air quality plan.

Impact 3.2-2: Construction and operation of the Proposed Project would result in a cumulatively considerable net increase in NO_x emissions during construction, and a cumulatively considerable net increase in VOC, NO_x, CO, PM₁₀, and PM_{2.5} during operation of the Proposed Project.

Impact 3.11-1: Construction of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact 3.11-2: Operation of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact 3.11-3: Construction of the Proposed Project would generate excessive groundborne vibration levels.

Impact 3.14-1: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-2: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-3: Major events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-4: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-5: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-6: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under Adjusted Baseline conditions.

Impact 3.14-8: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-9: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-10: Certain components of the Proposed Project would generate VMT in excess of applicable thresholds.

Impact 3.14-11: Operation of the Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions.

Impact 3.14-15: The Proposed Project would substantially affect circulation for a substantial duration of construction under Adjusted Baseline conditions.

Impact 3.14-28: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under Adjusted Baseline conditions.

Impact 3.14-29: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under Adjusted Baseline conditions.

Impact 3.14-30: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under Adjusted Baseline conditions.

Impact 3.14-31: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under Adjusted Baseline conditions.

Impact 3.14-32: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under Adjusted Baseline conditions.

Cumulative Significant and Unavoidable Impacts

Impact 3.2-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in inconsistencies with implementation of applicable air quality plans.

Impact 3.2-6: Construction and operation Proposed Project, in conjunction with other cumulative development, would result in cumulative increases in short-term (construction) and long-term (operational) emissions.

Impact 3.11-5: Construction of the Proposed Project, in conjunction with other cumulative development, would result in cumulative temporary increases in ambient noise levels.

Impact 3.11-6: Operation of the Proposed Project, in conjunction with other cumulative development, would result in cumulative permanent increases in ambient noise levels.

Impact 3.11-7: Construction of the Proposed Project, in conjunction with other cumulative development, would generate excessive groundborne vibration.

Impact 3.14-16: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-17: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-18: Major events at the Proposed Project Arena would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-19: Operation of the Proposed Project ancillary land uses would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-20: Daytime events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-21: Major events at the Proposed Project Arena would cause significant impacts on neighborhood streets under cumulative conditions.

Impact 3.14-23: Daytime events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-24: Major events at the Proposed Project Arena would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-25: The Proposed Project would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions.

Impact 3.14-27: The Proposed Project would substantially affect circulation for a substantial duration of construction under cumulative conditions.

Impact 3.14-33: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts at intersections under cumulative conditions.

Impact 3.14-34: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would cause significant impacts on freeway facilities under cumulative conditions.

Impact 3.14-35: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would adversely affect public transit operations or fail to adequately provide access to transit under cumulative conditions.

Impact 3.14-36: Major events at the Proposed Project, when operating concurrently with major events at The Forum and/or the NFL Stadium, would result in inadequate emergency access under cumulative conditions.

Impact 3.14-37: The Proposed Project would substantially affect circulation for a substantial duration during construction during major events at The Forum and/or the NFL Stadium under cumulative conditions.

Environmental Effects of the Project Variants

West Century Pedestrian Bridge Variant

Implementation of the Century Pedestrian Bridge Variant would result in the same or similar significant impacts as those described for the Proposed Project. No new significant impacts would be generated under this Variant. While there would be some minor increases in construction-related impacts because construction would occur about 50 feet closer to sensitive receptors northwest of the Project Site, the Century Pedestrian Bridge Variant would generate beneficial effects related to pedestrian access and vehicular circulation.

Alternate Prairie Access Variant

Implementation of the Alternate Prairie Access Variant would result in the same or similar significant impacts as those described for the Proposed Project. No new significant impacts would be generated under this Variant. Although this variant would result in removal of four existing residential units in commercial zones along South Prairie Avenue, the loss of these units is not considered a significant environmental effect. In addition, the Alternate Prairie Access Variant would generate beneficial effects and avoid significant impacts related to light spillover on the affected housing units and would improve circulation to and from the Project Site from South Prairie Avenue.

Alternatives to the Proposed Project

As required under CEQA, in addition to the analysis of the Proposed Project, the EIR also presents a discussion of a reasonable range of alternatives to the Proposed Project. The alternatives evaluated must be potentially feasible and capable of achieving most of the basic

objectives of the Proposed Project while avoiding or substantially lessening one or more of the significant impacts of the Proposed Project.

Some alternatives initially considered by the City for evaluation in the EIR were eliminated from further consideration because they were either infeasible, would not meet most of the basic objectives of the Proposed Project, or would not avoid or substantially lessen one or more of the significant impacts of the Proposed Project. As a result, such alternatives as an entertainment venue, a substantially reduced arena, housing, and employment center/business park were eliminated from further consideration.

A total of seven alternatives, including five alternative locations, were evaluated in the EIR, as summarized below. The focus of the alternative locations was to identify the impacts that would occur if the arena and as much of the other elements of the Proposed Project as feasible were to be developed at another site, including several that are not as proximate to The Forum and the NFL Stadium, as a means of avoiding or lessening the traffic and related impacts of concurrent events at these facilities.

Alternative 1: No Project

Under CEQA, the No Project Alternative must consider the effects of foregoing the Proposed Project. Alternative 1, the No Project Alternative, describes the environmental conditions that exist at the time that the environmental analysis commences (CEQA Guidelines section 15126.6(c)(2)). In the case of the Proposed Project, the Project Site is already in a developed state, so continuation of existing conditions (the “no development” alternative) would involve continued operation of existing land uses and businesses on the Project Site. It is assumed that the LA Clippers would remain playing at the Staples Center in Downtown Los Angeles, and the LA Clippers’ team offices would continue to be located on Flower Street, within two blocks of Staples Center. In addition, the LA Clippers would continue to use its practice and training facility in the Playa Vista neighborhood within Los Angeles. In light of the stated commitment of the LA Clippers ownership to have the team remain in Los Angeles, it is reasonable to assume that LA Clippers ownership and the City would seek an alternate location for the development of a new IBEC in Los Angeles.

Because no new development would occur at the Project Site, the effects of the No Project Alternative would be a continuation of the existing conditions, and none of the impacts identified for the Proposed Project would occur. The effects of continued use of Staples Center for LA Clippers games would continue to create a range of environmental effects in and around downtown Los Angeles and the region, including the generation of Vehicle Miles Travel (VMT) and associated congestion during pre- and post-event hours, and generation of criteria air pollutants including ozone precursors and small particulate matter. Because these effects are ongoing, they are considered part of the regional environmental setting and would not be subject to mitigation through the CEQA process.

The No Project Alternative would achieve none of the City's or applicant's objectives for the Proposed Project.

Alternative 2: Reduced Project Size

Alternative 2 assumes that only the arena, pedestrian plaza, and southern parking garage would be constructed on the Arena Site. None of the other proposed facilities (i.e., hotel, retail shops, outdoor stage, team practice facility, medical clinic, and team offices) would be constructed. The LA Clippers' team offices would continue to be located on Flower Street within two blocks of Staples Center, while the LA Clippers would continue to use their practice and training facility in the Playa Vista neighborhood of Los Angeles. The arena would be reduced by approximately 3 percent to approximately 17,500 seats, equal in size to the smallest recently constructed NBA arena, and 3,775 on-site parking spaces. The West Parking Garage would be constructed as well as the pedestrian bridge linking the multi-level parking structure on the West Parking Garage Site to the pedestrian plaza on the Arena Site. Additionally, another parking structure would be located to the south of the arena on the Arena Site and the Transportation Hub Site would only serve buses, TNC vehicles and taxis via a surface parking and pickup/drop-off lot.

Although under Alternative 2 a number of uses would be removed from the Proposed Project, many of the impacts of the Proposed Project on environmental resources affected by the size and location of the Project Site would be either the same, or nearly so. The primary significant impacts of the Proposed Project that would be lessened in magnitude under Alternative 2 would include the emission of criteria air pollutants and GHGs, construction noise, and demand for public utility services. Conversely, compared to the Proposed Project, Alternative 2 would increase the magnitude of operational noise impacts due to the removal of structures that would attenuate noise generated from the arena and plaza areas.

Under Alternative 2, the slightly reduced capacity of the arena would reduce vehicle trip generation in the pre-event and post-event peak hours for major events in the weekday and weekend evenings by approximately 3 percent. This slight reduction in trips would not materially reduce the significant impacts found for the Proposed Project on intersections, neighborhood streets, and freeway facilities. The slight reduction in venue capacity would reduce the significant VMT impacts identified for events at the venue, however, by eliminating the potential to consolidate LA Clippers team uses, including the arena, practice facility, sports medicine and treatment facilities, and team offices in a single location, Alternative 2 would likely increase the amount of travel between these uses that are currently located disparately throughout the region. The result of this would be increased trip-making and increased VMT.

The reduced size of Alternative 2 means that it would meet some, but not all of the objectives of the City and the applicant. In particular, this alternative would be less responsive than the Proposed Project to the City's objectives to promote economic health of the City, provision of public and youth-oriented space, and increasing employment opportunities; it would fail to achieve the applicant's objective of consolidating team facilities and providing complementary retail, public benefits, and increasing City revenues.

Alternative 3: City Services Center Alternative Site

Alternative 3 assumes that a new entertainment and sports center would be built near downtown Inglewood, approximately 1.5 miles northwest of the Project Site. Alternative 3 would involve the demolition of the facilities that presently occupy the City Services Center Alternative Site and adjacent firefighter training academy, and the construction of an arena and parking structure separated by a pedestrian plaza that would include an outdoor stage. The proposed parking structure would include approximately 2,520 parking spaces, which represents a 30 percent reduction in parking compared to the Proposed Project. Additional off-site parking for events at the arena would be provided by an existing parking structure owned and operated by the Faith Central Bible Church. In addition, approximately 30,000 sf of ground floor retail oriented towards the pedestrian plaza would be provided on the lower level of the parking structure. Other team facilities, hotel, or a new potable water well would not be constructed as the site is not large enough to accommodate the additional square footage.

Under Alternative 3 all of the uses that presently occupy the City Services Center Alternative Site and adjacent firefighter training academy would be relocated to the Project Site along West Century Boulevard. Unlike the Proposed Project, the relocation of these uses would not require the vacation of either West 101st Street or West 102nd Street.

Although the City Services Center Alternative Site is about 65 percent smaller than the Project Site, Alternative 3 also involves relocation of uses from the City Services Center Alternative Site to the Project Site, and thus impacts such as effects on biological and cultural resources, exposure to existing soil-borne hazards, drainage and water quality effects, and impacts on public services would be similarly likely to occur despite the reduced size of the site for the construction of the Proposed Project. The primary significant impacts of the Proposed Project that would be lessened in magnitude under the City Services Center Alternative would include the emission of criteria air pollutants and GHGs due to less construction and smaller overall development, and construction and operational noise as a result of the smaller size of the site and relatively fewer sensitive receptors in proximity to the site. Conversely, compared to the Proposed Project, Alternative 3 would increase potential for spillover lighting and shadow effects due to the location and orientation of residences to the site.

Under Alternative 3, the ability to walk to the Crenshaw/LAX light rail line Downtown Inglewood Station without the need for shuttling would increase the attractiveness of rail transit, although this effect could be partially offset since only one rail line would be thus accessible. Although this alternative would have fewer effects on non-event days due to the reduced amount of ancillary uses, for major events it would be expected to have intersection, neighborhood street, and freeway facility impacts at a similar level as the Proposed Project, although distributed across the transportation system differently. Further, the location of the Alternative 3 site relative to The Forum and the NFL Stadium, would mean that Proposed Project impacts on intersections, neighborhood streets, freeway facilities, and public transit during concurrent events at The Forum and/or the NFL Stadium would be shifted and somewhat lessened from those for the Proposed Project during concurrent events.

Because Alternative 3 would not consolidate LA Clippers facilities on a single site, it would be less responsive to City and applicant objectives for the Proposed Project. In addition, reduction in the amount of development and separating the new arena from complementary uses in the HPSP would be less responsive to both the City and applicant objectives to increase economic activity in and revenues to the City, and to create a dynamic, year-round sports and entertainment district destination in the southwestern portion of the City. Further, although Alternative 3 would include relocation of current City Services Center and the firefighter training academy uses to the Arena Site portion of the Project Site, it would result in a less intensive use of the Project Site than the Proposed Project, and thus would be less responsive to City Objective 5 than the Proposed Project.

Finally, constructing the arena and related uses on the City Services Center Alternative site would require, as an initial matter, designing and constructing replacement facilities for those uses that are currently located on the Project Site, and, thus, it is uncertain if this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024-2025 season, and thus could be unable to meet project applicant Objective 1a.

Alternative 4: Baldwin Hills Alternative Site

Under Alternative 4, the Proposed Project would be constructed on a portion of the existing Baldwin Hills Crenshaw Plaza mall, located approximately 4.5 miles north of the Project Site in the City of Los Angeles community of Baldwin Hills. Alternative 4 would be constructed exclusively on the southern parcel of the existing mall site and would involve the demolition of the Sears store, the east parking structure along Crenshaw Boulevard, and smaller commercial and retail buildings along Stocker Street, Santa Rosalia Drive, and Marlton Avenue. The Baldwin Hills Alternative would be similar in size, function and character as the Proposed Project; however, this alternative would not include a hotel or a new potable water well.

Because the size of the arena and the amount of development would be essentially the same as the development in the Proposed Project, many of the impacts of the Proposed Project that are affected by the intensity of development would remain the same or very similar at the Baldwin Hills Alternative Site, but would occur in a location different from the Proposed Project. The impacts that would be similar include changes to visual character and shadow impacts, effects on biological resources, drainage and water quality, construction vibration, as well as demands on public services and utilities.

The Baldwin Hills Alternative would tend to marginally reduce construction air pollutant and GHG emissions and noise impacts due to the elimination of construction of the hotel and water well. Other impacts that would be reduced at this site include loss of protected trees, exposure to aircraft noise, and transportation effects during concurrent events at The Forum and/or NFL Stadium.

Conversely, several environmental impacts would be more severe at the Baldwin Hills Alternative site. Because two known archaeological sites are located on the Baldwin Hills site, impacts of the Baldwin Hills Alternative on archaeological resources, paleontological resources, and human remains would be greater than at the Project Site. The Baldwin Hills site area is

generally quieter than the Project Site vicinity, and thus the Proposed Project at this location would result in more severe noise impacts with Alternative 4 than under the Proposed Project. There are limitations in the sewer systems serving the Baldwin Hills site, resulting in the need for infrastructure improvements that could result in significant environmental impacts.

Under Alternative 4, the ability to walk to the Crenshaw/LAX light rail line Martin Luther King Jr. Station without the need for shuttling would increase the attractiveness of rail transit, although this effect could be partially offset since there would be access to only one rail line. The removal of a portion of the retail uses at Baldwin Hills Crenshaw Plaza shopping mall to accommodate the Proposed Project at the Baldwin Hills Alternative Site would reduce the net vehicle trip increase generated by the Proposed Project at this site. Although the net new trips generated by major events at the arena would be reduced somewhat, a substantial reduction in the level of intersection, neighborhood street, or freeway facility impacts would not be expected.

Average trip lengths for attendees of events at the Alternative 4 site would likely be shorter than those for events at the Proposed Project given the site's location closer to the regional center, reducing the significant VMT impacts identified for events at the Proposed Project, but not to a level that is less than significant. Given that the location of the Alternative 4 site is over 3 miles from The Forum and NFL Stadium, the level of additional project-related impact on intersections, neighborhood streets, freeway facilities, and public transit during concurrent events at The Forum and/or NFL Stadium would be substantially reduced from that for the Proposed Project during concurrent events.

Because the Baldwin Hills Alternative Site is located in the City of Los Angeles and not in the City of Inglewood, none of the City of Inglewood's objectives for the Proposed Project would be met under Alternative 4. Because the Baldwin Hills Alternative site would first require acquiring the site, and then designing and approving the project through the City of Los Angeles, it is uncertain whether this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024-2025 season; thus, this alternative could be unable to meet project applicant Objective 1a. While some of the applicant's other objectives could potentially be achieved at the Baldwin Hills site, this alternative would not combine with the future NFL Stadium to create a dynamic, year-round sports and entertainment district destination in the southwestern portion of Inglewood.

Alternative 5: The District at South Bay Alternative Site

Under Alternative 5, the Proposed Project would be relocated to a site in the City of Carson approximately 8 miles southeast of the Project Site on a 157-acre site that is a former Class II landfill that is currently undergoing remediation, and which was previously considered as a site for an NFL stadium that could have served as the home for the Chargers and Raiders franchises. Alternative 5 would involve the construction of an arena with 18,500 seats along with a pedestrian plaza, retail shops, outdoor stage, team practice facility, medical clinic, and team offices. Approximately 9,000 surface parking spaces would be provided on the site. This alternative would not include a hotel or a new potable water well.

Although located at a site 11 miles south of Inglewood, many of the impacts of Alternative 5 would be similar in magnitude as those of the Proposed Project. Such impacts include effects on scenic resources, shadows on residences and sensitive uses, geologic and seismic effects, exposure to accidental spills of hazardous materials, and effects on public services and utilities. Impacts that would be reduced under the District at South Bay Alternative compared to the Proposed Project would include effects related to biological resources, cultural resources, proximity to airports, surface drainage and water quality, and operational and construction noise.

Compared to the Proposed Project, the District at South Bay Alternative Site is located 11 miles further south from Staples Center and further from access to the LA Metro light rail system, trip making and VMT would be higher at this site. As a result, impacts related to VMT, criteria air pollutant and GHG emissions, and transportation energy would be greater than under the Proposed Project. Because the District at South Bay Alternative Site is a former landfill that is currently under remediation, development of this alternative has the potential to have impacts related to on-site contamination that would be more severe than those described for the Proposed Project.

Because Silver Line express bus service can be readily increased if needed and the Silver Line provides one-seat service to the Metro Red/Purple Lines and Union Station in downtown Los Angeles, it is anticipated that vehicle trip generation for events in the arena at the Alternative 5 site would be similar to that for the Proposed Project. As noted above, average trip lengths for attendees of events at the District at South Bay Alternative Site would likely be longer than those for events at the Proposed Project given the site's location farther from the regional center, increasing the level of the significant VMT impacts identified for events at the Proposed Project. Because of the immediate proximity of the Alternative 5 site to the I-110, I-405, and I-710 and local arterials, locating the Proposed Project on the District at South Bay Alternative Site would likely impact a lesser number of intersections and neighborhood streets than the Proposed Project. Because the location of the District at South Bay Alternative Site is over 8 miles from The Forum and the NFL Stadium, and thus the Proposed Project at this site would not be likely to have additional significant impacts on intersections, neighborhood streets, freeway facilities, and public transit during concurrent events at The Forum and/or the NFL Stadium.

Because The District at South Bay Alternative is located in the City of Carson and not in the City of Inglewood, none of the City of Inglewood's objectives for the Proposed Project would be met under Alternative 5. Because the District at South Bay Alternative site would first require acquiring the site, and then designing and approving the project through the City of Carson, it is uncertain whether this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024-2025 season; thus, this alternative could be unable to meet Project applicant Objective 1a. While this alternative could achieve some of the applicant's other objectives, it would not combine with the future NFL Stadium to create a dynamic, year-round sports and entertainment district destination in the southwestern portion of the City of Inglewood, and because of its distance from downtown Los Angeles, it may not meet the applicant's objective to develop on a site that is considered geographically desirable and accessible to the LA Clippers current and anticipated fan base.

Alternative 6: Hollywood Park Specific Plan Alternative Site

Under Alternative 6, elements of the Proposed Project would be developed on an approximately 12-acre site south of the NFL Stadium currently under construction within the HPSP area to the north of the Project Site across West Century Boulevard. As with the Proposed Project, Alternative 6 would involve the construction of a new multi-purpose arena to serve as the home of the LA Clippers NBA basketball team in the City of Inglewood and all of the related development included in the Proposed Project, including the relocation of the LA Clippers team offices and team practice and athletic training facility, but not including the proposed hotel or replacement potable water well.

The development of an arena under Alternative 6 would include an agreement between the operators of the NBA arena and the NFL Stadium to coordinate events and shared parking. A total of 1,045 additional parking spaces would be developed within surface parking areas and subterranean parking structures located within the Alternative 6 site, with the remainder of the parking need for this alternative being provided through the parking facilities within the HPSP area through coordination between the NFL Stadium, parking facility operators and the operator of the arena.

Most of the impacts of the HPSP Alternative would be equal to or less than the impacts of the Proposed Project. Because the HPSP Alternative site is located near the Project Site, impacts such as Aesthetics, Cultural Resources, Hazardous Materials, Hydrology and Water Quality, Land Use and Public Services would be similar to or the same as those described for the Proposed Project.

Because Alternative 6 would not include the development of a hotel and replacement water well, the emissions of criteria pollutants and GHG emissions would be somewhat reduced compared to the Proposed Project. Because the Alternative 6 site has been previously graded and prepared for development, it is devoid of trees and other biological resources, and thus would avoid the impacts of the Proposed Project on nesting bird habitat and loss of protected trees. As a result of the increased distance from the Alternative 6 site to nearby noise, vibration, and light sensitive receptors, impacts related to noise generated by construction and operation of the project, vibration related to on-site construction activities, and spillover light from project operations that would occur with the Proposed Project would be avoided with this alternative.

Alternative 6 would be of similar size to the Proposed Project, with similar access to transit, and would have similar vehicle trip generation for arena events and ancillary uses as the Proposed Project. Due to the proximity of the Alternative 6 site to restaurant and retail uses in the HPSP area, arrival and departure times would be less concentrated in time, but a material reduction in the level of intersection or freeway facility impacts would not be expected. Further, like the Proposed Project, because of pre- and post-event congestion Alternative 6 could adversely impact on-time performance for buses operating in the vicinity, and would have similar impacts on access to Centinela Hospital as the Proposed Project. The same mitigation measures for impacts on transit operations and emergency access that are required for the Proposed Project would be required for Alternative 6.

Impacts related to effects on neighborhood streets south and east of the Project Site would be diminished with Alternative 6 due to the lack of connectivity in the local roadway network near the HPSP site. In addition, because Alternative 6 would not include a hotel, it would not have a significant impact as a result of hotel-related VMT.

Because this alternative would be developed on the HPSP site and would include an agreement between the operators of the Alternative 6 arena and the NFL Stadium to coordinate events and shared parking, the potential for some concurrent event scenarios would be much less likely, including concurrent events at NFL Stadium and the Alternative 6 arena, as well as concurrent events at The Forum, the NFL Stadium, and the Alternative 6 arena.

While Alternative 6 would meet most of the City's objectives for the Proposed Project, the HPSP area is not underutilized to the same degree as the Project Site, and thus it would not be as responsive to City Objective 5 as the Proposed Project. The HPSP Alternative site is a privately owned property subject to a detailed specific plan (the Hollywood Park Specific Plan), as well as a Development Agreement between the City and the HPSP developer. These plans and agreements are currently being implemented. There is, therefore, substantial uncertainty regarding site control and the feasibility of this alternative. The development of Alternative 6 would potentially require amendments to the HPSP, which would require the consent of the landowner and approval of the City pursuant to the terms of the Development Agreement between the City and the property owner. As a result, it is uncertain whether this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024-2025 season. For this reason, this alternative could be unable to meet Project applicant Objective 1a.

Alternative 7: The Forum Alternative Site

Under Alternative 7, elements of the Proposed Project would be developed on an approximately 28-acre site currently occupied by the approximately 350,000 sf historic Forum concert and event venue (the Forum Alternative site), located approximately 0.8 miles north of the Project Site in the City of Inglewood. Similar to the Proposed Project, development under Alternative 7 would include the Arena Structure, including an approximately 915,000 sf arena to host LA Clippers NBA games and other events, the LA Clippers team offices (71,000 sf), the LA Clippers practice and training facilities (85,000 sf) and a sports medicine clinic (25,000 sf). Seating capacity of the arena under Alternative 7 would remain at 18,000 attendees for LA Clippers basketball games and a maximum capacity of up to 18,500 attendees for concert events.

The Forum Alternative site is currently developed with an historic concert venue known as The Forum, which has hosted sporting and entertainment events in the City since 1967 and is listed on both the National Register of Historic Places (National Register) and the California Register of Historical Resources (California Register). The development of a modern arena that meets NBA standards on the Forum Alternative site would require the acquisition of the site by the project applicant, and the demolition of the existing Forum building in order to provide sufficient land to potentially accommodate the uses included in the Proposed Project.

The event-related environmental characteristics of the Forum Alternative are similar to the conditions that exist today during events at The Forum. However, the estimated number of events (approximately 243 per year) would be increased compared to recent activity levels at The Forum (approximately 115 per year). Non-event day impacts would be similar to those described for the Proposed Project, and would be greater than exist today because the existing Forum building and site do not include any of the ancillary uses that would be included in this alternative. Impacts related to views and shadows, biological and cultural resources, hazardous materials and airport hazards, noise and vibration, and public services would be similar to those of the Proposed Project.

Construction air emissions would be somewhat increased under this alternative due to the increased demolition associated with the removal of the existing Forum building. Because this alternative would not include a hotel, the operational air pollutant and GHG emissions, water demand, wastewater generation, and energy demand would be reduced under the Forum Alternative. It is expected that lighting impacts of Alternative 7 would be less than those described for the Proposed Project, but with mitigation the effects would be similar.

Because the Forum Alternative arena and ancillary uses would be of similar size and in a similar setting as the Proposed Project, the trip generation and related impacts on intersections, local roadways, and freeways, as well as impacts related to emergency access to Centinela Hospital would be similar to those described for the Proposed Project. Since the on-site parking development in Alternative 7 is similar to the Proposed Project, a similar number of employees and event attendees would park off site, resulting in similar impacts related to pedestrian flows to and from the Alternative 7 site. Mitigation measures that would be the same or similar as the Proposed Project would be required to lessen the significant traffic impacts of the Forum, with a similar number of significant and unavoidable impacts.

Impacts related to effects on neighborhood streets south and east of the Project Site would be diminished with Alternative 7 due to the lack of connectivity in the local roadway network near the Forum site. In addition, because Alternative 7 would not include a hotel, it would not have a significant impact as a result of hotel-related VMT. Because this alternative involves the demolition of the historic Forum building, it would eliminate the potential for some concurrent event scenarios, including concurrent events at The Forum and the Proposed Project, as well as concurrent events at The Forum, the NFL Stadium, and the Proposed Project.

The Forum Alternative would result in a significant impact on aesthetics and historic resources as a result of the demolition of the National Register and California Register listed Forum building, an impact that would not occur with the Proposed Project. As explained above, the demolition of the historic Forum building would be a necessary element of this alternative because (1) there is no feasible method of adaptively reusing the historic structure to accommodate the construction of a modern NBA arena, and (2) there is insufficient land on the Forum Alternative site for the development of such an arena without demolition of the existing Forum building. Required mitigation measures would include documentation under the Historic American Building Survey, development and implementation of a salvage plan, and development of displays that tell the

history of The Forum. Even with these mitigation measures, the demolition of the historic Forum building would be significant and unavoidable impact.

Alternative 7 would meet most of the City's objectives for the Proposed Project, but because the Forum site is a viable business and key existing part of the City's entertainment district, it would fail to meet the City Objective 5 to transform vacant and underutilized land to the same extent as the Proposed Project. The Forum is a privately owned property subject to a Development Agreement between the City and The Forum property owner. There is, therefore, substantial uncertainty regarding site control and the feasibility of this alternative. Constructing the arena and related uses on the Forum Alternative site would first require that the site would become feasibly available and could be acquired by the project applicant, and then would require design and entitlement of Alternative 7 by the City of Inglewood. Thus, it is uncertain if this alternative site would allow the applicant to begin hosting LA Clippers home games in the 2024-2025 season. For this reason, Alternative 7 could be unable to meet project applicant Objective 1a.

Environmentally Superior Alternative

An EIR is required to identify the environmentally superior alternative from among the range of reasonable alternatives that are evaluated. If the No Project Alternative is considered environmentally superior, the EIR must identify which among the others is environmentally superior. It should be noted that environmental considerations are one set of the factors that must be considered by the public and the decision makers in deliberations on the Proposed Project. Other factors of importance include but are not limited to urban design, economics, social factors, and fiscal considerations.

From the alternatives evaluated in this EIR, the environmentally superior alternative would be Alternative 1 – the No Project Alternative. This alternative would avoid all significant impacts associated with the Proposed Project.

As discussed above, when the No Project Alternative is identified as the Environmentally Superior Alternative, CEQA requires the Lead Agency to select the Environmentally Superior Alternative from among the other alternatives considered in the EIR. The other alternatives would either not avoid most of the impacts of the Proposed Project (Alternative 2), or would result in many similar impacts but also result in additional material significant impacts that would not occur under the Proposed Project. The selection of an alternative that is considered environmentally superior often involves trade-offs between alternatives. For example, one alternative may have greater transportation impacts, while another may have lesser transportation impacts but greater cultural resources impacts. For these reasons, the identification of the Environmentally Superior Alternative is to a considerable degree inherently subjective and value based.

Among the other alternatives considered in this EIR, the City has determined that the Environmentally Superior Alternative would be Alternative 3 – the City Services Center Alternative. This alternative would (1) lessen impacts related to intensity of development by eliminating some of the ancillary uses and by developing on a smaller site than the Proposed

Project; (2) move some of the most intense vehicular activity associated with arena events further away from the most congested part of the City’s arterial network; (3) move this vehicular activity to an area that is further away from The Forum and the NFL Stadium, and thereby lessen transportation impacts occurring during concurrent events at those venues, and (4) maximize the opportunity for arena patrons to use transit because of its proximity to the LA Metro Crenshaw/LAX line Downtown Inglewood station.

Summary Table

Table S-2 (Summary of Impacts and Mitigation Measures), has been organized to correspond with the environmental issues discussed in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. The summary table is arranged in four columns:

1. Environmental impacts (“Impact”).
2. Level of significance without mitigation (“Significance Before Mitigation”).
3. Mitigation measures (“Mitigation Measure”).
4. The level of significance after implementation of mitigation measures (“Significance After Mitigation”).

If an impact is determined to be significant or potentially significant, feasible mitigation measures are identified, where appropriate. More than one mitigation measure may be required to reduce the impact to a less-than-significant level. This EIR assumes that all applicable plans, policies, and regulations would be implemented, including, but not necessarily limited to, City General Plan policies, laws, and requirements or recommendations of the City of Inglewood. Applicable plans, policies, and regulations are identified and described in the Regulatory Setting of each issue area and within the relevant impact analysis. A description of the organization of the environmental analysis, as well as key foundational assumptions regarding the approach to the analysis, is provided in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures.

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.1 Aesthetics			
<p>3.1-1: Construction and operation of the Proposed Project could substantially degrade the existing visual character or quality of public views of the site and its surroundings, or could conflict with the City's zoning and regulations governing scenic quality.</p>	LS	None required.	NA
<p>3.1-2: Construction and operation of the Proposed Project could create a new source of substantial light or glare which could adversely affect day or nighttime views in the area.</p>	PS	<p>Mitigation Measure 3.1-2(a) Construction Lighting. The project applicant shall implement the following measures to avoid or minimize disturbances related to construction lighting:</p> <ul style="list-style-type: none"> • Require construction contractors use construction-related lighting only where and when necessary for completion of the specific construction activity. • Require construction contractors to ensure that all temporary lighting related to construction activities or security of the Project Site is shielded or directed to avoid or minimize any direct illumination onto light-sensitive properties located outside of the Project Site. • Designate a Community Affairs Liaison and conspicuously post this person's number around the project site, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding to any local complaints about disturbances related to construction or security lighting. The Community Affairs Liaison shall receive all public complaints and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem. The Community Affairs Liaison shall coordinate with a designated construction contractor representative for the purpose of investigating the complaint and undertaking all feasible measures to protect public health and safety. • Adjacent residents within 500 feet of the Project Site shall be notified of the construction schedule, as well as the name and contact information of the project Community Affairs Liaison. 	LS
		<p>Mitigation Measure 3.1-2(b) Lighting Design Plan. Prior to issuance of a building permit, the project applicant shall submit to the City a Lighting Design Plan, based on photometric data, that demonstrates that project-contributed lighting from light-emitting diode (LED) lights, illuminated signs, or any other project lighting onto the light-sensitive receptor properties identified as SR 1, SR 2, and SR 4 in the LDA lighting analysis report would not result in more than 2 foot-candles of lighting intensity or generate direct glare onto the property so long as those sites are occupied by light-sensitive receptor uses, or that an illuminated sign from the Project would produce a light intensity of greater than 3 foot-candles above ambient lighting on residentially zoned property. Where existing conditions exceed these levels, the Lighting Design Plan shall avoid exacerbating existing conditions, but need not further reduce light levels on light-sensitive receptor properties.</p> <p>Measures to ensure that the lighting and illuminated signage from the Project would not exceed the identified thresholds may include but are not limited to relocating and or/shielding pole- or building-mounted LED lights; directing illuminated signage away from residential properties; implementing a screening material for parking garages or other structures to allow ventilation while reducing the amount of spill light; designing exterior lighting to confine illumination to the Project Site; restricting the operation of outdoor lighting to certain hour after events are completed; limiting the luminosity of certain lights or signs; and/or providing structural and/or vegetative screening from sensitive uses.</p>	

NOTES:

SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.1 Aesthetics (cont.)			
3.1-2 (cont.)		<p>Mitigation Measure 3.1-2(c) Hotel Design. The design of the proposed hotel shall be prohibited from using (1) reflective glass that exceeds 50 percent of any building surface and on the bottom three floors, (2) mirrored glass, (3) black glass that exceeds 25 percent of any surface of any building, and (4) metal building materials that exceed 50 percent of any street-facing surface of a building.</p>	
3.1-3: Construction and operation of the Proposed Project could cast shadows on shadow-sensitive uses for more than three hours between the hours of 9:00 AM and 3:00 PM PST on either the summer or winter solstice.	LS	None required.	NA
3.1-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could substantially degrade the existing visual character or quality of public views of the site and its surroundings, or conflict with the City's zoning and regulations governing scenic quality.	LS	None required.	NA
3.1-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could cumulatively create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	PS	<p>Mitigation Measure 3.1-5 Implement Mitigation Measures 3.1-2(a), 3.1-2(b), and 3.1-2(c) Construction Lighting, Lighting Design Plan, and Hotel Design.</p>	LS
3.2 Air Quality			
3.2-1: Construction and operation of the Proposed Project would conflict with implementation of the applicable air quality plan.	PS	<p>Mitigation Measure 3.2-1(a) Implement Mitigation Measure 3.14-2(b). Implementation of a comprehensive Transportation Demand Management (TDM) program.</p> <p>Mitigation Measure 3.2-1(b) Implement Mitigation Measure 3.2-2(b). Emergency Generator and Fire Pump Generator Maintenance & Testing.</p> <p>Mitigation Measure 3.2-1(c) Implement Mitigation Measure 3.2-2(c). Construction Emissions Minimization Plan.</p> <p>Mitigation Measure 3.2-1(d) Implement Mitigation Measure 3.2-2(d). Incentives for vendors and material delivery trucks to use ZE or NZE trucks during operation.</p>	SU

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.2 Air Quality (cont.)			
<p>3.2-2: Construction and operation of the Proposed Project would result in a cumulatively considerable net increase in NOx emissions during construction, and a cumulatively considerable net increase in VOC, NOx, CO, PM10, and PM2.5 during operation of the Proposed Project.</p>	PS	<p>Mitigation Measure 3.2-2(a) Implement Mitigation Measure 3.14-2(b).</p> <p>Mitigation Measure 3.2-2(b) Emergency Generator and Fire Pump Generator Maintenance & Testing. The Applicant shall conduct maintenance and/or testing of the emergency generators or fire pump generators on three separate non-event days. Each emergency generator shall be tested on a separate non-event day and the two fire pump generators may be tested together on a separate non-event day.</p> <p>Mitigation Measure 3.2-2(c) The project applicant shall prepare and implement a Construction Emissions Minimization Plan. Before a construction permit is issued, the project applicant shall submit this plan to the City Department of Public Works for review and approval. The plan shall detail compliance with the following requirements:</p> <ol style="list-style-type: none"> 1) The Plan shall set forth in detail how the project applicant will implement Project Design Feature 3.2-1. 2) The Plan shall require construction contractor(s) to use off-road diesel-powered construction equipment that meets or exceeds California Air Resources Board (CARB) and US Environmental Protection Agency (EPA) Tier 4 off-road emissions standards for equipment rated at 50 horsepower or greater. Such equipment shall be outfitted with Best Available Control Technology (BACT) devices including, but not limited to, a CARB certified Level 3 Diesel Particulate Filters. This requirement shall be included in applicable bid documents, and the successful contractor(s) shall be required to demonstrate the ability to supply compliant equipment prior to the commencement of any construction activities. A copy of each unit's certified tier specification and CARB or South Coast Air Quality Management District operating permit (if applicable) shall be available upon request at the time of mobilization of each applicable unit of equipment. The City shall require quarterly reporting and provision of written documentation by contractors to ensure compliance, and shall conduct regular inspections to ensure compliance with these requirements. 3) The project applicant shall require, at a minimum, that operators of heavy-duty haul trucks visiting the Project during construction commit to using 2010 model year or newer engines that meet CARB's 2010 engine emission standards of 0.01 grams per brake horsepower-hour (g/bhp-hr) for particulate matter (PM) and 0.20 g/bhp-hr of NO_x emissions or newer, cleaner trucks. In addition, the project applicant shall strive to use zero-emission (ZE) or near-zero-emission (NZE) heavy-duty haul trucks during construction, such as trucks with natural gas engines that meet CARB's adopted optional NO_x emissions standard of 0.02 g/bhp-hr. Contractors shall be required to maintain records of all trucks visiting the Project, and such records shall be made available to the City upon request. 4) The project applicant shall ensure all construction equipment and vehicles are in compliance with the manufacturer's recommended maintenance schedule. The project applicant shall maintain maintenance records for the construction phase of the Project and all maintenance records shall remain on site for a period of at least 2 years from completion of construction. 	SU

 LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.2 Air Quality (cont.)			
3.2-2 (cont.)		<p>5) The project applicant shall enter into a contract that notifies all construction vendors and contractors that vehicle idling time will be limited to no longer than 5 minutes or another timeframe as allowed by California Code of Regulations Title 13, section 2485, Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling, unless exempted by this regulation. For any vehicle that is expected to idle longer than 5 minutes, the project applicant shall require the vehicle's operator to shut off the engine. Signs shall be posted at the entrance and throughout the site stating that idling longer than 5 minutes is not permitted.</p> <p>Mitigation Measure 3.2-2(d) The project applicant shall provide incentives for vendors and material delivery trucks that would be visiting the Project to encourage the use of ZE or NZE trucks during operation, such as trucks with natural gas engines that meet CARB's adopted optional NOx emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr). At a minimum, incentivize the use of 2010 model year delivery trucks.</p>	
3.2-3: Construction and operation of the Proposed Project could expose sensitive receptors to substantial pollutant concentrations.	LS	None required.	NA
3.2-4: Construction and operation of the Proposed Project could result in other emissions (such as those leading to odors).	LS	None required.	NA
3.2-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in inconsistencies with implementation of applicable air quality plans.	PS	<p>Mitigation Measure 3.2-5(a) Implement Mitigation Measure 3.14-2(b). Implementation of a comprehensive Transportation Demand Management (TDM) program.</p> <p>Mitigation Measure 3.2-5(b) Implement Mitigation Measure 3.2-2(b). Emergency Generator and Fire Pump Generator Maintenance & Testing.</p> <p>Mitigation Measure 3.2-5(c) Implement Mitigation Measure 3.2-2(c). Construction Emissions Minimization Plan.</p> <p>Mitigation Measure 3.2-5(d) Implement Mitigation Measure 3.2-2(d). Incentives for vendors and material delivery trucks to use ZE or NZE trucks during operation.</p>	SU
3.2-6: Construction and operation Proposed Project, in conjunction with other cumulative development, would result in cumulative increases in short-term (construction) and long-term (operational) emissions.	PS	<p>Mitigation Measure 3.2-6(a) Implement Mitigation Measure 3.14-2(b). Implementation of a comprehensive Transportation Demand Management (TDM) program.</p> <p>Mitigation Measure 3.2-6(b) Implement Mitigation Measure 3.2-2(b). Emergency Generator and Fire Pump Generator Maintenance & Testing.</p>	SU

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.2 Air Quality (cont.)			
3.2-6 (cont.)		<p>Mitigation Measure 3.2-6(c) Implement Mitigation Measure 3.2-2(c). Prepare and implement a Construction Emissions Minimization Plan.</p> <p>Mitigation Measure 3.2-6(d) Implement Mitigation Measure 3.2-2(d). Incentivize use of ZE or NZE trucks.</p>	
3.2-7: Construction and operation Proposed Project, in conjunction with other cumulative development, could contribute to a cumulative exposure of sensitive receptors to substantial pollutant concentrations.	LS	None required.	NA
3.2-8: Construction and operation Proposed Project, in conjunction with other cumulative development, could result in cumulative increases of other emissions (such as those leading to odors).	LS	None required.	NA
3.3 Biological Resources			
3.3-1: Construction and operation of the Proposed Project would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service.	NI	None required.	NA

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.3 Biological Resources (cont.)			
3.3-2: Construction of the Proposed Project could have the potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	PS	<p>Mitigation Measure 3.3-2</p> <p>The project applicant shall conduct tree removal activities required for construction of the Project outside of the resident or migratory bird and raptor breeding season (February 1 through August 31) where feasible. For construction activities or ground disturbing activities such as demolition, tree and vegetation removal, or grading that would occur between February 1 through August 31, the project applicant shall retain a qualified biologist to conduct preconstruction surveys not more than one week prior to the commencement of construction activities in suitable nesting habitat within the Project Site for nesting birds and raptors. This survey shall include areas located within 100 feet from construction to avoid indirect impacts to nesting birds. During the preconstruction survey, nests detected shall be mapped using global positioning system software, and species confirmed to be nesting or likely nesting will be determined.</p> <p>If active nests for avian species protected under the Migratory Bird Treaty Act or California Fish and Game Code are found during the survey, the qualified biologist shall determine an appropriate buffer for avoiding the nest (where no work will occur) until the biologist is able to determine that the nest is no longer active. A minimum 100-foot no-work buffer shall be established around any active bird nest; however, the buffer distance may be adjusted by a qualified biologist depending on the nature of the work that is occurring in the vicinity of the nest, the known tolerance of the species to noises and vibrations, and/or the location of the nest. If, in the professional opinion of the qualified biologist, the Project would impact a nest, the biologist shall immediately inform the construction manager and work activities shall stop until the biologist delineates a suitable buffer distance and/or determines that the nest is no longer active.</p>	LS
3.3-3: Construction of the Proposed Project could have the potential to conflict with local policies or ordinances protecting biological resource, such as a tree preservation policy or ordinance.	PS	<p>Mitigation Measure 3.3-3</p> <p>a) To ensure that all new trees planted at a 1:1 ratio as required by the City's Tree Preservation Ordinance are of sufficient size, quantity, and quality, the following shall be implemented:</p> <ul style="list-style-type: none"> • Prior to any on-site tree disturbance or removal of any protected tree, a tree permit shall be obtained from the City of Inglewood in accordance with the City of Inglewood Tree Preservation Ordinance (Inglewood Municipal Code Chapter 12, Article 32). The tree permit shall identify the appropriate size of tree to be replaced (i.e., 36-inch box tree). • All replacement mitigation trees shall be monitored by a certified arborist annually for minimum of 3 years following the completion of construction and planting, respectively. Monitoring shall verify that all encroached and replacement trees are in good health at the end of the 3-year monitoring period. Any encroached or replacement tree that dies within the 3-year monitoring period shall be replaced, and the replacement tree shall be monitored annually for 3 years. Annual monitoring reports shall be prepared by a certified arborist and submitted to the City. The monitoring report shall depict the location of each encroachment and replacement mitigation tree, including a description of the health of each tree based on a visual assessment. 	LS

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.3 Biological Resources (cont.)			
3.3-3 (cont.)		<p>b) To ensure proper protection of trees to remain during project construction, the following shall be implemented.</p> <ul style="list-style-type: none"> • The Tree Protective Zone (TPZ) of protected trees to be retained and that are located within 25 feet from the grading limits, shall be enclosed with temporary fencing (e.g., free-standing chain-link, orange mesh drift fencing, post and wire, or equivalent). A smaller TPZ may be established in consultation with a certified arborist. The fencing shall be located at the limits of the TPZ and shall remain in place for the duration of construction activities in the area, or as determined by the City. • Prune selected trees to provide necessary clearance during construction and to remove any defective limbs or other parts that may pose a failure risk. All pruning shall be completed (or supervised) by a certified arborist and adhere to the Tree Pruning Guidelines of the International Society of Arboriculture. Trenching shall be routed so as to minimize damage to roots of protected trees roots if feasible. Any required trenching within the TPZ should be accomplished by the use of hand tools, to the extent feasible, while under the direct supervision of a certified arborist. If roots larger than 2 inches in diameter are encountered, the arborist shall provide recommendations for pruning or avoidance. Any major roots encountered should be conserved if feasible and treated as recommended by the arborist. If extensive disturbance to tree roots would occur such that tree health would be impacted as determined by the certified arborist, the tree shall be replaced at 1:1 per Mitigation Measure 3.3-3(a) above. • Any work conducted within the TPZ of a protected tree shall be monitored by a certified arborist. The monitoring arborist shall prescribe measures for minimizing or avoiding long-term impacts to the tree, such as selective pruning to minimize construction impacts. • No storage of equipment, supplies, vehicles, or debris should be allowed within the TPZ of a protected tree. No dumping of construction wastewater, paint, stucco, concrete, or any other clean-up waste should occur within the TPZ. No temporary structures should be placed within the TPZ. 	
3.3-4: Construction and operation of the Proposed Project, in combination with other cumulative development, could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	LS	None required.	NA
3.3-5: Construction and operation of the Proposed Project, in combination with other cumulative projects, could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	LS	None required.	NA

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.4 Cultural and Tribal Cultural Resources			
3.4-1: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of a historical resource pursuant to section 15064.5.	PS	<p>Mitigation Measure 3.4-1</p> <p>Retention of Qualified Archaeologist. Prior to the start of ground-disturbing activities associated with the Project, including demolition, trenching, grading, and utility installation, the project applicant shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (US Department of the Interior, 2008) to carry out all mitigation related to cultural resources.</p> <p>a) Monitoring and Mitigation Plan. Prepare, design, and implement a monitoring and mitigation program for the Project. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project Site, data recovery (including halting or diverting construction so that archaeological remains can be evaluated and recovered in a timely manner), artifact and feature treatment, procurement, and reporting. The Plan shall be prepared and approved prior to the issuance of the first grading permit.</p> <p>b) Cultural Resources Sensitivity Training. The qualified archaeologist and Native American Monitor shall conduct construction worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Plan as outlined in (i), for all construction personnel conducting, supervising, or associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.</p> <p>c) Archaeological and Native American Monitoring. The qualified archaeologist will oversee archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations such as grading, trenching, or any other excavation activity associated with the Project and as defined in the Monitoring and Mitigation Plan. If, after advanced notice, the Tribe declines, is unable, or does not respond to the notice, construction can proceed under supervision of the qualified archaeologist. The frequency of monitoring shall be based on the rate of excavation and grading activities, the materials being excavated, and the depth of excavation, and if found, the quantity and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased entirely, if determined adequate by the qualified archaeologist and the Native American monitor.</p> <p>d) In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the project applicant regarding recommendation for treatment and ultimate disposition of the resource(s).</p>	LS

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.4 Cultural and Tribal Cultural Resources (cont.)			
3.4-1 (cont.)		<ul style="list-style-type: none"> e) If it is determined that the discovered archaeological resource constitutes a historical resource or a unique archaeological resource pursuant to CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. f) In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the project applicant, and appropriate Native American representatives (if the find is of Native American origin). The Cultural Resources Treatment Plan shall provide for the adequate recovery of the scientifically consequential information contained in the archaeological resource through laboratory processing and analysis of the artifacts. The Treatment Plan will further make recommendations for the ultimate curation of any archaeological materials, which shall be curated at a public, non-profit curation facility, university or museum with a research interest in the materials, if such an institution agrees to accept them. If resources are determined to be Native American in origin, they will first be offered to the Tribe for permanent curation, repatriation, or reburial, as directed by the Tribe. If no institution or Tribe accepts the archaeological material, then the material shall be donated to a local school or historical society in the area for educational purposes. g) If the resource is identified as a Native American, the qualified archaeologist and project applicant shall consult with appropriate Native American representatives, as identified through the AB 52 consultation process in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered, to the extent feasible. h) Prepare a final monitoring and mitigation report for submittal to the applicant, and the South Central Coastal Information Center (SCCIC), in order to document the results of the archaeological and Native American monitoring. If there are significant discoveries, artifact and feature analysis and final disposition shall be included with the final report, which will be submitted to the SCCIC and the applicant. The final monitoring report shall be submitted to the applicant within 90 days of completion of excavation and other ground disturbing activities that require monitoring. 	
3.4-2: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5.	PS	Mitigation Measure 3.4-2 Implement Mitigation Measure 3.4-1.	LS

NOTES:
LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.4 Cultural and Tribal Cultural Resources (cont.)			
<p>3.4-3: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of a Tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:</p> <ul style="list-style-type: none"> i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1 (k). ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe. 	PS	<p>Mitigation Measure 3.4-3 Implement Mitigation Measure 3.4-1.</p>	LS
<p>3.4-4: Construction of the Proposed Project could have the potential to disturb human remains including those interred outside of dedicated cemeteries.</p>	PS	<p>Mitigation Measure 3.4-4 Inadvertent Discovery of Human Remains. In the event of the unanticipated discovery of human remains during excavation or other ground disturbance related to the Project, all work shall immediately cease within 100 feet of the discovery and the County Coroner shall be contacted in accordance with PRC section 5097.98 and Health and Safety Code section 7050.5. The project applicant shall also be notified. If the County Coroner determines that the remains are Native American, the California Native American Heritage Commission (NAHC) shall be notified in accordance with Health and Safety Code section 7050.5, subdivision (c), and PRC section 5097.98 (as amended by AB 2641). The NAHC shall designate a Most Likely Descendant (MLD) for the remains per PRC section 5097.98. Until the landowner has conferred with the MLD, the project applicant shall ensure that a 50-foot radius around where the discovery occurred is not disturbed by further activity, is adequately protected according to generally accepted cultural or archaeological standards or practices, and that further activities take into account the possibility of multiple burials.</p>	LS

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.5 Energy Demand and Conservation (cont.)			
3.5-3: Construction and operation of the Proposed Project could result in the relocation or construction of new or expanded electric power, natural gas or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.	LS	None required.	NA
3.5-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could cause wasteful, inefficient, or unnecessary consumption of energy resources during construction or operation of the Proposed Project.	LS	None required.	NA
3.5-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could conflict with or obstruct a State or local plan for renewable energy or energy efficiency.	LS	None required.	NA
3.5-6: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in the relocation or construction of new or expanded electric power, natural gas or telecommunication facilities, the construction or relocation of which could cause significant environmental effects.	LS	None required.	NA
3.6 Geology and Soils			
3.6-1: Construction and operation of the Proposed Project could have the potential to result in the substantial erosion or the loss of topsoil.	PS	Mitigation Measure 3.6-1 Implement Mitigation Measure 3.9-1(a). Comply with Applicable Regulations as Approved by the City and the Los Angeles Regional Water Quality Control Board (RWQCB).	LS
3.6-2: Construction of the Proposed Project could have the potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	PS	Mitigation Measure 3.6-2 A qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards (SVP, 2010) shall be retained by the project applicant and approved by the City prior to the approval of grading permits. The qualified paleontologist shall:	LS

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.6 Geology and Soils			
3.6-2 (cont.)		<ul style="list-style-type: none"> a) Prepare, design, and implement a monitoring and mitigation program for the Project consistent with Society of Vertebrate Paleontology Guidelines. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project Site, data recovery (including halting or diverting construction so that fossil remains can be salvaged in a timely manner), fossil treatment, procurement, and reporting. The Plan monitoring and mitigation program shall be prepared and approved by the City prior to the issuance of the first grading permit. If the qualified paleontologist determines that the Project-related grading and excavation activity will not affect Older Quaternary Alluvium, then no further mitigation is required. b) Conduct construction worker paleontological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Plan as outlined in (a). In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. The training session shall provide instruction on the recognition of the types of paleontological resources that could be encountered within the Project Site and the procedures to be followed if they are found. Documentation shall be retained by the qualified paleontologist demonstrating that the appropriate construction personnel attended the training. c) Direct the performance of paleontological resources monitoring by a qualified paleontological monitor (meeting the standards of the SVP, 2010). Paleontological resources monitoring shall be conducted pursuant to the monitoring and mitigation program developed under (a), above. Monitoring activities may be altered or ceased if determined adequate by the qualified paleontologist. Monitors shall have the authority to, and shall temporarily halt or divert work away from exposed fossils or potential fossils, and establish a 50-foot radius temporarily halting work around the find. Monitors shall prepare daily logs detailing the types of ground disturbing activities and soils observed, and any discoveries. d) If fossils are encountered, determine their significance, and, if significant, supervise their collection for curation. Any fossils collected during Project-related excavations, and determined to be significant by the qualified paleontologist, shall be prepared to the point of identification and curated into an accredited repository with retrievable storage. e) Prepare a final monitoring and mitigation report for submittal to the City in order to document the results of the paleontological monitoring. If there are significant discoveries, fossil locality information and final disposition shall be included with the final report which will be submitted to the appropriate repository and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that could affect Older Quaternary Alluvium. 	
3.6-3: Construction and operation of the Proposed Project in conjunction with other cumulative development, could have the potential to result in substantial erosion or loss of topsoil.	PS	Mitigation Measure 3.6-3 Implement Mitigation Measure 3.9-1(a). Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB.	LS
3.6-4: Construction of the Proposed Project, in conjunction with other cumulative development, could have the potential to contribute to cumulative impacts on paleontological resources.	PS	Mitigation Measure 3.6-4 Implement Mitigation Measure 3.6-2.	LS

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.7 Greenhouse Gas Emissions			
3.7-1: Construction and operation of the Proposed Project could generate "net new" GHG emissions, either directly or indirectly, that could have a significant impact on the environment.	S	<p>Mitigation Measure 3.7-1(a)</p> <p>1) Project GHG Emissions. Estimate the Project's net new GHG emissions over the 30-year operational life of the Project. The estimate shall be based on final design, project-specific traffic generation, actual energy use estimates, equipment to be used on site, and other emission factors appropriate for the Project, using the best available emissions factors for electricity, transportation engines, and other GHG emission sources commonly used at the time the GHG Reduction Plan is completed, reflecting existing vehicle emission standards and building energy standards. Net operational (incremental) emissions shall be derived by adding the annual operational emissions and backfill emissions and then subtracting from that total existing emissions and emissions from relocated LA Clippers games and market shifted non-NBA events, as illustrated in Table 3.7-9a and Table 3.7-9b. The estimate shall include the Project's construction GHG emissions, which shall be amortized over the 30-year operational life of the Project, shown in Table 3.7-7 to be 603 metric tons of carbon dioxide equivalent (MTCO_{2e})/year.</p> <p>2) GHG Mitigation. Include reduction measures that are sufficient to reduce or offset incremental emissions over the net neutral threshold, are verifiable, and are feasible to implement over project life. At a minimum, the GHG Reduction Plan shall include: (i) implementation of all measures set forth under Section A. below; and (ii) emissions reductions associated with implementation of Project Design Features 3.2-1 and 3.2-2 and Mitigation Measures 3.2-2(b) and 3.14-2(b) regarding the reduction of NO_x and PM_{2.5} emissions, to the extent these features and measures have co-benefits in the form of quantifiable GHG emissions reductions. The project applicant shall be required to implement a combination of measures identified in Section B below, or co-benefits of NO_x and PM_{2.5} emissions reduction measures required under AB 987, to achieve any remaining GHG emission reductions beyond those identified in (i) and (ii) above necessary to meet the no net new GHG emissions threshold over the 30-year operational life of the Project.</p> <p>A. Required GHG Reduction Measures.</p> <p>a. Minimize energy demand, including electricity and natural gas demand through implementation of LEED Gold certification design features.</p> <p>b. Implement a transportation demand management (TDM) program that includes the following, subject to further refinement and revision through coordination between the City and the project applicant at the time of project approval:</p> <p>i. TDM 1 – Encourage Alternative Modes of Transportation (Rail, Public Bus, and Vanpool). The IBEC Project shall encourage alternative modes of transportation use by providing monetary incentives and bus stop improvements near the Project Site such as, but not limited to:</p> <ul style="list-style-type: none"> • Integrated event and transit ticketing to enable seamless connections and provide event-day travel updates. • Discounted event tickets with the purchase of a transit pass or providing proof of a registered TAP card (the regional fare payment method). • Giveaways for transit users (goods for attendees, free tickets for employees, etc.). 	LS

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.7 Greenhouse Gas Emissions (cont.)			
3.7-1 (cont.)		<ul style="list-style-type: none"> • Rewards/gamification opportunities for fans to compete for prizes or points based on their transportation choices. • Bus stop facilities improvements: the IBEC Project shall provide on-site and/or off-site improvements such as lighting, new benches and overhead canopies, added bench capacity if needed, and real-time arrival information for an improved user experience for bus stops that are relocated as a result of the IBEC Project. • Transit and/or Multi-Modal Subsidy: the IBEC Project shall provide pre-tax commuter benefits for employees. • Vanpool Subsidy: This shall provide pre-tax commuter benefits for employees. • Marketing and outreach campaign to event attendees and employees for transit usage. 	
		<p>ii. TDM 2 – Event-day Dedicated Shuttle Services</p> <p>The following shall be provided to ensure sufficient connectivity to existing and planned Metro Rail Stations:</p> <ul style="list-style-type: none"> • The IBEC Project shall provide dedicated shuttle service from the Green Line at Hawthorne Station, Crenshaw/LAX Line at AMC/96th Station, and Crenshaw/LAX Line at La Brea/Florence (Downtown Inglewood) Stations for Arena events. This shuttle service shall be a dedicated event-day shuttle service from the venue for employees and attendees. • The IBEC Project shall provide no less than 27 shuttles with a capacity of no less than 45 persons per shuttle to accommodate employees and attendees traveling to and from the Project Site. Due to the arrival and departure of employees prior to and after the attendees, respectively, the same shuttles shall be utilized for the employees. Shuttle service shall begin no less than two hours before the event and extend to at least 30 minutes after the start of the event. After the event, shuttle service shall begin no less than 30 minutes before the end of the event and shall continue for at least one hour after the end of the event. • The IBEC Project shall implement Mitigation Measure 3.14-2(b), requiring the IBEC operator to provide enough shuttles to ensure that there is successful and convenient connectivity with short wait times to these light rail stations. To this end, the IBEC operator will monitor the number of people using shuttles to travel between the above light rail stations and the IBEC. If the monitoring shows that peak wait times before or after major events exceeds 15 minutes, then the IBEC operator must add enough additional shuttle runs to reduce wait times to meet this target. The aim is to require increased shuttle runs as necessary to make sure that demand is accommodated within a reasonable amount of time and to encourage use of transit. • The IBEC Project shall provide a convenient and safe location on site for shuttle pick-up and drop-off on the east side of South Prairie Avenue, approximately 250 feet south of West Century Boulevard. The drop-off location shall be adjacent to the Arena so that shuttle users would not need to cross South Prairie Avenue to arrive at the Arena. The IBEC Project shall implement Mitigation Measure 3.14-3(f), which requires constructing a dedicated northbound right-turn lane that would extend from the bus pull-out on the east side of South Prairie Avenue to West Century Boulevard. 	

NOTES:
 LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.7 Greenhouse Gas Emissions (cont.)			
3.7-1 (cont.)		<p>iii. TDM 3 – Encourage Carpools and Zero-Emission Vehicles</p> <p>The IBEC Project shall provide incentives to encourage carpooling and zero-emission vehicles as a means for sharing access to and from the Project Site. The incentives shall include:</p> <ul style="list-style-type: none"> • Incentives for carpools or zero-emission vehicles, including preferential parking with the number of parking spots in excess of applicable requirements, reduced parking costs, discounted rides (or other, similar benefits) to incentivize sharing/pooling for attendees using transportation network company (TNC) rides to or from an event, or other discounts/benefits. • Variable parking price based on car occupancy - structured to encourage carpooling. • 8 percent of parking spaces with electrical vehicle charging stations in excess of the minimum requirement of 6 percent (i.e., a minimum of three hundred and thirty (330) electric vehicle charging stations (EVCS) shall be installed within the three proposed on-site parking garages serving the Project for use by employees, visitors, event attendees, and the public). <p>iv. TDM 4 – Encourage Active Transportation</p> <p>The IBEC Project shall include features that would enhance the access for bicyclists and pedestrians, including the following:</p> <ul style="list-style-type: none"> • Bicycle parking in excess of applicable code requirements as follows: 60 employee bike parking spaces and 23 attendee bike parking spaces. • Showers and lockers for employees. • A bike valet service if needed to accommodate bike parking space needs. • A bicycle repair station where bicycle maintenance tools and supplies are readily available on a permanent basis and offered in good condition. • Coordination of bike pools and walk pools. • Sidewalks or other designated pathways following safe routes from the pedestrian circulation to the bicycle parking facilities and throughout the development. <p>v. TDM 5 – Employee Vanpool Program</p> <p>The IBEC Project shall provide an employee vanpool program to accommodate up to 66 employees utilizing the vanpool service. Each vanpool shall have a capacity of at least 15 persons per vehicle. The vanpool program shall be in conjunction with a vanpool subsidy providing pre-tax commuter benefits for employees as indicated in TDM 1.</p> <p>vi. TDM 6 – Park-n-Ride Program</p> <p>The IBEC Project shall provide a regional park-n-ride program that utilizes charter coach buses with a capacity of no less than 45 persons per bus. Parking lot locations shall correspond to zip code ticket purchase data, and the site circulation shall be designed to account for the charter coaches.</p>	

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.7 Greenhouse Gas Emissions (cont.)			
3.7-1 (cont.)		<p>vii. TDM 7 – Information Services</p> <p>The IBEC Project shall provide services to inform the public about activities at the IBEC, including the following:</p> <ul style="list-style-type: none"> • Strategic Multi-modal Signage/Wayfinding • Real-time travel information; Changeable Message Sign (CMS) and social media • Welcome packets for new employees and ongoing marketing • Commercials/Advertisement - Television, Website, Social Media, Radio, etc. • Information kiosk or bulletin board providing information about public transportation options. <p>viii. TDM 8 – Reduce On-Site Parking Demand</p> <p>The IBEC Project shall include features that reduce on-site parking demand. These features shall include:</p> <ul style="list-style-type: none"> • Provide coach bus/minibus/microtransit staging and parking areas: the IBEC Project is designed to accommodate 20 minibus/microtransit/paratransit parking spaces and 23 charter coach bus spaces. The capacity for minibus/microtransit/paratransit shall be no less than 10 persons per vehicle. • Allocate sufficient TNC staging spaces: the IBEC Project shall be designed to accommodate approximately 160 spaces for TNC staging. <p>ix. TDM 9 – Event Day Local Microtransit Service</p> <p>The IBEC Project shall provide a local minibus/microtransit³ service for all event days with a service range of approximately 6 miles surrounding the Project Site. Each minibus shall have a capacity of no less than 10 persons per vehicle and shall provide service to employees and event attendees.</p> <p>x. Monitoring</p> <p>The TDM Program shall include an ongoing program to monitor each of the TDM Program elements listed above. The monitoring program shall collect data on the implementation of each specific TDM strategy and shall assess the extent to which the TDM Program is meeting demand for alternative forms of transportation and reducing vehicle trips and reliance on private automobiles. The information obtained through this monitoring program shall be provided to the City Traffic Engineer on an annual basis.</p> <p>c. A monitoring report shall be prepared not less than once each year. The report shall evaluate the extent to which the TDM Program encourages employees to reduce single-occupancy vehicle trips and to use other modes of transportation besides automobile to travel to basketball games and other events hosted at the Project. The monitoring report shall be provided to the City Traffic Engineer (ongoing) and the State of California Office of Planning and Research (through 2030).</p>	

³ A minibus is a physically smaller bus and/or shuttle (i.e., with capacity for 20 or fewer people). Microtransit refers to short-distance (i.e., approximately 6 miles or less) shuttle service.

3.7 Greenhouse Gas Emissions (cont.)			
3.7-1 (cont.)		<ul style="list-style-type: none"> d. The TDM Program shall be a dynamic document that is expected to be revised and refined as monitoring is performed, experience is gained, additional information is obtained regarding the Project transportation characteristics, and advances in technology or infrastructure become available. Any changes to the TDM Program shall be subject to review and approval by the City Traffic Engineer. In reviewing any proposed changes to the TDM Program, the City Traffic Engineer shall ensure that the TDM Program, as revised, is equally or more effective in addressing the issues set forth above. e. Install "smart parking" systems in the on-site parking garages serving the Project to reduce vehicle circulation and idle time within the structures by more efficiently directing vehicles to available parking spaces. 	
		<p>B. Potential Additional GHG Reduction Measures</p> <p>The GHG Reduction Plan shall identify and quantify any additional GHG reduction measures proposed by the project applicant to reduce incremental emissions to below the net zero threshold. These additional measures may include one or more of the following:</p> <ul style="list-style-type: none"> a. Potential on-site measures: <ul style="list-style-type: none"> i. Installation of additional photovoltaic systems as carports on the Eastern Parking Garage. ii. Purchase of energy for on-site consumption through the Southern California Edison (SCE) Green Rate, which facilitates SCE's purchase of renewable energy to meet the needs of Green rate participants from solar renewable developers within the SCE service territory or similar opportunities for renewable electricity that may arise in the future. iii. If available after approval by applicable regulatory agencies, on-site use of renewable natural gas.⁴ iv. Implementation of a waste diversion program with a goal of reducing landfill waste to zero. b. Potential off-site measures: <ul style="list-style-type: none"> i. Carbon offset credits. The project applicant may purchase carbon offset credits that meet the requirements of this paragraph. Carbon offset credits must be verified by an approved registry. An approved registry is an entity approved by CARB to act as an "offset project registry" to help administer parts of the Compliance Offset Program under CARB's Cap and Trade Regulation. Carbon offset credits shall be permanent, additional, quantifiable, and enforceable. ii. Transit and City Fleet Vehicles Replacement. The project applicant may enter into an agreement to cover replacement costs of existing City municipal fleet and transit vehicles with Zero Emissions Vehicles (ZEVs) and install related Electric Vehicle Charging Stations (EVCS). iii. Local EV Charging Stations. The project applicant may enter into agreements to install EVCS locations in the City for use by the public. iv. The project applicant may develop or enter into partnership with other organizations to develop a tree planting program in the City. 	

⁴ Renewable natural gas is a biogas which has been upgraded to a quality similar to fossil natural gas and having a methane concentration of 90% or greater. A biogas is a gaseous form of methane obtained from biomass. By upgrading the quality to that of natural gas, it becomes possible to distribute the gas to customers via the existing gas grid within existing appliances.

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
		v. EV Home Charger Program. The project applicant may implement a program to cover 100 percent of the costs of purchasing and installing EV chargers for residential use in local communities near the Project Site.	
3.7 Greenhouse Gas Emissions (cont.)			
3.7-1 (cont.)		<p>The GHG Reduction Plan may include different, substitute GHG reduction measures that are equally effective or superior to those proposed above, as new technology and/or other feasible measures become available during construction or the operational life of the Project. The GHG Reduction Plan shall identify such different, substitute GHG reduction measures, and shall provide enough information to assess the feasibility of these measures. The project applicant may rely on such measures only if they are reviewed by the City Chief Building Official, are quantified, are found to be feasible, and are found to be at least as effective as those measures listed above. The Plan shall identify and quantify any other GHG reduction measures needed to reduce the Project incremental GHG emissions to no net new GHG emissions, or better.</p> <p>Mitigation Measure 3.7-1(b)</p> <p>Annual GHG Verification Report. The project operator shall prepare an Annual GHG Verification Report, which shall be submitted to the City, with a copy provided to CARB, in the first quarter of each year following the commencement of project operations. The Annual GHG Verification Report shall estimate the Project's emissions for the previous year based on operational data and methods, and using appropriate emissions factors for that year, as set forth in the GHG Reduction Plan, and determine whether additional offset credits, or other measures, are needed for the Project to result in net zero GHG emissions. It shall include a process for verifying the actual number and attendance of net new, market-shifted, and backfill events.</p> <p>If an Annual GHG Verification Report determines that the Project's emissions for the previous year were lower than necessary to achieve net zero GHG emissions, credit for any emissions reductions achieved below net zero shall be applied to the next year in the following Annual GHG Verification Report. The Annual GHG Verification Report shall be verified by a qualified, independent expert entity retained at the project applicant's expense. GHG offset credits to achieve net zero GHG emissions for the previous year, if necessary, shall have been purchased by the end of each reporting year.</p> <p>Following completion and verification of the Annual GHG Verification Report, the GHG Reduction Plan shall be refined as may be needed in order to maintain emissions below net zero over the next reporting year. Any such revisions shall be prepared by the qualified expert retained by the project applicant and shall be subject to review and approval by the City.</p> <p>In reviewing the GHG Reduction Plan, any revisions to that plan, or other reports related to implementation of the Plan, the City may retain a qualified expert to assist with this review. The selection of such an expert shall be at the City's discretion. Any expenses incurred by the City in retaining this expert shall be borne by the project applicant.</p> <p>The provisions of this Mitigation Measure 3.7-1(b) may be consolidated with the reporting obligations pursuant to AB 987, as memorialized in the conditions of approval to the Project, into a single GHG reduction monitoring and verification report.</p>	
3.7-2: Construction and operation of the Proposed Project could be inconsistent with applicable plans, policies and regulations adopted for the purpose of reducing the emissions of GHGs.	LS	None required.	NA

NOTES:
LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.8 Hazards and Hazardous Materials			
3.8-1: Construction and operation of the Proposed Project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	LS	None required.	NA
3.8-2: Construction and operation of the Proposed Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	LS	None required.	NA
3.8-3: Construction and operation of the Proposed Project could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.	LS	None required.	NA
3.8-4: Construction and operation of the Proposed Project would be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, could have the potential to create a significant hazard to the public or the environment.	PS	<p>Mitigation Measure 3.8-4</p> <p>Prior to initiating any ground disturbing activities on the Project Site, the project applicant shall prepare a Soil Management Plan (SMP) that is submitted and approved by the Los Angeles County Health Hazardous Materials Division (HHMD). The SMP shall be prepared by a Registered Environmental Assessor (REA) or other qualified expert, and shall address the findings of the two EKI technical memoranda dated June 28, 2019, and/or subsequent relevant studies.</p> <p>During construction, the contractor shall implement the SMP. If unidentified or suspected contaminated soil or groundwater evidenced by stained soil, noxious odors, or other factors, is encountered during site preparation or construction activities on any portion of the Project Site, work shall stop in the excavation area of potential contamination. Upon discovery of suspect soils or groundwater, the contractor shall notify the HHMD and retain an REA or qualified professional to collect soil samples to confirm the type and extent of contamination that may be present.</p> <p>If contamination is confirmed to be present, any further ground disturbing activities within areas of identified or suspected contamination shall be conducted according to a site specific health and safety plan, prepared by a California state licensed professional. The contractor shall follow all procedural direction given by HHMD and in accordance with the SMP to ensure that suspect soils are isolated, protected from runoff, and disposed of in accordance with transport laws and the requirements of the licensed receiving facility.</p> <p>If contaminated soil or groundwater is encountered and identified constituents exceed human health risk levels, ground disturbing activities shall not recommence within the contaminated areas until remediation is complete and a "no further action" letter is obtained from the appropriate regulatory agency or direction is otherwise given that construction can commence. The project applicant shall submit the "no further action" letter or equivalent notification to the City prior to resumption of any ground disturbing activity on the relevant portion of the Project Site.</p>	LS

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.8 Hazards and Hazardous Materials (cont.)			
3.8-5: Construction and operation of the Proposed Project would be located within an airport land use plan area and could result in a safety hazard or excessive noise for people residing or working in the project area or could create a hazard to navigable airspace and/or operations at a public airport.	PS	Mitigation Measure 3.8-5 The project applicant shall submit an application to the Airport Land Use Commission (ALUC) for a determination that that the Project is consistent with the Airport Land Use Plan. The project applicant shall submit Form 7460-1, "Notice of Proposed Construction or Alteration," to the Federal Aviation Administration (FAA) or notify the FAA through the Obstacle Evaluation/Airport Airspace Analysis system, consistent with the requirements of 14 Code of Federal Regulations (CFR) Part 77, prompting completion of an aeronautical study to determine whether the Project would constitute a hazard to air navigation. A copy of the 14 CFR Part 77 notification shall be included in the compatibility review application for the Project. Prior to the issuance of building permits, the project applicant shall provide the City with a copy of the ALUC-issued consistency determination, and the FAA-issued "Determination of No Hazard to Air Navigation." The project applicant shall implement all recommendations made by the FAA, including those for marking and lighting of project components that are determined to constitute obstructions in federal airspace, and any requirements set forth in the ALUC consistency determination regarding height restrictions.	LS
3.8-6: Construction and operation of the Proposed Project could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	LS	None required.	NA
3.8-7: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	LS	None required.	NA
3.8-8: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	LS	None required.	NA
3.8-9: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.	LS	None required.	NA

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.8 Hazards and Hazardous Materials (cont.)			
3.8-10: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could be located on sites that are included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, could create a significant hazard to the public or the environment.	LS	None required.	NA
3.8-11: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would be located within an airport land use plan area and could cumulatively result in a safety hazard or excessive noise for people residing or working in the project area, or could create a hazard to navigable airspace and/or operations at a public airport	LS	None required.	NA
3.8-12: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	LS	None required.	NA
3.9 Hydrology and Water Quality			
3.9-1: Construction and operation of the Proposed Project could have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality, or conflict with or obstruct implementation of a water quality control plan.	PS	<p>Mitigation Measure 3.9-1(a)</p> <p>Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB. The project applicant shall comply with the MS4 permit regulations, NPDES General Construction Permit, Inglewood Municipal Code regulations, the County's LID Standards Manual, and the USGBC's LEED program. A LID Report and SWPPP shall be prepared to the satisfaction of the City and Los Angeles RWQCB to ensure the prevention of substantial water quality degradation during construction and operation of the Project. These plans shall be approved by the City and Los Angeles RWQCB to confirm that these permit and regulatory requirements have been satisfied before construction commences on the site.</p> <p>Mitigation Measure 3.9-1(b)</p> <p>Sweeping. Operation of the Project shall include periodic sweeping to remove oil, grease, and debris from parking lots of 25 spaces or more. Such sweeping shall occur not less than weekly.</p>	LS

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.10 Land Use and Planning			
3.10-1: Construction and operation of the Proposed Project could physically divide an established community.	LS	None required.	NA
3.10-2: Construction and operation of the Proposed Project could conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.	LS	None required.	NA
3.10-3: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could physically divide an established community.	LS	None required.	NA
3.10-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.	LS	None required.	NA
3.11 Noise and Vibration			
3.11-1: Construction of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	PS	<p>Mitigation Measure 3.11-1</p> <p>Construction Noise Reduction Plan. Prior to the issuance of any demolition or construction permit for each phase of project development, the project applicant shall develop a Construction Noise Reduction Plan to minimize daytime and nighttime construction noise at nearby noise sensitive receptors. The plan shall be developed in coordination with an acoustical consultant and the project construction contractor, and shall be approved by the City Chief Building Official. The Plan shall include the following elements:</p> <ul style="list-style-type: none"> • A sound barrier plan that includes the design and construction schedule of the temporary and permanent sound barriers included as project design features for the Project, or sound barriers that achieve an equivalent or better reduction in noise levels to noise-sensitive receptors. • Buffer distances and types of equipment selected to minimize noise impacts. • Haul routes subject to preapproval by the City. • Construction contractors shall utilize equipment and trucks equipped with the best available noise control techniques, such as improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically attenuating shields or shrouds, wherever feasible. 	SU

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.11 Noise and Vibration (cont.)			
3.11-1 (cont.)		<ul style="list-style-type: none"> • Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. • Stationary noise sources (e.g., generators) shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or other measures to the extent feasible. Pole power shall be utilized at the earliest feasible point in time, and to the maximum extent feasible in lieu of generators. If stationary construction equipment such as diesel- or gasoline-powered generators, must be operated continuously, such equipment must be located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible. • Use of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions. • Designate a Community Affairs Liaison and conspicuously post this person's number around the project site, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding to any local complaints about construction activities. This Community Affairs Liaison shall receive all public complaints about construction noise disturbances and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem. The Community Affairs Liaison shall coordinate with a designated construction contractor representative for the purpose of investigating the noise disturbance and undertaking all feasible measures to protect public health and safety. • Adjacent noise-sensitive residents and commercial uses (i.e., educational, religious, transient lodging) within 500 feet of demolition and pile driving activity shall be notified of the construction schedule, as well as the name and contact information of the project Community Affairs Liaison. 	
<p>3.11-2: Operation of the Proposed Project would result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Proposed Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.</p>	PS	<p>Mitigation Measure 3.11-2(a)</p> <p>Noise Reduction Plan. The project applicant shall prepare a Noise Reduction Plan for Major event pre- and post-event conditions that results in composite noise levels from amplified sound and mechanical equipment of no more than 3 dBA over ambient conditions at any noise-sensitive receptor. The level of noise reduction shall be documented by a qualified noise consultant and submitted to the City. The Noise Reduction Plan shall be submitted to and approved by the City prior to the first Major Event at the Arena. Noise reduction strategies could include, but are not limited, the following.</p> <ul style="list-style-type: none"> • Construction of the permanent sound barriers included in the Project as project design features, or construction of permanent sound barriers that achieve an equivalent or better noise reduction as the permanent sound barriers proposed as project design features. • Equip noise generating mechanical equipment, including emergency generators, transformers, and HVAC units with sound enclosures. • Locate noise generating mechanical equipment at the furthest distance from sensitive receptors as feasible. 	SU

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.11 Noise and Vibration (cont.)			
3.11-2 (cont.)		<ul style="list-style-type: none"> • Design the outdoor stage and sound amplification system (placement and/or number of speakers, and maximum volume) so as to limit noise levels near noise-sensitive receptors. • Utilize sound-absorbing materials on the exterior of Plaza buildings. • Enclose the rooftop restaurant space with a material that would serve as a noise barrier such as glass. <p>Mitigation Measure 3.11-2(b) Implement Mitigation Measure 3.14-2(b) (Implementation of a comprehensive Transportation Demand Management (TDM) program).</p>	
3.11-3: Construction of the Proposed Project would generate excessive groundborne vibration levels.	PS	<p>Mitigation Measure 3.11-3(a) Minimize Construction Equipment Vibration. To address potential structural damage impacts, the operation of construction equipment that generates high levels of vibration, such as vibratory rollers, large bulldozers/drill rigs and loaded trucks, shall occur no nearer than 20 feet from neighboring structures, if feasible.</p> <p>Mitigation Measure 3.11-3(b) Vibration, Crack, and Line and Grade Monitoring Program. If vibratory rollers, large bulldozers or loaded trucks are required to operate within 20 feet of existing structures, implement a vibration, crack, and line and grade monitoring program at existing buildings located within 20 feet of demolition/construction activities. The following elements shall be included in this program:</p> <p>a) Pre-Demolition and Construction:</p> <ol style="list-style-type: none"> i. Photos of current conditions shall be included as part of the crack survey that the construction contractor will undertake. This includes photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labeled in detail and dated. ii. The construction contractors shall identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities. Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the project. iii. The construction contractor shall determine the number and placement of vibration receptors at the affected buildings in consultation with a qualified architect. The number of units and their locations shall take into account proposed demolition and construction activities so that adequate measurements can be taken illustrating vibration levels during the course of the project, and if/when levels exceed the established threshold. iv. A line and grade pre-construction survey at the affected buildings shall be conducted. <p>b) During Demolition and Construction:</p> <ol style="list-style-type: none"> i. The construction contractor shall regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in post-construction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors. 	SU

NOTES:
LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.11 Noise and Vibration (cont.)			
3.11-3 (cont.)		<ul style="list-style-type: none"> ii. The construction contractor shall collect vibration data from receptors and report vibration levels to the City Chief Building Official on a monthly basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels, along with proposed corrective actions to avoid vibration levels approaching or exceeding the established threshold. c) Post-Construction <ul style="list-style-type: none"> i. The applicant (and its construction contractor) shall provide a report to the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the project and/or show how the project did not cause physical damage to the buildings. The report shall include annotated analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a post-construction line and grade survey shall also be included in this report. ii. The project applicant (and its construction contractor) shall be responsible for repairs from damage to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings. 	
Mitigation Measure 3.11-3(c)			
<p>Designate Community Affairs Liaison. Designate a Community Affairs Liaison and conspicuously post this person's contact information around the project site, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complaints about construction activities. This Community Affairs Liaison shall receive all public complaints about construction vibration disturbances and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem. The Community Affairs Liaison shall have the authority to coordinate with a designated construction contractor representative for the purpose of investigating the noise disturbance and undertaking all feasible measures to protect public health and safety, and shall ensure that steps be taken to reduce construction vibration levels as deemed appropriate and safe by the designated construction contractor representative. Such steps could include the application of vibration absorbing barriers, substitution of lower vibration generating equipment or activity, rescheduling of vibration-generating construction activity, or other potential adjustments to the construction program to reduce vibration impacts at the adjacent vibration-sensitive receptors.</p>			
3.11-4: The Proposed Project is located within the Planning Boundary/Airport Influence Area for LAX as designated within the airport land use plan and could expose people residing or working in the region surrounding the Project Site to excessive noise levels.	LS	None required.	NA

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.11 Noise and Vibration (cont.)			
3.11-5: Construction of the Proposed Project, in conjunction with other cumulative development, would result in cumulative temporary increases in ambient noise levels.	PS	Mitigation Measure 3.11-5 Implement Mitigation Measure 3.11-1. (Construction Noise Reduction Plan).	SU
3.11-6: Operation of the Proposed Project, in conjunction with other cumulative development, would result in cumulative permanent increases in ambient noise levels.	PS	Mitigation Measure 3.11-6(a) Implement Mitigation Measure 3.11-2(a). (Noise Reduction Plan). Mitigation Measure 3.11-6(b) Implement Mitigation Measure 3.14-2(b) (Implementation of a comprehensive Transportation Demand Management (TDM) program).	SU
3.11-7: Construction of the Proposed Project, in conjunction with other cumulative development, would generate excessive groundborne vibration.	PS	Mitigation Measure 3.11-7 Implement Mitigation Measures 3.11-3(a), 3.11-3(b), 3.11-3(c). (Minimize Construction Equipment Vibration; Vibration, Crack, and Line and Grade Monitoring Program; and Designate Community Affairs Liaison).	SU
3.11-8: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could expose people residing or working in the region surrounding the Project Site to excessive noise levels from airport noise.	LS	None required.	NA
3.12 Population, Employment, and Housing			
3.12-1: Construction and operation of the Proposed Project could induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).	LS	None required.	NA
3.12-2: Construction and operation of the Proposed Project could displace substantial numbers of existing people or housing units necessitating the construction of replacement housing elsewhere.	LS	None required.	NA

3.13 Public Services (cont.)			
3.13-11: Construction and operation of the Proposed Project could result in substantial adverse physical impacts associated with the need for or provision of new or physically altered schools, the construction of which could cause significant environmental impacts.	LS	None required.	NA
3.13-12: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could contribute to cumulative substantial adverse physical impacts associated with the need for or provision of new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools.	LS	None required.	NA
3.14 Transportation and Circulation			
3.14-1: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under Adjusted Baseline conditions.	S	<p>Mitigation Measure 3.14-1(a)</p> <p>The project applicant shall implement elements of the Transportation Demand Management (TDM) Program described in Mitigation Measure 3.14-2(b) including strategies, incentives and tools to provide opportunities for daytime and non-event employees to reduce single-occupancy vehicle trips and use other modes besides automobile to travel to and from the Project Site. These elements include:</p> <p>a) TDM 1/Encourage Alternative Modes of Transportation (Rail, Public Bus, and Vanpool) – The Project shall encourage alternative modes of transportation use by providing monetary incentives and bus stop improvements near the Project Site such as:</p> <ul style="list-style-type: none"> • Bus stop facilities improvements: The Project would provide on-site and/or off-site improvements such as lighting, new benches and overhead canopies, added bench capacity if needed, and real-time arrival information for an improved user experience for bus stops that are relocated as a result of the Project. • Transit and/or Multi-Modal Subsidy: The Project would provide pre-tax commuter benefits for employees. • Vanpool Subsidy: This would provide pre-tax commuter benefits for employees. • Marketing and outreach campaign for transit usage. <p>b) TDM 3/Encourage Carpools and Zero-Emission Vehicles – The Project shall provide several incentives that would encourage carpooling and zero-emission vehicles as a means for sharing access to and from the Project Site including the following:</p> <ul style="list-style-type: none"> • Provide incentives for carpools or zero-emission vehicles, including preferential parking with the number of parking spots in excess of applicable requirements, reduced parking costs, or other discounts/benefits. 	SU

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-1 (cont.)		<p>c) TDM 4/Encourage Active Transportation – The Project shall include features which enhance access for bicyclists and pedestrians including the following:</p> <ul style="list-style-type: none"> • Bicycle parking: provide bicycle parking in excess of applicable code requirements. The Project Site would provide 60 employee bike parking spaces and 23 attendee bike parking spaces. • Provide showers and lockers for employees. • Bicycle fix-it station: provide a bicycle repair station where bicycle maintenance tools and supplies are readily available on a permanent basis and offered in good condition. • Sidewalks or other designated pathways following safe routes from the pedestrian circulation to the bicycle parking facilities and throughout the development. <p>d) TDM 5/Employee Vanpool Program – The Project shall provide an employee vanpool program that would accommodate up to 66 employees utilizing the vanpool service. Each vanpool is assumed to have a capacity of 15 persons per vehicle. The vanpool program would be in conjunction with a vanpool subsidy providing pre-tax commuter benefits for employees as indicated in TDM 1.</p> <p>e) TDM 7/Information Services – The Project shall provide services to inform employees about transportation options including the following:</p> <ul style="list-style-type: none"> • Welcome packets for new employees and ongoing marketing. • Information kiosk or bulletin board providing information about public transportation options. 	
		<p>Mitigation Measure 3.14-1(b) Implement Mitigation Measure 3.14-3(f) (Northbound Exclusive Right-turn Lane and Overlap Phase on South Prairie Avenue at West Century Boulevard).</p> <p>Mitigation Measure 3.14-1(c) Implement Mitigation Measure 3.14-3(l) (Implement protected or protected/permissive left-turn phasing on South Prairie Avenue at West 104th Street).</p>	
3.14-2: Daytime events at the Proposed Project Arena would cause significant impacts at intersections under Adjusted Baseline conditions.	S	<p>Mitigation Measure 3.14-2(a) The project applicant shall prepare and implement an Event Transportation Management Plan (TMP). The Event TMP shall address the issues set forth below, and shall achieve the identified standards for each of these issues:</p> <p>a) <u>Vehicle Queuing on City Streets:</u> Through added intersection capacity and/or traffic management, traffic does not queue back to the upstream locations listed below during more than 5 percent of a pre-event peak hour (assuming no other concurrent events):</p> <ul style="list-style-type: none"> • Northbound South Prairie Avenue: vehicle queues do not spill back from the project vicinity to I-105, causing vehicle queues on the South Prairie Avenue off-ramp to exceed their available storage. • Southbound South Prairie Avenue: vehicle queues do not spill back from the project vicinity to beyond Manchester Boulevard. • Eastbound West Century Boulevard: vehicle queues do not spill back from the project vicinity to I-405, causing vehicle queues on the West Century Boulevard off-ramps to exceed their available storage. 	SU

NOTES:
LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-2 (cont.)		<ul style="list-style-type: none"> • Westbound West Century Boulevard: vehicle queues do not spill back from the project vicinity to beyond Crenshaw Boulevard. b) <u>Pedestrian Flows</u>: Through pedestrian flow management, pedestrians do not spill out of sidewalks onto streets with moving vehicles, particularly along portions of West Century Boulevard and South Prairie Avenue adjacent to the Project. c) <u>Vehicular Parking</u>: A comprehensive parking plan is implemented that could include strategies such as a reservation system. A comprehensive parking plan is implemented to minimize unnecessary vehicular circulation (while looking for parking) within and adjacent to the Project. The Plan could include strategies such as a reservation system, smartphone parking app, directional signage, and real-time parking garage occupancy. d) <u>Bicycle Parking</u>: Signage is clearly visible to direct bicyclists to on-site event bicycle parking. The on-site bicycle parking shall have an adequate supply to accommodate a typical major event. If monitoring shows that there is demand for on-site bicycle parking that is not being met, then additional supply (such as a bicycle valet) shall be identified. e) <u>Shuttle Bus Loading</u>: An adequate amount of curb space (accompanied by appropriate traffic management strategies) is provided along South Prairie Avenue to efficiently accommodate shuttle buses that transport attendees to/from light rail stations. f) <u>Shuttle Bus Capacity and Wait Times</u>: An adequate supply of shuttle buses is provided such that peak wait times for attendees before and after major events do not exceed 15 minutes. g) <u>Paratransit</u>: Specific suitable locations are provided to accommodate paratransit vehicle stops. h) <u>Ridehailing</u>: Traffic management strategies (including active enforcement, wayfinding, signage, etc.) are implemented to minimize pre-event passenger drop-offs in travel lanes or at curbs along the project frontage, and to provide orderly vehicle staging, passenger loading, and traffic flow of ridehailing vehicles after events. For post-event conditions, the arena is placed within a 'geofenced area' in which attendees requesting a TNC are directed to meet the TNC vehicle at the East Parking Garage. If monitoring shows that ridehailing vehicles are using travel lanes or curbs along the project frontage to drop off passengers during the pre-event period, then TCOs and/or barricades shall be stationed at locations where unauthorized drop-offs are occurring. i) <u>Neighborhood Streets</u>: Reduce traffic volumes on local and collector street segments identified in the Draft EIR as having a significant impact without causing a significant impact on other local and collector street segments. Discourage and reduce event-related cut-through traffic while maintaining access for residents and their guests. j) <u>Truck Staging</u>: Large trucks associated with concerts or other special events do not park or idle along South Prairie Avenue, West Century Boulevard, or any local/collector street in the project vicinity, with the exception of Doty Avenue between West Century Boulevard and West 102nd Street. k) <u>Parking Garage/Lot Operations</u>: Through effective garage/lot operations, vehicles do not spill back onto public streets and adversely affect the roadway network prior to events while waiting to enter garages/lots. 	

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-2 (cont.)		<p data-bbox="737 358 1024 380">Mitigation Measure 3.14-2(b)</p> <p data-bbox="737 391 1818 488">The project applicant shall implement a TDM Program. The TDM Program shall include strategies, incentives, and tools to provide opportunities for non-event employees and patrons as well as event attendees and employees to reduce single-occupancy vehicle trips and to use other modes of transportation besides automobile to travel to basketball games and other events hosted at the Project. The TDM Program shall include:</p> <p data-bbox="737 500 1818 570">a) TDM 1/Encourage Alternative Modes of Transportation (Rail, Public Bus, and Vanpool) – The Project shall encourage alternative modes of transportation use by providing monetary incentives and bus stop improvements near the Project Site such as:</p> <ul data-bbox="779 581 1818 938" style="list-style-type: none"> <li data-bbox="779 581 1818 602">• Integrated event and transit ticketing to enable seamless connections and provide event-day travel updates. <li data-bbox="779 613 1818 662">• Discounted event tickets with the purchase of a transit pass or providing proof of a registered TAP card (the regional fare payment method). <li data-bbox="779 673 1818 695">• Giveaways for transit users (goods for attendees, free tickets for employees, etc.). <li data-bbox="779 706 1818 755">• Rewards/gamification opportunities for fans to compete for prizes or points based on their transportation choices. <li data-bbox="779 766 1818 836">• Bus stop facilities improvements: The Project shall provide on-site and/or off-site improvements such as lighting, new benches and overhead canopies, added bench capacity if needed, and real-time arrival information for an improved user experience for bus stops that are relocated as a result of the Project. <li data-bbox="779 847 1818 868">• Transit and/or Multi-Modal Subsidy: The Project would provide pre-tax commuter benefits for employees. <li data-bbox="779 880 1818 901">• Vanpool Subsidy: This would provide pre-tax commuter benefits for employees. <li data-bbox="779 912 1818 933">• Marketing and outreach campaign for transit usage. <p data-bbox="737 954 1818 1052">b) TDM 2/Event-day Dedicated Shuttle Services – The Project shall provide connectivity to the existing and future Metro Rail Stations and would take advantage of the transportation resources in the area. The Project shall ensure that enough shuttles would be provided for successful and convenient connectivity with short wait times. The following shall be provided:</p> <ul data-bbox="779 1063 1818 1312" style="list-style-type: none"> <li data-bbox="779 1063 1818 1161">• The Project shall provide dedicated shuttle service from the Green Line at Hawthorne Station, Crenshaw/LAX Line at AMC/96th Station, and Crenshaw/LAX Line at Downtown Inglewood station for arena events. This shuttle service shall be a dedicated event-day shuttle service from the venue for employees and attendees. <li data-bbox="779 1172 1818 1312">• The Project shall provide an estimated 27 shuttles with a capacity of 45 persons per shuttle to accommodate employees and attendees traveling to and from the Project Site. Due to the arrival and departure of employees prior to the attendees, the same shuttles would be utilized for the employees. It is anticipated that the shuttle service would begin two hours before the game and extend to 30 minutes after the start. After the game, shuttle service would begin 30 minutes before the end, and continues one hour after. 	

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-2 (cont.)		<ul style="list-style-type: none"> • The Project shall provide a convenient and safe location on site for shuttle pick-up and drop-off on the east side of South Prairie Avenue, approximately 250 feet south of West Century Boulevard. The drop-off location shall be adjacent to the arena so that shuttle users would not need to cross South Prairie Avenue to arrive at the arena. • The project applicant shall monitor the number of people using shuttles to travel between the above light rail stations and the Project. If the monitoring shows that peak wait times before or after major events exceeds 15 minutes, then the project applicant shall add sufficient additional shuttle capacity to reduce wait times to meet this target. The aim is to require increased shuttle runs as necessary to make sure that demand is accommodated within a reasonable amount of time and to encourage use of transit. c) TDM 3/Encourage Carpools and Zero-Emission Vehicles – The Project shall provide several incentives that would encourage carpooling and zero-emission vehicles as a means for sharing access to and from the Project Site including the following: <ul style="list-style-type: none"> • Provide incentives for carpools or zero-emission vehicles, including preferential parking with the number of parking spots in excess of applicable requirements, reduced parking costs, discounted rides (or other similar benefits) for those sharing TNC rides to or from the event, or other discounts/benefits. • Provide variable parking price based on car occupancy – structured to encourage carpooling. • The Project would provide 8 percent of parking spaces with electrical vehicle charging stations in excess of the minimum requirement of 6 percent. d) TDM 4/Encourage Active Transportation – The Project shall include features which enhance access for bicyclists and pedestrians including the following: <ul style="list-style-type: none"> • Bicycle parking: Provide bicycle parking in excess of applicable code requirements. The Project Site would provide 60 employee bike parking spaces and 23 attendee bike parking spaces. • Provide showers and lockers for employees. • A bike valet service would be implemented if needed to accommodate bike parking space needs. • Bicycle fix-it station: Provide a bicycle repair station where bicycle maintenance tools and supplies are readily available on a permanent basis and offered in good condition. • Coordinate bike pools and walk pools. • Sidewalks or other designated pathways following safe routes from the pedestrian circulation to the bicycle parking facilities and throughout the development. e) TDM 5/Employee Vanpool Program – The Project shall provide an employee vanpool program that would accommodate up to 66 employees utilizing the vanpool service. Each vanpool is assumed to have a capacity of 15 persons per vehicle. The vanpool program would be in conjunction with a vanpool subsidy providing pre-tax commuter benefits for employees as indicated in TDM 1. 	

NOTES:
 LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-2 (cont.)		<p>f) TDM 6/Park-n-Ride Program – The Project shall provide a regional park-n-ride program that would utilize charter coach buses with a capacity of up to 45 persons per bus to accommodate up to 1,980 attendees. Parking lot locations would correspond to zip code ticket purchase data, and the site circulation would be designed to account for the charter coaches. The operation of this park-n-ride would be similar to the currently operating park-n-ride program from the Hollywood Bowl venue located in the Hollywood Hills within the County of Los Angeles.</p> <p>g) TDM 7/Information– The Project shall provide information services to inform the public about activities at the Project including the following:</p> <ul style="list-style-type: none"> • Strategic multi-modal signage/wayfinding. • Real-time travel information; changeable message sign (CMS) and social media. • Welcome packets for new employees and ongoing marketing. • Commercials/advertisement – television, website, social media, radio, etc. • Information kiosk or bulletin board providing information about public transportation options. <p>h) TDM 8/Reduce On-Site Parking Demand – The Project shall include features that reduce on-site parking demand such as:</p> <ul style="list-style-type: none"> • Provide coach bus/minibus/microtransit staging and parking areas: The Project is designed to accommodate 20 minibus/microtransit/paratransit parking spaces and 23 charter coach bus spaces. The capacity for minibus/microtransit/paratransit is 10 persons per vehicle and 45 persons per bus for the charter coach bus. • Allocated sufficient TNC staging spaces: The Project is designed to accommodate approximately 160 spaces for TNC staging. <p>i) TDM 9/Event-Day Local Microtransit Service – The Project shall provide a local minibus/microtransit service for all event days with a service range of approximately 6 miles surrounding the Project Site. Each minibus is assumed to have a capacity of 10 persons per vehicle, and the service would accommodate up to 66 employees and up to 180 attendees on all event days.</p> <p>j) Monitoring – The TDM Program shall include an ongoing program to monitor each of the TDM Program elements listed above. The monitoring program shall collect data on the implementation of each specific TDM strategy, and shall assess the extent to which the TDM Program is meeting demand for alternative forms of transportation, and reducing vehicle trips and reliance on private automobiles. The information obtained through this monitoring program shall be provided to the City Traffic Engineer on an annual basis.</p>	
<p>A monitoring report shall be prepared not less than once each year. The report shall evaluate whether the TDM Program is achieving the reductions in vehicle trips set forth above. The monitoring report shall be provided to the City Traffic Engineer and the State of California Office of Planning and Research.</p> <p>The TDM Program will be a dynamic document that is expected to be revised and refined as monitoring is performed, experience is gained, additional information is obtained regarding the Project's transportation characteristics, and advances in technology or infrastructure become available. Any changes to the TDM Program shall be subject to review and approval by the City Traffic Engineer. In reviewing any proposed changes to the TDM Program, the City Traffic Engineer shall ensure that the TDM Program, as revised, is equally or more effective in addressing the issues set forth above.</p>			

NOTES:

LS = less than significant; PS = potentially significant; S = Significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-2 (cont.)		<p>Mitigation Measure 3.14-2(c) The project applicant shall work with the City of Inglewood and the City of Los Angeles to implement capacity-increasing improvements at the West Century Boulevard/La Cienega Boulevard intersection. Recommended improvements include two elements:</p> <ul style="list-style-type: none"> a) Restripe the westbound approach to convert the outside through/right lane to a dedicated right-turn lane and operate it with an overlap phase. This is consistent with the LAX Landside Modernization Program improvements planned for this location. b) Remove median island on the west leg and restripe the eastbound and westbound approaches to add second left-turn lanes in each direction. <p>Mitigation Measure 3.14-2(d) The project applicant shall construct (via restriping and conversion of median) second left-turn lanes on the northbound and southbound approaches to the West Century Boulevard/Hawthorne Boulevard/La Brea Boulevard intersection and operate the northbound right-turn with an overlap phase.</p> <p>Mitigation Measure 3.14-2(e) Implement Mitigation Measure 3.14-3(f) (Implement northbound exclusive right-turn lane and overlap phase on South Prairie Avenue at West Century Boulevard).</p> <p>Mitigation Measure 3.14-2(f) The project applicant shall restripe the westbound West 104th Street approach to Yukon Avenue from consisting of a shared left/through/right lane to consist of a left/through lane and a dedicated right-turn lane.</p> <p>Mitigation Measure 3.14-2(g) The project applicant shall work with the City of Inglewood and Caltrans to widen the I-105 off-ramp approach to South Prairie Avenue to consist of two lefts, a shared left/through/right, and a dedicated right-turn lane. This would require complying with the Caltrans project development process as a local agency-sponsored project. Depending on the complexity and cost of the improvement, this could include (but is not limited to) a cooperative agreement, permit engineering evaluation report, project study report, project report, environmental and engineering studies, project design, construction, etc.</p> <p>Mitigation Measure 3.14-2(h) The project applicant shall restripe the eastbound approach of Manchester Boulevard at La Brea Avenue to provide a separate right-turn lane, resulting in one left-turn lane, two through lanes and one right-turn lane.</p> <p>Mitigation Measure 3.14-2(i) The project applicant shall restripe the westbound approach of Manchester Boulevard at Crenshaw Boulevard to provide a second left-turn lane, resulting in two left-turn lanes, one through lane and one shared through/right-turn lane.</p>

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-13: The Proposed Project could have the potential to adversely affect existing or planned pedestrian facilities, or fail to adequately provide for access by pedestrians.	S	<p>Mitigation Measure 3.14-13</p> <p>The project applicant shall widen the east leg crosswalk across West Century Boulevard at South Prairie Avenue to 20 feet.</p>	LS
3.14-14: The Proposed Project could have the potential to result in inadequate emergency access under Adjusted Baseline conditions.	S	<p>Mitigation Measure 3.14-14</p> <p>The project applicant shall work with the City and the Centinela Hospital Medical Center (CHMC) to develop and implement a Local Hospital Access Plan that would maintain reasonable access to the hospital by emergency and private vehicles accessing the CHMC emergency room. Measures to be included in the plan could include, but may not be limited to, the following:</p> <ul style="list-style-type: none"> a) Development of a wayfinding program that consists of the following: <ul style="list-style-type: none"> Placement of signage (e.g., blank-out signs, changeable message signs, permanent hospital alternate route signs, etc.) on key arterials that may provide fixed alternate route guidance as well as real-time information regarding major events. This program would benefit from the project financial contribution to the City's ITS program (see Mitigation Measure 3.14-2(o)) by including cameras, vehicle queue spillback detection loops on eastbound West Century Boulevard, and other technologies which, if implemented, could enable the wayfinding signs to be automatically illuminated when necessary. b) Coordination with CHMC regarding updates to their website and any mobile apps so that employees, visitors, and patients visiting those sites are provided with advanced information of when events are scheduled. c) Provide direction to TCOs regarding best practices for accommodating emergency vehicles present in congested conditions during pre-event and post-event conditions. <p>The Local Hospital Access Plan shall consider, develop, and implement solutions to address potential access restrictions caused by construction activity at the Project (see Impact 3.14-15). The Plan shall have a monitoring and coordination component including observations of accessibility to the Emergency Department during periods when events are and are not being held at the Project. Coordination would include participation by the project applicant in quarterly working group meetings with hospital administrators to identify and address circulation concerns.</p> <p>The Local Hospital Access Plan shall be reviewed by the City, the Police Department, Los Angeles County Fire Department, and approved by the City prior to the first event at the Project arena.</p>	LS

TABLE S-2
SUMMARY OF IMPACTS AND MITIGATION MEASURES

Impact	Significance Before Mitigation	Mitigation Measure	Significance After Mitigation
3.14 Transportation and Circulation (cont.)			
3.14-15: The Proposed Project would substantially affect circulation for a substantial duration of construction under Adjusted Baseline conditions.	S	<p>Mitigation Measure 3.14-15</p> <p>Before issuance of grading permits for any phase of the Project, the project applicant shall prepare a detailed Construction Traffic Management Plan that will be subject to review and approval by the City Department of Public Works, in consultation with affected transit providers and local emergency service providers. The plan shall ensure that acceptable operating conditions on local roadways are maintained. At a minimum, the plan shall include:</p> <ul style="list-style-type: none"> a) Identification of haul routes and truck circulation patterns; not permitting trucks to travel on residential streets. b) Time of day of arrival and departure of trucks. c) Limitations on the size and type of trucks; provision of a staging area with a limitation on the number of trucks that can be waiting; not permitting trucks to park or stage on residential streets. d) Preparation of worksite traffic control plan(s) for lane and/or sidewalk closures. e) Identification of detour routes and signing plan for street/lane closures. f) Provision of driveway access plan so that safe vehicular, pedestrian, and bicycle movements are maintained (e.g., steel plates, minimum distances of open trenches, and private vehicle pick up and drop off areas). g) Maintain safe and efficient access routes for emergency vehicles and transit. h) Manual traffic control when necessary. i) Provisions for pedestrian and bicycle safety. j) Identification of locations for construction worker parking; not permitting construction worker parking on residential streets. k) Strategies to reduce the proportion of employee and delivery trips made during weekday AM and PM peak hours through employee shift and construction material delivery scheduling. l) Strategies to be undertaken (e.g., alternate routing/parking of employees and deliveries, etc.) to reduce the adverse effects during events at The Forum or NFL Stadium of construction-related closures of travel lanes along the project frontage. <p>A copy of the construction traffic management plan shall be submitted to local emergency response agencies and transit providers, and these agencies shall be notified at least 30 days before the commencement of construction that would partially or fully obstruct roadways.</p>	SU
3.14-16: Operation of the Proposed Project ancillary land uses would cause significant impacts at intersections under cumulative conditions.	S	<p>Mitigation Measure 3.14-16(a)</p> <p>Implement Mitigation Measure 3.14-1(a) (Elements of the TDM Program for daytime and non-event employees).</p> <p>Mitigation Measure 3.14-16(b)</p> <p>Implement Mitigation Measure 3.14-3(f) (Implement northbound exclusive right-turn lane and overlap phase on South Prairie Avenue at West Century Boulevard).</p> <p>Mitigation Measure 3.14-16(c)</p> <p>Implement Mitigation Measure 3.14-2(g) (I-105 Off-Ramp Widening at South Prairie Avenue).</p>	SU

CHAPTER 1

Introduction

Murphy’s Bowl LLC (the project applicant) in conjunction with the City of Inglewood proposes entitlement, construction and operation of the proposed Inglewood Basketball and Entertainment Center (IBEC), which would include an approximately 915,000-square-foot (sf), 18,000-fixed-seat arena (Arena Structure or Arena) suitable for National Basketball Association (NBA) games, with up to 500 additional temporary seats for other sports or entertainment events; an approximately 85,000-sf team practice and athletic training facility; approximately 71,000 sf of Los Angeles (LA) Clippers team office space; an approximately 25,000 sf sports medicine clinic for team and potential general public use; approximately 48,000 sf of commercial uses; a hotel with up to 150 guest rooms; up to 15,000 sf of community uses; an outdoor plaza with landscaped areas, and community gathering space; removal and relocation of an existing City of Inglewood (City)-owned water well; and surface- and structured-parking facilities to serve the proposed development. These activities are referred to collectively as the Proposed Project. For a detailed description and exhibits of the Proposed Project, please see Chapter 2, Project Description.

This Environmental Impact Report (EIR) has been prepared pursuant to the California Environmental Quality Act (CEQA) (Public Resources Code (PRC) section 21000 et seq.) and CEQA Guidelines (Title 14, section 15000 et seq. of the California Code of Regulations) (CEQA Guidelines) in order to disclose the potential environmental consequences of implementing the Proposed Project (State Clearinghouse Number 2018021056). As required under CEQA, the EIR evaluates and describes potentially significant environmental impacts, identifies potentially feasible mitigation measures to avoid or reduce the significance of potential impacts, and evaluates the comparative effects of potentially feasible alternatives to the Proposed Project.

1.1 Background

The Project Site is located in the southwestern portion of the City of Inglewood within Los Angeles County, approximately 10 miles south/southwest of downtown Los Angeles. The main portion of the Project Site, referred to as the Arena Site, is bounded by West Century Boulevard on the north, South Prairie Avenue on the west, South Doty Avenue on the east, and a straight line extending east from West 103rd Street to South Doty Avenue to the south. The Arena Site is approximately 16.71 acres. Chapter 2, Project Description, presents exhibits of the Project Site, the surrounding area, and surrounding land uses.

The Project Site encompasses four, specific locations where different features of the Proposed Project would be located:

- *Arena Site:* The central part of the Project Site. The features located on the Arena Site include the Arena, outdoor plaza, community space, practice facility, sports medicine clinic, team offices, retail/restaurants, a parking structure, and related development;
- *West Parking Garage Site:* The part of the Project Site west of the Arena Site. The features located on the West Parking Garage Site include a multi-level parking structure to serve patrons of the Arena Site;
- *East Transportation and Hotel Site:* The portion of the Project Site east of the Arena Site, across South Doty Avenue. The East Transportation and Hotel Site includes a three story parking garage located on a portion of the site fronting West Century Boulevard, along with a paved surface lot area on a portion of the site fronting West 102nd Street. The ground floor of the parking garage and the surface lot area will serve as a transportation hub. The transportation hub includes a staging and parking area for coach buses and microtransit vehicles, a passenger loading area, and a staging/queuing area for transportation network company (TNC) vehicles such as Uber and Lyft vehicles, and taxis serving the Arena Site.¹ The second and third floors of the garage would provide parking for patrons of the Arena Site. The east side of the East Transportation and Hotel Site would include a limited service hotel and associated parking facilities; and
- *Well Relocation Site:* The portion of the Project Site immediately east of the Arena Site. The Well Location Site would contain a City-owned and -operated potable water well.

A portion of West 101st Street, west of South Prairie Avenue, would be vacated and replaced by the first floor of the parking garage. A portion of West 102nd Street between South Prairie Avenue and South Doty Avenue would be vacated and developed with the Arena Structure and related development.

All but six of the parcels that make up the Project Site are currently vacant or undeveloped. The six developed parcels, approximately 2.9 acres all within the Arena Site, include a fast food restaurant (on a privately-owned parcel), a motel (on a privately-owned parcel), a warehouse and light manufacturing facility (on two privately-owned parcels), a commercial catering business (on a privately-owned parcel), and a groundwater well and related facilities (on a City-owned parcel).

The Project Site is located approximately 2 miles east of Los Angeles International Airport (LAX) and approximately 1.5 miles north of Jack Northrop Field/Hawthorne Municipal Airport (HHR). This places a portion of the Project Site within the Planning Boundary/Airport Influence Area for LAX as designated in the Airport Land Use Plan (ALUP). The Project Site's location within the ALUP limits the nature and type of development that can occur. Additionally, the Aircraft Noise Mitigation Program (ANMP), which arises from federal and state regulations, established two strategies to manage the impacts of aircraft noise, including (1) sound insulation of structures, and (2) property acquisition followed by the conversion of an incompatible land use

¹ The East Transportation and Hotel Site could accommodate pick-ups and drop-offs of employees and attendees using private buses, charter buses, microtransit, TNCs, taxis, or other private vehicles. It would not be used as a connection point for public transportation options such as Metro buses.

to compatible land uses. In the 1990s, pursuant to the ANMP and the Federal Aviation Regulation (FAR) Part 150, the Los Angeles World Airports implemented a comprehensive program to provide residential sound proofing to homes that are impacted by an average noise level of 65 dB or more and also relocated hundreds of residential homes east of LAX, including homes east of LAX in the Manchester Square and Airport/Belford areas near LAX. LAX has also adopted a Federal Aviation Administration (FAA)-approved Noise Control/Land Use Compatibility Program, which makes certain residential areas in the City of Inglewood and other surrounding jurisdictions near LAX eligible for FAA funding.

Beginning in the mid-1980s, the FAA issued noise grants to the City of Inglewood as part of the LAX Noise Control/Land Use Compatibility Program, with the objective of recycling incompatible land uses to land uses which are compatible with the noise levels of airport operations. Under that program, the FAA and the City of Inglewood approved the acquisition of a number of parcels on the Project Site. In compliance with FAA grant agreements, the City must dispose of the land purchased under the grant at the earliest practicable time for fair market value, and use its best efforts to dispose of such land subject to the retention or reservation of any interest or right therein necessary to ensure that such land is used only for purposes which are compatible with the noise levels of operation of the airport. The FAA has stated that the Proposed Project appears to be a compatible use of the properties acquired in compliance with the FAA grant program, and that residential development of these noise-impacted properties is “inherently inconsistent with the intent of the City’s land acquisition/noise mitigation program, approved and funded by the FAA,” and that residential use of the properties “may be inconsistent with Grant Assurance #21, Compatible Land Use; and Grant Assurance 31, Disposal of Land.”²

The City of Inglewood Redevelopment Agency was established in 1969. On January 10, 2012, the City elected to become the Successor Agency of the former Inglewood Redevelopment Agency. All but 10 of the 41 parcels within the Arena Site are owned by the City or the Successor Agency. The remaining parcels within the Arena Site are privately-owned. Future uses on all parcels within the Arena Site are subject to review pursuant to the ALUP. The Well Relocation Site is owned by the City. All but one of the parcels within the West Parking Garage Site are owned by the City, with one owned by the Successor Agency. The East Transportation and Hotel Site is entirely owned by the Successor Agency.

The City has been working diligently for years to try to redevelop the vacant parcels that comprise the Project Site into commercial or industrial uses. Despite these efforts, redevelopment of this site has not occurred. The blighted conditions of the surrounding environment, perceptions of public safety problems, and broader economic instability in the market (among other challenges) have made it difficult to attract investors and developers to the Project Site.

In 1984, the LA Clippers relocated from San Diego to Los Angeles and played in the downtown Los Angeles Sports Arena for 15 years. In 1999, the LA Clippers moved to the nearby Staples

² David F. Cushing, Manager, Los Angeles Airports District Office, U.S. Department of Transportation, Federal Aviation Administration, August 26, 2019.

Center which the team shares with the NBA's Los Angeles Lakers, the National Hockey League's Los Angeles Kings, and the Women's National Basketball Association's Los Angeles Sparks.³ Sharing the Staples Center with other organizations has created scheduling conflicts in the past. The LA Clippers' team offices and practice and athletic training facilities are currently located in downtown Los Angeles and in Playa Vista, respectively. The LA Clippers organization has stated its desire to consolidate its operations and facilities in a single location, along with a state-of-the-art, multi-purpose sports and entertainment center. Additionally, the LA Clippers organization seeks an opportunity to play home games in its own arena, where it has scheduling priority to maximize fan attendance and interest.

Initially approved on June 15, 2017, the City of Inglewood, the Successor Agency, the Inglewood Parking Authority, and Murphy's Bowl LLC entered into an Exclusive Negotiating Agreement (ENA) regarding the purchase of various parcels within the Project Site to allow the project applicant to propose and for the City to review and consider approval of the development of an NBA basketball arena complex that would become the new home of the LA Clippers.⁴ The ENA was amended and restated on August 15, 2017. The ENA contemplates the potential use of eminent domain for the Project Site. In the event that private parcels are acquired by eminent domain, adequate controls will be imposed to ensure that the public purpose and use for which they were acquired are protected.

1.2 Purpose and Use of this EIR

As described in CEQA Guidelines section 15121(a), an EIR is a public information document that assesses potential environmental effects of a proposed project, as well as identifies mitigation measures and alternatives to a proposed project that could reduce or avoid adverse environmental impacts. CEQA requires that state and local government agencies consider the environmental consequences of projects over which they have discretionary authority. The Proposed Project, as defined in Chapter 2, Project Description, would require a discretionary action under CEQA and is the subject of this EIR. The EIR is an informational document used in the planning and decision-making process. The purpose of an EIR is not to advocate or recommend either approval or denial of a proposed project.

1.3 Recent Relevant Legislation

Assembly Bill 987 (AB 987)

AB 987 was signed by Governor Jerry Brown on September 30, 2018. The bill added section 21168.6.8 to the Public Resources Code (PRC section 21168.6.8) and provides for expedited judicial review in the event that the certification of this EIR or the granting of project approvals are challenged, so long as certain requirements are met. The provisions of PRC

³ Los Angeles Times, 1998. Clippers to Join Kings, Lakers in New Arena. Available: <http://articles.latimes.com/1998/apr/17/local/me-40174>. Accessed October 15, 2018.

⁴ City of Inglewood Office of the City Manager, 2017. Exclusive Negotiating Agreement with Murphy's Bowl LLC, a Delaware Limited Liability Corporation. Available: <https://www.cityofinglewood.org/AgendaCenter/ViewFile/Item/782?fileID=748>. Published June 15, 2017. Accessed October 3, 2018.

section 21168.6.8 are similar to the provisions of the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900; PRC sections 21178 through 21189.3), which established expedited judicial review of certified Environmental Leadership Development Projects. In order to qualify for expedited judicial review under AB 987, the Proposed Project must implement a transportation demand management program that will achieve a 15 percent reduction in vehicle trips, and must not result in any net additional greenhouse gas emissions. Additionally, as a condition of approval of the Proposed Project, the City must require the project applicant to implement measures that will achieve reductions of specified amounts of certain criteria pollutants and toxic air contaminants.⁵ The Governor has certified the project as complying with the provisions of AB 987.

The Proposed Project must:

- A. Receive Leadership in Energy and Environmental Design (LEED) gold certification for new construction within one year of the completion of the first NBA season.
- B. Implement trip reduction measures including the following:
 - i. Implementation of a transportation demand management plan that, upon full implementation, will achieve and maintain a 15 percent reduction in the number of vehicle trips, collectively, by attendees, employees, visitors, and customers as compared to operations absent the transportation demand management program;
 - ii. To accelerate and maximize vehicle trip reduction, each measure in the transportation demand management program shall be implemented as soon as feasible, so that no less than a 7.5 percent reduction in vehicle trips is achieved and maintained by the end of the first NBA season during which an NBA team has played at the arena;
 - iii. A 15 percent reduction in vehicle trips shall be achieved and maintained as soon as feasible, but not later than January 1, 2030. The applicant shall verify achievement to the lead agency and the Office of Planning and Research; and
 - iv. If the applicant fails to verify achievement of the reduction required by clause (iii), the lead agency shall impose additional feasible measures to reduce vehicle trips by 17 percent, or, if there is a rail transit line with a stop within one-quarter mile of the arena, 20 percent, by January 1, 2035.
- C. Be located on an infill site.
- D. Be consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy for which the State Air Resources Board, pursuant to subparagraph (H) of paragraph (2) of subdivision (b) of section 65080 of the Government Code, has accepted a metropolitan planning organization's determination that the sustainable communities strategy or the alternative planning strategy would, if implemented, achieve the greenhouse gas emission reduction targets.

⁵ Office of the Governor, 2018. Assembly Bill 987 Signing Message. September 30. A copy of PRC section 21168.6.8 is contained in Appendix N of this Draft EIR.

AB 987 also requires that the Governor certify that the following conditions are met in order for the Proposed Project to qualify for expedited judicial review:

- (1) The Proposed Project will result in a minimum investment of one hundred million dollars (\$100,000,000) in California upon completion of construction.
- (2) The Proposed Project creates high-wage, highly skilled jobs that pay prevailing wages and living wages, employs a skilled and trained workforce, as defined in subdivision (d) of Section 2601 of the Public Contract Code, provides construction jobs and permanent jobs for Californians, and helps reduce unemployment.
- (3) Compliance with AB 987 would require the Proposed Project to result in no net additional emission of greenhouse gases, including greenhouse gas emissions from employee transportation, as determined by the State Air Resources Board pursuant to Division 25.5 (commencing with Section 38500) of the Health and Safety Code. Not less than 50 percent of the greenhouse gas emissions reductions necessary to achieve this requirement must be from local, direct greenhouse gas emissions reduction measures, and the project applicant may obtain offset credits for up to 50 percent of the greenhouse gas emissions reductions necessary to achieve it.
- (4) The project applicant demonstrates compliance with the solid waste and recycling requirements of Chapters 12.8 (commencing with Section 42649) and 12.9 (commencing with Section 42649.8) of Part 3 of Division 30, as applicable.
- (5) The project applicant has entered into a binding and enforceable agreement that all mitigation measures required pursuant to CEQA and any other environmental measures required by AB 987 to certify the Proposed Project under AB 987 shall be conditions of approval of the Proposed Project, and those conditions will be fully enforceable by the lead agency or another agency designated by the lead agency.
- (6) The project applicant agrees to pay any additional costs incurred by the courts in hearing and deciding any case subject to AB 987.
- (7) The project applicant agrees to pay the costs of preparing the record of proceedings for the Proposed Project concurrent with review and consideration of the Proposed Project pursuant to CEQA.

AB 987 also requires that, as a condition of approval of the project, the lead agency shall require the project applicant, in consultation with the South Coast Air Quality Management District, to implement measures that will achieve criteria pollutant and toxic air contaminant reductions over and above any emission reductions required by other laws or regulations in communities surrounding the project. At a minimum, these measures must achieve reductions of a minimum of 400 tons of NO_x and 10 tons of PM_{2.5} over the 10 years following the commencement of construction of the Proposed Project. Of these amounts, a minimum of 130 tons of NO_x and 3 tons of PM_{2.5} would be achieved within the first year following commencement of construction of the Proposed Project. If the project applicant can demonstrate and verify to the South Coast Air Quality Management District that it has invested at least thirty million dollars (\$30,000,000) to achieve the requirements of this subdivision, the requirements of this subdivision shall be deemed met, so long as one-half of the reductions described above are met. Greenhouse gas emissions reductions achieved through these NO_x and PM_{2.5} reduction measures shall count toward the applicant's obligations to achieve 50 percent of the greenhouse gas reductions through local, direct greenhouse gas reduction measures.

In accordance with PRC section 21168.6.8(g), the City has prepared the record of proceedings concurrently with the preparation of the Draft EIR, is making the Draft EIR and all other documents submitted to or relied upon by the City in preparing the Draft EIR readily accessible in electronic format on the date of release of the Draft EIR. Further, as required, the City will make any documents prepared by the City or submitted to the City by the applicant after the release of the Draft EIR available to the public in a readily accessible electronic format within 5 days of release or receipt. Comments on the project received by the City in an electronic format will be made available within 5 days of receipt, and any comments not in electronic format will be converted and made available in electronic format within 14 business days. These documents may be accessed from www.IBECProject.com. The Draft EIR will be circulated for a public review and comment period beginning on December 27, 2019, and ending on February 10, 2020. A copy of PRC section 21168.6.8 is contained in Appendix N of this Draft EIR.

Finally, if the project is approved, the City must certify the final record of proceedings within 5 days of filing a Notice of Determination.

1.4 Environmental Review

1.4.1 Preliminary Project Evaluation

In its preliminary review of the application for the Proposed Project, the City, as the Lead Agency under CEQA, determined that the Proposed Project is subject to CEQA and determined that an EIR pursuant to CEQA Guidelines section 15161 is the appropriate environmental document. Having determined an EIR is required to evaluate changes in the environment that would result from construction and operation of the Proposed Project, the City elected not to prepare an Initial Study Checklist, as permitted by CEQA Guidelines section 15060(d).

1.4.2 EIR Scoping

On February 20, 2018, the City issued a Notice of Preparation (NOP) (included in Appendix A). The NOP public comment period ended on March 22, 2018. The NOP was distributed to governmental agencies, organizations, and persons interested in the Proposed Project. The City sent the NOP to agencies with statutory responsibilities in connection with the Proposed Project and requested their input on the scope and content of the environmental information that should be addressed in the EIR. The City Economic and Community Development Department's Planning Division held a Scoping Meeting on March 12, 2018, at Inglewood City Hall to provide information about the Proposed Project and the anticipated CEQA process, and to receive comments regarding the scope of the EIR.

Pursuant to PRC section 21099.4, the City consulted with identified responsible and trustee agencies throughout the preparation of this EIR. This includes meetings with those agencies identified in **Table 1-1**. In addition, the City conducted multiple meetings with other stakeholders to gather input.

In response to the NOP, the City of Inglewood received 75 written comment letters regarding the Proposed Project. All of the comment letters received by the City are provided in Appendix B. Comments pertaining to environmental issues analyzed in this EIR were considered in each technical section of Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. The scope of this EIR includes environmental issues determined to be potentially significant as determined through preparation of the NOP, responses to the NOP, scoping meetings, and discussions with the public, consulting staff, and the City of Inglewood.

**TABLE 1-1
RESPONSIBLE AND TRUSTEE AGENCIES CONTACTED DURING PREPARATION OF THE DRAFT EIR**

Agency	Role
Responsible Agencies	
Federal Aviation Administration (FAA) / Airport Land Use Commission (ALUC)	Review and approval of Form 7460-1.
California Department of Transportation (Caltrans)	Review and consider impact analysis and mitigation measures for Caltrans maintained and operated facilities including freeways and on- and off-ramps.
California Department of Water Resources (DWR)	Approvals related to decommissioning and relocation of water well.
Los Angeles County Metropolitan Transportation Authority (Metro)	Review and consider impact analysis and mitigation measures for Metro-maintained and operated facilities including bus and light-rail facilities.
Los Angeles County Department of Environmental Health	Decommissioning and removal of existing well; remediation of onsite contamination.
Los Angeles Department of Health Services, Division of Drinking Water	Approvals related to decommissioning and relocation of water well.
Los Angeles County Sanitation District	Approvals related to decommissioning and relocation of water well.
Los Angeles County Flood Control District/ Dominguez Channel Watershed Group	Compliance with National Pollution Discharge Elimination System (NPDES) MS4 Permit.
South Coast Air Quality Management District (SCAQMD)	Review and consider impact analysis and mitigation measures related to air quality and potential related health risks.
Trustee Agencies	
California Department of Fish and Wildlife	Review and consider impact analysis and mitigation measures related to protected species, including those protected under the Migratory Bird Treaty Act (MBTA).
Federal Agencies	
Federal Aviation Administration	Review and approval of Form 7460-1.

This process identified potentially significant impacts associated with the construction and/or operation of the Proposed Project in the following issue areas:

- Aesthetics;
- Air Quality;
- Biological Resources;
- Cultural and Tribal Cultural Resources;

- Energy Demand and Conservation;
- Geology and Soils;
- Greenhouse Gas Emissions;
- Hazards and Hazardous Materials;
- Hydrology and Water Quality;
- Land Use and Planning;
- Noise and Vibration;
- Population, Employment, and Housing;
- Public Services (Fire Protection and Emergency Medical Services and Facilities, Police Protection, Parks or Recreation Services, and Schools);
- Transportation and Circulation; and
- Utilities and Service Systems (Water Supply, Wastewater, Stormwater, and Solid Waste).

1.4.3 Project Variants

The environmental analysis in this EIR includes two Project Variants: the West Century Boulevard Pedestrian Bridge Variant and the Alternate Prairie Access Variant. These Project Variants are analyzed in Chapter 5, Project Variants, and are briefly described in Chapter 2, Project Description. These Project Variants are not proposed as part of the Proposed Project as there is uncertainty about the feasibility of the Project Variants. They are identified and analyzed in this EIR, however, to provide the flexibility to allow the City to approve them as part of the Proposed Project, if desired, and if the uncertainty around the implementation of one or both of the Project Variants can be overcome.

1.4.4 Public Review

The Draft EIR is available for public review and comment beginning December 27, 2019, and concluding at 5:00 PM on February 10, 2020. The Draft EIR can be accessed at the following locations:

City of Inglewood Website: <https://www.cityofinglewood.org/1036/Murphys-Bowl-Proposed-NBA-Arena>

Project Website: www.IBECProject.com

Printed copies of the Draft EIR will be available at the following locations:

City of Inglewood Main Library: 101 West Manchester Boulevard, Inglewood CA 90301

Inglewood Crenshaw-Imperial Branch Library: 11141 South Crenshaw Boulevard, Inglewood CA 90303

City of Inglewood Economic and Community Development Department: One West Manchester Boulevard, 4th Floor, Inglewood CA 90301

During the review and comment period, written comments (including email) regarding the Draft EIR may be submitted to the City at the address below.

Mindy Wilcox, AICP, Planning Manager
City of Inglewood, Planning Division
One West Manchester Boulevard, 4th Floor
Inglewood, CA 90301
E-Mail: ibecproject@cityofinglewood.org

1.4.5 Final EIR and EIR Certification

Following the public review and comment period for the Draft EIR, the City will prepare responses that address all substantive written and oral comments on the Draft EIR's environmental analyses received within the specified review period. The responses and any revisions to the Draft EIR will be provided in a Response to Comments document. The Draft EIR and its Appendices, together with the Response to Comments document, will constitute the Final EIR (commonly referred to collectively as the EIR) for the Proposed Project.

1.4.6 Mitigation Monitoring and Reporting Program

Throughout this EIR, mitigation measures have been clearly identified and presented in language that will facilitate establishment of a mitigation monitoring and reporting program. As required under CEQA, a mitigation monitoring and reporting program (MMRP) will be prepared at the time of certification of the Final EIR for the Proposed Project and will identify the specific timing and roles and responsibilities for implementation of adopted mitigation measures.

1.5 Document Organization

This Draft EIR document is organized as follows:

- **Summary** – This chapter provides a summary of the Proposed Project. This chapter includes an overview of the project description, identified areas of controversy, a discussion of key environmental effects, a discussion of significant and unavoidable impacts, a discussion of cumulative effects, an overview of alternatives, and a summary table that includes each environmental impact, level of impact, and all applicable mitigation measures.
- **Chapter 1, Introduction** – This chapter describes the Proposed Project background, other applicable legislation (AB 987), and the purpose and organization of the EIR.
- **Chapter 2, Project Description** – This chapter describes in detail all elements of the Proposed Project. The description includes, with text and graphics, the location and boundaries of the Proposed Project, statements of objectives from the project applicant and the City, and a description of the Proposed Project components and characteristics.
- **Chapter 3, Environmental Setting, Impacts, and Mitigation Measures** – For each environmental issue, this chapter discusses the environmental and regulatory setting, the methodology used, the detailed analysis of potential impacts (including direct, indirect, and cumulative impacts), and, if necessary, a discussion of potentially feasible mitigation measures.
- **Chapter 4, Other CEQA Required Considerations** – This chapter discusses several issues required to be included in an EIR, including effects not found to be significant, significant

and unavoidable impacts, significant irreversible environmental changes, and any potential socioeconomic/urban decay-related impacts.

- **Chapter 5, Project Variants** – This chapter discusses and analyzes the potential impacts of the two variants of the Proposed Project.
- **Chapter 6, Alternatives** – This chapter describes potentially feasible alternatives to the Proposed Project that may avoid or substantially reduce one or more significant impacts while attaining most of the basic objectives of the Proposed Project, and evaluates the comparative environmental effects of the alternatives. It also discloses those alternatives that were considered but rejected from detailed analysis.
- **Chapter 7, List of Preparers and Persons Consulted** – This chapter identifies the agency staff and consultants who prepared the EIR, and agencies or individuals consulted during preparation of the EIR.
- **Appendices** – The appendices include environmental scoping information and technical reports and data used in the preparation of the Draft EIR. These documents are included in electronic format at the back of the Draft EIR and printed copies are available for review at the City offices.

This page intentionally left blank

CHAPTER 2

Project Description

2.1 Introduction

This chapter presents information regarding the components and characteristics of the proposed Inglewood Basketball and Entertainment Center (IBEC, or Proposed Project) and the discretionary approvals required for its implementation. This chapter describes the site where the Proposed Project would be located (Project Site). The Project Site encompasses four, specific locations where different features of the Proposed Project would be located, which are each described in more detail below:

- *Arena Site:* The central part of the Project Site. The features located on the Arena Site would include the Arena Structure, practice facility, sports medicine clinic, team offices, outdoor plaza, community space, retail/restaurants, a parking structure, and related development;
- *West Parking Garage Site:* The part of the Project Site west of the Arena Site, across South Prairie Avenue. The features located on the West Parking Garage Site would include a multi-level parking structure to serve patrons of the Arena Site;
- *East Transportation and Hotel Site:* The portion of the Project Site east of the Arena Site, across South Doty Avenue. The East Transportation and Hotel Site would include a three-story parking garage located on a portion of the site fronting West Century Boulevard, along with a paved surface lot area on a portion of the site fronting West 102nd Street. The ground floor of the parking garage and the surface lot area would serve as a transportation hub. The transportation hub would include a staging and parking area for coach buses and micro-transit vehicles, a passenger loading area, and a staging/queuing area for transportation network company (TNC) vehicles such as Uber and Lyft vehicles, and taxis serving the Arena Site.¹ The second and third floors of the garage would provide parking for patrons of the Arena Site. The east side of the East Transportation and Hotel Site would include a limited service 150-room hotel and associated parking facilities; and
- *Well Relocation Site:* The portion of the Project Site immediately east of the Arena Site. The Well Location Site would contain a relocated City-owned and -operated potable water well.

2.2 Project Location

As presented in **Figure 2-1**, the Project Site is located in the southwestern portion of the City of Inglewood within Los Angeles County, approximately 10 miles south/southwest of downtown

¹ The East Transportation and Hotel Site could accommodate pick-ups and drop-offs of employees and attendees using private buses, charter buses, micro-transit, TNCs, taxis, or other private vehicles. It would not be used as a connection point for public transportation options such as Metro buses.

Los Angeles. The Project Site is located immediately to the south of the Hollywood Park Specific Plan (HPSP) area, across West Century Boulevard. Within the HPSP area, a new National Football League stadium (NFL Stadium),² the future home of the Los Angeles Rams and Los Angeles Chargers teams, is under construction. The HPSP also authorizes development of retail, office, residential, special events venue, and parking development. The Forum, an approximately 17,500-seat entertainment venue, is located approximately 0.75 miles north of the Project Site, near the intersection of South Prairie Avenue and Manchester Boulevard. The Project Site is located approximately 1.5 miles east of the Los Angeles International Airport (LAX) and approximately 1.5 miles north of the Hawthorne Municipal Airport. The areas surrounding the four locations within the Project Site are generally comprised of industrial, commercial, and residential uses, along with other uses such as religious and educational facilities.

The Project Site is served by a network of transportation facilities that provide access to the greater metropolitan area. Regional access to the Project Site is provided by the San Diego Freeway (I-405) located approximately 1.5 miles to the west; the Glenn Anderson Freeway, also known as the Century Freeway (I-105), located approximately 1 mile to the south; and the Harbor Freeway (I-110) located approximately 3.5 miles to the east.

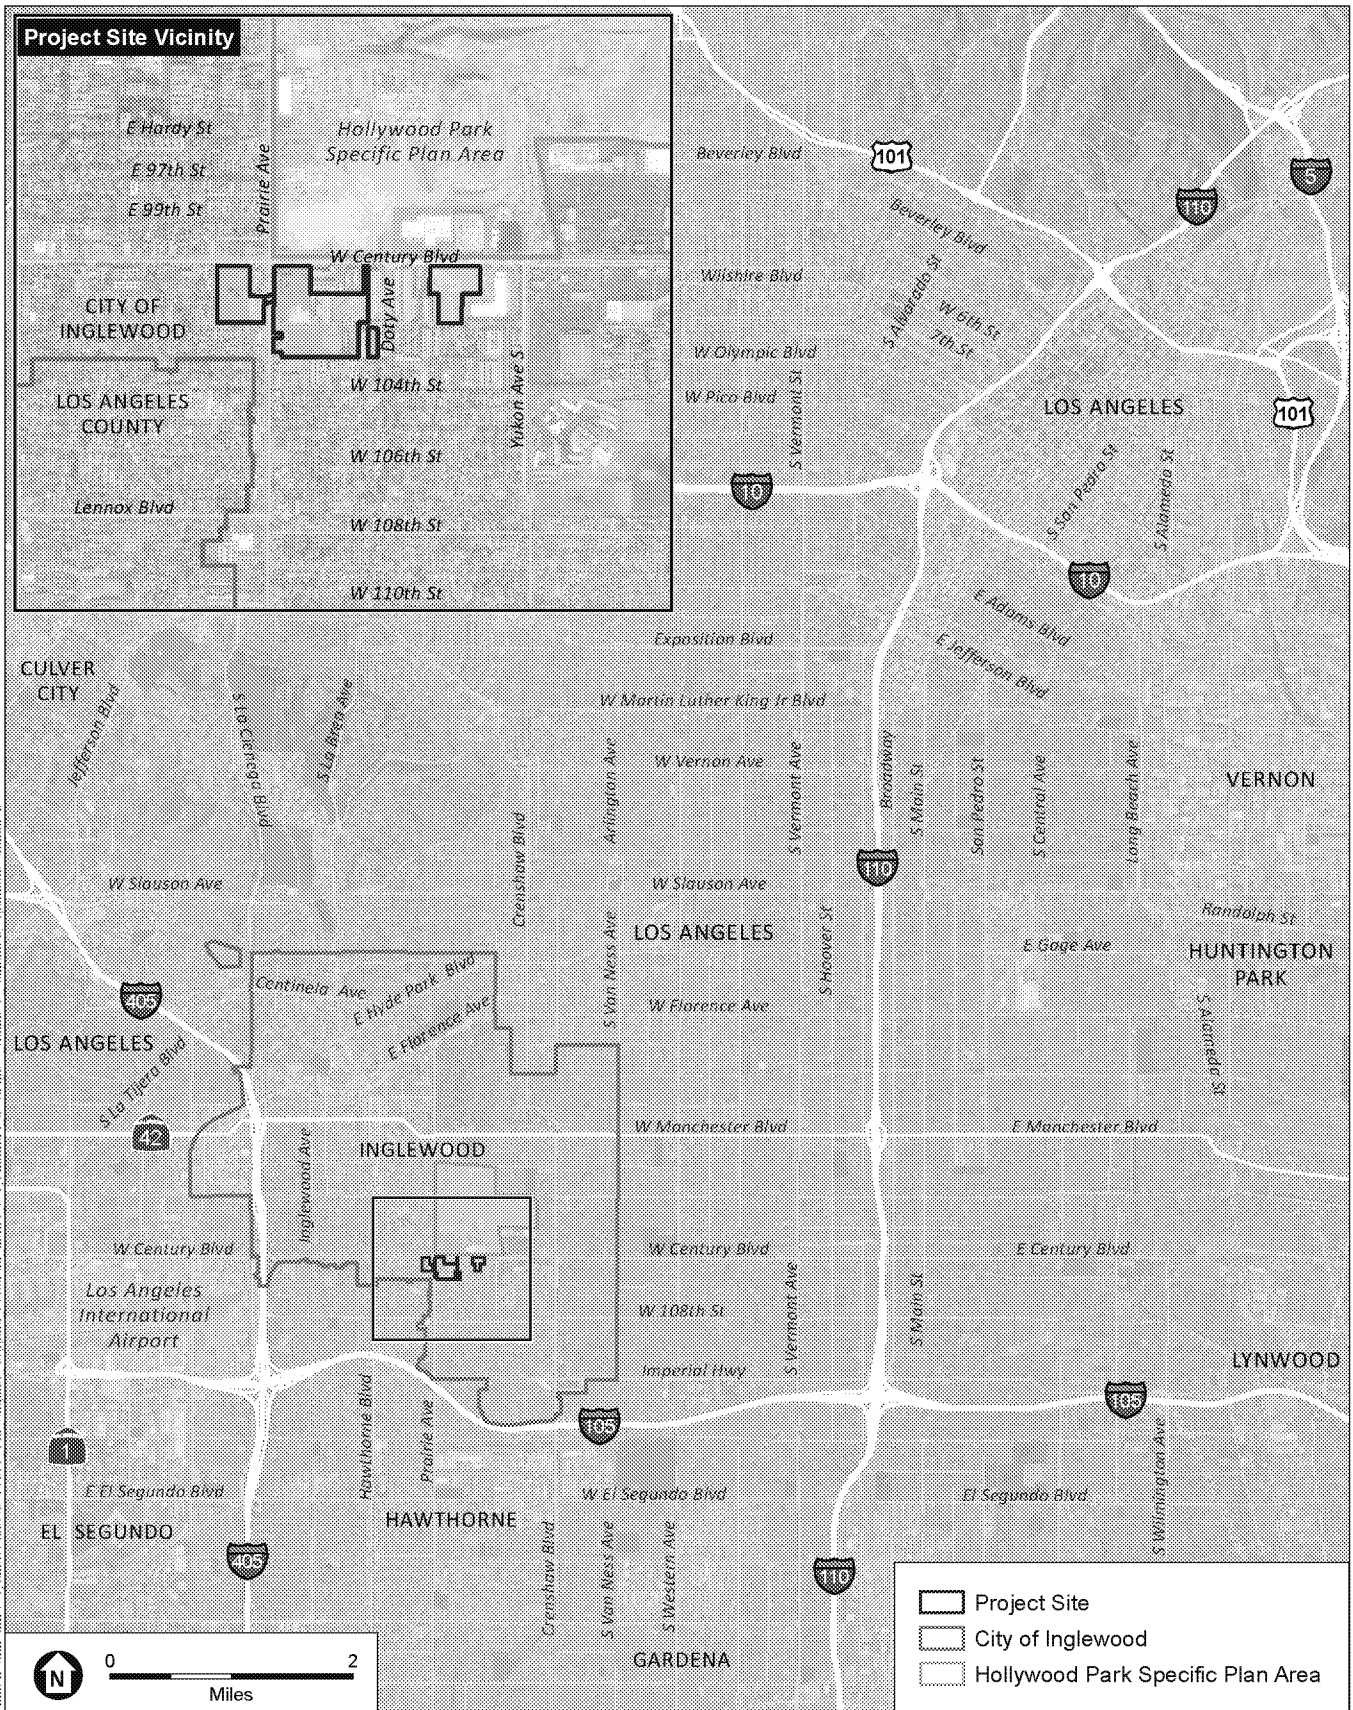

Local access is provided by West Century Boulevard that borders the Project Site on the north and is a commercial corridor that runs east–west through the City of Inglewood. South Prairie Avenue is also a major commercial corridor which passes through the Project Site between the Arena Site to the east and the West Parking Garage Site to the west, and provides north–south access through the City of Inglewood and beyond.

The Project Site is less than 1 mile from the Los Angeles County Metropolitan Transportation Authority (Metro) Green Line’s Hawthorne/Lennox Station (see Figure 3.14-4 in the Transportation and Circulation section). The Metro Green Line provides light rail service between Redondo Beach and Norwalk. The route also serves the communities of El Segundo, Hawthorne, South Los Angeles, Lynwood, and Downey.

Currently under construction, the Metro Crenshaw/LAX Line will provide a new light rail connection between the existing Metro Exposition Line and the Metro Green Line. The Crenshaw/LAX Line will serve the cities of Los Angeles, Inglewood, Hawthorne, and El Segundo, and portions of unincorporated Los Angeles County. The Crenshaw/LAX Line will also provide light rail service to LAX.³ Three stations associated with the Metro Crenshaw/LAX

² This stadium is currently referred to the Los Angeles Stadium and Entertainment District at Hollywood Park.

Inglewood Basketball and Entertainment Center

Figure 2-1
Regional Map

Line are planned in the City of Inglewood: the Downtown Inglewood Station located approximately 1.6 miles to the north of the Project Site, the Westchester/Veterans Station located approximately 2 miles northwest of the Project Site, and the Fairview Heights station located approximately 2 miles north of the Project Site. Construction of the Metro Crenshaw/LAX Line is currently underway, and is estimated to be completed in 2019.⁴ The Project Site is also served by multiple Metro bus lines including bus lines 117 and 212/312.

2.3 Project Objectives

CEQA Guidelines section 15124(b) establishes that the Project Description must include a statement of the objectives to be achieved by the Proposed Project. The Proposed Project constitutes a Public/Private partnership between Murphy's Bowl LLC and the City as the Proposed Project would involve the disposition of property owned by the City of Inglewood and the City of Inglewood as Successor Agency to the City Inglewood Redevelopment Agency, the vacation of portions of City-owned streets, potential condemnation actions to acquire privately owned, non-residential parcels as well as acquisition of public and potential acquisition of privately-owned parcels, by the project applicant for the development of the Project that is designed to maximize the public benefits. The project objectives for the Proposed Project include both the stated objectives of the City of Inglewood, as well as the stated objectives of the project applicant, Murphy's Bowl LLC. The following are the City's stated objectives for the Proposed Project:

1. Support the revitalization of the City of Inglewood, promote the City as a premiere regional sports and entertainment center recognized at the local, regional, national, and international levels, and support its City of Champions identity by bringing back a National Basketball Association (NBA) franchise to the City.
2. Facilitate a project that promotes the City's objectives related to economic development, and that enhances the general economic health and welfare of the City by encouraging viable development, stimulates new business and economic activity, and increases City revenue (property, sales, admissions and transient occupancy taxes).
3. Expand the opportunities for the City's residents and visitors to participate in a wide range of sporting, cultural, civic and business events.
4. Strengthen the community by providing public and youth-oriented space, outdoor community gathering space, and outdoor plazas.
5. Transform vacant or underutilized land within the City into compatible land uses within aircraft noise contours generated by operations at LAX, in compliance with Federal Aviation Administration (FAA) grants to the City.
6. Encourage sustainable, modern, integrated development that includes coordinated traffic event management strategies, encourages public transit opportunities to the Project Site, provides safe and adequate pedestrian circulation, and reflects a high level of architectural design quality and landscape amenities.
7. Create employment and construction-related employment opportunities in the City of Inglewood.

⁴ United States Department of Transportation. Crenshaw/LAX Transit Corridor. Available: <https://www.transportation.gov/tifia/financed-projects/crenshaw-lax-transit-corridor>. Accessed June 25, 2018.

8. Cause the construction (with private funds) of a public assembly and related uses that are geographically desirable and accessible to the general public to host sporting, cultural, business, and community events along with myriad youth- and community- oriented programs.
9. Cause the construction (with private funds) of a project that provides substantial public benefits, including jobs, property and sales taxes, admissions taxes, and transient occupancy taxes.
10. Achieve the objectives described above in an expeditious and environmentally conscious manner.

The following are the project applicant's stated objectives for the Proposed Project:

- 1. Build the long-term home of the LA Clippers NBA basketball team.**
 - a. Construct a state-of-the-art multi-purpose basketball and entertainment center with a capacity of up to 18,000 fixed seats to host LA Clippers home games beginning in the 2024–2025 NBA season.
 - b. Locate a basketball and entertainment center on a site that is geographically desirable and accessible to the LA Clippers' current and anticipated fan base.
 - c. Consolidate LA Clippers team operations and facilities in a single location that includes practice facilities, team executive and management offices, a sports medicine clinic, and adequate parking for both events and daily operations.
 - d. Design and develop the basketball and entertainment center to accommodate up to 18,500 attendees for other entertainment, cultural, sporting, business and community events when not in use for LA Clippers home games.
 - e. Create a lively, visitor- and community-serving environment year-round for patrons, employees, community members, and visitors to the surrounding neighborhood and nearby sports and entertainment venues by providing complementary on-site retail, dining, and/or community spaces.
 - f. Contribute to the economic and social well-being of the surrounding community by providing public benefits such as opportunities for youth- and community-oriented programs, and increasing revenues generated by property and sales taxes, admissions taxes, and potential transient occupancy taxes.
- 2. Develop a financially viable public/private Project that is constructed and operated from private funding sources.**
 - a. Locate the Proposed Project on a site that can be readily assembled and entitled to enable the feasible development of the Proposed Project to host the LA Clippers home basketball games in the 2024–2025 NBA season.
 - b. Create a unique visitor experience that is competitive with other new major event venues, including state-of-the-art media, sound, and lighting systems, patron amenities, and other features.
 - c. Enhance the future success of the Proposed Project by providing signage, naming rights, and sponsorship opportunities to assist in the private financing of the Proposed Project.
 - d. Support the financial viability of the Proposed Project by developing sufficient complementary on-site uses to enhance the productive use of the site on event and non-event days, including retail, dining, and potential hotel uses.

3. **Design a Project that is synergistic with nearby existing and proposed uses and incorporates state-of-the-art urban design and venue design principles.**
 - a. Locate the Proposed Project on a site near other existing and planned mixed-use development to create a dynamic, year-round sports and entertainment district destination.
 - b. Develop the basketball and entertainment center with features that enhance the Proposed Project sense of place as a major urban sports and entertainment venue, including gathering spaces, signage, and other amenities.
 - c. Create inviting and appropriately scaled pedestrian environments to facilitate the movement of pedestrians and create safe and secure assembly areas for fans and visitors.
 - d. Develop the Proposed Project to meet high-quality urban design and sustainability standards.
 - e. Design the Proposed Project to take advantage of existing and planned public transit, and incorporate appropriate vehicular, pedestrian, and bicycle access and amenities that encourage sustainable transportation options.
 - f. Increase walkability and improve the pedestrian experience on adjacent public rights of way near the Project Site, and enhance the streetscape appearance by providing perimeter and interior landscaping.

2.4 Project Site Existing Conditions

2.4.1 Location

The entire Project Site, as shown in **Figure 2-2**, is comprised of approximately 28 acres of land. The main portion of the Project Site is bounded by West Century Boulevard on the north, South Prairie Avenue on the west, South Doty Avenue on the east, and an imaginary straight line extending east from West 103rd Street to South Doty Avenue to the south. This approximately 17-acre area is described as the Arena Site. The Project Site includes three additional components: the West Parking Garage Site is an approximately 5-acre site bounded by West Century Boulevard to the north, hotel and residential uses to the west, South Prairie Avenue to the east, and West 102nd Street to the south; the East Transportation and Hotel Site is an approximately 5-acre site bounded by West Century Boulevard to the north, industrial and commercial uses to the east and west, and West 102nd Street to the south; and the Well Relocation Site is an approximately 0.7-acre parcel located at 3812 West 102nd Street, surrounded by vacant land to the west and south and bounded by residential uses to the east.

As shown in **Figure 2-3**, most of the Project Site, approximately 84 percent, consists of parcels owned by the City of Inglewood or the City of Inglewood as Successor Agency to the Inglewood Redevelopment Agency. The Project Site is partially within the Planning Boundary/Airport Influence Area for the LAX Airport as designated within the Los Angeles County Airport Land Use Plan. As depicted in **Figure 2-4**, the Project Site falls within the Airport Influence Area for LAX for the southern LAX runway.

2.4.2 General Plan and Zoning

As shown in **Figure 2-5**, the majority of the Project Site is designated as Industrial in the City of Inglewood General Plan Land Use Element. A small portion of the Project Site along the South Prairie Avenue corridor is designated as Commercial.

As shown in **Figure 2-6**, the Project Site has several zoning designations. The City of Inglewood Zoning Code designates the eastern half of the approximately 17-acre Arena Site, the entirety of the East Transportation and Hotel Site, and the entirety of the Well Relocation Site as M-1L, Limited Manufacturing. Approximately half of the Arena Site bordering the east side of South Prairie Avenue and the northern and eastern portions of the West Parking Garage Site are zoned C-2A, Airport Commercial. The West Parking Garage Site also contains some parcels zoned as P-1, Parking; R-2, Residential Limited Multifamily; and R-3, Residential Multiple Family.

Additional detail regarding existing zoning of the Project Site is provided in Section 3.10, Land Use and Planning.

2.4.3 Existing Uses on the Project Site

All but six of the parcels that make up the Project Site are currently vacant or undeveloped. The six developed parcels, approximately 2.9 acres all within the Arena Site, include a fast food restaurant (on a privately owned parcel), a motel (on a privately owned parcel), a warehouse and light manufacturing facilities (on two privately owned parcels), a commercial catering business (on a privately owned parcel), and a groundwater well and related facilities (on a City-owned parcel). Another 1.5 acres consists of street segments to be vacated and incorporated into the Project Site (see **Table 2-1**). The existing land uses within the Project Site are described below and shown in **Figure 2-3**.

Arena Site

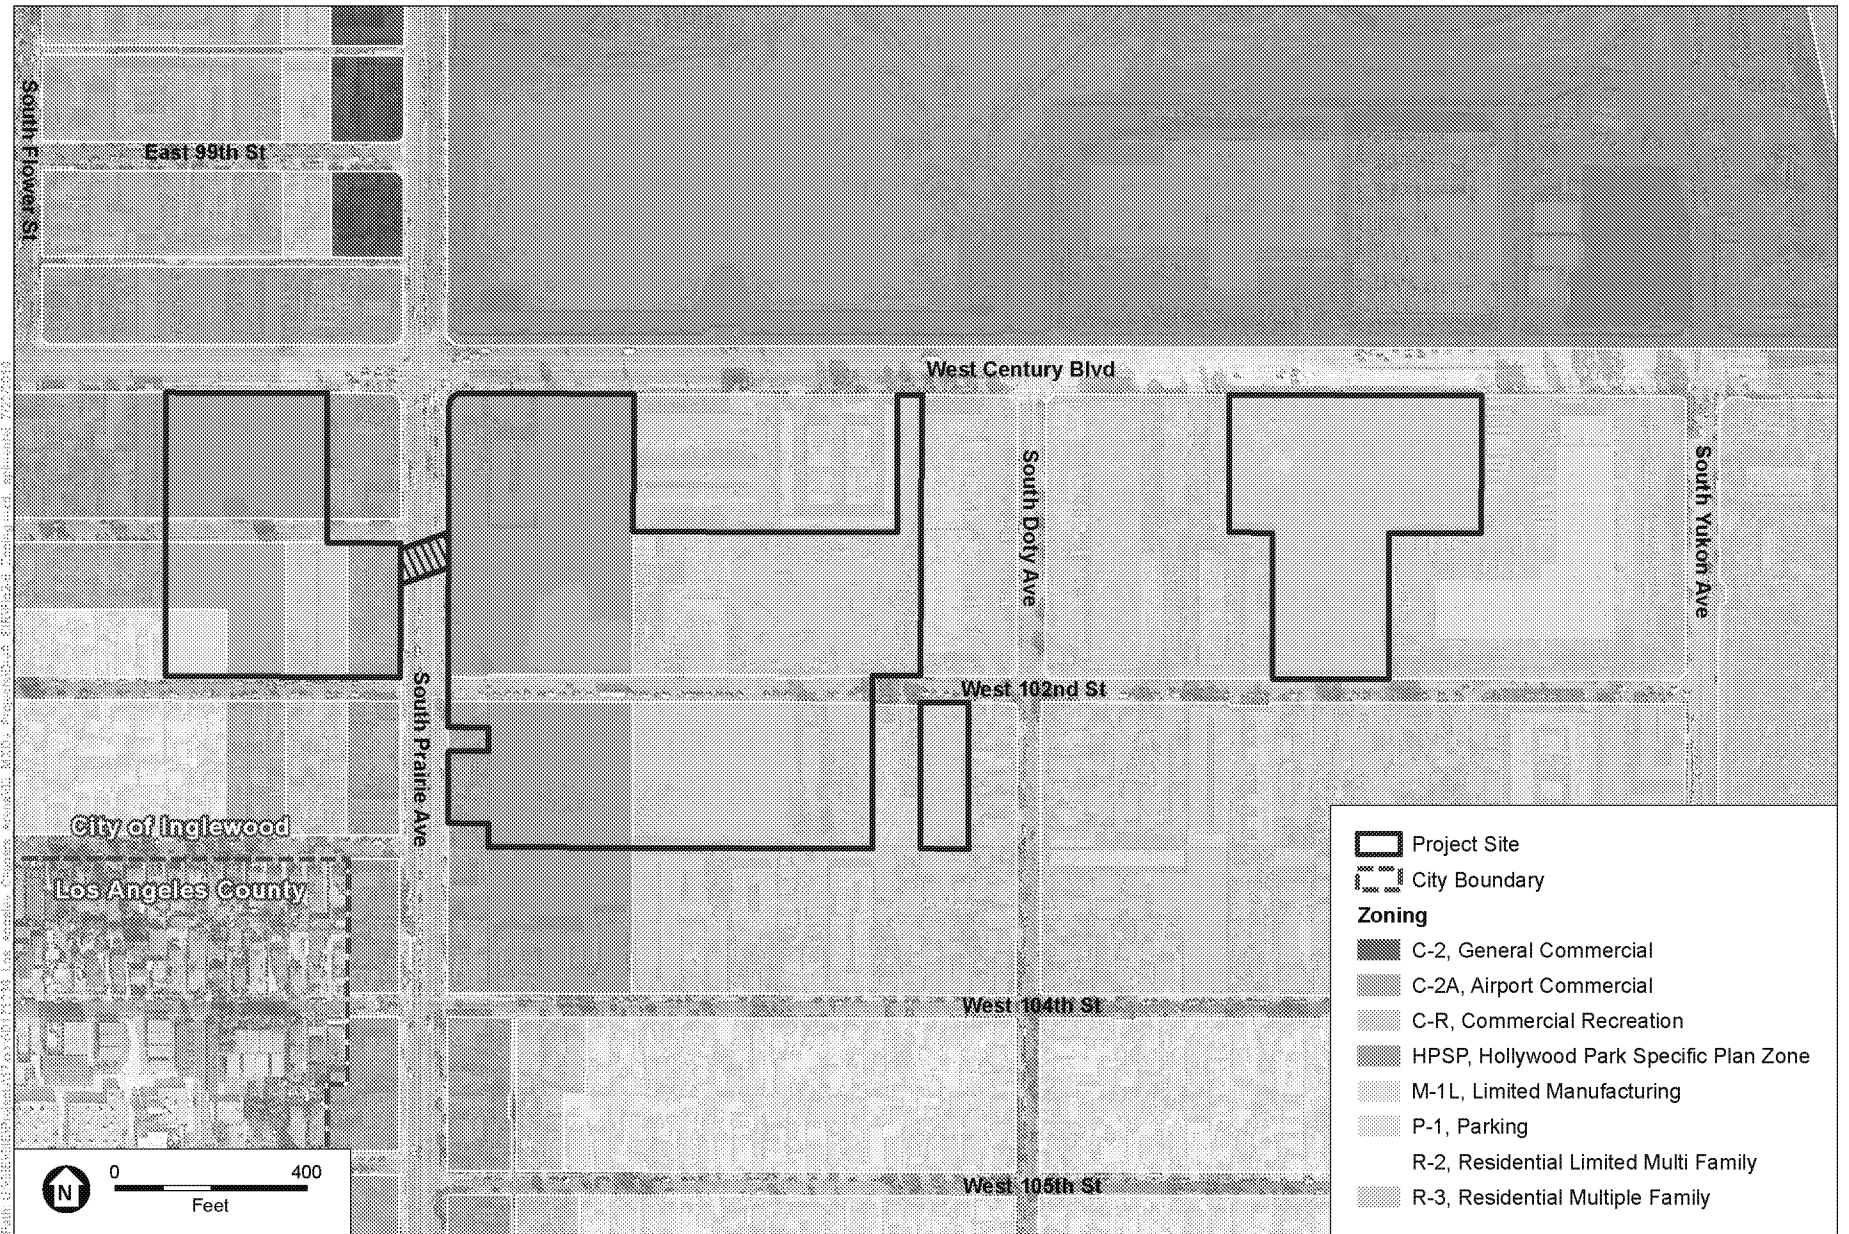

Consisting of approximately 17 acres, the Arena Site is an irregularly shaped area formed by 41 parcels and a portion of an existing public street, generally bounded by West Century Boulevard on the north, South Prairie Avenue on the west, South Doty Avenue on the east, and a straight line extending east from West 103rd Street to South Doty Avenue to the south. Although the majority of the Arena Site consists of vacant lots, all six of the developed parcels within the Project Site are located within the Arena Site.

Developed parcels within the Arena Site with frontage along West Century Boulevard include an occupied Church's Chicken Restaurant fast-food restaurant located at the southeast corner of West Century Boulevard and South Prairie Avenue (10004 South Prairie Avenue). On the sidewalk directly to the north and east of the Church's Chicken Restaurant are two Metro bus stops. Both Metro bus stops include benches and bus shelters. The parcel immediately to the east of the Church's Chicken Restaurant along West Century Boulevard is developed with a two-story, 38-room Rodeway Inn & Suites motel (3940 West Century Boulevard). Associated surface parking is provided directly in front of the motel along West Century Boulevard with additional parking located to the rear of the motel. Vehicle access to the motel is provided from West Century Boulevard.

SOURCES: Los Angeles County Assessor Portal, 2018. Available: <https://portal.assessor.lacounty.gov/>. Accessed June 25, 2018. TerraServer, 2018.

Directly east of the Rodeway Inn & Suites motel, fronting West Century Boulevard, are two vacant parcels surrounded by chain link fencing that are included in the Arena Site. The unoccupied hotel (formerly operated as the Airport Park View Hotel) and commercial self-storage building located east of those vacant parcels along West Century Boulevard are not included in the Arena Site (and are not included in the Project Site). East of the self-storage building and lot is a narrow vacant parcel that is part of the Arena Site, currently improved with a paved access leading to other vacant parcels within the Arena Site that were previously used to support the storage and staging of construction materials associated with a street improvement project. This vacant parcel is surrounded by chain link fencing and green screening.

Developed parcels within the Arena Site with frontage along West 102nd Street include a two-story, unoccupied warehouse/light manufacturing facility located on the north side of West 102nd Street approximately 450 feet east of the intersection of South Prairie Avenue and West 102nd Street (3195 West 102nd Street). This lot is improved with a surface parking lot and access gate along West 102nd Street. Immediately to the east of the warehouse/manufacturing facility parcel is the City of Inglewood Water Well #6, which is surrounded and secured by vertical blue metal fencing and an access gate. An unoccupied one- and two-story concrete commercial

building with an access driveway and small parking area is located further east along the south side of West 102nd Street (3838 West 102nd Street).

Also within the Arena Site is a parcel located along the east side South Prairie Avenue south of West 102nd Street that is currently improved with the Let's Have A Cart Party catering business (10212 South Prairie Avenue), which includes a one-story commercial building, surface parking, and a small storage shed.

The Arena Site also includes a portion of West 102nd Street that would be vacated as part of the Proposed Project. The portion of West 102nd Street that would be vacated is approximately 900 feet long, from South Prairie Avenue on the west to 3820 West 102nd Street to the east. This portion of West 102nd Street includes narrow sidewalks on both the north and south sides of the street, a few trees and minimal landscaping on the north side of the street, and overhead utility lines and poles on the south side of the street.

The remaining parcels within the Arena Site are vacant lots surrounded by chain link fencing or chain link fencing with green screening. The vacant lots contain sparse non-native grasses and ornamental plants. These vacant lots have frontage along the south side of West Century Boulevard, the east side of South Prairie Avenue, and the north and south side of West 102nd Street. Wooden utility poles and lines carrying service to adjacent properties are located on some of the lots along West 102nd Street and South Prairie Avenue. As described below, four vacant lots within the Arena Site are improved with outdoor advertising structures.

Outdoor Advertising Displays

There are four outdoor advertising structures (billboards) on the Arena Site, as shown on Figure 2-3. The vacant parcel at 10220 South Prairie Avenue includes a dual-faced static outdoor advertising display which is lit by floodlights facing upward. This approximately 30-foot-tall outdoor advertising display is mounted on dual poles, and includes an access ladder for maintenance crews to climb to reach the outdoor advertising display faces. The outdoor advertising display faces are clearly visible to drivers on both northbound and southbound South Prairie Avenue.

The vacant parcel at 10200 South Prairie Avenue (southeast corner of South Prairie Avenue and West 102nd Street) has a dual-faced, static outdoor advertising display mounted on a single pole. This outdoor advertising display is not lit on either side. This outdoor advertising display is relatively small, both in height and in surface area; the top of the outdoor advertising display is only approximately 15 feet from ground-level. The outdoor advertising display is visible to southbound drivers on South Prairie Avenue, but an existing street tree somewhat obscures the outdoor advertising display's visibility to drivers on northbound South Prairie Avenue.

The vacant parcel at the northeast corner of South Prairie Avenue and West 102nd Street contains a dual-faced, static outdoor advertising display mounted on two metal poles. Both faces of the outdoor advertising display are illuminated by floodlights that are directed upward. The outdoor

advertising display is approximately 20 feet tall and the outdoor advertising display faces are clearly visible to drivers on both northbound and southbound South Prairie Avenue.

The Arena Site contains a fourth static outdoor advertising display along West Century Boulevard, on a vacant parcel immediately west of the unoccupied Airport Park View Hotel parcel. This outdoor advertising display is single-faced, with advertising visible only to westbound drivers on West Century Boulevard. The outdoor advertising display face is lit with a floodlight that is angled upward. This outdoor advertising display is mounted on dual poles, is approximately 20 feet tall, and includes an access ladder for maintenance crews to climb to reach the outdoor advertising display face.

West Parking Garage Site

To the west of the Arena Site, the West Parking Garage Site includes 27 parcels totaling approximately 5 acres on the north and south sides of West 101st Street, bounded by West Century Boulevard to the north, South Prairie Avenue on the east, West 102nd Street to the south, and residential and motel uses to the west. The site is currently vacant and is surrounded by chain link fencing. The West Parking Garage Site also includes a portion of West 101st Street that would be vacated as part of the Proposed Project. The portion of West 101st Street that would be vacated is approximately 350 feet long, between the Airport Motel on the west and the Sunshine Coin Laundry building to the east. This portion of West 101st Street includes narrow, separated sidewalks on both the north and south sides of the street, two mature trees on the north side of the street and one mature tree on the south side of the street, streetlights on the south side of the street, and overhead utility lines and poles on the north side of the street. Portions of the West Parking Garage Site are temporarily being used for construction staging by the City of Inglewood Public Works Department.

East Transportation and Hotel Site

Approximately 650 feet to the east of the Arena Site, the East Transportation and Hotel Site is a “T-shaped” group of five parcels encompassing approximately 5 acres. It is bounded by West Century Boulevard to the north and West 102nd Street to the south. The East Transportation and Hotel Site is vacant and surrounded by vertical metal fencing and intermittent green screening.

Well Relocation Site

The Well Relocation Site is located at 3812 West 102nd Street, approximately 100 feet east of the Arena Site. The vacant site consists of two parcels totaling approximately 0.7 acres. The site is surrounded by metal chain link fencing on the northern and eastern edges, a wrought iron fence along the southern boundary, and a building, half-block wall, and wrought iron fencing along the western boundary.

2.4.4 Access

Primary access to the Project Site is provided by West Century Boulevard, which borders the Project Site to the north. West Century Boulevard is a major east–west commercial corridor

within the City of Inglewood and provides connections to LAX and I-405 to the west and the City of Los Angeles and I-110 to the east. Between the Arena Site to the east and the West Parking Garage Site to the west, South Prairie Avenue is a major commercial corridor that provides north-south access through the City of Inglewood and provides connections to the City of Los Angeles to the north and I-105 and the City of Hawthorne to the south.

Along the Arena Site eastern boundary, South Doty Avenue is a two lane a north-south collector road that provides connections to West Century Boulevard to the north and residential uses to the south. Traversing of the Arena Site and to the south of the East Transportation and Hotel Site is West 102nd Street, a two-lane road that travels east-west, connecting to South Prairie Avenue on the west and Yukon Avenue on the east.

2.5 Project Elements

The Proposed Project would include demolition of the existing on-site development and the subsequent construction of the proposed IBEC. **Table 2-2** summarizes the proposed development for the Proposed Project. A site plan showing the locations of the components of the Proposed Project within the Project Site is shown on **Figure 2-7**.

Project components would include an approximately 915,000-square foot (sf) multi-purpose arena (Arena Structure or Arena) designed to host the LA Clippers basketball team with up to 18,000 fixed seats for NBA games. The Arena could also be configured with up to 500 additional temporary seats for events such as family shows, concerts, conventions, corporate events, and other sporting events. It is proposed that with the construction of the Arena, the LA Clippers who currently play their games at the Staples Center in downtown Los Angeles, and whose team offices are currently located at 1212 South Flower Street within two blocks of Staples Center, would use the Arena as its new home for on completion of the Proposed Project, all home basketball games and team offices. The LA Clippers' existing practice and athletic training facilities are located in the Playa Vista neighborhood of Los Angeles, at 6854 South Centinela Avenue. The LA Clippers practice and athletic training facility would be relocated to the Project Site upon completion of the Proposed Project.

In order to accommodate those uses, the proposed Arena Structure would include an approximately 85,000 sf team practice and athletic training facility, an approximately 71,000 sf LA Clippers team office space, and an approximately 25,000 sf sports medicine clinic.

An outdoor plaza within the Arena Site would be used for pedestrian circulation, patron queuing, and gathering. The plaza would be approximately 80,000 sf of circulation and gathering space, with landscaped areas throughout. Surrounding or within the outdoor plaza would be approximately 48,000 sf of retail/restaurant uses, up to 15,000 sf of community uses that would accommodate community and youth-oriented programming, and an outdoor stage.

**TABLE 2-2
PROPOSED USES**

Project Component	Proposed Uses	Size
Arena Site		
Arena Structure	Premium and general seating, concessions	18,000 fixed seats with 500 temporary floor seats (approximately 915,000 sf)
LA Clippers Office Space	Offices, conference areas, kitchens, maintenance, and janitorial storage	71,000 sf
LA Clippers Team Practice and Training Facility	Team locker room, showers, and support spaces; video room; training and treatment; auxiliary locker rooms, basketball support and security, administrative offices	85,000 sf
Sports Medicine Clinic	Medical offices, medical treatment and rehabilitation areas, waiting areas, maintenance, and janitorial storage for team and potential general public use	25,000 sf
Community Space	Flexible exhibition, educational, and event space for community and youth-oriented uses	up to 15,000 sf
Commercial Uses	Retail shops, full service and quick service restaurants, kitchens, bars, and food service	48,000 sf
Full-Service Restaurant/Bar ^a		15,000 sf
Coffee Shop		5,000 sf
Quick Service Restaurant		4,000 sf
LA Clippers Team Store		7,000 sf
Other LA Clippers Experience/General Retail		17,000 sf
Outdoor Plaza	Outdoor community gathering space and landscaping	80,000 sf (surface area)
Parking Garage	Parking for premium ticket holders, VIPs, and certain team personnel	650 spaces
West Parking Garage Site		
Parking Garage	Parking for Arena and retail visitors and employees	3,110 spaces
East Transportation and Hotel Site		
Parking Garage	Parking for Arena and retail visitors and employees	365 spaces
Bus Staging and Transportation Network Company Drop-Off	Private and charter bus staging, taxi queuing, and rideshare pick-up/drop off	182 car (TNC) spaces 20 coach/bus spaces 23 mini bus spaces
Hotel	Hotel rooms, lobby area, administration offices, support areas, and parking	Up to 150 guest rooms
Well Relocation Site		
Water Well	City of Inglewood Groundwater Well #8	n/a

NOTE:

^a This use may be developed as two or more spaces on the Arena Site. Uses could include indoor, outdoor, patio, and/or rooftop restaurant, bar, or lounge space, totaling not more than 15,000 sf.

SOURCE: Murphy's Bowl LLC, September 27, 2018.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 2-7
Conceptual Site Plan

This page intentionally left blank

The Proposed Project would include parking facilities. A parking garage with 650 spaces immediately south of the Arena Structure would be located on the Arena Site. A pedestrian bridge would span South Prairie Avenue, connecting the plaza to the West Parking Garage Site. Uses on the West Parking Garage Site would include a proposed approximately 3,110-space parking garage. The East Transportation and Hotel Site, located approximately 1,300 feet east of the Arena Structure between West Century Boulevard and West 102nd Street, would include an approximately 365-space structured parking garage, with a transportation hub on the ground level of the parking garage and a surface lot on the south side of the parcel to accommodate TNCs and buses. A limited service hotel of up to 150 guest rooms and hotel parking would be developed on the East Transportation and Hotel Site, to the east of the surface parking lot.

The existing Inglewood Water Well #6 would be removed and replaced with a new Water Well #8 within the Project Site, on a separate parcel (the Well Relocation Site) further to the east along the south side of West 102nd Street.

2.5.1 Project Components/Design

Arena Site

The Arena Site is the central part of the Project Site and includes the Arena Structure, practice facility, sports medicine clinic, team offices, retail/restaurants, plaza, stage, access pavilion, community space, and some parking including media and team parking. These project components are described below.

Arena Structure

The Arena Structure would be a multi-level structure of approximately 915,000 sf, providing 18,000 fixed seats for LA Clippers home games, and up to 500 additional temporary floor seats for various events including other sporting events, concerts, and community events. Other uses programmed in the Arena Structure would include locker rooms, changing areas, premium clubs, suites, lounges, ticket and box offices, media areas, concession spaces, kitchens, restrooms, retail spaces, storage, maintenance and equipment spaces, promotional space and other visitor amenities, and loading docks (see **Figures 2-8 through 2-14** for conceptual floor plans of each level of the Arena Structure).

The primary arena entrance for event attendees would be located on the ground level on the northern portion of the Arena Structure fronting the plaza. The northeast corner of the Arena Structure would include an employee access pavilion which would serve as the main entryway for employees entering the Arena Structure. Additional entrances would be located on the southern edge of the building from the parking garage that would be available for premium ticket holders, performers, players, the general public and certain employees. Entry points are illustrated in Figure 2-7.

The Arena Structure would include an 85,000-sf team practice and training facility and a 25,000-sf sports medicine clinic. The team practice and training facility would be for LA Clippers' team use and would include a lobby area, full-sized basketball courts, and team locker and training

areas. The sports medicine clinic would house a variety of professionals, including physical therapists, nutritionists, and coaches who would work with the LA Clippers team athletes. The sports medicine clinic may also be available to provide medical services to the general public.

The Proposed Project would include development of up to 71,000 sf of office uses for LA Clippers employees that would be located within the Arena Structure. As mentioned above, currently LA Clippers' team offices are located in downtown Los Angeles. The existing team office uses and LA Clippers employees would be relocated to the new office space on the Project Site.

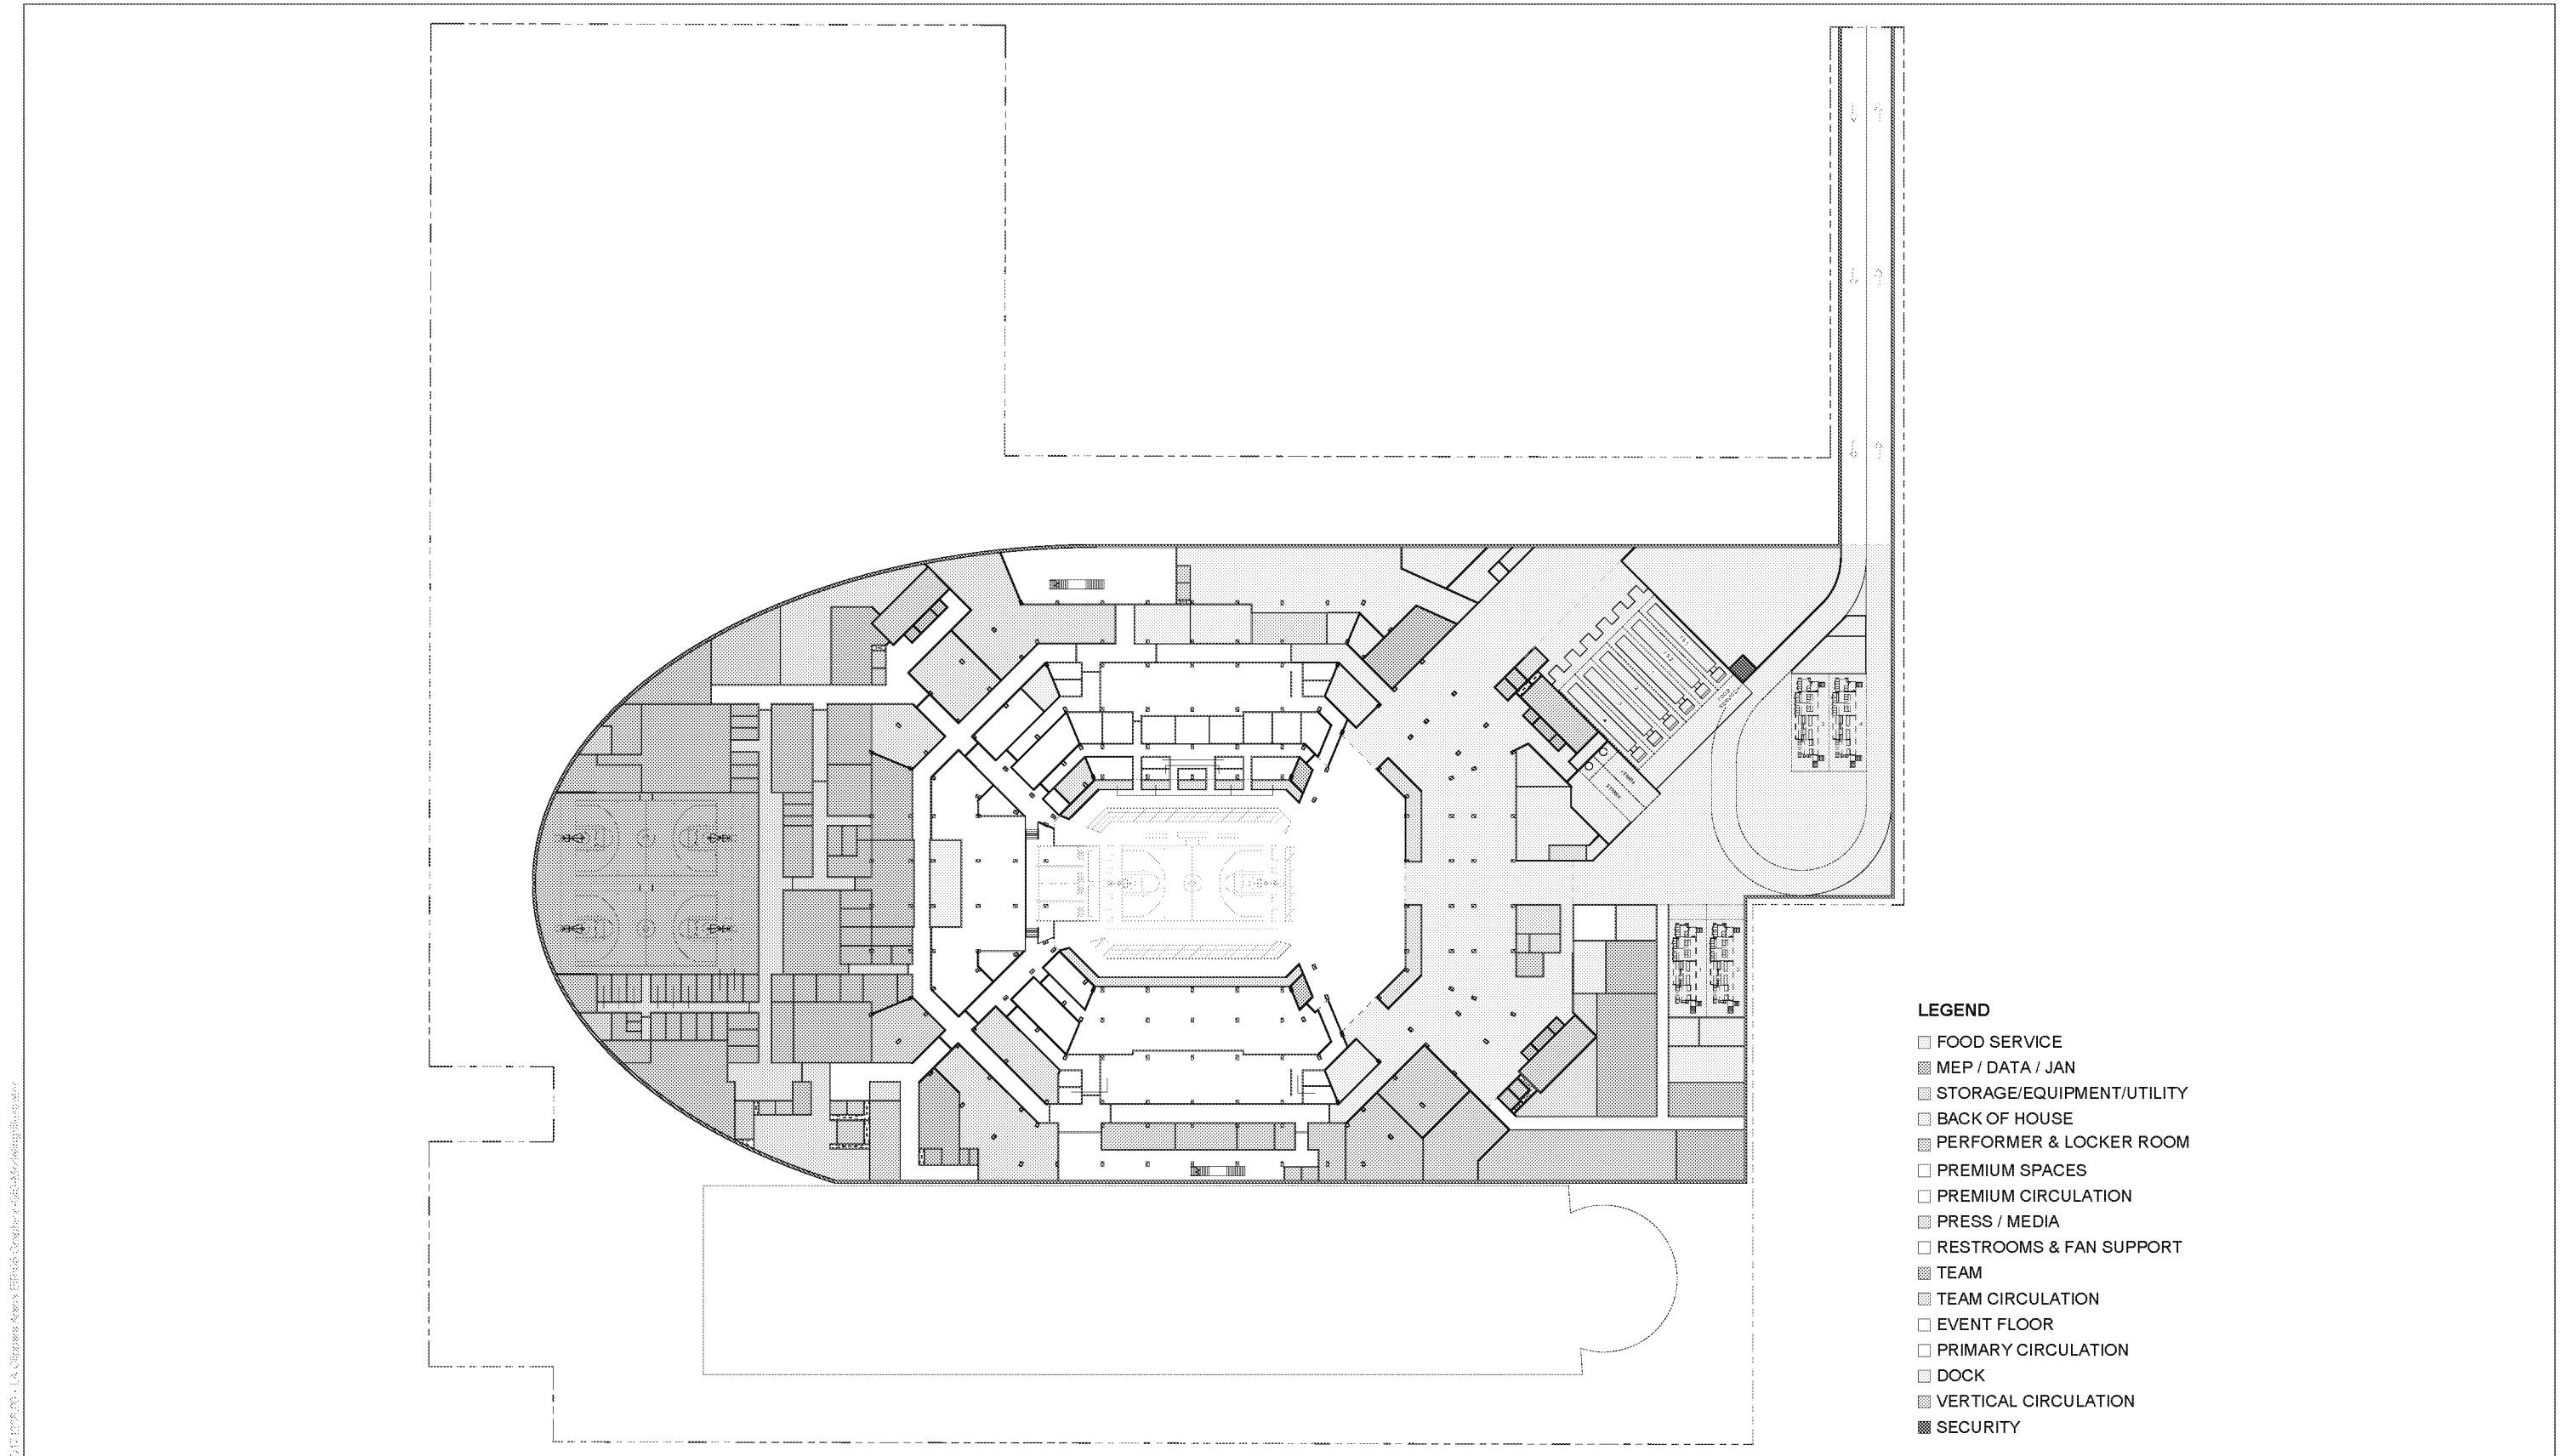

The roof of the Arena Structure and appurtenances would rise no higher than 150 feet above ground level at its highest point, where the existing ground level is approximately 90 feet above mean sea level (AMSL). Therefore, the Arena Structure and any appurtenances would be no higher than 240 feet AMSL. **Figure 2-15** shows the conceptual elevation (building height) of the Arena Structure roof level at 215.6 feet AMSL (rounded to approximately 216 feet).

The building would be an ellipsoid-shaped, multi-faceted structure with a grid-like façade and roof that would be highly visible, distinctive, and instantly recognizable due to a design unique in the City and the region, especially at night when it would be accentuated by distinctive lighting and signage. The façade and roof would be comprised of a range of textures and materials, including metal and glass, with integrated solar panels in the most exposed locations. Distinctive lighting and signage could be positioned inside and outside the building. Satellite dishes would be integrated into the roof of the Arena Structure but would generally not be visible from the ground. **Figures 2-16** and **2-17** show conceptual renderings of the Arena Structure, and Section 3.1, Aesthetics, presents conceptual views of the Project Site from various viewpoints.

Outdoor Plaza, Commercial, and Community Uses

The outdoor plaza would serve as a pedestrian-oriented activity and gathering area and queuing area before events at the Arena Structure. The outdoor plaza would be adjacent to and partially bounded by the ancillary structures programmed for restaurant and retail uses and a community space.

The outdoor plaza would facilitate pedestrian movement to and from the Arena Structure before and after games, concerts, and private events. The outdoor plaza is anticipated to be utilized seven days per week, at varying activity levels, with pedestrian flows associated with the commercial and community uses as well as other activities independent of events hosted within the Arena Structure. Retail, commercial, and restaurant uses surrounding the plaza would be built on two levels. An escalator would connect the ground-level outdoor plaza to the upper-level ancillary uses, and ultimately to the pedestrian bridge that connects the outdoor plaza to the parking garage across South Prairie Avenue.

Figure 2-16
Conceptual Rendering of Arena Structure – Aerial View

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 2-17
Conceptual Rendering of Arena Structure – Plaza View

The outdoor plaza would include landscaping and seating areas, public art, and an outdoor stage. Landscaping would include native drought resistant plants, with a palette that is coordinated to create continuity across the Project Site (see **Figure 2-18**). The outdoor plaza would be comprised of hardscape and landscaped planters. Hardscape areas would feature the use of a variety of paving materials and colors. Public art pieces would help to define the experience of the outdoor plaza area.

The outdoor stage would have amplified sound and could be used for musical performances, LA Clippers-related events, or community events. The outdoor plaza and stage would be equipped with light-emitting diode (LED) video boards directed to the interior of the plaza, speakers, lighting signage, including internally illuminated static signage, and digital signage including static LED displays and LED video boards.

Retail shops and food and drink uses totaling 48,000 sf would be developed adjacent to the plaza. Some of these commercial uses would be associated with the LA Clippers, such as a team store selling team merchandise and other LA Clippers-related experiences. Other commercial uses would include a full-service restaurant/lounge, a full-service restaurant/bar, a quick-service restaurant, a coffee shop, and retail stores.

A pedestrian bridge would directly connect the retail uses on the west side of the outdoor plaza to the parking structure proposed west of South Prairie Avenue. Escalators would bring people from the upper level of the retail building on the west side of the plaza down to the plaza level.

The Proposed Project could include up to 15,000 sf of flexible community space within a structure located adjacent to the outdoor plaza area, within the Arena Site. This element of the Proposed Project is envisioned as a flexible space for educational purposes and community interaction. Possible activities could include exhibits, education seminars, workshops, meetings, networking events, and sporting demonstrations.

Parking and Access

Circulation and parking facilities on the Project Site are described below. The locations of these facilities are also shown on Figure 2-7.

Automobile Access and Parking

A parking garage for 650 spaces would be located immediately south of the Arena Structure within the Arena Site (the South Parking Garage). Parking for 100 LA Clippers' athletes and LA Clippers full-time employees, and 550 premium spaces for fans and other VIPs would be available in this three-story, above-ground parking garage, with a direct entrance to the Arena Structure for employees and visitors.

Vehicular access to the parking garage would be accessed from a right-turn only driveway on South Prairie Avenue between West 102nd Street and 103rd Street. The driveway would therefore be accessible by those traveling northbound on South Prairie Avenue. Movements would be restricted to inbound and outbound right-turns at all times. The South Parking Garage would also

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 2-18
Preliminary Landscaping Plan

be accessible from the east via West 102nd Street and Doty Avenue. A speed ramp on the east side of the parking structure would provide vertical access to the parking garage. A drop-off area located immediately to the south of the Arena Structure would be available for office employees during weekday hours.

The South Parking Garage would be connected to the Arena Structure and would use a combination of concrete, precast panels, and metal screening, and would have associated lighting and signage. The parking structure would be equipped to accommodate 52 electric vehicle charging parking spaces (EVCs).

Service and Delivery Access and Loading

Small service and delivery vehicles providing services or materials for retail and food service venues would enter the Arena Site via a site access road accessed from West Century Boulevard, approximately 350 feet east of South Prairie Avenue, immediately west of the existing Airport Park View hotel parcel.

Large delivery vehicles such as semi-trucks, trash collection trucks, and large food service trucks would access the Arena Site from a new, gated service ramp accessed from West Century Boulevard, approximately 200 feet west of South Doty Avenue, between two existing commercial buildings. This service ramp would slope downward, providing access to a loading and staging area, at the below-grade event level of the Arena Structure. The Arena Structure would include six loading docks to provide easy loading and unloading of materials and supplies at the event level.

Media Truck/Broadcast Access and Parking

Media/broadcast trucks that are a feature of NBA basketball games require parking in areas that provide clear access to the southern sky for satellite connections. Media and associated truck parking would be provided on a designated media parking area located east of the Arena Structure. Certain media trucks that do not require clear sky access would be accommodated in parking areas located at the below-grade event level, accessed via the service ramp from West Century Boulevard. Electric hookups would be provided for media trucks so they would not be required to idle or use portable generators while in use before, during, or after events. Media trucks would access the Arena Site media truck surface parking area from the internal roadway accessed from West Century Boulevard.

Bicycle Parking

Approximately 60 long-term bicycle parking spaces for employees and 23 short-term bicycle parking spaces would be provided adjacent to the access pavilion on the northeast corner of the arena building.

Pedestrian Access and Transit Connections

Pedestrians would access the Arena Site via sidewalks along West Century Boulevard and South Prairie Avenue. Pedestrians coming from the West Parking Garage would use the South Prairie Avenue pedestrian bridge to access the Arena Site; and pedestrians coming from the East

Transportation and Hotel Site would access the Arena Site via sidewalks along West Century Boulevard and the north sidewalk on West 102nd Street. Pedestrian access to the Arena Structure would be provided through doorways on the north side of the building, fronting the plaza. There would be no visitor pedestrian access to the Arena Structure or the plaza from West 102nd Street east of the Arena Site. Employees would be able to enter through the plaza or through an employee pavilion accessed from West 102nd Street.

To accommodate shuttles that would transport people from nearby Metro light rail stations to the Project Site, a new shuttle drop-off cutout would be provided along the east side of South Prairie Avenue near the entrance to the arena plaza. This shuttle stop would be primarily used for shuttles between Metro light rail stations and the Arena.

West Parking Garage Site

The largest parking facility serving the Project Site would be a six-story parking structure that would include 3,110 spaces located along West Century Boulevard west of South Prairie Avenue. Access into the parking garage would be from a signalized driveway on approximate 475 feet west of South Prairie Avenue, and West Century Boulevard and a signalized driveway on South Prairie Avenue located approximately 575 feet south of West Century Boulevard. A new publicly accessible roadway would be constructed along the west side of the parking garage, connecting West Century Boulevard to West 101st and West 102nd Streets. Approximately 350 linear feet of West 101st Street would be vacated and developed as part of the parking structure. The vacated portion of West 101st Street would extend from the western boundary of the existing retail center (Starbucks/Warehouse Liquor Mart/Sunshine Coin Laundry) at the southwest corner of South Prairie Avenue and West Century Boulevard, to the alignment of the proposed new north-south public roadway along the western boundary of the site (see Figure 2-7). A “bulb out” would be developed at the northwest corner of South Prairie Avenue and West 102nd Street that would limit eastbound vehicle traffic on West 102nd to a stop sign controlled right turn out only onto South Prairie Avenue. No left turns out, and no left or right turns from South Prairie Avenue would be provided to West 102nd Street. An existing traffic signal on South Prairie Avenue and West 102nd Street would be removed. Direct access would not be provided from West 102nd Street, the remaining portion of West 101st Street (directly west of South Prairie Avenue), or the new alley/fire lane extending from West 102nd Street to West Century Boulevard.

The West Parking Garage would include 23 visitor bicycle parking spaces and potentially a bicycle valet. The parking garage would be equipped to accommodate 249 EVCs.

The main pedestrian access from the West Parking Garage Site into the Arena Site would be from an approximately 27-foot-wide second-level pedestrian bridge that would cross South Prairie Avenue. The pedestrian bridge would provide a minimum vertical clearance of 17 feet over South Prairie Avenue. The pedestrian bridge would allow for easy pedestrian access between the second floor of the parking garage to the second floor of the westernmost building in the plaza, with escalators providing access into the plaza.

The perimeter of the parking structure would include landscaping, pedestrian pathways, edge treatments and new street trees to promote the visual compatibility of the new parking facilities and facilitate safe pedestrian access.

East Transportation and Hotel Site

This approximately 5.16-acre portion of the Project Site east of the Arena Site would include a parking garage, transportation hub, and limited-service hotel. These project elements are described below. The location of these elements is shown on Figure 2-7.

Parking Garage/Transportation Hub

The parking garage/transportation hub would consist of a parking garage and surface parking lot to accommodate private vehicle parking, private or charter bus staging, and TNC staging, pick-up and drop-off.

The Proposed Project would include construction of a three-story parking garage on the northern portion of the East Transportation and Hotel Site, along West Century Boulevard. The ground level of the parking garage would accommodate private or charter bus staging and TNC pick-up and drop-off, and would connect to the surface parking lot on the southern portion of the site, which is intended to accommodate TNC staging. A driveway would be constructed as the southern leg of the West Century Boulevard/Hollywood Park Casino Drive intersection to provide ingress and egress access to the ground level of the transportation hub for bus and TNC vehicles. The bus staging and TNC drop-off area would include spaces for approximately 182 TNC vehicles, taxis, or similar vehicles), 20 charter coach buses, and 23 mini-buses, microtransit, and paratransit vehicles.

Parking for private vehicles would be provided only on the second and third floors of the parking garage. Private vehicles would enter the site from West 102nd Street and ramp up into the structure to park on the second and third floors of the parking garage. Vehicles would exit the parking structure similarly, ramping down and exiting onto West 102nd Street. The parking garage would include parking for 365 private vehicles. The parking garage would be equipped to accommodate 29 EVCs.

The perimeter of the parking garage and surface parking lot would include landscaping, pedestrian pathways, edge treatments and new street trees to promote the visual compatibility of the new parking facilities and facilitate safe pedestrian access.

Hotel

The Proposed Project would include a limited-service hotel use with up to 150 rooms on an approximately 1.3-acre portion of the East Transportation and Hotel Site. The hotel could include amenities such as a lobby, business center, a fitness room, a guest laundry facility, a market pantry, and/or an outdoor gathering area. The hotel would not include meeting spaces or restaurant services. The hotel would be approximately six stories, with a maximum height of approximately 100 feet, consistent with the maximum allowable height in the M1-L zone and

maximum allowable under FAA rules. The hotel building would consist of ground floor parking and a ground floor lobby and guest amenity uses. The second floor would consist of structured parking, guest amenity uses, and back-of-house uses. Guest rooms would occupy floors three through six.

Vehicular access to the hotel would be from West Century Boulevard. Parking for hotel guests would be provided with ground-level and structured parking within the hotel building. Vehicles would enter the site from West Century Boulevard, then travel to the southern portion of the site to access the ground floor parking area and/or ramp up to the second floor parking. Adequate parking for the hotel use would be provided solely within the hotel portion of the East Transportation and Hotel Site.

The hotel building would be anticipated to be constructed of varied materials, including but not limited to stucco, concrete, plaster, wood, masonry, glass, metal, tile, and/or stone. Outdoor gathering spaces for hotel guests may be provided through ground-level courtyards and/or upper level terraces. Landscaping and security lighting would be provided around the hotel and parking area. Building signage and directional signage may be provided on the site.

Well Relocation Site

As part of the Proposed Project, the City-owned and operated Inglewood Water Well #6 that is located within the Arena Site would be removed and relocated. A new City-owned and City-operated well, Water Well #8, would be constructed to replace the existing water well. The new City-owned and operated Water Well #8 would be located on the southern third of the two-parcel Well Relocation Site, south of West 102nd Street and west of South Doty Avenue. The location of Well #8 is shown on Figure 2-7.

The well would include water pumps and associated infrastructure that would be visible above ground, similar to the existing Water Well #6. No buildings or lighting are proposed. The ground surface would be covered with gravel or crushed stone, with a 15-foot-wide paved driveway adjacent to the western side of the proposed well location for vehicle access.

A 6-foot-tall concrete masonry unit security fence with automated sliding access gate would enclose the well site, with additional security provided via security cameras connected to the City of Inglewood via the pump station telemetry system. The well site would not include a permanent on-site backup generator.

The well would be drilled approximately 750 feet below ground surface, with a submersible pump to reduce noise to nearby residences. The Well #8 raw water discharge piping would connect to the existing City of Inglewood raw water main, located immediately in front of the project site on West 102nd Street. An existing utility pole located 50 feet east of the Well Relocation Site on West 102nd Street is expected to be the connection location to provide the power for the new well facility.

The proposed well waste line discharge would also connect to the LA County Flood Control District (LACFCD) catch basin (located at the southwest corner of West 102nd Street and South Doty Avenue) that is connected to an 84-inch storm drain (located in the eastern right-of-way of South Doty Avenue). A gravity well drain line would be constructed from the site east to the LACFCD storm catch basin.

Sound Barriers

Temporary and permanent sound barriers would be constructed on the Project Site (see **Figure 2-19**). The temporary sound barriers would be placed during the initial phase of any construction activities on portions of the Project Site, and would only be present during the construction of the Proposed Project. The proposed permanent barriers would remain in place during the operational life of the Proposed Project.

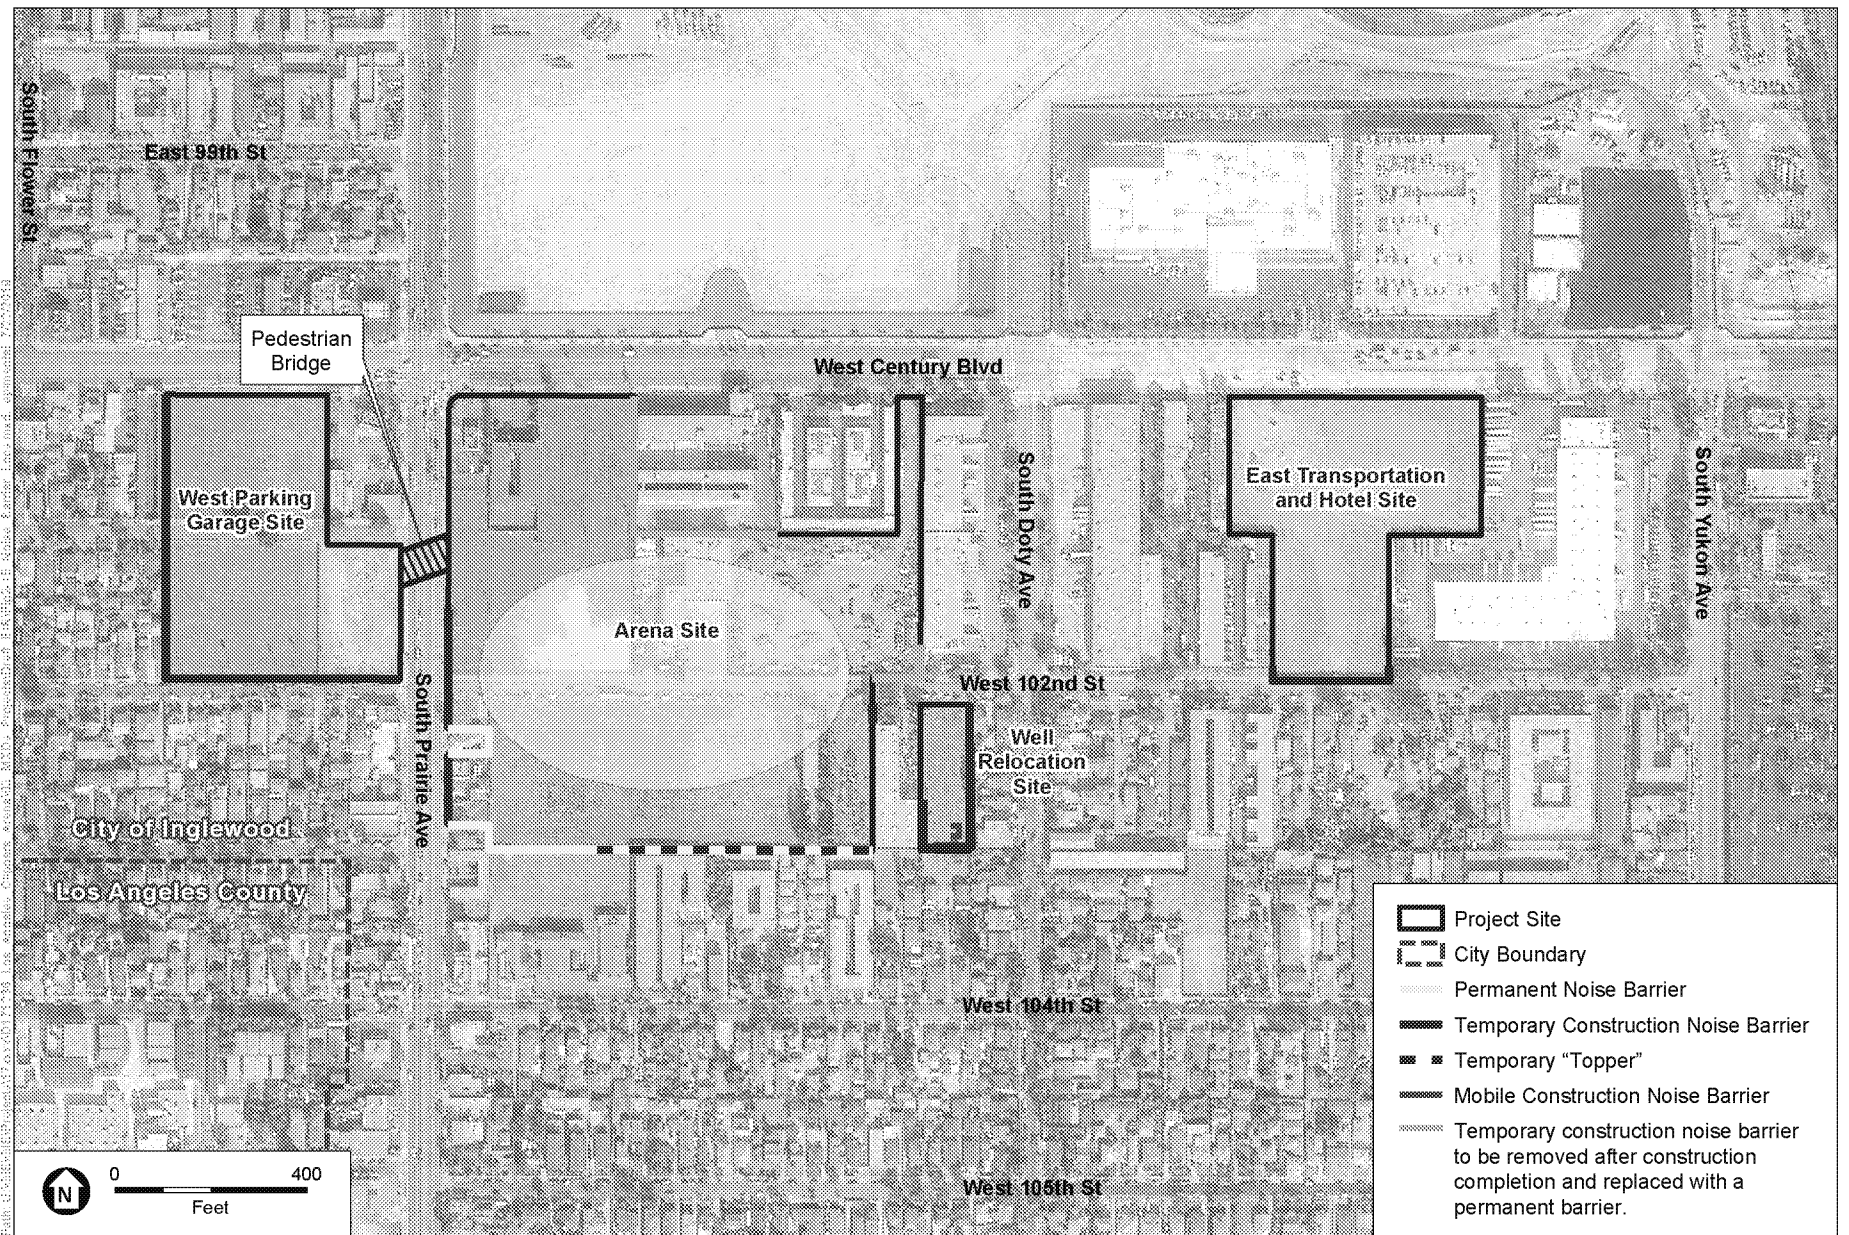

Arena Site

A proposed 15-foot-high permanent sound barrier would be constructed along the full length of the southern boundary of the Arena Site. A temporary, additional 7-foot-high sound barrier “topper” would be placed along the eastern two-thirds of this permanent wall for the duration of construction activities on the Arena Site. Permanent 12-foot-high sound barriers are proposed to be constructed along the shared boundaries of the Arena Site and the residences located at 10204 South Prairie Avenue and 10226 South Prairie Avenue prior to the start of any major construction activities on the Arena Site. A temporary 12-foot-high sound barrier is proposed along the western boundary of the Arena Site from the southern boundary to approximately mid-block between West 101st Street and West 102nd Street. Barriers would not be placed in front of the residences located at 10204 South Prairie Avenue and 10226 South Prairie Avenue so as to continue to allow resident access to those parcels from South Prairie Avenue.

A temporary 16-foot-high sound barrier is proposed along the shared boundary of the Arena Site and the Airport Park View Hotel, which would be replaced with a permanent 12-foot-high sound wall after the conclusion of major construction activities on the Arena Site. Similarly, the temporary 12-foot-high sound barrier proposed at the northeast corner of the Arena Site and West 102nd Street during construction would be replaced with a permanent 8-foot-high sound wall at the conclusion of major construction activities. A temporary 12-foot-high sound barrier is also proposed at the southeast corner of the Arena Site and West 102nd Street between the southern sidewalk of West 102nd Street and the northern facade of the industrial use located adjacent to the Arena Site to the east, south of West 102nd Street.

West Parking Garage Site

A proposed temporary 12-foot-high sound barrier would be placed along the western and southern boundaries of the West Parking Garage Site to remain in place during any construction activities occurring on this portion of the Project Site.

SOURCE: TerraServer, 2018; AECOM, 2019; ESA, 2019.

Inglewood Basketball and Entertainment Center

Figure 2-19
Noise Barrier Locations

East Transportation and Hotel Site

A proposed temporary 8-foot-high sound barrier would be placed along the southern boundary of the East Transportation and Hotel Site during construction activities on this portion of the Project Site. Portions of this temporary sound barrier would extend along the southerly east and west boundaries of the site.

Well Relocation Site

A temporary sound barrier ranging between 15 feet and 26 feet is proposed along the length of the south and east boundaries of the Well Relocation Site and along a portion of the west boundary of the site, which would be removed after completion of construction activities on the Well Relocation Site.

2.5.2 Projected Number and Schedule of Events

The proposed Arena would primarily be used for LA Clippers home basketball games, as well as a performance venue that could be configured for other sporting events, concerts, conferences, conventions, civic events, and family-oriented shows, including a configuration to accommodate a temporary ice floor for holiday or live entertainment events.

The LA Clippers are expected to host up to five preseason games in October and 41 regular season games from October to mid-April on an annual basis. Although the current NBA playoff format could allow for a maximum of 16 home playoff games from April to June, it is anticipated that the Arena would host an average of three playoff games per year, based on NBA team averages. Other events such as concerts, family shows, conventions and corporate or civic events, and non-LA Clippers sporting events would take place in the Arena throughout the year, with attendance ranging from small events up to 2,000 attendees (average of 300 attendees) to full Arena capacity. It is estimated that the Arena could host approximately 178 non-LA Clippers events annually, with an additional 16 smaller outdoor events in the plaza. As detailed in **Table 2-3**, approximately 243 events per year are anticipated.

2.5.3 Employment

Future employment would include permanent employment associated with the operations of the Arena and other uses included in the Proposed Project, as well as temporary employment to support events throughout the year.

LA Clippers and IBEC Arena Employees

As shown in **Table 2-4**, the LA Clippers organization currently maintains approximately 254 FTE employees, which includes approximately 54 basketball operations employees such as players, coaches, and staff, and approximately 200 employees in executive management, business operations and various support capacities. The Proposed Project would include approximately the same number LA Clippers employees as under current conditions. It is anticipated that the Proposed Project would also require approximately 75 FTE employees to provide operations and management services for the Arena.

TABLE 2-3
ANTICIPATED ANNUAL EVENT CHARACTERISTICS

Event Type	Anticipated Annual Frequency	Average Attendance	Maximum Attendance	Event-Day Employees ^a	Season	Temporal Characteristics
LA Clippers Home Basketball Game	Up to 5 Preseason Games 41 Regular Season Games 3 Postseason Games ^d	12,000 16,000 18,000	18,000 18,000 18,000	1,320 ^b 1,320 ^b 1,320 ^b	2 weeks in early October Mid-October to Mid-April Mid-April to Mid-June	Preseason Game Start Time: Variable Regular Season Game Start Time: Typically 7:30 PM ^c Postseason Game Start Time: Variable <u>Monthly Distribution</u> Approximately 7 games per month, October through April <u>Weekly Distribution</u> Monday through Friday: Approximately 5–6 games per month Saturday: Approximately 1–2 games per month Sunday: Approximately 0–1 games per month
Concerts ^e	Up to 5 per year (large) Up to 8 per year (medium) Up to 10 per year (small)	15,000 12,000 7,000	18,500 14,500 9,500	1,120 ^f 795 ^f 530 ^f	Throughout the year ^g	Typical Concert Time: 7:30 PM to 10:30 PM <u>Weekly Distribution</u> Primarily Friday and Saturday nights
Family Shows ^h	Up to 20	6,000	8,500	530 ^f	Throughout the year ^g	Weekly distribution and times variable
Other Events ⁱ	Up to 35	5,000	7,500	480 ^f	Throughout the year ^g	Weekly distribution and times variable
Corporate/Community Events ^j	Up to 100	300	2,000	25 ^f	Throughout the year ^g	Weekly distribution and times variable
Plaza Events ^k	Up to 16	2,400	4,000	25	Throughout the year ^g	Weekly distribution and times variable

NOTES:

- ^a Estimates do not include full-time Arena management and operations employees, LA Clippers basketball operations employees including players and coaches, LA Clippers employees that work in the management offices or related facilities during the day, or visiting event performers and their support staff at the Arena.
- ^b Provided by Venue Solutions Group based on a blended analysis of the Amway Center, American Airlines Arena, Madison Square Garden, and Staples Center operations; includes 1,200 non-LA Clippers employees and 120 LA Clippers employees to provide game-day operations support.
- ^c The majority of LA Clippers regular season home games hosted on weekday and Saturday nights would start at 7:30 PM, with Sunday games starting at 6:30 PM, per the stated preference of the LA Clippers and within the range of other team schedules in the Pacific Standard Time zone. However, to be conservative for analytical purposes, the EIR analysis assumes 7:00 PM start times for weekday and Saturday basketball games, which are allowed under the NBA rules. This assumption is conservative because it schedules the start-time for basketball games closer to the PM peak period for traffic on weekdays (4:00 PM to 6:00 PM).
- ^d The current NBA playoff format, implemented in the 2002–03 season, involves four rounds of best-of-seven series and allows for a potential maximum of 16 home games in one season. Based on an analysis of the past playoff appearances of all current NBA teams, the anticipated average annual number of home playoff games is 3 games.
- ^e Annual number and size of concerts may vary according to market conditions and availability of the Arena; these estimates represent the anticipated annual average occurrences of each concert type.
- ^f Provided by Venue Solutions Group based on a blended analysis of the Amway Center, American Airlines Arena, Madison Square Garden, and Staples Center operations.
- ^g Concerts, family shows, other events, and corporate/community events may be scheduled throughout the year, provided such events do not conflict with LA Clippers home basketball games.
- ^h Examples of family shows include Disney Live, Harlem Globetrotters and Marvel Universe Live.
- ⁱ Examples of other sporting events include college basketball, boxing, lacrosse, Arena football, or non-recurring events such as professional wrestling shows. Events could be professional, collegiate or amateur competitions. Other events could include speaking events or civic events such as local graduation ceremonies.
- ^j Examples of corporate or community events include small conventions, conferences, cultural events, civic events and private events. Events could be hosted on the Arena floor or in club, locker room and concourse space throughout the Arena, or in the plaza.
- ^k Examples of plaza events include outdoor exhibitions or festivals for arts, food, technology, or similar activities, fan appreciation days, holiday celebrations, and similar outdoor events.

SOURCE: Murphy's Bowl LLC, 2018.

**TABLE 2-4
EXISTING AND FUTURE NON-EVENT EMPLOYEES**

Description	Description	Total Employees
LA Clippers Employees (Relocating)		
Basketball Operations (includes players, coaches, staff, etc.)	Players, coaches, training staff, etc.	54
Executive Management and Business Operations	Executive management, legal, finance, human resources, media and broadcasting staff, public and community relations, hospitality services, etc.	100
Business Operations Support	Customer service, sales and marketing support, team operations support	100
<i>Subtotal</i>		<i>254^a</i>
IBEC Arena Employees (Future)		
Arena Operations and Management	Management, Arena maintenance and operations, security, housekeeping	75
<i>Subtotal</i>		<i>75^a</i>
Other Project Employees (Future)		
Restaurant	Staff and management for full-service restaurants	112
Shopping Center/Retail/Arena and Plaza Experience	Flagship team store, quick-service restaurant and coffee shop, and general retail/service and related employees	216
Sports Medicine Clinic	Care providers (doctors, nurses, specialists) and business operations staff	35
Community Space	Staff, management, and instructors for flexible community space, meeting rooms/classrooms, and related areas	26
Hotel	Staff and management for limited service hotel	50
<i>Subtotal</i>		<i>439^b</i>
Total		768

NOTES:

^a Employee totals represent full-time or full-time-equivalent employees.^b Employee totals represent all employees (full-time and part-time).

SOURCE: Murphy's Bowl LLC, 2018.

Event-Related Employees

Event-related employees would be required to support events hosted at the proposed Arena, including security, ushers, ticket takers, food service and hospitality staff, and other event-related staff. The number of event-related employees required, and the types of services provided, for an event hosted at the Arena would vary depending on the type and size of event. As shown in Table 2-3, the highest number of event-related employees would be required to support an LA Clippers home basketball game, approximately 1,320 employees, which includes approximately 120 LA Clippers business operations support employees who would also work at LA Clippers games. Other major full-capacity events, such as a large concert, would require approximately 1,120 event-related employees.

Events that would not utilize the capacity of the Arena would require fewer employees. Medium-sized events, including weekend family shows and other events, are anticipated to require

between 480 and 530 event-related employees. Smaller events are anticipated to require approximately 25 employees.

Depending on the nature of the event, some event-related employees would work on days leading up to the event. Event-related employees would typically begin to arrive at the Arena several hours before an event, and depending on their responsibilities, some employees would remain on site for several hours or longer after events.

Other Project Employees

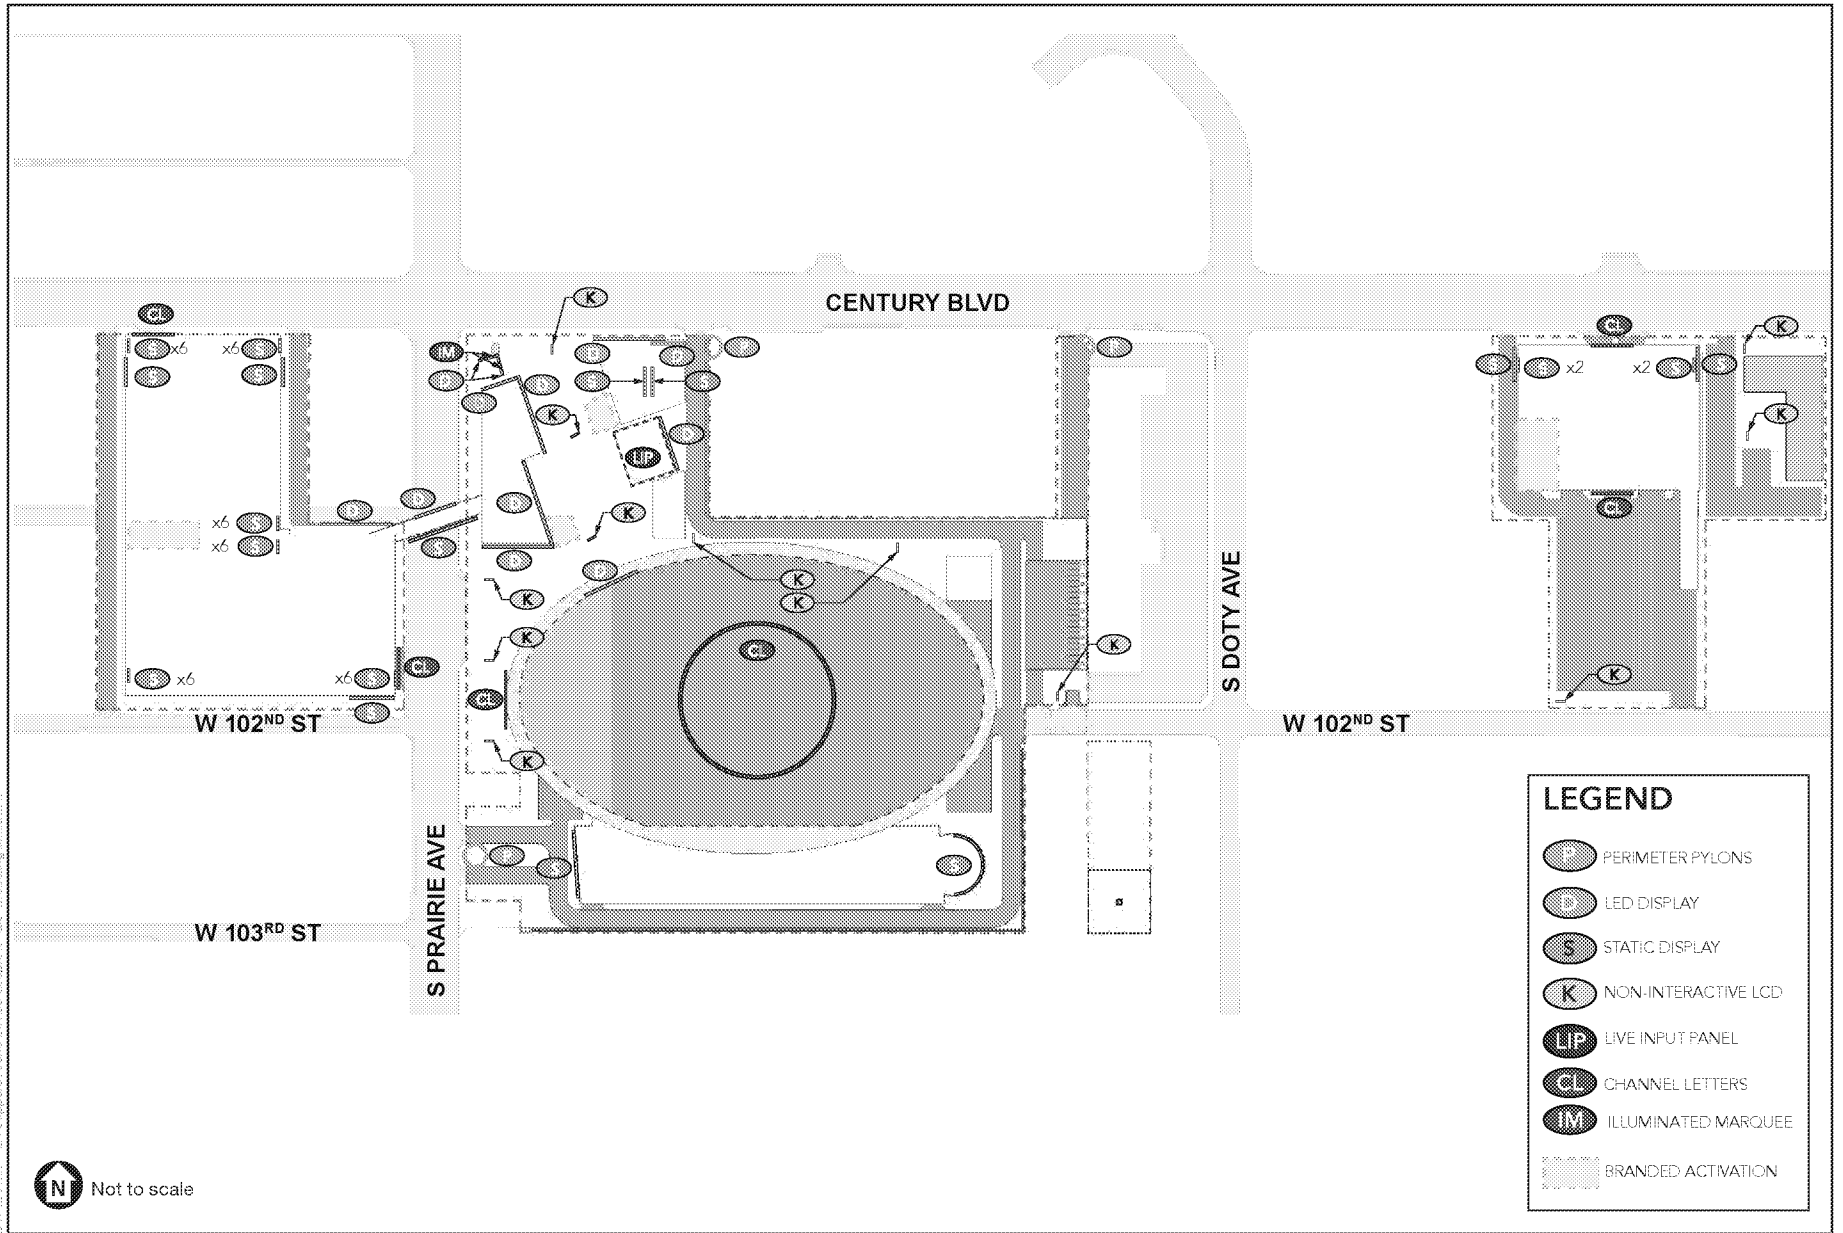

As shown in Table 2-4, above, the proposed commercial uses within the plaza buildings, including retail, dining, and similar services or experiences, are estimated to require a total of 328 employees. These uses would operate seven days per week, year round, independent of event center operations. The community space and the sports medicine clinic are anticipated to operate on weekdays, and are estimated to require 26 employees and 35 employees, respectively. It is estimated that the hotel would require 50 employees.

2.5.4 Signage and Lighting

Signage

The Proposed Project would include a variety of signs of different types and sizes placed throughout the Project Site to create a lively, interactive experience and aesthetic. The general type and potential location of signs anticipated to be included in the Proposed Project are illustrated in **Figure 2-20**. Project signage would be provided to promote the LA Clippers and the Arena, building activities and events, building and team sponsors, civic activities and events, dining and retail establishments within the Project Site, and other products and services. The Proposed Project would also include hotel, retail, and restaurant building identification signage, public parking entry and loading dock entry identification signs, pedestrian and vehicle wayfinding signage, and other informational signage. Such signs may be digital displays using LEDs or LED video boards, internally illuminated static wall signs or channel letter signs, externally illuminated supergraphic signs or banners, projections onto glass or solid surfaces, monument signs, kiosks, and pylon signs. The digital display signage may use LED technology to convey changing messages, pictures, and full motion graphics or videos, or could use other similar display technology that may emerge in the future.

As shown in Figure 2-20, signs may be mounted on the exterior of the Arena Structure or integrated into façade of the structure itself, as well as mounted on the buildings surrounding the plaza, the three parking structures, pedestrian circulation areas, and the hotel. Signage may be oriented to the major thoroughfares of West Century Boulevard and South Prairie Avenue, or to the visitors within the plaza and other pedestrian and vehicle circulation areas within the Project Site. Interior to the Arena Site, large, high-resolution LED video boards are proposed on the Arena Structure and at the rear of the plaza stage, oriented to pedestrian visitors in the plaza. Other signage throughout the Project Site could include free-standing signage and interactive LCD (liquid crystal display) kiosks within the plaza and pedestrian circulation areas, including

S:\IT\2020-20 - LA - Chicago - Arena - EIR\06-Concepts - 06-20-20\Workshop\Briefing\

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 2-20
Conceptual Sign Locations

the parking structures and pedestrian bridge. An up to 100-foot-tall illuminated marquee sign tower with a digital display would stand at the northwest corner of the plaza and an internally illuminated rooftop sign would be present on top of the Arena Structure.

Lighting

The type of lighting and its intensity on the Project Site would vary, depending on how the venue is being used at any given time. Exterior lighting for the Arena Site would be provided to illuminate different areas of the Arena Structure and adjacent plaza. During non-event days, adequate lighting for employees and visitors would be provided by site pedestrian pole-mounted light fixtures in the plaza and pedestrian circulation areas, as well as small floodlights for landscape and tree lighting, and lighting along the access roadway around the Arena Site. The vertical surfaces of the Arena Structure and its adjacent commercial, office, and community facility buildings would be illuminated in a manner that highlights its architecture and street edges along West Century Boulevard and South Prairie Avenue. The parking areas, the pedestrian bridge, and the hotel would be illuminated to highlight circulation paths and landscape features, and to create a safe pedestrian experience. Additional wayfinding lighting would be provided to help orient people around the Project Site. Perimeter and architectural lighting, as well as illuminated signage, would be limited in areas adjacent to existing residential uses, and in some areas would be screened from direct view by sound or security walls. All lighting would be directed into the interior of the Project Site, and away from off-site areas.

It is anticipated that the most intense lighting on the Project Site would be within the Arena Site which would be brightly lit during major spectator events such as basketball games and concerts, and for similar events or activities. In addition to plaza lighting provided for security and to increase visibility for visitors, the interior of the Arena Site would be lit with directed theatrical lighting in the Arena Structure around the stage during events, as well as light from LED video boards, other digital displays, and illuminated signage. Interior lighting within the Arena Structure itself may be seen through transparent facets (glass or perforated materials) on the Arena Structure façade.

Several new street lights would be installed adjacent to public roadways surrounding the Project Site, including along West Century Boulevard, South Prairie Avenue, and West 102nd Street. Street lights would be installed at regular intervals along street rights-of way, standardized heights, and standardized lighting intensities in compliance with City standards.

Sustainability

The Proposed Project would be designed and constructed to meet the US Green Building Council's Leadership in Energy and Environmental Design (LEED®) Gold certification requirements. Some of the sustainable characteristics would be related to the Project Site, and others would be related to the project design and construction methods. The project applicant has submitted an application to the Governor pursuant to Assembly Bill (AB) 987 confirming that the Proposed Project will be designed to meet this standard and achieve certification within one year

of the end of the first full NBA season, as required by AB 987. Assuming the first NBA season is 2024–2025, then LEED certification would be required by June 30, 2026.

The Proposed Project would apply for LEED certification of the proposed buildings and accompanying development in the Building Design + Construction (BD+C) category, and would adopt a LEED campus approach in order to capture site-wide strategies such as those related to stormwater management and provision of open space. LEED certification for the Arena Structure would be sought under LEED BD+C New Construction and Major Renovation, and certification for the other buildings surrounding the proposed plaza would be sought under LEED BD+C Core + Shell. The hotel would be LEED Gold certified under LEED BD+C Hospitality. Measures would be incorporated into the final design of each component to achieve sufficient points for LEED Gold certification. Based on prior experience with sports facilities and other major venues, the design team for the Proposed Project has identified a menu of project features that are within control of the project applicant and that could be feasibly implemented to achieve the necessary points to achieve a LEED Gold certification, consistent with the requirements of AB 987.

The relevant characteristics of the Project Site would involve its location in an urban, infill location, the density of the site and connectivity to the adjacent community, and accessibility to public transportation. Several design features are under consideration for inclusion for the Proposed Project. Features under consideration include, but are not limited to, indoor and outdoor water reduction measures, on-site renewable energy generation, optimized energy performance, and responsible construction and demolition waste management strategies, heat island reduction measures, light pollution reduction measures.

2.5.5 Implementation

The Proposed Project would include text amendments to Chapter 5 (Offenses, Miscellaneous) and Chapter 12 (Planning and Zoning) of the City of Inglewood Municipal Code and conforming changes to the City of Inglewood General Plan. These amendments would include changes to the City's noise regulations to allow for the proposed operations and events to be hosted at the Proposed Project, as well as amendments to create an overlay zone for the Project Site to establish development standards including standards for height, setbacks and lot size, permitted uses, signage regulations, and a site plan and design review processes to ensure compliance with those development standards as well as project-specific design guidelines to be adopted by the City of Inglewood as part of the Development Agreement for the Proposed Project. The design guidelines would address certain design elements and considerations, including building orientation, massing, scale, and materials, plaza treatments, landscaping and lighting design, parking and loading design, vehicular and pedestrian access and circulation, signage and graphics, walls, fences and screening, and similar elements.

As with the City's site plan review procedures established in City of Inglewood Municipal Code Chapter 12, Article 18.1, the design and site plan review process for the Proposed Project would include a review of on-site and off-site vehicular and pedestrian circulation, emergency accessibility, site layout and building orientation, architectural design and neighborhood

compatibility, landscaping and related site improvements, parking accommodations, signs, and other applicable design considerations to ensure compliance with applicable standards. While additional refinements may be made to the design of the Proposed Project prior to construction, the text changes to the Inglewood Municipal Code and the design guidelines would not permit any modification or change that would create a new significant environmental effect not fully considered and analyzed in this EIR.

2.5.6 Circulation

Vehicular

The primary vehicular access to the Project Site would be provided along the major corridors of South Prairie Avenue and West Century Boulevard.

Arena Site

An approximately 900-linear-foot section of West 102nd Street between South Prairie Avenue and South Doty Avenue would be vacated and developed with portions of the Arena Structure and related uses. A new site access road would run along the north and east perimeters of the Arena Site, connecting West Century Boulevard to West 102nd Street. This new segment of the internal access road would not be used by the general public for vehicular or pedestrian access, but would be limited to select visitors and employees, security, media, team members, entertainment talent, small delivery vehicles, and emergency personnel. This segment of the access road would also provide direct access to the media/broadcast truck parking area and utility yard/equipment area on the east side of the Arena Structure.

A new site access road would run along the south and east perimeters of the Arena Site, connecting South Prairie Avenue to West 102nd Street. This new segment of the internal access road would provide public access to the team parking, VIP parking, and public parking garage immediately south of the Arena Structure, as well as the weekday employee and visitor drop-off area. The access point on South Prairie Avenue would not be signalized, and would be a right-in, right-out vehicular movement only. Construction of this access would require the removal of the existing reversible lane gantry that spans South Prairie Avenue, approximately 100 feet north of the intersection with West 104th Street. The access road's connection with West 102nd Street would be stop-sign controlled.

West Parking Garage Site

An approximately 350-linear-foot portion of West 101st Street, west of South Prairie Avenue, would be vacated and developed with a portion of the parking garage. Access to the parking structure would be from West Century Boulevard through a signalized driveway approximately 475 feet west of South Prairie Avenue. This new driveway would be accessible from eastbound West Century Boulevard; egress at this intersection would allow vehicles to travel only westbound on West Century Boulevard during post-event periods. This driveway would be operational on event days and closed on non-event days.

A new signalized driveway would provide access to the West Parking Garage on South Prairie Avenue, approximately 575 feet south of West Century Boulevard. This driveway would be operational at all times. There would physically be only one left turn lane on northbound South Prairie Avenue and one right-turn only turn lane on southbound South Prairie Avenue. However, during pre-event times, two left turn lanes on northbound South Prairie Avenue, and the right-turn only turn lane on southbound South Prairie Avenue would provide access to the West Parking Garage. Egress at this access point would allow vehicles to travel only southbound on South Prairie Avenue after major events at the IBEC.

A proposed new, publicly accessible roadway immediately west of the parking garage would connect West Century Boulevard to West 102nd Street. Another publicly accessible roadway would be constructed between West Century Boulevard to West 101st Street on the east side of the parking structure. The access roads both on the west perimeter and along the northeast edge of the proposed parking garage are intended to maintain vehicular access around the parking garage to nearby uses including residential units on West 102nd Street and the commercial center at the southwest corner of South Prairie Avenue and West Century Boulevard (see Figure 2-7). None of the intersections created by these new access roadways would be signalized.

East Transportation and Hotel Site

Vehicle access to the ground-level transportation hub on the East Transportation and Hotel Site would be provided from West Century Boulevard, approximately 400 feet east of South Doty Avenue and aligned with the existing configuration of Hollywood Park Casino Drive, with modification of the existing traffic signal and installation of a left turn pocket. Private vehicle access to the parking structure would be provided from West 102nd Street via a non-signalized intersection. Vehicular access to the hotel would be provided from West Century Boulevard.

Delivery and Service Truck Access and Loading

Large delivery trucks and service vehicles, particularly semi-trucks, would access the Arena Site below-grade via a new, gated service ramp entrance on West Century Boulevard, approximately 200 feet west of South Doty Avenue, between two existing commercial buildings (see Figure 2-7). The service ramp would provide direct access to the loading docks and marshaling area located within the below-grade event level of the Arena Structure. This area would include six loading docks for semi-trucks, allowing for simultaneous on- and off-loading of the types of vehicles that typically carry performance staging equipment. Adjacent to the loading docks would be parking areas for smaller vehicles that may require secure, temporary parking. Large trucks and service vehicles would exit the Arena Structure via the same service ramp and would exit to West Century Boulevard. Exiting vehicles would be prohibited from turning left onto West Century Boulevard. Entering vehicles would be permitted to enter from either eastbound or westbound West Century Boulevard.

Small service and delivery vehicles providing services or materials for retail and food service venues could enter the Arena Site via a site access road accessed from West Century Boulevard,

approximately 350 feet east of South Prairie Avenue, immediately west of the existing Airport Park View Hotel parcel, with alternate access or egress to this site access road at West 102nd Street.

Shuttle Service

Before, during, and after LA Clippers basketball games and other large events, the Proposed Project would provide shuttle service that would connect the Project Site to the Metro Green Line's Hawthorne/Lennox Station and the Metro Crenshaw/LAX Line's La Brea/Florence Station. The shuttle service would drop off and pick up attendees at the proposed shuttle pick-up and drop-off location on the west side of the Arena Site along South Prairie Avenue (see **Figure 2-21**).

The shuttles from the Metro Green Line's Hawthorne/Lennox Station would travel north on South Prairie Avenue to the shuttle pick-up and drop-off location on the west side of South Prairie Avenue, adjacent to the proposed Arena. The shuttle would then depart the Arena Site, turn west on West Century Boulevard, then turn south on Hawthorne Boulevard to return to the Hawthorne/Lennox Station.

The shuttles from the Metro Crenshaw/LAX Line's La Brea/Florence Station would travel south on South Prairie Avenue, turn east on West Century Boulevard, before turning south on South Doty Avenue. The shuttles would then turn west on West 102nd Street, then south to follow the internal roadway network on the Arena Site. The shuttles would then turn north on South Prairie Avenue to access the shuttle pick-up and drop-off area on the east side of South Prairie Avenue. The shuttles would then continue north on South Prairie Avenue to return to the La Brea/Florence Station.

Public Bus Transit

There are currently eight bus stops located on streets and sidewalks adjacent to the Project Site: four on South Prairie Avenue and four on West Century Boulevard. Two of the bus stops at the southeast corner of West Century Boulevard and South Prairie Avenue would be removed and relocated as part of the Proposed Project (see **Figure 2-22**). The bus stop that serves Metro line 117, east of South Prairie Avenue, for eastbound traffic on West Century Boulevard would be temporarily relocated to the west side of the intersection during Project construction, then permanently relocated back to the east side of the intersection directly in front of the proposed plaza. The bus stop that serves Metro lines 212/312, south of West Century Boulevard, for northbound traffic on South Prairie Avenue would be permanently relocated to the northeast corner of the intersection. No other bus stops are proposed to be relocated.

Pedestrians

Implementation of the Proposed Project would include development of an above-grade pedestrian bridge that would cross South Prairie Avenue linking the plaza with the West Parking Garage Site. The majority of pedestrian traffic flowing between the western parking garage and the plaza are expected to use the pedestrian bridge. The pedestrian bridge would have a minimum vertical clearance of 17 feet from roadway surface to bottom of the pedestrian bridge, and would be constructed of materials that would match the parking garage, community uses/retail buildings,

Inglewood Basketball and Entertainment Center

Figure 2-22
Temporary and Permanent Bus Stop Relocations

and/or the Arena Structure. The pedestrian bridge would connect with the second story of the retail building on the west side of the plaza, with escalators connecting to the ground level of the plaza. Pedestrians could also cross South Prairie Avenue between the West Parking Garage Site and the Arena Site via a crosswalk on the south side of the South Prairie Avenue/new West Parking Structure Site signalized intersection (see **Figure 2-23**).

Pedestrian access to and from the Arena Site from the north and south would be provided via sidewalks along South Prairie Avenue.

Pedestrian access to the Arena Site from the East Transportation and Hotel Site would be via the sidewalk along the south side of West Century Boulevard. At the end of an event at the Arena Structure, pedestrians would be able to access the East Transportation and Hotel Site via both the south-side sidewalk on West Century Boulevard and via the north-side sidewalk on West 102nd Street. Pedestrian access between the Arena Site and the proposed hotel would occur via sidewalks along West Century Boulevard.

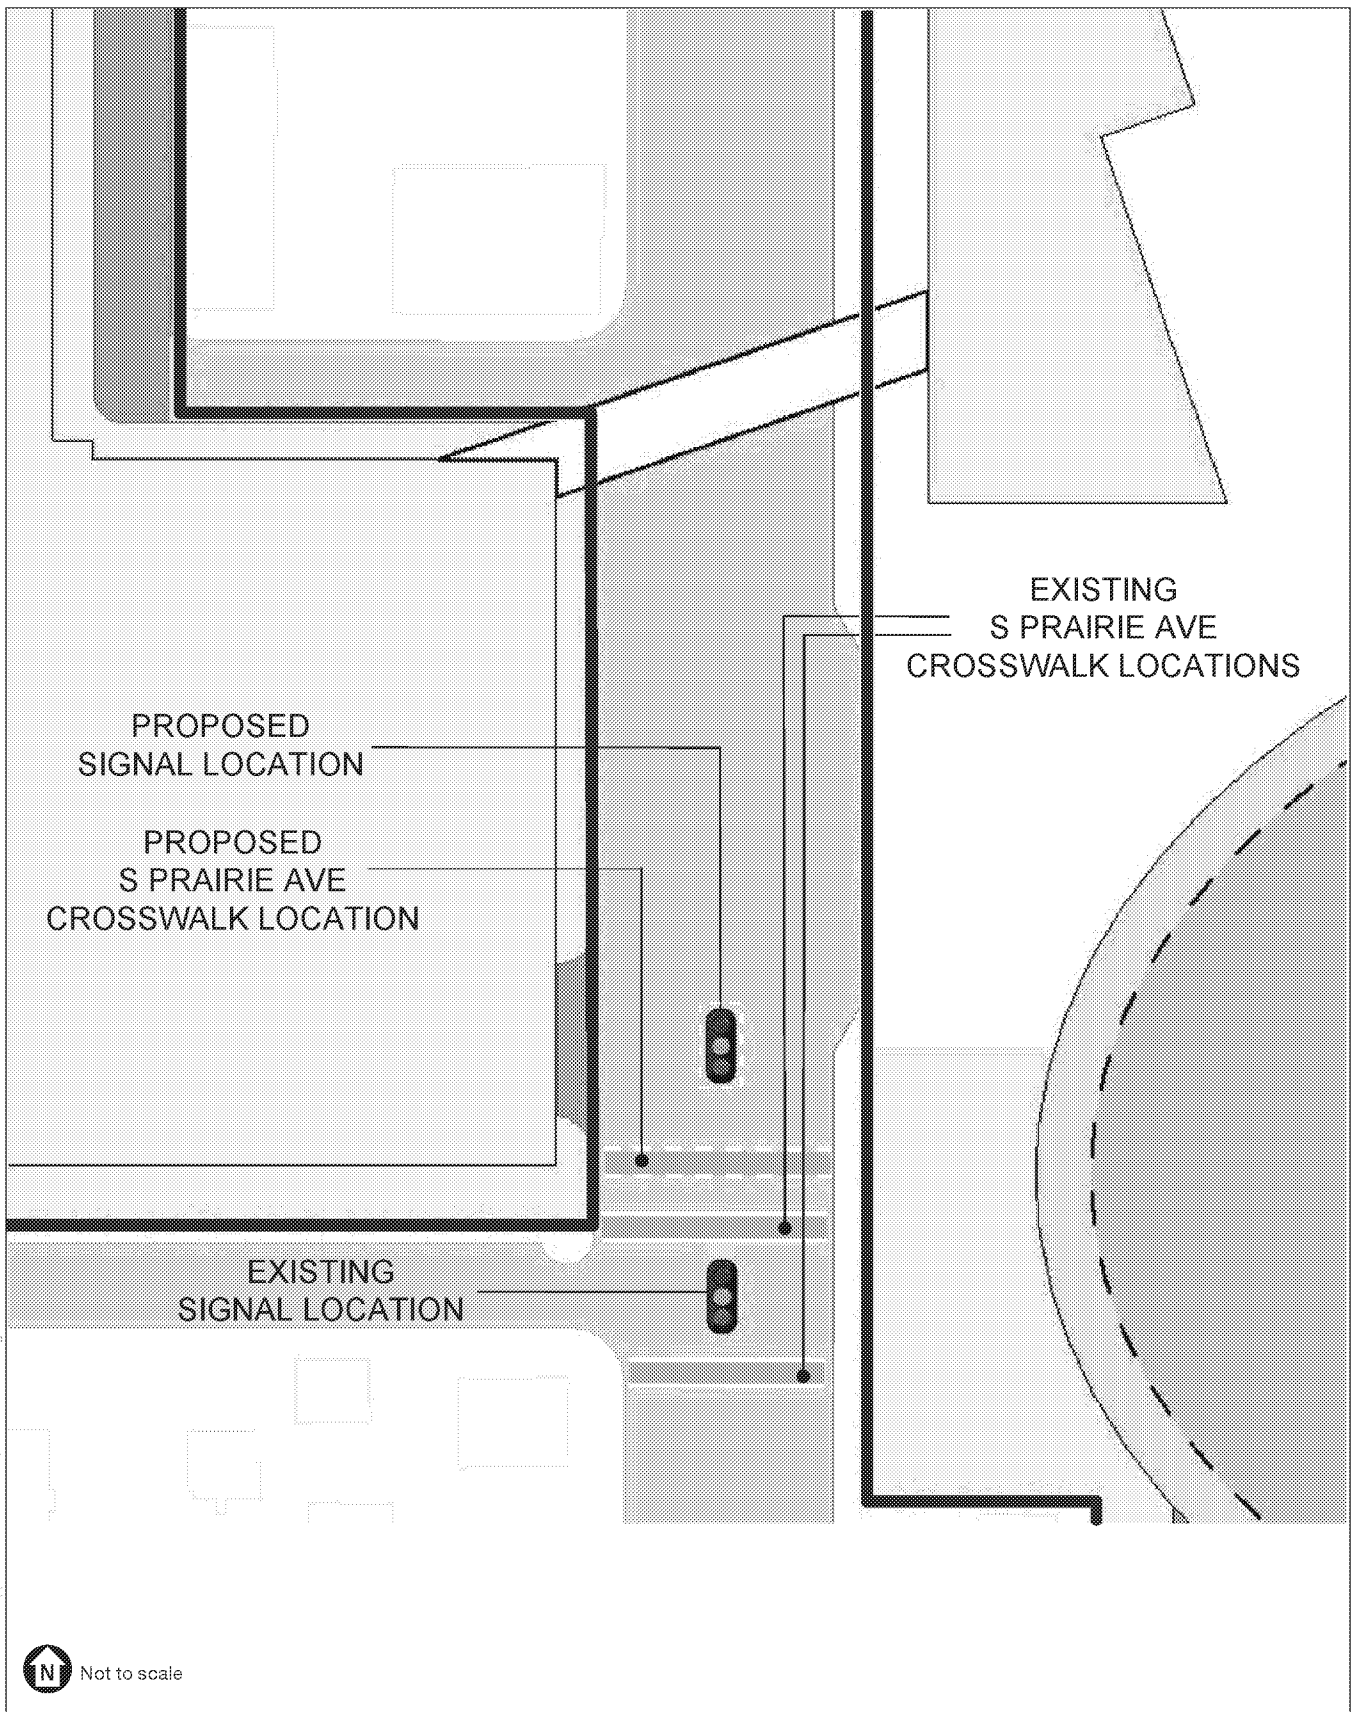

The plaza adjacent to the Arena Structure would serve as the main pedestrian gathering/circulation entryway into the Arena Structure. The majority of attendees with general admission tickets would enter the Arena Structure from the plaza into entrances located on the northern facade of the Arena Structure. Secondary pedestrian entries would be located on the south side of the Arena Structure from the adjacent south parking garage, as well as an employee entrance on the eastern side of the Arena Structure. These secondary entrances would be used by the team, media, talent, and employees, and a limited number of attendees with access to the premium parking in the south parking structure located on the Arena Site.

Bicycles

The Proposed Project would exceed the requirements of the City of Inglewood Municipal Code for the provision of short- and long-term bicycle parking (Section 10-151, Transportation Demand and Trip Reduction Measures; Section 12-42.1, Transportation Demand Management Requirements for Carpool Parking and Bicycle Facilities). Approximately 60 bicycle parking spaces for employees would be provided in the employee access pavilion on the east side of the Arena Site and 23 short-term bike parking spaces for patrons would be provided on the West Parking Garage Site (see **Figure 2-24**). A bike valet service could also be accommodated in the west parking garage, if needed.

2.5.7 Project Variants

There are two variations of the Proposed Project that are under consideration by the project applicant and the City. These variants are briefly described in this chapter and are fully described and analyzed in Chapter 5, Project Variants. These variants are not proposed as part of the Proposed Project because there is some uncertainty about their feasibility. They are being identified and analyzed, however, to provide the flexibility to allow the City to approve them as part of the Proposed Project, if desired.

S:\11\1196_00 - I.A. Village Area - EIR\6.0\Drawings\2014\20140610\20140610_1196_00_1196_00_1196_00_1196_00.dwg

Inglewood Basketball and Entertainment Center

Figure 2-23
Proposed Crosswalk Locations

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 2-24
Bicycle and Electric Vehicle Parking

Each project variant would include the same land use program, parking and loading locations, mechanical equipment types and locations, basic TDM program, streetscape improvements, and sustainability features as the Proposed Project. The variants are not mutually exclusive – the City potentially could approve neither, either or both project variants.

West Century Boulevard Pedestrian Bridge Variant

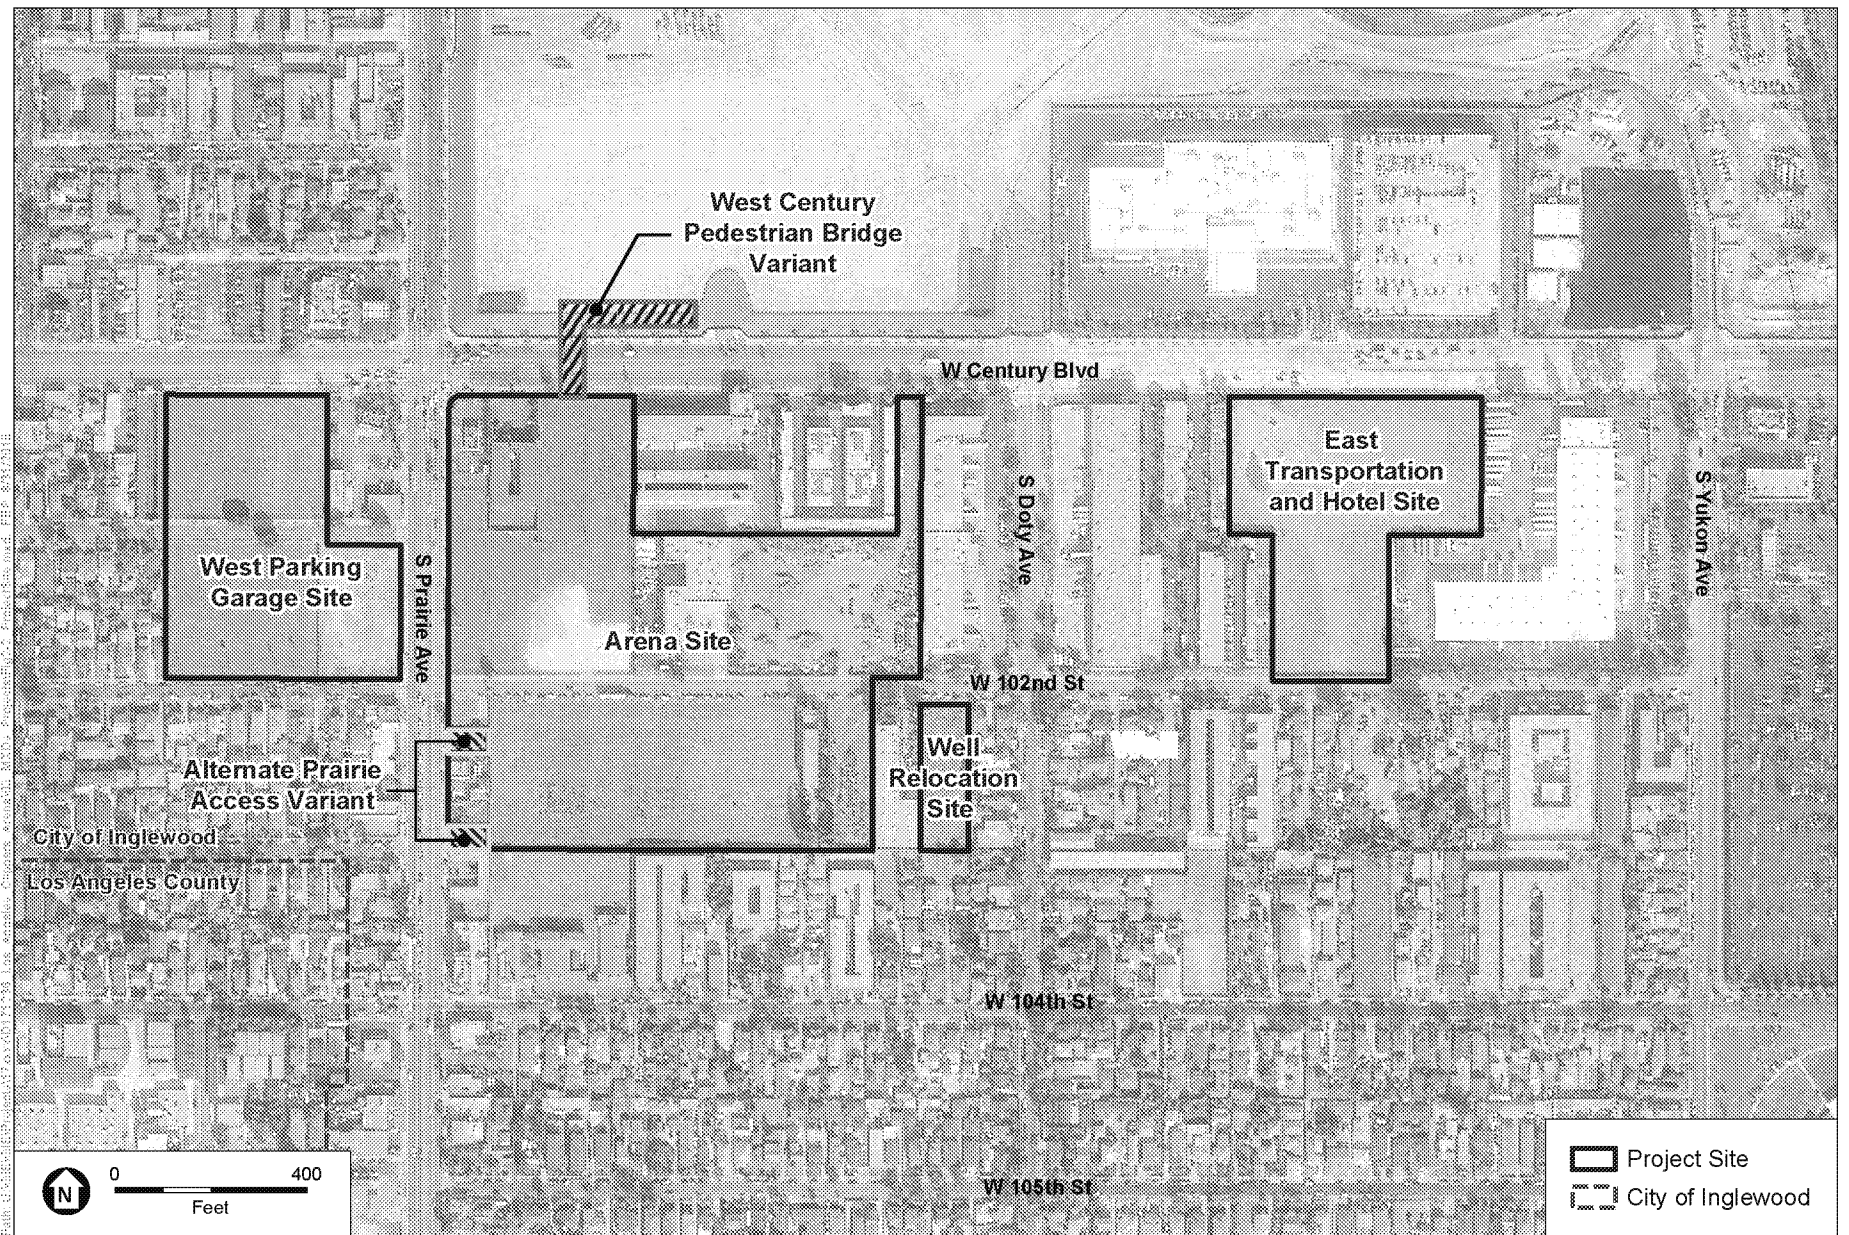

The West Century Boulevard Pedestrian Bridge Variant would result in the construction of a pedestrian bridge across West Century Boulevard (the Century Pedestrian Bridge). The West Century Boulevard Pedestrian Bridge would be designed to include an escalator from the outdoor plaza's ground level up to the second story of the retail building on the east side of the outdoor plaza on the Arena Site. The West Century Boulevard Pedestrian Bridge would connect the retail building to the HPSP area to the north of the Project Site (see **Figure 2-25**). The West Century Boulevard Pedestrian Bridge would connect with a public plaza area on the north side of West Century Boulevard. The pedestrian bridge would provide a vertical clearance of approximately 17 feet over West Century Boulevard, and would be designed similarly to the pedestrian bridge crossing South Prairie Avenue, which is included as part of the Proposed Project. The West Century Boulevard Pedestrian Bridge Variant could be incorporated into the development of either the Proposed Project or the Alternate Prairie Avenue Access Variant.

This variant is being included because it is unknown whether the property owner north of the Project Site would agree to connect a pedestrian bridge to its property on the north side of West Century Boulevard. The pedestrian bridge connection north of West Century Boulevard could tie into future retail or other uses planned on that site. Because there is uncertainty about whether a pedestrian bridge could tie into the property to the north, this element is being evaluated as a project variant.

Alternate Prairie Access Variant

This variant would expand the boundary of the Arena Site portion of the Project Site by adding two additional properties to the Proposed Project: 10204 South Prairie Avenue and 10226 South Prairie Avenue (see **Figure 2-25**). These two parcels currently contain a triplex and a single-family home, respectively. Under the Alternate Prairie Access Variant, the two parcels would be acquired by the project applicant through voluntary sales, the existing structures removed, and the properties cleared and prepared for development. Under this variant, the vehicular access to/from South Prairie Avenue would be moved 75 feet to the south, and this shift would result in a straight east–west alignment for the southernmost access road with West 103rd Street. The pickup/drop-off area would be reconfigured, and two new driveways to/from South Prairie Avenue to the pickup/drop-off area would be provided. As a result, the area devoted to hardscape and landscaping along South Prairie Avenue would increase by roughly 4,200 sf.

This variant is being included because whether the owners of these residential properties will agree to sell them to the project applicant through voluntary sales is unknown at this time. For this reason, there is uncertainty about whether these parcels will be acquired.

Inglewood Basketball and Entertainment Center

Figure 2-25
Project Variants

2.5.8 Utilities

Water

Water infrastructure to support the Proposed Project would be achieved through a combination of tying into existing water lines, removing and relocating water lines, and construction of new water mains and lines (see **Figure 2-26**).

A new 27-inch water transmission line would be constructed from the intersection of South Prairie Avenue/West 102nd Street southward to the driveway to the Arena Site. The new water transmission line would wrap around the Arena Site within the new roadway right-of-way, to connect with an existing water line at the intersection of the new roadway/West 102nd Street, immediately east of the Arena Structure. Six-, 10- and 12-inch domestic water lines would be extended from existing water lines into the Project Site. Water line connections and connections would occur on the Project Site or within public rights-of-way. On the Well Relocation Site, a new 12-inch potable water transmission line would connect the new well to the existing 27-inch water transmission line in West 102nd Street (see **Figure 2-27**).

On the West Parking Garage Site, approximately 340 linear feet of water main line within West 101st Street would be abandoned and re-routed to continue serving surrounding users.

A 2-inch reclaimed water line would be installed to connect the West Parking Garage Site to the existing 36-inch reclaimed water line in South Prairie Avenue (see **Figure 2-28**). A new 3-inch reclaimed water line would also extend from the existing line in South Prairie Avenue to the plaza.

Wastewater

Wastewater infrastructure to support the Proposed Project would be achieved through a combination of tying into existing sewer lines, removing and relocating sewer lines, and construction of new sewer lines (see **Figure 2-29**).

An existing 8-inch sewer line would be removed and replaced with a new 12-inch sewer line, extending easterly along West 103rd Street from South Freeman Avenue and entering into the southwest corner of the Arena Site. That line would connect to new 8-inch sewer pipes on the Arena Site which would extend northward and wrap around the west side of the Arena, then eastward into the proposed plaza, then northward along the east side of the plaza and within the proposed access road. Another 8-inch sewer line would extend from the southwest corner of the Arena Site within the access road and northward to a new manhole just south of West 102nd Street. Six-inch sewer lines would be extended from new sewer lines into the Project Site, and connections would occur on the Project Site or within public rights-of-way.

On the West Parking Garage Site, approximately 340 linear feet of an 8-inch sewer main line within West 101st Street would be abandoned and re-routed to the east to continue serving surrounding users. A new 8-inch sewer line would be constructed from the western edge of the

new parking garage on the Arena Site and the West Parking Garage Site eastward to connect with existing sewer infrastructure in South Prairie Avenue.

Drainage

Storm drainage infrastructure to support the Proposed Project would be achieved through a combination of tying into existing drainage lines, removing and relocating storm drainage lines, and construction of new drainage lines (see **Figure 2-30**). A Low-Impact Development (LID) plan has been developed and will be implemented for the Proposed Project; strategies from the LID plan would be employed to reduce the impacts of stormwater runoff.

An underground detention basin and pretreatment system would be constructed in the new access roadway immediately west of the West Parking Garage Site, immediately north of West 101st Street. Another underground detention basin and pretreatment system would be constructed under the southern parking garage on the Arena Site.

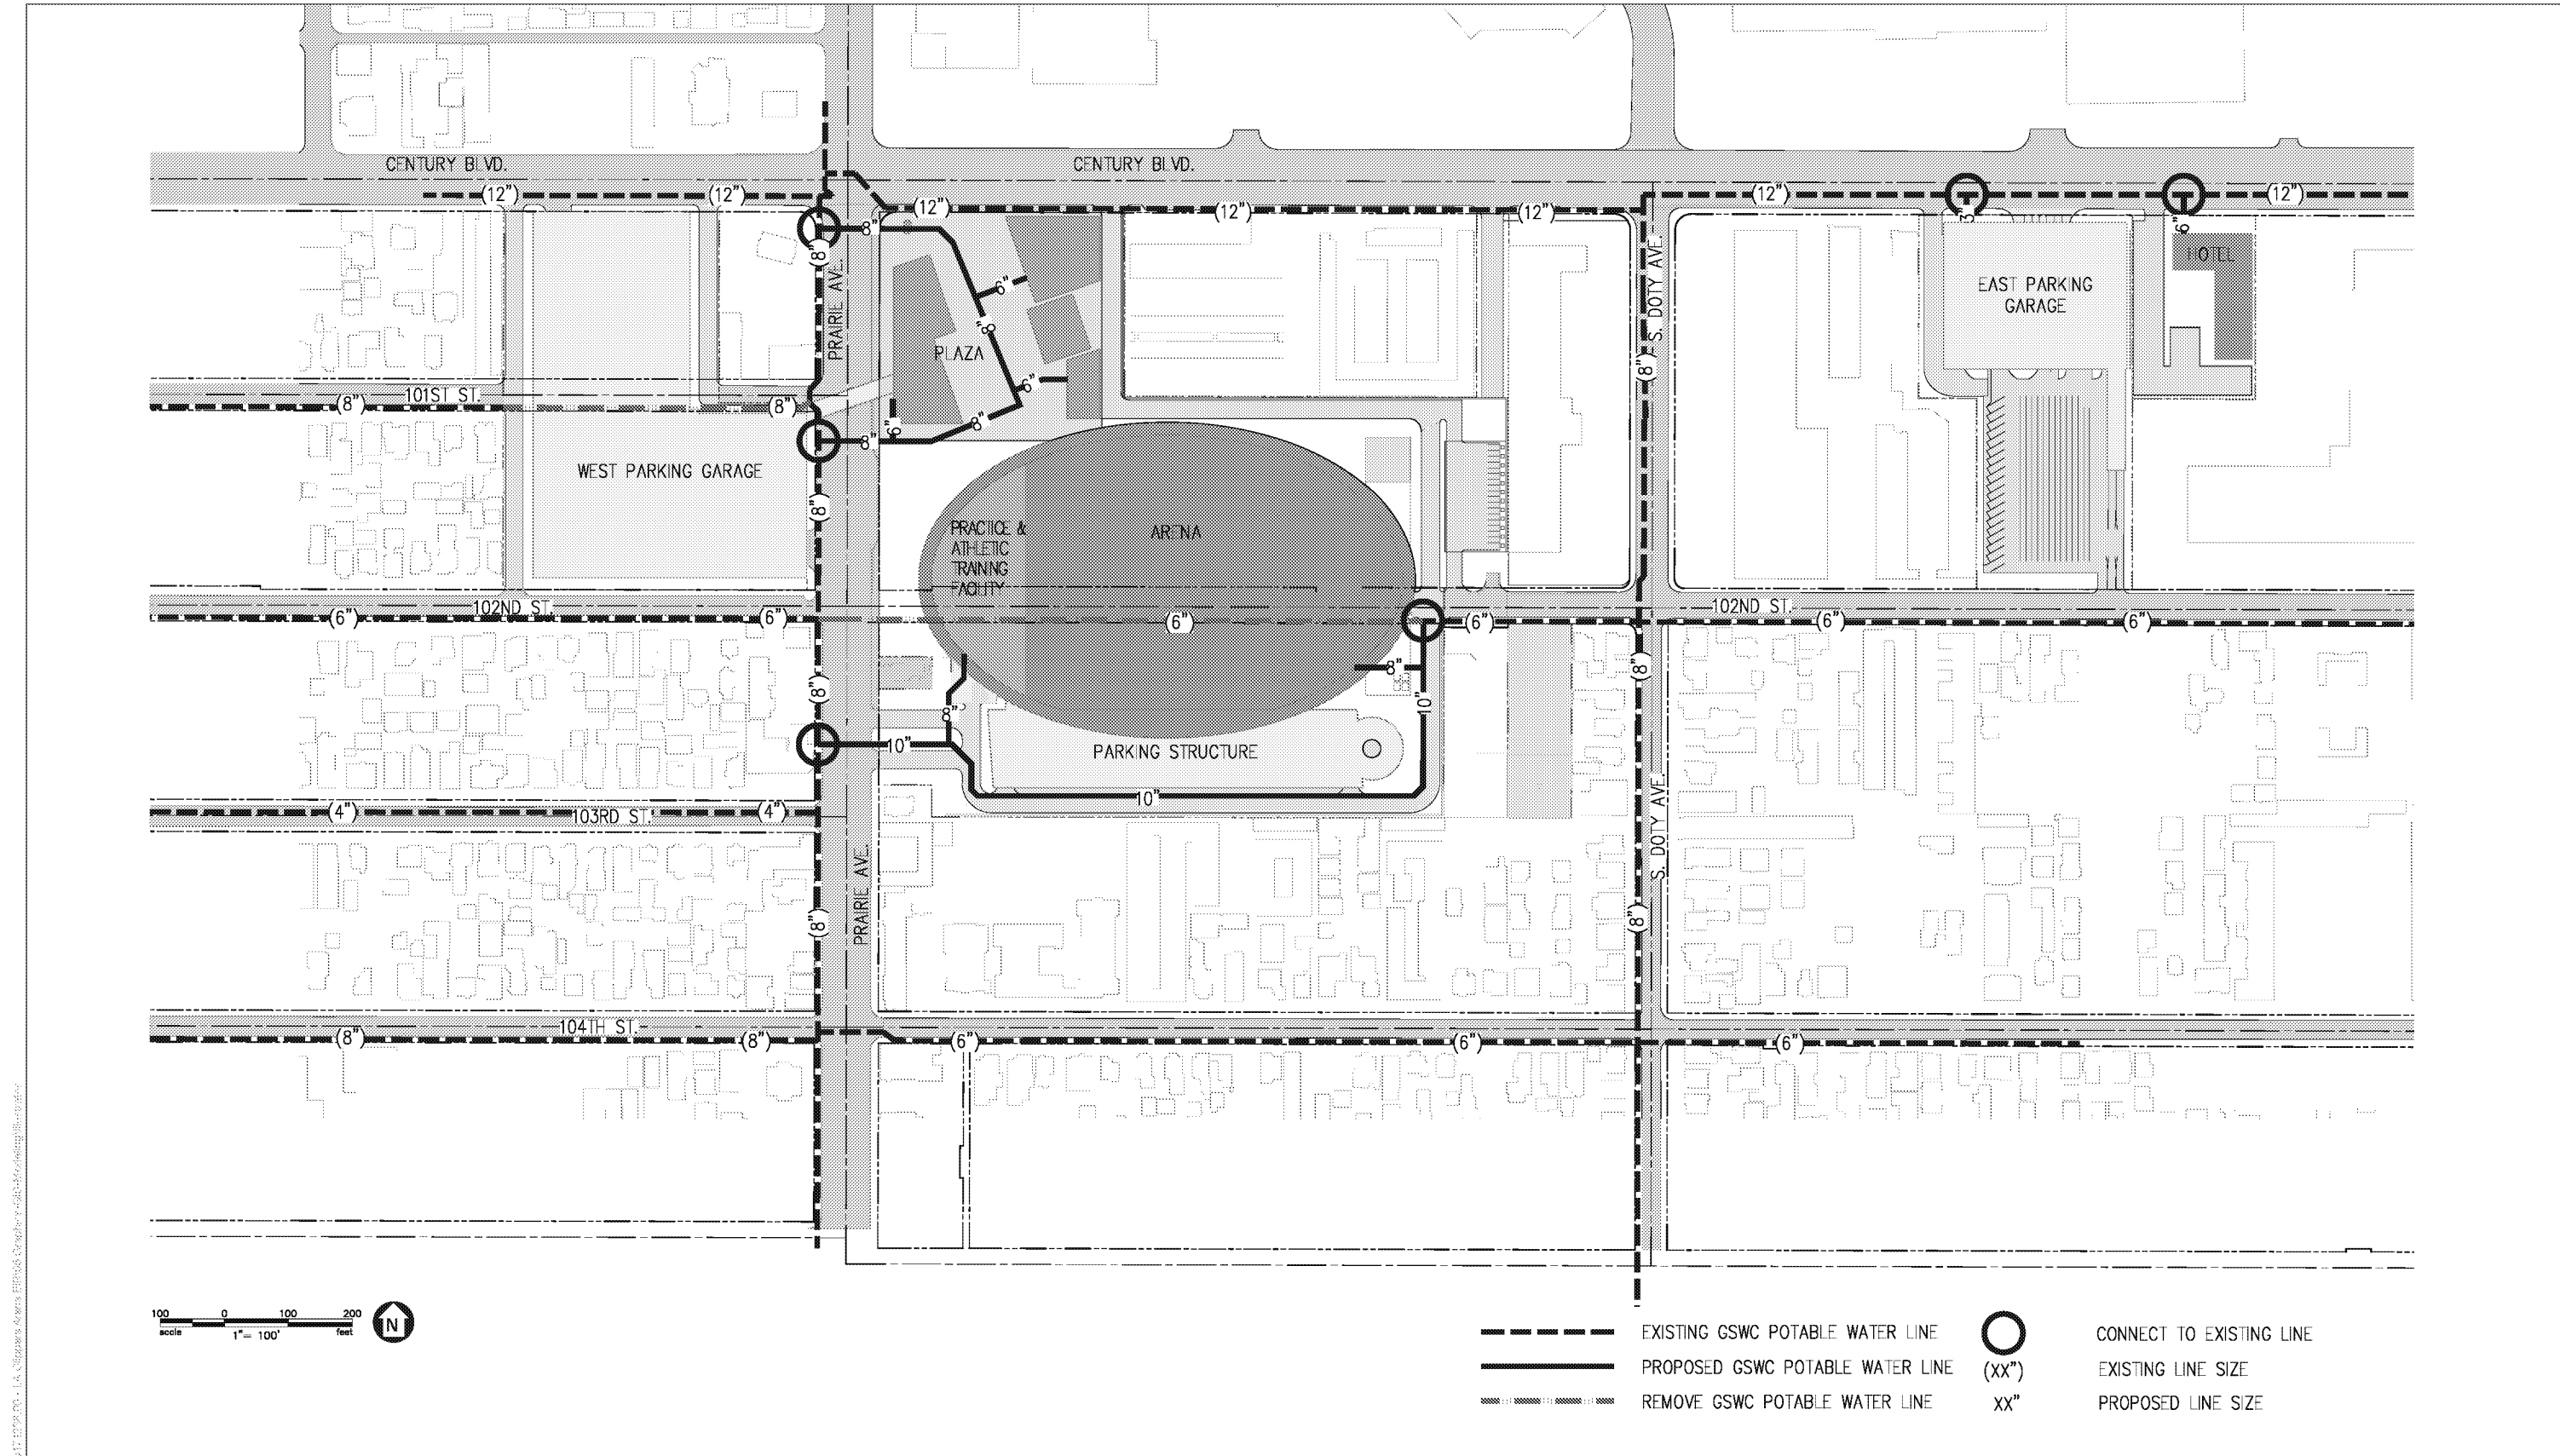

A small existing storm drainage line that enters the Arena Site near the South Prairie Avenue/West 102nd Street intersection would be abandoned. New 12-, 18- and 24-inch storm drainage lines would be extended from existing drainage lines in South Prairie Avenue near West 103rd Street into the Project Site. Storm drainage connections would occur on the Project Site or within public rights-of-way.

A new 18-inch storm drainage line and bio-filtration system would be constructed along the western, southern, and eastern edges of the East Transportation and Hotel Site to capture stormwater runoff from the parking lot.

Bio-filtration systems would be installed in landscaped areas throughout the Project Site. Bio-filtration features would implement best management practices (BMPs) and would include features such as bio-filtration planters and bio-swales. The proposed bio-filtration systems would be designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to mimic pre-developed conditions.

Electricity

To improve energy efficiency of the Proposed Project, rooftop solar photovoltaic panels would be installed on top of the Arena Structure. A photovoltaic solar panel system between 700 and 1,500 kilowatts (kW) would be installed that would have the capacity to generate more than one million kW hours per year. The panels would generate renewable energy and offset grid energy use. Battery energy storage would be integrated to optimize payback of the photovoltaic system by reducing event day peak loads and saving time-of-use charges.

This page intentionally left blank

Further, the Proposed Project would connect to existing Southern California Edison (SCE) electrical infrastructure in the vicinity of the site (see **Figure 2-31**). The closest SCE substation to the Project Site is located at 4128 West 103rd Street (Lennox Substation), and it would be the primary source of power to the site. The Proposed Project would be fed from a 16 kilovolt system. A second circuit, for redundancy, could come from the same substation, and new overhead and underground facilities would be required to complete this second tie. Existing overhead electrical lines on the Arena Site and West Parking and Transportation Site would be removed and relocated underground within the Project Site. The removal and relocation of existing overhead lines within the Project Site would be conducted to avoid any interruption of service to customers located on properties adjacent to the Project Site.

New on-site electrical facilities would be located within a utility yard near the southeast corner of the Arena Site. Structures required to serve the Project Site consist of switches, capacitor banks, multiple transformers, and metering equipment. Emergency power would be provided by means of two generators dedicated for the Arena Structure, plaza buildings, and the South Parking Garage with total capacity of up to 2,400 kW, located in the utility yard on the east side of the Arena Structure. Emergency power to support emergency lighting would be provided by a 300 kW inverter (battery storage) for the West Parking Garage and a similar 100 kW inverter for the East Transportation Hub and Parking Garage. The emergency generators would automatically start in the event of a power outage.

Several new street lights would be installed adjacent to public roadways surrounding the Project Site and near hammerhead-style turnarounds, including the areas of the parking structure and surface parking lot. Power would be provided to these light locations through localized connections within street rights-of-way.

Natural Gas

Southern California Gas Company is the natural gas provider in the area. The gas mains through the neighborhood were installed decades ago for residential use, and the existing pipes are smaller, primarily 2-inch lines, and not typically large enough to handle the necessary volume for the proposed gas demands. The Proposed Project would increase the size of the distribution main in West 102nd Street to a 4-inch line and tie into the 8-inch line on the west side of South Prairie Avenue (see **Figure 2-31**). An existing 2-inch line in West 102nd Street, and existing services to the east would instead be connected to an existing gas main in South Doty Avenue. A gas main in West 101st Street would be abandoned, and existing services to the commercial site at the southwest corner of West Century Boulevard and South Prairie Avenue would be connected to an existing gas main in South Prairie Avenue. Service to the Arena Site would be from the gas main in South Prairie Avenue and extended along the southern access road to a new meter location in the southeast corner of the Arena Site.

Telecommunications

Spectrum Business is the primary cable provider in the area. Spectrum has existing facilities overhead on the electrical poles along West 101st Street west of South Prairie Avenue, West 102nd Street east of South Prairie Avenue, and from south to north paralleling South Prairie Avenue to the east within the Project Site. Spectrum would need to relocate their facilities in order to accommodate the Arena Structure and the West Parking Garage Site.

Telecommunications cable lines within the Project Site would be installed in the same utility trenches as undergrounded electrical service.

A distributed antenna system (DAS) will be installed at the Project Site to provide cellular and emergency communications connections. DAS systems use a series of antennas to distribute signals in dense areas. Antennas can be integrated into building facades, installed on the interiors of building spaces, or be mounted on exterior structures such as poles.

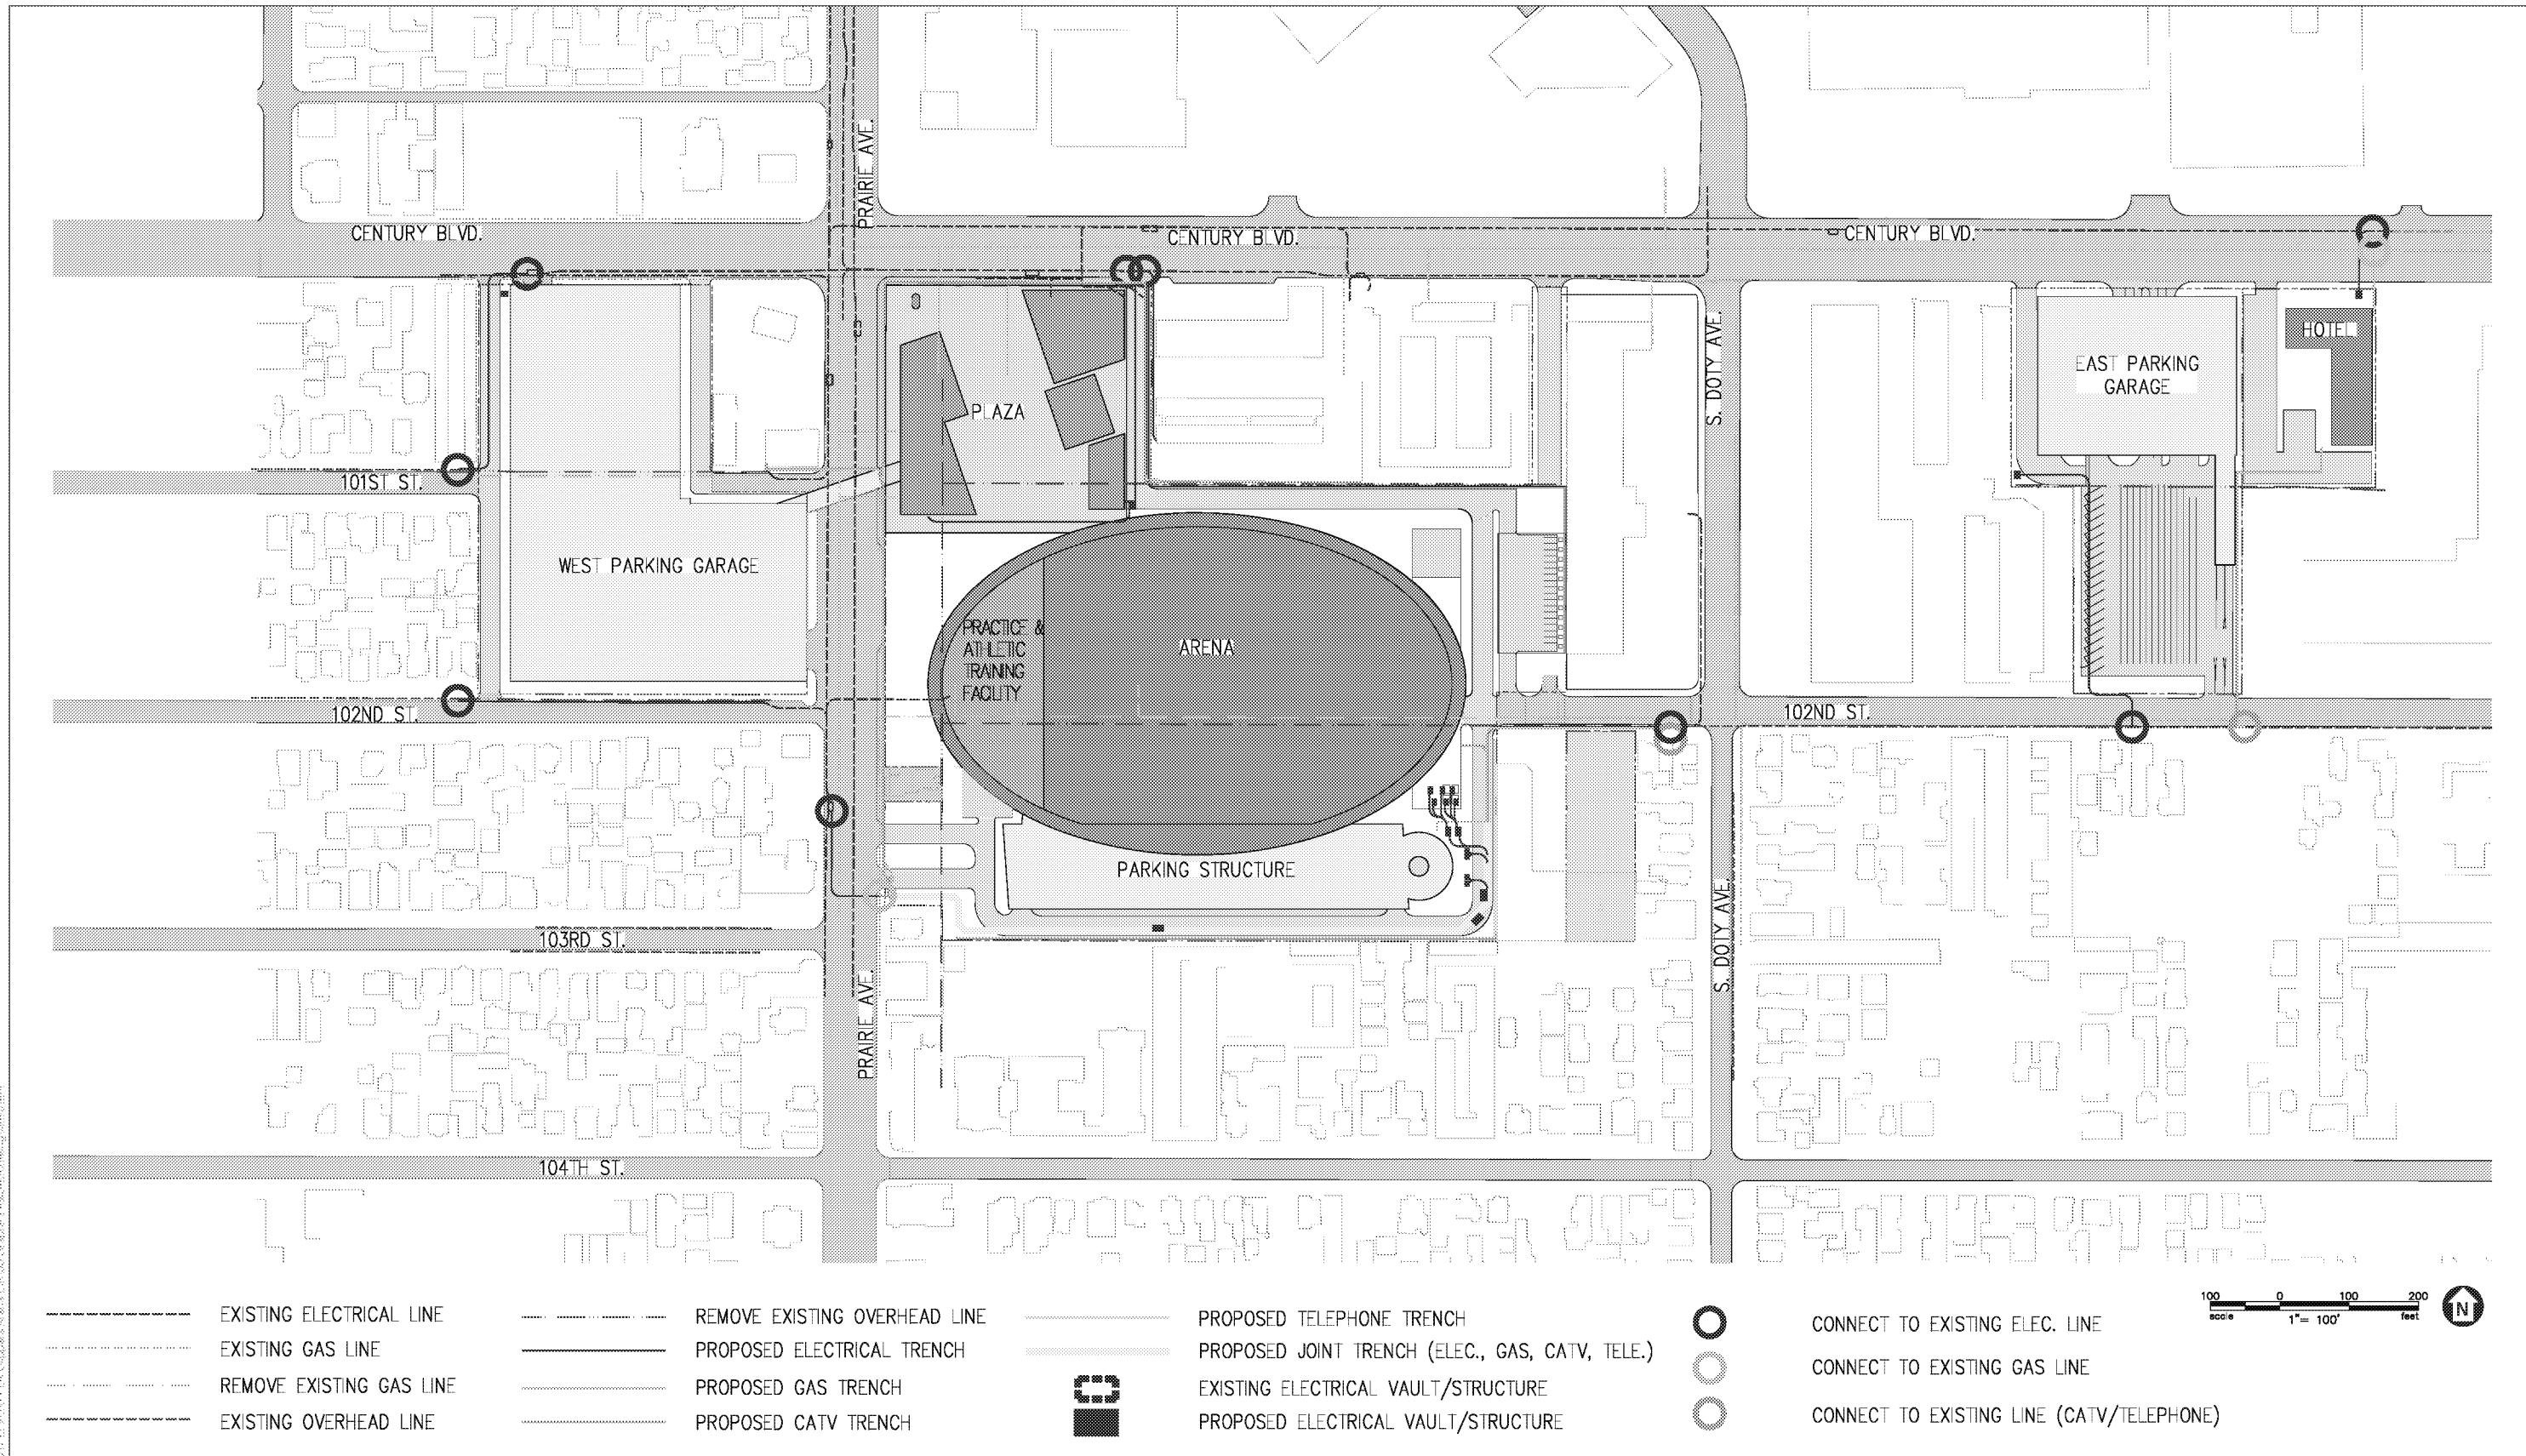

2.5.9 Construction and Phasing

Construction of the proposed Arena, practice facility, sports medicine clinic, offices, public plaza, parking garages, TNC pick-up/drop-off area, and relocated well would occur over approximately 40 months starting in 2021 and concluding in 2024. There would be numerous overlapping construction phases, as presented in **Table 2-5**.

Construction activities would include demolition of any existing structures or improvements on site, site preparation, excavation and grading, building construction and interior finishing work, structure enclosure and architectural coating, and paving and exterior landscaping. Demolition activities are anticipated to generate approximately 7,607 tons of demolition debris (asphalt and general construction debris). The Proposed Project would export approximately 296,915 cubic yards of soil during grading and excavation activities. Heavy-duty equipment, vendor supply trucks and concrete trucks would be used during construction of foundations, parking structures, and buildings.

All construction equipment staging would occur on the Project Site. The primary construction laydown yard would be on the East Parking Site from the beginning of construction through construction completion. Temporary laydown areas on the Arena Site would also be established as necessary during construction. During construction of East Parking Structure, the laydown area would only occupy southern portion of the East Parking Site that would later developed as the surface parking/TNC area.

Over the course of the construction schedule, the length of workdays would vary in range from 8 hours to 24 hours, with construction activity occurring up to 6 days per week. The 24-hour workdays would be required during a variety of activities, including but not limited to construction such as foundation concrete pours, well-drilling, and assembly of large components of steel framing of the Arena Structure. The 24-hour workdays would be required for a number of reasons, including technical requirements of certain construction techniques, worker safety, labor rules, and avoidance of conflicts on City streets and highways in the vicinity.

NOTE:

^a The Arena Site construction phase includes development of the Arena Structure, south parking garage, practice facility, sports medicine clinic, offices, sound barriers, privately owned outdoor plaza, commercial and community uses surrounding the plaza, and pedestrian bridge spanning South Prairie Avenue.

^b The approximate construction time period for the East Transportation and Hotel Site represents the construction timeframe for the parking garage and surface parking lot. While the timing and duration of construction for the hotel component is unknown at this time, the dates and durations presented here are used as approximations, conservatively based on the earliest anticipated construction of this component.

SOURCES: Murphy's Bowl, 2019. ESA, 2019.

Arena Site

Sound Barriers/Demolition/Site Preparation/Utilities

The first phase of construction, beginning with construction of both permanent and temporary sound barriers around the Arena Site, would begin in July 2021. Demolition of the existing buildings, removal of on-site outdoor advertising displays, removal of parking lots, and removal of above- and below-ground utility infrastructure and preparation of the site would also begin in July 2021 and last approximately four months. Demolition and site preparation would involve a number of excavators, loaders, dump trucks, and water trucks. Demolition and site preparation activities would result in approximately 15 to 30 haul truck loads per day of solid/inert material.

Existing on-site and off-site utility infrastructure that is no longer needed to serve the Arena Site would be removed and new utility infrastructure would be trenched and installed. Drainage infrastructure would be installed to drain the Arena Site.

Grading/Excavation

The mass excavation phase would involve earth movement and hauling on an exposed site of approximately 16 acres during a 4-month period between November 2021 and February 2022. Excavation depths on the Arena Site would be at a maximum of 35 feet below ground surface to accommodate the Arena bowl. Excavation activities would result in up to approximately 150 haul truck trips per day.

Foundations/Building Construction/Finishing

The deep foundations/footings phase of construction would involve the pre-drilling and auger displacement of concrete foundation piles throughout the excavation area. Concrete would be delivered to the site and poured into the site and pre-drilled caissons to form the footings that would support the foundations of the structures on the Project Site. The primary work of this phase would take place over the course of approximately 6 months, from December 2021 to May 2022, with a secondary phase of approximately four months from October 2022 to January 2023.

The construction phase would involve the erection of steel, concrete and precast concrete elements. The construction phase of the Arena Site would take place over about 28 months starting in March 2022 and lasting to June 2024. This phase would include the erection of the Arena Structure, which would involve the use of numerous cranes, loaders, welders, generators, concrete pumpers, and similar construction equipment. This phase would also involve a wide variety of interior finishing and structure enclosure activities involving creating and outfitting interior spaces and completing the exterior finish of the building, including plumbing, electrical, heating and air conditioning systems, seat and other event system installation, and the like. Application of architectural coatings would occur during this phase, likely between July 2022 and May 2024.

Site paving, exterior site work, and landscaping would occur between February 2024 and May 2024.

West Parking Garage Site

Construction of the parking structure on the West Parking Garage Site would occur from July 2021 to February 2023. Site preparation, excavation, and installation of utilities would involve earth movement and hauling on an exposed site of approximately 5 acres during a 3-month period between July 2021 and September 2021. Site preparation and excavation activities would result in approximately 53 haul truck trips per day.

Construction of the West Parking Garage would include pouring of foundations, erection of support structures, concrete pours, application of architectural coatings, and site paving over approximately 18 months, from September 2021 to February 2023.

Construction of the pedestrian bridge spanning South Prairie Avenue would occur in four phases over a five-month period, and would occur concurrently with the construction of other elements constructed on the Arena Site. Stage 1 would consist of erecting the bridge, building the bridge on site, the delivery a steel structure from off site, and pouring concrete on site. Stage 2 would consist of bridge installation. Stage 3 would consist of another concrete pour while Stage 4 would consist of cladding the bridge, finishing the installation, installing the handrails, and applying the final treatment. Construction of the bridge is anticipated to require the full closure of South Prairie Avenue for three nights during Stage 1 and one night during Stage 3, and the closure of select lanes on South Prairie Avenue for three to four nights during Stages 2 and 4.

East Transportation and Hotel Site

Construction of the East Transportation and Hotel Site would include both the transportation hub (parking garage and surface parking) and the hotel. Site preparation and installation of utility infrastructure for the East Transportation and Hotel Site would occur over approximately 4 months, from July 2021 to October 2021. The site would then be used as a construction staging area while other elements of the Proposed Project are constructed. The site would be graded and any necessary excavation would occur in October 2023.

Beginning in February 2024 and lasting through June 2024, the East Parking Garage and associated surface parking area (Transportation Hub) would be constructed. Construction activities would begin with constructing the parking garage foundation and concrete pours, while architectural coatings, site paving, and landscaping would complete development of the transportation hub.

The exact timing of construction of the hotel is unknown. However, it is conservatively assumed that construction of the hotel could occur concurrent with construction of other aspects of the Proposed Project. Construction of the hotel could begin as early as February 2024 and be completed by October 2024. The construction of the hotel would include construction of building foundations, concrete pours, erection of the hotel structure including any integrated parking facilities, paving, and landscaping. Construction of the hotel would use typical construction equipment and methods for a mid-rise building. It is anticipated that construction vehicles would park on site during construction activities.

Well Relocation Site

Construction of the Well Relocation Site would last for approximately 11 months beginning in July 2021. The first phases of construction on this site would include erection of temporary sound barriers along the eastern, southern, and a portion of the western boundaries of the site. The Well Relocation Site would be graded, and a mobile construction noise barrier would be brought onto the site. Drilling and casing for the well would begin in August 2021 and end in December 2021. Utility infrastructure would be installed between January 2022 and May 2022. Final paving and fencing would conclude in June 2022.

Construction Traffic Circulation

Construction workers would park primarily on the East Transportation and Hotel Site during construction activity on the Arena Site, West Parking Garage Site, and Well Relocation Site. Spillover parking could also be accommodated on portions of the Well Relocation Site. During later stages of construction activity, when portions of the East Transportation and Hotel Site are unavailable for parking, construction workers would park in the parking structures constructed on the Arena Site and West Parking Garage Site, with spillover parking available on the Well Relocation Site.

Arena Site

During construction of the Arena Site, the easternmost travel lane of northbound South Prairie Avenue would be fenced and closed to travel from West Century Boulevard to 10204 South Prairie Avenue (see **Figure 2-32**). The sidewalk along the South Prairie Avenue frontage would also be closed to pedestrians. Driveway access to the residences at 10204 South Prairie Avenue and 10226 South Prairie Avenue would be maintained for the duration of project construction.

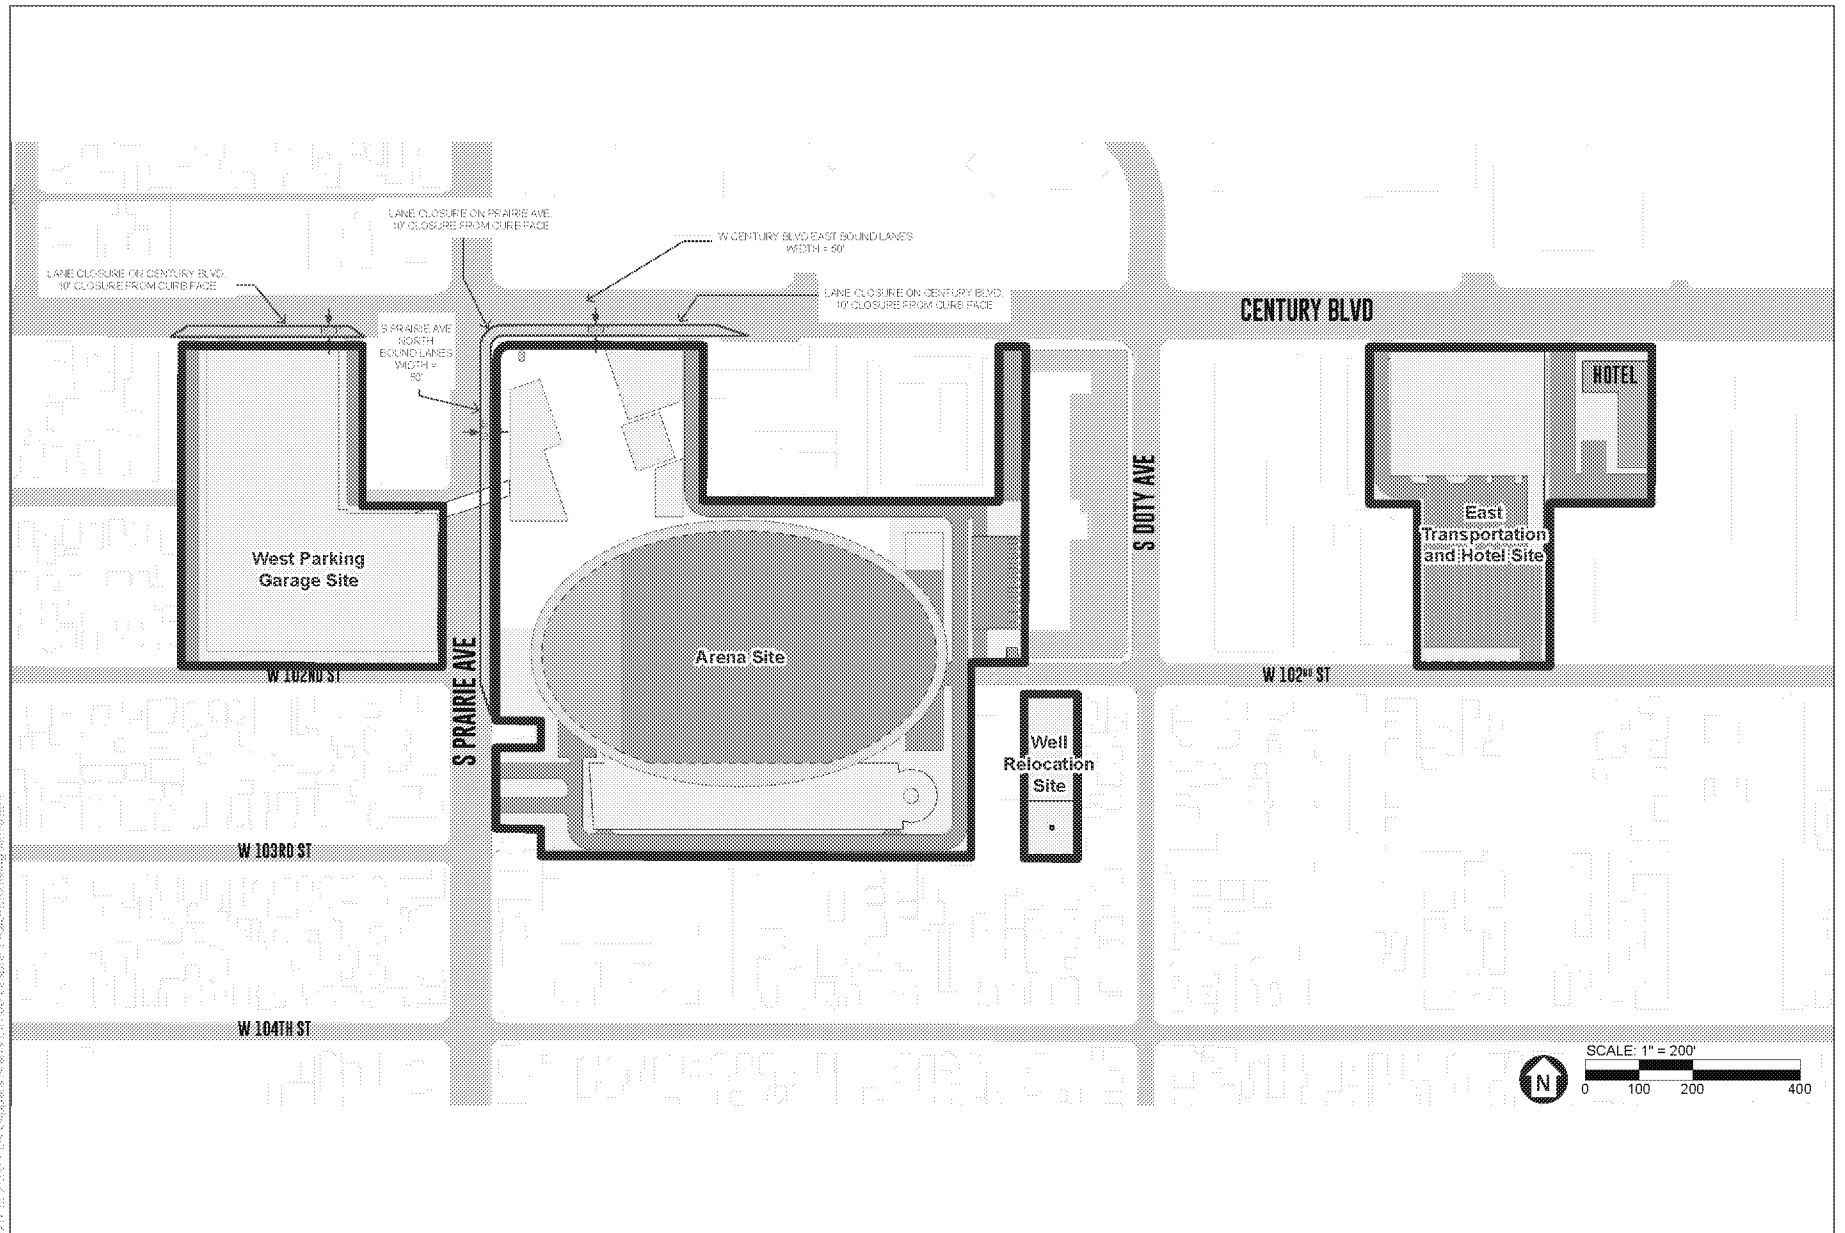

The southernmost lane on eastbound West Century Boulevard would also be closed to traffic from South Prairie Avenue to approximately 450 feet east, in front of the Airport Park View Hotel. The sidewalk along the West Century Boulevard frontage would also be closed to pedestrians.

West Parking Garage Site

The southernmost lane on eastbound West Century Boulevard would be closed during the construction of the West Parking Garage Site. No other travel lanes would be affected during construction of this site. The sidewalk along the West Century Boulevard frontage would also be closed to pedestrians.

Truck Routes

Construction vehicles would largely follow truck routes that would be established for the Proposed Project. Construction vehicles would use major arterials in the vicinity of the Project Site including, but not limited to, West Manchester Avenue, West Century Boulevard, Hawthorne Boulevard, South Prairie Avenue, South Doty Avenue, Yukon Avenue, and Crenshaw Boulevard. Regional freeways in the area include the Harbor Freeway and Century Freeway.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 2-32
Construction - Lane Closures

The direction of outbound truck trips would be determined by the destination of the truck, especially during demolition when trucks would be transporting demolition materials to recycling facilities or landfills. Outbound trucks hauling construction trash would be traveling to Gardena, metal iron and scrap would be transported to Los Angeles, and concrete and asphalt would be transported to Irwindale.

Construction Employment

Construction-related jobs generated by the Proposed Project would likely be filled by employees within the construction industry within the City of Inglewood and the greater Los Angeles County region. Construction industry jobs generally have no regular place of business and many construction workers are highly specialized (i.e., crane operators, steel workers, masons, etc.). Thus, construction workers commute to job sites throughout the region that may change several times a year dictated by the demand for their specific skills. The work requirements of most construction projects are also highly specialized and workers are employed on a job site only as long as their skills are needed to complete a particular phase of the construction process.

During construction activities, there would be a minimum of 35 construction workers on the Project Site at any one time, with a maximum number of 1,175 construction workers on the Project Site at any one time. Throughout Project construction, the number of construction workers on site would ebb and flow to match the intensity of each stage of construction.

2.6 Actions

Implementation of the Proposed Project is anticipated to require, but may not be limited to, the following actions by the City of Inglewood:

- Certification of the EIR to determine that the EIR was completed in compliance with the requirements of CEQA, that the decision-making body has reviewed and considered the information in the EIR, and that the EIR reflects the independent judgment of the City of Inglewood.
- Adoption of a Mitigation Monitoring and Reporting Plan, which specifies the methods for monitoring mitigation measures required to eliminate or reduce the Proposed Project's significant effects on the environment.
- Adoption of CEQA findings of fact, and for any environmental impacts determined to be significant and unavoidable, a Statement of Overriding Considerations.
- Approval of amendments to the General Plan's Land Use and Circulation Elements, with conforming map and text changes to reflect the plan for the Proposed Project, including:
 - Redesignation of certain properties in the Land Use Element from Commercial to Industrial;
 - Addition of specific reference to integrated sports and entertainment facilities and related and ancillary uses on properties in the Industrial land use designation text;
 - Updating Circulation Element maps and text to reflect vacation of portions of West 101st Street and West 102nd Street and to show the location of the Proposed Project; and

- Updating Safety Element map to reflect the relocation of the municipal water well and related infrastructure.
- Approval of a Specific Plan Amendment to the Inglewood International Business Park Specific Plan to exclude properties within the Project Site from the Specific Plan Area.
- Approval of amendments to Chapter 12 and Chapter 5 of the Inglewood Municipal Code, including:
 - Text amendments to create an overlay zone establishing development standards including standards for height, setbacks and lot size, permitted uses, signage regulations, noise regulations, parking regulations, public art requirements, site plan and design review processes, and other land use controls; and
 - Conforming Zoning Map amendments applying the overlay zone to the Project Site or portions thereof.
- Approval of the vacation of portions of West 101st Street and West 102nd Street, and adoption of findings in connection with that approval.
- Approval of right-of-way to encroach on City streets.
- Approval of a Disposition and Development Agreement (DDA) by the City of Inglewood governing terms of disposition and development of property.
- Approval of a Development Agreement (DA) addressing community benefits, vesting entitlements for the Proposed Project, and establishing IBEC Project-specific Design Guidelines to address certain design elements, including building orientation, massing, design and materials, plaza treatments, landscaping and lighting design, parking and loading design, pedestrian circulation, signage and graphics, walls, fences and screening, and similar elements.
- Approval of subdivision map(s) or lot line adjustments to consolidate properties and/or adjust property boundaries within the Project Site.
- Approval of conditions of approval with respect to the requirements of Assembly Bill 987.
- Approval of any other conditions of approval deemed necessary and appropriate by the City.
- Any additional actions or permits deemed necessary to implement the Proposed Project, including demolition, grading, foundation, and building permits, any permits or approvals required for extended construction hours, tree removal permits, and other additional ministerial actions, permits, or approvals from the City of Inglewood that may be required.

Additionally, if the project applicant is unable to acquire privately-owned, non-residential parcels within the Project Site, the City, in its sole discretion, may consider the use of eminent domain to acquire any such parcels, subject to applicable law, and the imposition of adequate controls necessary to ensure that the public purpose and use for which they were acquired are protected.

In addition to approvals by the City of Inglewood, approvals or actions by other agencies or entities would include, but not be limited to, the following:

- Determination of consistency with the LAX Airport Land Use Plan by the Los Angeles County Airport Land Use Commission.

- Issuance of permits to allow for municipal water well relocation by the Los Angeles County Department of Public Health.
- Review of the Proposed Project by the FAA under 14 Code of Federal Regulations Part 77 for issuance of a Determination of No Hazard.

Additional approvals or permits may also be required from federal, State, regional, or local agencies, including but not limited to the following:

- Los Angeles Regional Water Quality Control Board;
- South Coast Air Quality Management District;
- Los Angeles County Fire Department;
- Los Angeles County Metro; and
- California Department of Transportation.

CHAPTER 3

Environmental Setting, Impacts, and Mitigation Measures

3.0 Introduction to the Analysis

This EIR evaluates the physical environmental effects that would potentially occur from implementation of the Proposed Project. The structure of the technical sections included in this chapter is discussed below, and definitions of key terms that are used throughout this EIR are provided. Comments that were received during the scoping period are summarized herein as well. In addition, this section includes a description of certain possible environmental impacts that are typically considered under CEQA, but are not analyzed in detail in this EIR because it was determined the Proposed Project would have no impact. This section also provides a discussion of the Adjusted Baseline Environmental Setting and the identification of other past, present, or reasonably foreseeable projects that are used in the analysis of cumulative impacts throughout this chapter.

3.0.1 Definitions of Terms Used in the EIR

This EIR uses a number of terms that have specific meaning under CEQA. Among the most important of the terms used in the EIR are those that refer to the significance of environmental impacts. The following terms describe environmental effects of the Proposed Project:

- **Significance Criteria:** A set of criteria used by the lead agency (City of Inglewood) to determine at what level or threshold an impact would be considered significant. Thresholds of significance are identifiable quantitative, qualitative, or performance levels of a particular environmental effect that are supported by substantial evidence.¹ Thresholds of significance used in this EIR include those standards provided by the City of Inglewood unless otherwise specifically defined.
- **No Impact:** No impact means that the Proposed Project would result in no direct or indirect adverse changes (or impacts) to the environment, with respect to the applicable significance criterion. A project impact with a no impact determination would also not contribute to a cumulative impact. Where the Proposed Project would not have an impact, the impact statement states this definitively.
- **Less-than-Significant Impact:** A project impact is considered less than significant when the physical change caused by the Proposed Project would not exceed the applicable significance criterion.

¹ CEQA Guidelines section 15064.7.

- **Potentially Significant Impact:** A potentially significant impact is identified where the Proposed Project may cause a substantial adverse change in the environment, depending on certain unknown conditions related to the Proposed Project or the affected environment. For CEQA purposes, a potentially significant impact is treated as if it were a significant impact. A project impact is considered potentially significant if the Proposed Project is anticipated to exceed identified standards of significance thereby result in a substantial adverse change in the physical conditions of the environment. Significant impacts are identified by the evaluation of project-related physical change compared to specified significance criteria. A significant impact is defined as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.”² In instances where potentially significant impacts are identified, the EIR must consider whether mitigation measures (as defined below) or alternatives to the Proposed Project would reduce those impacts.
- **Significant and Unavoidable Impact:** A project impact is considered significant and unavoidable if it would result in a substantial adverse physical change in the environment that cannot be feasibly mitigated to a less-than-significant level.
- **Cumulative Impact:** Under CEQA, a cumulative impact refers to “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.”³ “A cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts.”⁴ A project has “cumulatively considerable” environmental effects (i.e., is significant) when “the incremental effects of [the] project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.”⁵
- **Mitigation Measure:** Where a potentially significant impact or significant and unavoidable impact is identified, feasible mitigation measures that could minimize the identified significant adverse impact are required.⁶ A mitigation measure is an action that could be taken that would avoid or reduce the magnitude of a significant impact. CEQA Guidelines section 15370 defines mitigation as:
 - a. Avoiding the impact altogether by not taking a certain action or parts of an action;
 - b. Minimizing impacts by limiting the degree of magnitude of the action and its implementation;
 - c. Rectifying the impact by repairing, rehabilitating, or restoring the affected environment;
 - d. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and
 - e. Compensating for the impact by replacing or providing substitute resources or environments, including through permanent protection of such resources in the form of conservation easements.

³ CEQA Guidelines section 15355.

⁴ CEQA Guidelines section 15130(a)(1).

⁵ CEQA Guidelines sections 15065(a)(3), 15130(a), 15064(h)(1).

⁶ CEQA Guidelines section 15126.4.

3.0.2 Section Format

Chapter 3 is divided into technical sections (e.g., Section 3.1, Aesthetics) that present for each environmental resource issue area the physical environmental setting, the regulatory setting, standards of significance from which impacts are measured, analytical methods, an evaluation of potential impacts to the environment, and, where required, potentially feasible mitigation measures for identified significant impacts. Each section includes an analysis of project-specific and cumulative impacts for each issue area.

The technical environmental sections each begin with a description of the Proposed Project’s **environmental setting** and the **regulatory setting** as it pertains to a particular issue. The environmental setting provides a point of reference for assessing the environmental impacts of the Proposed Project and its alternatives. The environmental setting describes existing conditions at the time the NOP was circulated for the Proposed Project (February 2018). An **Adjusted Baseline** is considered in this EIR (see discussion below in Section 3.0.5) to account for nearby development in the Hollywood Park Specific Plan area. The regulatory setting presents relevant information about federal, state, regional, and/or local laws, regulations, plans or policies that pertain to the environmental resources addressed in each section. Each technical environmental section includes a discussion of whether there are any inconsistencies between the Proposed Project and applicable general plans, specific plans, and regional plans.⁷

Next, each section presents **significance criteria**, which identify the standards used by the City of Inglewood to determine the significance of effects of the Proposed Project. CEQA Guidelines section 15064.7 states that “... a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.”

A **methodology and assumptions** description in each section presents the analytical methods and key assumptions used in the evaluation of effects of the Proposed Project, and is followed by an **impacts and mitigation measures** discussion. The impact and mitigation portion of each section includes one or more impact statements, prefaced by an impact number in bold-faced type. An explanation of each impact is followed by an analysis of its significance. The impact discussion ends with a concluding statement regarding the significance of the impact and any related need for mitigation measures (either none are required, or all potentially feasible mitigation measures are presented to reduce an identified significant effect). The description of mitigation measures concludes with a description of the significance of the impact after application of the mitigation measure(s): either implementation of the mitigation measure(s) would reduce the impact to a less-than-significant level, or the impact would remain significant and unavoidable after implementation of all potentially feasible mitigation measures.

The analysis of environmental impacts considers both the construction and operational phases associated with implementation of the Proposed Project. As required by CEQA Guidelines

⁷ CEQA Guidelines section 15125(d).

section 15126.2(a), direct, indirect, short-term, long-term, onsite, and/or off-site impacts are addressed, as appropriate, for the environmental issue area being analyzed. Depending on the significance criteria, the impact analysis may consist of a qualitative discussion, a quantitative analysis, or a combination of both. Detailed technical appendices are also provided for several technical sections, where appropriate, and can be located at the end of the document.

Mitigation measures pertinent to each individual impact, if necessary, appear after the impact discussion section. The magnitude of reduction of an impact and the potential effect of that reduction in magnitude on the significance of the impact is also disclosed. An example of the format is shown below.

Impacts and Mitigation Measures

Impact 3.X-1: Impact statement (significance conclusion)

In the impact statement, terminology is used to indicate the level of significance of the impact. If an impact is less than significant, then the impact statement would say that the Proposed Project “could” affect a resource. If an impact is potentially significant or significant and unavoidable, then the impact statement would say that the Proposed Project “would” affect a resource.

A discussion of the Proposed Project’s impact is provided in paragraph form. A statement level of significance before application of any mitigation measures is provided in **bold**.

Mitigation Measure 3.X-1

Mitigation measure presented in italics and numbered to match the impact number.

Level of Significance After Mitigation: This paragraph describes how the mitigation measure(s) reduces the impact and identifies the residual level of impact in **bold**.

Cumulative Impacts

CEQA Guidelines section 15130 requires that an EIR discuss cumulative impacts of a project when a project’s incremental effect is cumulatively considerable. As defined in CEQA Guidelines section 15355, a cumulative impact consists of an impact that is created as a result of the combination of a project evaluated in the EIR together with other past, present, and reasonably foreseeable projects causing related impacts. CEQA Guidelines section 15130(b) requires that the discussion of cumulative impacts shall “reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone.”

In each topical section of the EIR, an analysis of cumulative impacts follows the project-specific impacts and mitigation measures evaluation. An introductory discussion that identifies the cumulative impact methodology and defines the cumulative context being addressed in each respective analysis (e.g., the South Coast Air Basin, or the City of Inglewood) is included at the beginning of the cumulative impact analysis in each technical section. In some instances, a

project-specific impact may be considered less than significant, but its contribution to a larger impact may be determined to be potentially significant when considered in combination with other cumulative development of the surrounding area or in combination with regional growth projections. In some instances, a potentially significant impact may result at the project level but would not result in a cumulatively considerable contribution to a significant cumulative impact. The cumulative impacts analyses are formatted the same as the project-specific impacts, as shown above in Section 3.0.2.

3.0.3 Comments Received During Scoping

In response to the Notice of Preparation (NOP), the City of Inglewood received a total of 18 comment letters regarding the Proposed Project. Additionally, 57 written comments were provided during the public scoping meeting held on March 12, 2018. A number of scoping-related comments were also received following the close of the comment period. All scoping comments received are provided in Appendix B. Although a number specific comments were raised in the NOP comments, comments generally fell into several main categories:

- Vehicular traffic management, particularly along freeways and local roadways;
- Parking supply and availability;
- Potential impacts to public transit and public transit facilities;
- Potential impacts on the surrounding area that could occur from the Proposed Project's provision of entertainment, retail, office, and hotel uses;
- Secondary economic impacts of the Proposed Project with respect to affordable housing;
- Adequate provision of public services and utilities;
- Noise and air quality impacts as a result of construction of the Proposed Project; and
- Cumulative impacts of the Proposed Project and other large venues nearby holding concurrent events.

The issues raised in these comments are addressed as appropriate in the EIR under the applicable environmental topic.

3.0.4 Effects Not Found to Be Significant

CEQA requires that the EIR contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and therefore not discussed in detail.⁸ Upon review of the Proposed Project, with consideration given to comments received during the scoping period as summarized in Appendix B, the City of Inglewood determined that, due to the physical characteristics of the Project Site and the Proposed Project, there would be no significant impact in certain specific environmental topic areas; therefore, these

⁸ CEQA Guidelines section 15128.

topics need not be further considered in the Draft EIR.⁹ The discussions below provide brief statements of reasons, supported by citations, for the City's determination that these issues do not warrant further consideration in the EIR.

Agricultural and Forestry Resources

A significant impact to Agricultural and Forestry Resources would occur if the Proposed Project would:

1. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;
2. Conflict with existing zoning for agricultural use, or a Williamson Act contract;
3. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g));
4. Result in the loss of forest land or conversion of forest land to non-forest use; or
5. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

The Proposed Project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use. (No Impact)

The area surrounding the Project Site is characterized by dense urban development, as well as vacant, undeveloped parcels that were previously developed over many years and more recently cleared for redevelopment. The Project Site is not designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (collectively referred to as "Farmland"), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency.¹⁰ As such, the Proposed Project would not convert Farmland, as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use. There would be **no project-level or cumulative impacts**.

⁹ Public Resources Code section 21003(e) states that "[t]o provide more meaningful public disclosure, reduce the time and cost required to prepare an environmental impact report, and focus on potentially significant effects on the environment of a proposed project, lead agencies shall, in accordance with section 21100, focus the discussion in the environmental impact report on those potential effects on the environment of a proposed project which the lead agency has determined are or may be significant. Lead agencies may limit discussion on other effects to a brief explanation as to why those effects are not potentially significant."

¹⁰ California Department of Conservation Division of Land Resource Protection, 2016. California Important Farmland Finder. Available: <https://maps.conservation.ca.gov/DLRP/CIFF/>. Accessed September 24, 2018.

The Proposed Project would not conflict with existing zoning for agricultural use, or a Williamson Act contract. (No Impact)

The Project Site is not included in the most recently released map showing Williamson Act contracts within Los Angeles County¹¹ and no portions of the Project Site are subject to a Williamson Act contract. The Proposed Project would not conflict with existing zoning for agricultural use, and would not conflict with a Williamson Act contract. There would be **no project-level or cumulative impacts**.

The Proposed Project would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)). (No Impact)

The Project Site is not zoned for timberland or timberland production by the City of Inglewood. Therefore, the Proposed Project would not conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production. There would be **no project-level or cumulative impacts**.

The Proposed Project would not result in the loss of forest land or conversion of forest land to non-forest use. (No Impact)

The Project Site is characterized by dense, urban development. The Project Site is not located on land that is zoned as forest land, either by the County of Los Angeles or by the City of Inglewood. As discussed above, since the Project Site is not irrigated and is surrounded by urban land, it is classified as Urban Land by the Natural Resources Conservation Service.¹² Therefore, implementation of the Proposed Project would not result in the loss of forest land or the conversion of forest land to non-forest use. There would be **no project-level or cumulative impacts**.

The Proposed Project would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use. (No Impact)

As discussed above, the Project Site is located within an urban environment characterized by dense development. The Project Site is not zoned as Farmland, and is classified as Urban Land. The Project Site is not under a Williamson Act contract. The Project Site is not zoned for agricultural use, nor is it designated for timberland, timberland production, or as forest land. Additionally, the Project Site is not currently utilized for agriculture, timberland or timberland production, or forest land. As such, the Proposed Project would not involve other changes in the existing environment which, due to their location or nature, could result in the conversion of

¹¹ California Department of Conservation Division of Land Resource Protection, 2016. Los Angeles County Williamson Act FY 2015/2016 Map. Available: ftp://ftp.consrv.ca.gov/pub/dlrp/wa/LA_15_16_WA.pdf. Accessed September 24, 2018.

¹² United States Department of Agriculture, Natural Resources Conservation Service, 2018. Web Soil Survey, Farmland Classification of Los Angeles County, California, Southeastern Part. Available: <https://websoilsurvey.nrcs.usda.gov/app/WebSoilSurvey.aspx>. Accessed May 15, 2018.

Farmland to non-agricultural use and would not result in the conversion of forest land to non-forest use. There would be **no project-level or cumulative impacts**.

Mineral Resources

A significant impact to Mineral Resources would occur if the Proposed Project would:

1. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; or
2. Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.

The Proposed Project would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. (No Impact)

The Project Site is in a Mineral Resource Zone (MRZ) classified as MRZ-1, which covers those areas where available geologic information indicates that little likelihood exists for the presence of significant mineral resources.^{13,14,15,16} Although the Project Site is located within the San Gabriel Production-Consumption Region, the Project Site is not located within a MRZ-2 zone, which would indicate that significant mineral resources are present.¹⁷ Construction and operation of the Proposed Project would not result in the loss of availability of any known mineral resource that would be of value to the region and the residents of the state. There would be **no project-level or cumulative impacts**.

The Proposed Project would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan. (No Impact)

As discussed above, the Project Site is located within a MRZ-1 zone, which indicates that there is little likelihood that the Project Site contains significant mineral resources. The Project Site is not delineated or designated by the City of Inglewood as a locally important mineral resource recovery

site. Construction and operation of the Proposed Project would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. There would be **no project-level or cumulative impacts**.

Wildfire

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, a significant impact related to wildfires would occur if the Proposed Project would:

1. Substantially impair an adopted emergency response plan or emergency evacuation plan;
2. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;
3. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; or
4. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

The Project Site is not located within or near an area designated as a state responsibility area¹⁸ nor is it classified as very high fire hazard severity zone or located near a very high fire hazard severity zone.¹⁹ Therefore, there would be **no project-level or cumulative impact**.

3.0.5 Adjusted Baseline

CEQA Guidelines section 15125 provides that an EIR must include a description of the physical environmental conditions in the project vicinity. It also allows for a lead agency to define existing conditions by conditions expected when the project becomes operational, when supported by substantial evidence. The Proposed Project is not expected to be complete and operational until mid-2024. At this time, the City of Inglewood has approved construction plans or issued building permits for, and construction has commenced on, significant portions of the Hollywood Park Specific Plan (HPSP) located immediately north of the Project Site, including the construction of a 70,000-seat open air NFL Stadium, a 6,000-seat performance venue, 518,077 square feet (sf) of retail and restaurant uses, 466,000 sf of office space, 314 residential units, an 11.89-acre park, a 4-acre civic use, and approximately 9,900 parking spaces, collectively known as the HPSP Adjusted Baseline projects (see **Table 3.0-1**).²⁰

¹⁸ California Department of Forestry and Fire Protection, 2019. State Responsibility Area Viewer. Available: <https://bofdata.fire.ca.gov/projects-and-programs/state-responsibility-area-viewer/>. Accessed February 27, 2019.

¹⁹ California Department of Forestry and Fire Protection, 2019. Wildland Hazard & Building Codes, California Fire Hazard Severity Zone Map Update Project. Available: <https://osfm.fire.ca.gov/divisions/wildfire-prevention-planning-engineering/wildland-hazards-building-codes/fire-hazard-severity-zones-maps/>. Accessed: February 27, 2019.

²⁰ Additional development at the remaining parts of the HPSP area is planned for the future. This additional future HPSP development is included as Cumulative Project #67 in Table 3.0-2, below.

**TABLE 3.0-1
 HPSP ADJUSTED BASELINE PROJECTS**

Land Use	Adjusted Baseline Projects^a	Estimated Operational Date^b
Retail	518,077 sf	September 2021
Office	466,000 sf	September 2021
Residential	314 units	May 2021
NFL Stadium	70,000 seats (2,772,304 sf)	Summer 2020
Perform. Venue	6,000 seats	Summer 2020
Open Space	11.89 ac	Summer 2020
Civic Use	4 ac	Summer 2020

NOTES:
^a Trifiletti Consulting, Inc., Related Project List Methodology for the Proposed Inglewood Basketball and Entertainment Center (IBEC), July 12, 2019.
^b Operational schedules for the HPSP Adjusted Baseline projects provided by the HPSP in a project schedule dated May 8, 2019.

Because of current and anticipated construction schedules, the City is reasonably certain that the HPSP Adjusted Baseline projects will be built and operational between summer 2020 and September 2021 when construction of the Proposed Project is expected to be underway, and prior to 2024 when operation of the Proposed Project would start. The NFL Stadium and performance venue will be operational by the summer 2020. Residential units will be operational in May 2021, with retail and office elements operational by September 2021. The open space and civic uses will be operational by summer 2020.

Construction and operation of the HPSP Adjusted Baseline projects will change the physical conditions that currently exist in the vicinity of the Project Site for most of the environmental topics addressed in this EIR. Due to the reasonable certainty that the HPSP Adjusted Baseline projects will be constructed and in operation prior to construction and operation of the Proposed Project, the City has determined that assuming the HPSP Adjusted Baseline projects in the baseline provides the most accurate picture of the Proposed Project’s impacts and that it would be misleading to disregard the HPSP Adjusted Baseline projects in the environmental setting. Accordingly, the changes associated with HPSP Adjusted Baseline projects are considered as part of the Adjusted Baseline Environmental Setting, which is the baseline against which the Proposed Project’s potential impacts are measured. How these changes affect the environmental setting is further described in each topical section under the heading Adjusted Baseline Environmental Setting.

Adjusted Baseline Transportation Assumptions

In addition to the development projects described above, improvements in the local transportation system are reasonably certain to be undertaken and operational prior to the commencement of operations for the Proposed Project, as described further below and in Section 3.14, Transportation and Circulation.

Roadways

A number of physical improvements are required as mitigations and/or conditions of approval of the Hollywood Park Specific Plan, are related to the City's ongoing Century Boulevard Improvement Plan, or are associated with the Crenshaw/LAX LRT project. These improvements either are under construction, or are approved and funded and scheduled; the improvements will be in place under all adjusted baseline condition scenarios. The full list of improvements is described further in Section 3.14, Transportation and Circulation, and presented in Table 3.14-13.

Transit

The adjusted baseline conditions transit network will differ considerably from existing conditions due to completion of the Crenshaw/LAX LRT prior to 2024. With this completion and the potential for a future Green Line South Bay extension, Metro is evaluating multiple operating scenarios, which would affect the routing of the trains, number of train cars, and potential peak and off-peak headways. The Metro board has currently approved Alternative C-3 for a 2-year pilot program; therefore, ridership forecasts for Alternative C-3 for a 2025 condition were used to represent the Adjusted Baseline condition. Alternative C-3 recommends an interline train between existing Norwalk Station (Green Line) and Expo/Crenshaw, and a short line train between Willowbrook/Rosa Parks Station and Redondo Beach Station (Green Line).

Metro is also studying changes to its bus system through the NextGen Bus study, but future changes to bus service are not yet defined and so would be speculative to assume. Therefore, the adjusted baseline conditions analysis assumes the existing bus routes that serve the Project Site will remain in operation at opening year of the Proposed Project.

3.0.6 Cumulative Assumptions

Pursuant to CEQA Guidelines section 15130(b)(1), either of the following are necessary to an adequate discussion of significant cumulative impacts:

- A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency; or
- A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing the cumulative effect.

This EIR conservatively considers both approaches where appropriate in this EIR, as described further below and evaluated specifically in each environmental resource topic.

Regional Growth Projections

The Project Site is located within the planning area of the Southern California Association of Governments (SCAG), the Southern California region's federally designated metropolitan planning organization. SCAG region includes six counties, including the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. Region wide, the population grew from 14.64 million people in 1990 to 16.52 million in 2000, a growth rate of nearly 1.28 percent per year. From 2000 to 2010, while the population of Inglewood dropped at an average rate of

0.3 percent per year, the region grew at an average rate of 1.03 percent per year. From 2010 to 2019, regionwide population growth slowed to an average of 0.61 percent per year, reaching a total of 19.16 million people in 2019.²¹

The 2016 RTP/SCS forecasts regionwide population growth to nearly 22.14 million as of 2040, which would represent an average growth rate of 0.73 percent per year from 2019, similar to potential citywide growth.²² According to SCAG's 2016 RTP/SCS growth forecast, the City is expected to see its population grow to 129,000 people in 2040, a 17 percent increase from 2017.²³

Cumulative Project List

The City published the NOP in February 2018. Following publication of the NOP, identification of cumulative projects focused on those projects that were proposed as of May 2018. This time frame coincides with the commencement of the City's environmental review process for the Proposed Project.

Table 3.0-2 provides a list of all past, present, and reasonably foreseeable projects. **Figure 3.0-1** identifies the locations of these cumulative projects. To understand the Proposed Project's contribution to cumulative impacts, the City, in consultation with other surrounding jurisdictions, has assembled a list of other known past, present, and reasonably foreseeable cumulative projects in the vicinity of the Project Site. Projects on this list consist of development projects within the City or other identified surrounding jurisdictions that have a pending development application, are approved, or are under construction, and transit and related infrastructure improvement projects that have been approved or proposed and under review.

As shown in **Table 3.0-3**, in total the Cumulative Projects List documents 145 projects with anticipated development of 1,903,815 sf of retail/commercial space, 8,675,487 sf of office space, 2,070,210 sf of industrial/warehouse/data center space, 9,315 residential units or beds, approximately 2,430 hotel rooms, and new or expanded schools to accommodate 6,401 students.

²¹ State of California, Department of Finance, E-5 Population and Housing Estimates for Cities, Counties and the State—January 1, 2011–2019. Sacramento, California, May 2019. Available: <http://www.dof.ca.gov/Forecasting/Demographics/Estimates/e-5>.

²² As shown in SCAG's 2016-2040 RTP/SCS Demographics & Growth Forecast Appendix, Table 8, the population forecasts indicate an average annual growth for the entire SCAG region between 2000 and 2040 of 0.73%. The highest growth rates are projected to be in counties that are peripheral in the region, including Imperial, Riverside, and San Bernardino Counties. Los Angeles County, by contrast, is projected to have the lowest growth rate projected over that period of the six counties in the region, at only 0.45% per year. Further, SCAG projects population growth to be slower in the 2015 to 2040 period, 0.57% regional per year instead of 0.73% for the full 2000–2040 period.

In addition, growth within Los Angeles County also varies depending on location. The traffic growth rate of 0.23% per year used in the Transportation analysis presented in Section 3.14 is from the Los Angeles Metro Congestion Management Plan specifically for the South Bay/LAX Regional Statistical Area (RSA) in which Inglewood is located. The South Bay/LAX RSA is projected to be one of the slower growing areas in LA County. In general, the inland areas of the region (Palmdale/Lancaster/Santa Clarita, Pomona) are projected to be the fastest growing areas in Los Angeles County, resulting in an overall regional average growth rate of 0.73%.

NOTES:

^a This HPSP Remaining Development (Cumulative Project #67) is in addition to HPSP Adjusted Baseline Environmental Setting projects identified in Table 3.0-1. The square footages, units, and hotel rooms presented here include the remaining uses in the HPSP, after completion of the HPSP Adjusted Baseline development, as shown above in Table 3.0-1.

^b Cumulative Project #73 involves the renovation of an existing 178-room hotel, and would add 4 rooms to a new total of 182.

3.1 Aesthetics

This section describes and evaluates potential impacts related to aesthetics, light, glare, shade, and shadow that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing visual character of Project Site and surrounding area, as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of federal, State, and local regulations related to aesthetics, light, and glare; (3) an evaluation of potential impacts related to aesthetics, light, glare, shade, and shadow that could result from construction and operation of the Proposed Project; and (4) an identification of feasible measures to mitigate significant impacts.

Comments received in response to the NOP for the EIR regarding aesthetics can be found in Appendix B. Issues and concerns regarding potential impacts related to aesthetics as a result of implementation of the Proposed Project are analyzed within this section.

The analysis included in this section was developed based on detailed information about the Proposed Project in Chapter 2, Project Description; visits to the Project Site in April 2018; photo-simulations prepared by the Proposed Project architects AECOM; a lighting analysis report prepared by Lighting Design Alliance (LDA) and photometric plans prepared by AECOM included as **Appendix C** to this EIR; and a shade and shadow study prepared for the Proposed Project by AECOM. The photo-simulations, lighting analysis report, and shade and shadow study were peer reviewed by ESA and the City during preparation of the EIR and are considered objective and accurate, and appropriate for inclusion in this Draft EIR.

3.1.1 Environmental Setting

Regional Setting and Project Vicinity

The City of Inglewood is located in southwest Los Angeles County, along the northern edge of the subarea commonly referred to as the South Bay. The proximity of Inglewood to the historic center of Los Angeles makes it one of the older and most urbanized of all the South Bay communities, and it is generally laid out in a grid system. The City includes areas of moderately dense development along major corridors that consist of commercial, industrial, and residential uses. The City has a relatively flat topography, which limits views of adjacent areas. The street corridors provide the only long-range views, which consist of limited distant views of the Baldwin Hills to the north and other urban developed areas.

The area surrounding the Project Site is composed of a mixture of one- to three-story commercial, industrial, entertainment, office, surface parking, and residential structures interspersed with vacant properties. Commercial and industrial buildings are concentrated along West Century Boulevard, a major commercial corridor that runs east–west through the City. The Hollywood Park Casino is located immediately north of the Project Site, on the north side of West Century Boulevard, and is a modern block-shaped structure with concrete and glass exterior with landscaped areas and a three-story concrete parking garage immediately east of the casino

building. The former Hollywood Park Racetrack site is under redevelopment to become the location of the future Los Angeles Stadium and Entertainment District within the Hollywood Park Specific Plan (HPSP) area. This area occupies approximately 300 acres immediately north of the Project Site and is described in detail below.

Commercial development, including big-box and small-box retail, fast food, restaurant, fitness, and service uses are located to the east of the Project Site. These modern buildings are primarily stucco with natural stone, tile, or glass building accents. The buildings are various sizes, heights, and colors and include illuminated signage. Expansive surface parking areas with ornamental landscaping surround the shopping centers. Commercial and industrial development are located immediately south of the Project Site and gradually transition from commercial and industrial uses to low and medium density residential neighborhoods largely composed of mid-century minimal-traditional and ranch style tract homes interspersed with two-story apartment complexes.

Prominent visual landmarks in the project vicinity include The Forum, a round indoor concert venue built in 1967 and meant to emulate the Roman Forum, approximately 1 mile north of the Project Site; the Centinela Hospital Medical Center, a modern hospital and medical campus, approximately 0.5 miles northwest of the Project Site; and Inglewood's 29-acre Civic Center, which includes the City Hall building, main library, a fire station, a police facility, a parking garage, and a public health complex in a square bounded by La Brea Avenue, Florence Avenue, Manchester Boulevard, and Fir Avenue, approximately 1 mile northwest of the Project Site. The Civic Center's most distinctive buildings are its eight-story City Hall, which sits atop a wide, two-story base, and the four-level library building, both constructed in the Brutalist style.

Project Site

All but six of the parcels that make up the Project Site are currently vacant land surrounded by perimeter metal chain link fencing. The six developed parcels include a fast food restaurant, a motel, a light manufacturing/warehouse facility, a commercial catering business, and a groundwater well and related facilities. The visual character of each portion of the Project Site and nearby areas is described in more detail below:

Arena Site

On-Site Visual Character

The Arena Site is generally bounded by West Century Boulevard on the north, South Prairie Avenue on the west, the S.E.S. International Express building on the east, and a straight line extending east from West 103rd Street to South Doty Avenue to the south.

The majority of the Arena Site is vacant. These vacant parcels are surrounded by metal chain link fencing along their perimeter. Visible through the fencing, the vacant parcels are mostly barren dirt (non-vegetated) areas with portions that are developed with concrete slab or buildings. There are some portions of the Arena Site that contain sparse non-native grasses and ornamental plants.

Although primarily vacant, the Arena Site contains a limited amount of existing development. Within the Arena Site, at the southeast corner of West Century Boulevard and South Prairie Avenue, is a Church's Chicken Restaurant fast-food restaurant that is set back behind a surface parking lot and limited landscaping. The Church's Chicken Restaurant is a distinctive yellow and red one-and-a-half story building that includes an approximately 10-foot-high free-standing oval sign.

To the east of the Church's Chicken Restaurant, is the two-story Rodeway Inn & Suites motel. The Rodeway Inn & Suites motel has an "O" shaped footprint with a rectangular courtyard situated in the middle that includes a driveway providing access to the surface parking lot at the rear of the property. It is clad in stucco and is set behind a surface parking lot. Although landscaping is limited, planters are located on the east and west sides of the parking lot that includes mature palm trees and shrubbery.

Within the Arena Site fronting West 102nd Street, is the City of Inglewood Water Well #6 that is surrounded by vertical blue metal fencing and an access gate. Also within the Arena Site to the west and north of Water Well #6, is a two-story commercial warehouse building and surface parking associated with unoccupied manufacturing/warehouse uses. The unoccupied manufacturing/warehouse building is a rectangular concrete block structure, with a curved façade entry that faces West 102nd Street and is set back from the street by associated surface parking, black metal fencing and a gated access driveway.

Also on the Arena Site along South Prairie Avenue south of West 102nd Street is a commercial catering business use (Let's Have a Cart Party) in a one-story stucco building that features a faux stone façade surrounded associated surface parking, metal fencing and a gated access driveway.

There are four outdoor advertising structures (billboards) on the Arena Site, as shown on Figure 2-3 in Chapter 2, Project Description. The vacant parcel at 10220 South Prairie Avenue includes a dual-faced static outdoor advertising display which is lit by floodlights facing upward. This approximately 30-foot-tall outdoor advertising display is mounted on dual poles, and includes an access ladder for maintenance crews to climb to reach the outdoor advertising display faces. The outdoor advertising display faces are clearly visible to drivers on both northbound and southbound South Prairie Avenue.

The vacant parcel at 10200 South Prairie Avenue (southeast corner of South Prairie Avenue and West 102nd Street) has a dual-faced, static outdoor advertising display mounted on a single pole. This outdoor advertising display is not lit on either side. This outdoor advertising display is rather small, both in height and in surface area; the top of the outdoor advertising display is only approximately 15 feet from ground level. The outdoor advertising display is visible to southbound drivers on South Prairie Avenue, but an existing street tree somewhat obscures the outdoor advertising display's visibility to drivers on northbound South Prairie Avenue.

The vacant parcel at the northeast corner of South Prairie Avenue and West 102nd Street contains a dual-faced, static outdoor advertising display mounted on two metal poles. Both faces of the

outdoor advertising display are illuminated by floodlights that are directed upward. The outdoor advertising display is approximately 20 feet tall and the outdoor advertising display faces are clearly visible to drivers on both northbound and southbound South Prairie Avenue.

The Arena Site contains a fourth static outdoor advertising display along West Century Avenue, on a vacant parcel immediately west of the unoccupied Airport Park View Hotel parcel. This outdoor advertising display is single-faced, with advertising visible only to westbound drivers on West Century Boulevard. The outdoor advertising display face is lit with a floodlight that is angled upward. This outdoor advertising display is mounted on dual poles, is approximately 20 feet tall, and includes an access ladder for maintenance crews to climb to reach the outdoor advertising display face.

As the Arena Site is largely vacant and surrounded by metal chain link fencing along the perimeter, the vacant portions of the Arena Site are not visually distinctive and have a low visual quality.

Off-Site Visual Character

To the North

West Century Boulevard is an active commercial corridor which borders the Arena Site on the north. The majority of West Century Boulevard adjacent to the Arena Site is characterized by one-to-three story commercial development that includes fast food restaurants, motels, retail, entertainment uses, and small commercial centers. Many of these uses are set behind, or adjacent to, supporting surface parking lots that front West Century Boulevard. West Century Boulevard also includes pockets of underutilized, abandoned, or vacant properties, which appear as vacant or largely vacant flat lots of land with weedy vegetation behind approximately 6-foot-high chain-link fencing along West Century Boulevard. West Century Boulevard is characterized by heavy traffic volumes, and, other than scattered street trees, is almost entirely devoid of greenery and landscaped open space.

Directly north of the Arena Site along West Century Boulevard, is the HPSP area. Within the HPSP area, the NFL Stadium (to be the home of the National Football League Los Angeles Rams and Los Angeles Chargers teams), is under construction. Currently, the HPSP area is mostly exposed dirt, with the concrete structure of the NFL Stadium visible from the Project Site and its surroundings. An approximately 12-foot-tall dirt berm fronts the north side of West Century Boulevard from South Doty Avenue to South Prairie Avenue, and along the east side of South Prairie Avenue from West Century Avenue to East Hardy Street, and further to the north from East Arbor Vitae Street to approximately East La Palma Drive. The entire HPSP area is surrounded along its perimeter by a 6-foot tall chain link fence wrapped in a black/green tarp to make the view into the site opaque. Accordingly, the visual character of much of north side of West Century Boulevard adjacent to the Arena Site largely consists of the aforementioned construction fencing. Above the fencing, various taller construction components such as mounds of soil and debris, cranes, and scaffolding are visible. The anticipated future visual character of

the north side of West Century Boulevard adjacent to the Arena Site is discussed below under the heading Adjusted Baseline Environmental Setting.

To the East

To the east of the Arena Site, along the south side of West Century Boulevard, is the three-story Airport Parkview Hotel that is set behind screened metal fencing. As the hotel is not operational, it is in a dilapidated condition, and is characterized by peeling paint and boarded windows.

East of the Airport Parkview Hotel, land uses begin to transition to larger-footprint industrial and warehouse development. Directly to the east of the Airport Park View Hotel are four two-story Extra Space Storage commercial buildings set behind expansive lawn area and landscaping. The Extra Space Storage buildings include pitched roofs and large distinctive gray and green paneling. Associated surface parking surrounds the four buildings.

To the east of the Extra Space Storage buildings, past a narrow City-owned parcel that is part of the Project Site, is a two-story warehouse building occupied by S.E.S. International Express, and an associated surface parking and truck loading area. The S.E.S. International Express building and associated truck loading area fronts West Century Boulevard and South Doty Avenue, and extends the entire block between West Century Boulevard and West 102nd Street. The S.E.S. International Express building has a blank grey and blue façade with minimal windows and is surrounded by metal fencing and surface parking. Landscaping includes trees and a narrow strip of low lying vegetation. The building is largely industrial in design, contains minimal landscaping and architectural elements, and is set behind fencing and surface parking.

The S.E.S. International Express frontage along the west side of South Doty Avenue includes the associated truck loading area which consists of surface parking, various parked trucks, truck roll-up doors and ramps. The truck loading area is set behind perimeter metal fencing, a gated driveway, and low lying vegetation.

Directly across the street from the S.E.S. International Express building on the east side of South Doty Avenue is a white two-story multi-tenant warehouse and industrial building and surface parking associated with ZHL Logistics and other tenants. The ZHL Logistics industrial building as viewed from South Doty Avenue includes the building's associated truck loading area, which consists of surface parking, various parked trucks, truck roll-up doors and ramps. The truck loading area includes perimeter metal fencing and a gated driveway. Each truck loading area is labeled with large non-illuminated signage denoting the individual tenants.

To the West and South

South of West 102nd Street, land uses along South Doty Avenue transition to lower-scale one- to two-story single-family homes interspersed with a limited number of two-story multi-family units. The majority of single-family homes are mid-century minimal-traditional and ranch style tract homes. Most homes are setback from the street by front lawns with each home including varying styles and amounts of landscaping. The multi-family units are stucco mid-century box-

style buildings. The majority of residential units are separated from the street and sidewalk by metal or wood fencing and gates.

Fronting West 104th Street and located immediately south of the Arena Site are one-to-two-story single-family residences and multi-family residences, and a church (Inglewood Southside Christian Church located at 3947 West 104th Street) with associated surface parking.

As mentioned earlier, South Prairie Avenue borders the Arena Site on the west. Land uses along South Prairie Avenue include one-to-two-story single-family homes, interspersed with one-and-two-story restaurants, automotive, commercial, and office uses. Similar to West Century Boulevard, much of the corridor also includes underutilized, abandoned, or vacant properties and contains minimal landscaping greenspace or pedestrian amenities.

Specific adjacent land uses to the west of the Arena Site along the west side of South Prairie Avenue between West 104th Street and West 103rd Street, include one-to-two-story single-family and multi-family units. The majority of single-family homes are mid-century/post-war minimal-traditional with some limited ranch style homes. The majority of homes have minimal lawn area and are setback from the street and sidewalk by metal or wood perimeter fencing and gates.

Commercial uses along South Prairie Avenue include auto-oriented development such as Auto Collision Team and LAX Mercedes BMW Service and Repair. Both uses are occupied single-story automotive shops that include surface parking, roll-up service doors, minimal landscaping and are surrounded by security fencing and gates. Other small-scale, commercial development includes Liquor Warehouse and Sunshine Coin Laundry. All of the uses include associated surface parking, perimeter security fencing.

Starbucks, a more modern commercial development, located at the southwest corner of West Century Boulevard and South Prairie Avenue, and is set back behind substantial landscaping and greenspace.

West Parking Garage Site

On-Site Visual Character

The West Parking Garage Site consists of 27 parcels totaling approximately 5 acres on the north and south sides of West 101st Street, bounded by West Century Boulevard on the north, South Prairie Avenue on the east, and West 102nd Street on the south. The West Parking Garage Site is surrounded by metal chain link fencing along the perimeter. Visible through the fencing are non-native grasses and ornamental plants.

Off-Site Visual Character

To the North

West Century Boulevard borders the West Parking Garage Site to the north. As mentioned previously, the visual quality of West Century Boulevard is characterized by a heavily trafficked auto-oriented environment, with minimal landscaping and pedestrian amenities. Land uses directly north of the West Parking Garage Site across West Century Boulevard include one-to-

two-story strip commercial development such as fast food restaurants (Jack in the Box and McDonalds), auto uses (Dr. Carfix/Tiki Smog and a Chevron gas station), motels (Holly Crest Hotel and Motel 6), and various small retail services. These uses are set behind, or adjacent to, supporting surface parking lots that front West Century Boulevard.

To the East

Immediately adjacent to the West Parking Garage Site to the east is a small grouping of one-story commercial structures that include a Starbucks set behind landscaping and trees, the Liquor Warehouse, and Sunshine Coin Laundry. The three separate buildings are constructed of stucco and block materials, each only one story. The buildings are arranged around a large shared surface parking lot lit by overhead lighting.

West 101st Street is a two lane street which separates the two vacant parcels that encompass the West Parking Garage Site. The Starbucks, the Liquor Warehouse, and Sunshine Coin Laundry are located north of West 101st Street near its intersection with South Prairie Avenue.

To the West

West of the fences that surround the vacant West Parking Garage Site, land uses transition to one-to-two-story single-family ranch-style tract homes. Many of the homes include attached garages and are set back from the street by front and side lawns. The majority of homes include metal and wood perimeter gates, with many homes incorporating decorative elements and landscaping. To the immediate west of the West Parking Garage Site along West Century Boulevard, is a motel (Airport Motel), a church (Iglesia Cristiana Pentecostes del Movimiento Misionero Mundial), and one-to-two-story residential uses.

The West Parking Garage Site is bordered on the east by South Prairie Avenue. South Prairie Avenue includes one-to-two-story single-family homes, interspersed with one-and-two-story restaurants, automotive, commercial and office uses and underutilized and vacant properties. Similar to West Century Boulevard, South Prairie Avenue is a highly auto-oriented corridor that contains minimal landscaping or pedestrian amenities.

To the South

The West Parking Garage Site is bordered on the south by West 102nd Street. The area south of West 102nd Street is comprised primarily of one-to-two-story single-family and multi-family units. The majority of homes have minimal lawn area and are set back from the street and sidewalk by metal or wood perimeter fencing and gates.

East Transportation and Hotel Site

On-Site Visual Character

The East Transportation and Hotel Site is a “T-shaped” group of five parcels consisting of approximately 5 acres. It is bounded by West Century Boulevard to the north and West 102nd Street to the south. The East Transportation and Hotel Site consists of vacant parcels surrounded

by vertical metal fencing and intermittent green screening. Visible through the fencing are barren areas with some patches of non-native grasses, ornamental plants, and trees.

Off-Site Visual Character

To the North

On the north side of West Century Boulevard, directly north of the East Transportation and Hotel Site, is the Hollywood Park Casino and associated three-story parking structure. Redeveloped in 2016, the Hollywood Park Casino features mid-century modern design elements and includes a distinct floor-to-roof glass entryway that is framed by a porte-cochere and a line of palm trees. The Hollywood Park Casino is set behind surface parking and features substantial landscaping that includes a variety of native plants. The three-story parking garage is located to the east of the Hollywood Park Casino and is partially screened by trees and perimeter landscaping.

To the East

Yukon Avenue is a north and south corridor located to the east of the East Transportation and Hotel Site. North of West 104th Street on the east side of Yukon Avenue, the built environment is dominated by large-scale commercial shopping centers (Century Plaza and The Village at Century) with big-box retailers such as Costco interspersed with smaller stores that are setback deeply from the street front by expansive surface parking. The surface parking is partially screened by low lying vegetation, narrow greenway, and metal fencing.

On the west side of Yukon Avenue, extending from West Century Boulevard to West 102nd Street are facilities associated with UPS Supply Chain Solutions including a long, one-story building, truck loading bays, surface parking, and trucks that are surrounded by metal fencing and secured gates. South of West 102nd Street on the west side of Yukon Avenue, land uses transition to one-to-two-story mid-century/post-war minimal-traditional and ranch style tract homes and two-story multi-family uses. The majority of homes have small front lawns and are setback from the street and sidewalk by metal or wood perimeter fencing and gates.

On the east side of Yukon Avenue, south of West 104th Street, are the Morningside High School, Monroe Middle School, and the Clyde Woodworth Imagine Learning Magnet school campuses. The school buildings are set back at a considerable distance from the street by associated surface parking and expansive green lawns and track and field facilities. The school campuses are surrounded by metal perimeter fencing.

To the West

West of the East Transportation and Hotel Site are commercial and light manufacturing/industrial uses including a single-story multi-tenant business center with shared surface parking, a vacant single-story warehouse, and a two-story multi-tenant warehouse and industrial building that borders South Doty Street. While well maintained, each of the industrial buildings are visually non-descript and feature blank facades and minimal design details.

To the South

South of the East Transportation and Hotel Site, West 102nd Street is a two lane road that is characterized by industrial and vacant land uses on the north side and smaller-scaled residential and commercial structures on the south side of the street. Specifically, the north side of West 102nd Street includes rear views of the UPS Supply Chain Solutions, Transworld Aquatic Enterprises, and ZHL Logistics buildings, surface parking, and truck loading areas. On the south side of West 102nd Street are two-story apartment complexes and one-story single-family homes, vacant parcels, and an industrial warehouse building with a blank façade.

Well Relocation Site

On-Site Visual Character

The Well Relocation Site is located at 3812 West 102nd Street. The site is currently vacant, and characterized by barren weedy soil. It is surrounded by metal chain link fencing on the northern and eastern edges, a wrought iron fence along the southern boundary, and a building, half-block wall, and wrought iron fencing along the western boundary.

Off-Site Visual Character

The Well Relocation Site is surrounded by vacant land and a two-story commercial/manufacturing building (C D S Cabinets) with stucco facades to the west. The two-story C D S Cabinets building features a blank façade, an absence of windows and is surrounded by security gates with a blank façade. Low density residential homes are located to the east and south. To the north, across West 102nd Street, are low-profile industrial warehouse buildings associated with S.E.S. International Express.

Viewpoints

With the exception of limited one- and two-story commercial uses located on the Arena Site, the Project Site consists of vacant land. The Project Site does not have tall visual profile. As a result, the Project Site is generally visible from only the immediate area. The most direct views of the Project Site are from motorists traveling along West Century Boulevard, South Doty Avenue, South Prairie Avenue, West 102nd Street, and West 101st Street, with limited views from South Yukon Avenue.

Light and Glare

Lighting

Nighttime lighting is necessary to provide and maintain safe, secure, and attractive environments. However, these lights have the potential to produce spillover light and glare, and if designed incorrectly, could be considered unattractive. Although nighttime light is a common feature of urban areas, spillover light can adversely affect light-sensitive uses, such as residential units at nighttime.

With respect to nighttime lighting and illumination, the area surrounding the Project Site has a relatively high level of ambient lighting, particularly along West Century Boulevard, South Prairie Avenue and Yukon Avenue, as those streets serve as active transportation corridors. High

levels of nighttime lighting along these roadways are generated by street lights, vehicle headlights, illuminated signage, lighted outdoor advertising displays, security lighting from industrial and commercial uses and parking lots, and interior building illumination. West Century Boulevard has the highest level of ambient lighting in the area, as it has substantial vehicle activity and through-traffic, and includes a higher degree of active nighttime uses such as the Hollywood Park Casino and various fast food, gas station, and motel uses. Ambient lighting along West Century Boulevard is also provided from security lighting from the HPSP area construction site, including lighting attached to cranes and other tall construction equipment. Lower density residential areas that border the Project Site to the south and west experience less intensive lighting, though some nighttime lighting is provided by street lighting, vehicle headlights, security lighting, and interior illumination from residences.

Glare

Glare results when a light source directly in the field of vision is brighter than the eye can comfortably accept. Squinting or turning away from a light source is an indication of glare. The presence of a bright light in an otherwise dark setting may be distracting or annoying, referred to as discomfort glare, or it may diminish the ability to see other objects in the darkened environment, referred to as disability glare. Reflective glare, such as the reflected view of the sun from a window or mirrored surface, can be distracting during the day.

Most glare in the project vicinity of the Project Site is generated by reflective materials on some surrounding buildings and glare from vehicles passing on major street corridors. The Project Site generates a minimal amount of glare due to the large expanse of unoccupied land that characterizes much of the Project Site. The few existing buildings on the Arena Site do not generate high levels of glare, as they are composed of non-reflective stucco and concrete materials and do not include expansive glass or windows. Three of the four outdoor advertising displays on the Arena Site are lit, with lighting directed upward toward the faces of the displays.

3.1.2 Adjusted Baseline Environmental Setting

Section 3.1, Aesthetics, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis.

Under the Adjusted Baseline, the NFL Stadium and related development in the HPSP area described above will be constructed and in operation prior to opening of the Proposed Project and will result a major visual change from the physical conditions that currently exist in the vicinity of the Project Site. The open air NFL Stadium will reach up to 175 feet in height, and the size and design of the structure means that the NFL Stadium will be visible within north-facing views from the Project Site. Further, during night events at the NFL Stadium the lights and associated glow will be clearly visible. Portions of the retail and restaurant uses that will be constructed immediately northeast of the intersection of West Century Boulevard and South Prairie Avenue will be visible from the Project Site, including a four-story parking structure and buildings up to 75 feet in height. The new structures will substantially add to the urban character of the visual environment north of the Arena Site.

3.1.3 Regulatory Setting

Federal

There are no federal regulations, plans, or policies applicable to aesthetics issues relevant to the Proposed Project.

State

State Scenic Highway Program

California's Scenic Highway Program was created by the Legislature in 1963 to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of lands adjacent to designated scenic highways. The State laws governing the Scenic Highway Program are found in the California Streets and Highways Code, Division 1, Chapter 2, Article 2.5, section 260 et seq. The State Scenic Highway System includes a list of federal and State highways that are either eligible for designation as scenic highways or have been so designated. These highways are identified in Streets and Highways Code sections 263 through 263.8. A highway may be designated scenic based upon the amount of natural landscape that can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view.

When a city or county nominates an eligible scenic highway for official designation, it must identify and define the scenic corridor of the highway. A scenic corridor is the land generally adjacent to and visible from the highway. A scenic corridor is identified using a motorist's line of vision. A reasonable boundary is selected when the view extends to the distant horizon. The corridor protection program does not preclude development, but seeks to encourage quality development that does not degrade the scenic value of the corridor. Jurisdictional boundaries of the nominating agency are also considered. The agency must also adopt ordinances to preserve the scenic quality of the corridor or document such regulations that already exist in various portions of local codes. These ordinances make up the scenic corridor protection program.

According to the California Department of Transportation (Caltrans) list of designated scenic highways under the California Scenic Highway Program, there are no highway segments within the City or within 5 miles of the Project Site that have been identified as scenic.¹

Local

City of Inglewood General Plan

Land Use Element

The City of Inglewood adopted its General Plan Land Use Element in 1980. The City amended the Land Use Element in 1986, 2009, and 2016. The Land Use Element provides a framework upon which the development of public and privately owned land can be based and contains goals and policies with respect to the architectural character, design, and visual quality in the City. The

¹ California Department of Transportation (Caltrans), 2012. *California Scenic Highway Program*. Available: http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/index.htm. Accessed November 12, 2018.

following goals and policies from the City of Inglewood General Plan Land Use Element relate to aesthetic and visual resources and are applicable to the Proposed Project:

Commercial Goal

Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood's major streets.

Open Space Element

The following policy from the City of Inglewood General Plan Open Space Element relates to aesthetic and visual resources and is applicable to the Proposed Project:

Policy 1. The City of Inglewood and its redevelopment agency, in reviewing and approving development plans, shall require the provision of landscaped plazas and gardens when possible, and the provision of landscaping within building setbacks and parking lots.

The Commercial Goal of the General Plan Land Use Element addresses development along Inglewood's major streets, including West Century Boulevard, which comprises the northern boundary of the Project Site and South Prairie Avenue, which forms the western boundary of the Arena Site and eastern boundary of the West Parking Garage Site.

As discussed above under Environmental Setting, the majority of the Project Site is vacant, and many of the vacant parcels are mostly barren dirt enclosed in chain-link fencing. The existing visual character of the Project Site, including its frontages along West Century Boulevard and South Prairie Avenue, is diminished by these underutilized and largely vacant parcels, which have a low visual quality. None of the existing buildings on the Project Site possess distinctive architecture or design elements that offset or ameliorate the poor visual quality of the predominantly vacant site.

The Proposed Project would replace these existing underutilized parcels with new entertainment, retail and restaurant, community, and hotel buildings, parking structures, and associated signage, landscaping, street trees, pedestrian pathways, and edge treatments. The proposed development would be designed with the intent to improve the appearance and visual character of the Project Site, including its appearance as viewed from the major streets that pass the Project Site. In addition, new physical development that would occur as part of the Proposed Project within the proposed overlay zone would be required to comply with project-specific design guidelines that would reflect the requirements of the City's site plan review process to ensure that new development under the Proposed Project is visually compatible and complimentary to its site and surroundings through review of building orientation, architectural design, neighborhood compatibility, landscaping, site improvements, signage, and other applicable design considerations. Consequently, the Proposed Project would be consistent with the applicable goals and policies of the City of Inglewood General Plan.

Inglewood International Business Park Specific Plan

The Inglewood International Business Park (IIBP) Specific Plan, adopted in 1993, established development standards for land use, urban design, circulation, site access, public works, public services, noise, and air quality; infrastructure requirements; and the design character for the southern portion of the City. The IIBP Specific Plan boundaries are West 102nd Street on the north, Yukon Avenue on the east, West 104th Street on the south, and South Prairie Avenue on the west. The area is bisected by South Doty Avenue.

The stated goal of the IIBP Specific Plan is to enable private development to create an aesthetically pleasing business park which facilitates large-scale corporate users while benefitting the City and the residents who live in the surrounding neighborhood. The IIBP Specific Plan identifies a range of permitted and prohibited uses largely focused on light industrial and employment generating uses, along with general commercial uses in the vicinity of South Prairie Avenue. The IIBP Specific Plan includes a circulation network that closes South Doty Avenue through the Specific Plan area, and includes a number of cul-de-sacs that extend south from West 102nd Street. Finally, the Specific Plan provides for setbacks along street frontages ranging from 25 feet along South Prairie Avenue to 15 feet along West 102nd Street. Although the IIBP Specific Plan was approved over 25 years ago, there have been no projects implemented as a business park use pursuant to the IIBP Specific Plan.

The portion of the Arena Site south of West 102nd Street and the entire Well Relocation Site is located within the IIBP Specific Plan area. A number of elements of the Proposed Project would be inconsistent with the land uses and circulation diagrams, and design guidelines of the of the IIBP Specific Plan. The Proposed Project would include proposed revisions to the City of Inglewood General Plan and City of Inglewood Zoning Code, and would include an action to remove the portions of the Project Site located within the IIBP Specific Plan area. Thus if approved as proposed, the Proposed Project would not be inconsistent with the IIBP Specific Plan.

City of Inglewood Municipal Code

Chapter 12, Planning and Zoning, Article 18.1. Site Plan Review. The site plan review process established in Chapter 12, Article 18.1 of the City of Inglewood Municipal Code is applicable to most new development within the City. The site plan review procedure has been established to permit City review and consideration of on-site and off-site vehicular and pedestrian circulation, emergency accessibility, site layout and building orientation, architectural design and neighborhood compatibility, landscaping and related site improvements, parking accommodations, signs and other applicable design considerations, based on the individual needs and circumstances of each proposed development project, in addition to satisfying the intent and policies of each project site's respective zone.

Chapter 12, Planning and Zoning, Article 23. Sign Regulations. Lighting and signage is also regulated by the Inglewood Municipal Code, which provides minimum standards to safeguard life, health, property, and the public welfare by regulating and controlling the design, quality of

materials, construction, size, height, location, and maintenance of all signs, sign structures, and other exterior advertising devices. Article 17.3 of Chapter 12 establishes a process to review and implement signage for certain projects through a Master Sign Plan process to promote signage that uses clear graphics, coordinates with the architectural elements of the building(s) on or near which the signage is located, reflects a modern, vibrant image of Inglewood, and enhances overall site aesthetics by regulating the number, size and location of signs.

Proposed Project Amendments to Municipal Code

As discussed in Section 2.5.6, implementation of the Proposed Project would include text amendments to the City of Inglewood Municipal Code to create an overlay zone for the Project Site that would establish development standards including standards for height, setbacks and lot size, permitted uses, and signage regulations. The amendments would create a project-specific site plan and design review process to ensure compliance with those standards, as well as establish project-specific design guidelines. The design guidelines would address certain design elements and considerations, including building orientation, massing, scale, and materials, plaza treatments, landscaping and lighting design, parking and loading design, vehicular and pedestrian access and circulation, signage and graphics, walls, fences and screening, and similar elements.

As with the City's existing site plan review procedures, the Proposed Project site plan and design review process would include a review of on-site and off-site vehicular and pedestrian circulation, emergency accessibility, site layout and building orientation, architectural design and neighborhood compatibility, landscaping and related site improvements, parking accommodations, signs, and other applicable design considerations to ensure compliance with applicable standards. While additional refinements may be made to the design of the Proposed Project prior to construction, the design guidelines would not permit any modification or change that would create a new significant environmental effect not fully considered and analyzed in this EIR.

3.1.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to aesthetics. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. In addition, a threshold of significance has been added to address the potential for shade or shadow impacts.

A significant impact would occur if the Proposed Project would:

1. Have a substantial adverse effect on a scenic vista;
2. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
3. Substantially degrade the existing visual character or quality of public views of the site and its surroundings, or conflict with applicable zoning and other regulations governing scenic quality;

4. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area; or
5. Cast shadows on shadow-sensitive uses for more than three hours between the hours of 9:00 AM and 3:00 PM PST on either the summer or winter solstice.

Methodology and Assumptions

The evaluation of potential impacts related to visual resources is based on detailed information about the Proposed Project in Chapter 2, Project Description; visits to the Project Site between April 2018 and July 2019; photo-simulations included in Figure 3.1-2 through Figure 3.1-12; a lighting analysis report and photometric plans included as Appendix C; and a shade and shadow study included in Figure 3.1-14 through Figure 3.1-19. The photo-simulations, and shade and shadow study were prepared by the project architects and peer reviewed by ESA and the City during preparation of the EIR and are considered objective and accurate and appropriate for inclusion and reliance in this Draft EIR. The lighting analysis report was prepared by Lighting Design Alliance (LDA), under contract to the City's EIR consultant, ESA; the report was reviewed by ESA prior to inclusion in this Draft EIR. More detailed information on the methods of analysis for each visual resource topic is provided below.

Visual Character

To assess the visual character of the Project Site and project vicinity, ESA conducted visits to the Project Site and surrounding vicinity in April 2018. The changes to the existing conditions that would occur under the Adjusted Baseline were considered. The site plan was reviewed and photo-simulations for the Proposed Project were prepared to show, in as realistic a manner and context as possible, the physical elements of the Proposed Project from key viewpoints, which were reviewed and approved by the City (see **Figure 3.1-1**). Based on professional observation and evaluation of the photo-simulations, the physical characteristics of the Proposed Project were compared with the visual features of the existing Project Site and the built environment of the Project Site and vicinity under the Adjusted Baseline condition. The evaluation assessed the potential effects of the Proposed Project on the visual character of the Project Site and the vicinity, including the ways that the Proposed Project would change the views from surrounding streets and sidewalks under the Adjusted Baseline condition.

Light and Glare

The evaluation of impacts related to light and glare was based on a review of the Proposed Project by ESA and the analysis and findings of the lighting analysis report prepared by LDA and photometric plans prepared by AECOM included as Appendix C of this Draft EIR. The lighting analysis report evaluated the potential spillover impacts of light generated by the Proposed Project, including light produced by exterior and interior lighting for the Arena Structure, exterior plaza lighting, parking garage lighting, light-emitting diode (LED) street and security lighting, hotel lighting, and large-scale integrated electronic display signs that would be developed and operated with implementation of the Proposed Project.

SOURCE: TerraServer, 2018; ESA, 2019.

Inglewood Basketball and Entertainment Center

Figure 3.1-1
Viewpoint Location Map

LDA conducted a series of site visits in January 2019 for the purposes of gathering existing light levels in an around the Project Site and to collect comparative brightness data from other comparable buildings and existing signage. The first part of the survey involved obtaining foot-candle illumination levels in and around the Project Site to identify existing light levels. A foot-candle is a measure of the amount of light that falls on a given surface. The survey determined that the Project Site is currently illuminated by LED street poles, building-mounted floodlights, and illuminated signage that contribute to the existing light levels on the site. The second part of the survey involved identifying existing light sources and brightness contributors located around the Project Site. This involved taking luminance measurements of the light sources. Luminance is a photometric measurement of the luminous intensity of a surface. Luminance indicates how much luminous power will be detected by an eye looking at the surface from a particular viewing angle. This is an indicator of how bright the surface will appear and if it will be a contributor to glare. In order to measure diversity, brightness, and density, measurements were taken during the day, and again during the evening. All foot-candle and illuminance readings were taken using an illuminance/light meter.

To determine the increase in nighttime light levels on and in the vicinity of the Project Site that would result from the Proposed Project, the lighting analysis report compares existing light levels (measured in foot-candles) to newly contributed light (calculated in foot-candles) based on a series of photometric plans prepared by AECOM, the project architects. The photometric plans identified and modeled expected light that would be produced by the Proposed Project, including light from Proposed Project arena façade, interior lighting, exterior plaza lighting, parking garage lighting, hotel lighting, large-scale integrated electronic display signs, LED light poles, and other Proposed Project light sources. The lighting analysis report and photometric plans are included in Appendix C.

Because the City of Inglewood Municipal Code does not include quantified standards for nighttime illumination levels, the lighting analysis report (and this Draft EIR) utilizes nighttime illumination standards included in the City of Los Angeles Municipal Code for exterior lighting (Chapter 9, Article 3, section 93.0117) and for signage (Division 62, Section 91.6205 M) provided below.

City of Los Angeles Municipal Code, Chapter 9, Article 3, Section 93.0117. No exterior light source may cause more than 2 foot-candles of lighting intensity or generate direct glare onto exterior glazed windows or glass doors; elevated habitable porch, deck, or balcony; or any ground surface intended for uses such as recreation, barbecue or lawn areas or any other property containing a residential unit or units.

City of Los Angeles Municipal Code, Division 62, Section 91.6205 M. No sign shall be illuminated in such a manner as to produce a light intensity of greater than 3 foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property.

For the purposes of this EIR, based on the nighttime illumination standards included in the City of Los Angeles Municipal Code for exterior lighting and for illuminated signs, light impacts are

considered significant if an exterior light source from the Proposed Project would cause more than 2 foot-candles of lighting intensity or generate direct glare onto any residential property, or if a sign from the Proposed Project would be illuminated in such a manner as to produce a light intensity of greater than 3 foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property. This EIR does not consider increased operational nighttime illumination on non-residential uses, such as commercial or industrial uses, from the Proposed Project to be significant unless the increased illumination would create a safety hazard or otherwise interfere with the regular operation of the non-residential use.

Shade and Shadow

The evaluation of potential Proposed Project impacts related shade and shadow are based on the shade and shadow study prepared for the Proposed Project by AECOM and peer reviewed by ESA. For the purposes of this analysis, shade and shadow impacts would be considered significant if shadow-sensitive uses would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM Pacific Standard Time (PST) on either the summer or winter solstice. These two points in time represent extreme conditions for length of shadows and direction of shadows. Shadow-sensitive uses are considered to include residential uses or outdoor spaces associated with residential or recreational uses or existing solar panels. Commercial and industrial properties, parking uses, streets, sidewalks, and other such land uses are not considered to be sensitive for the purposes of the analysis of shade and shadow effects.

Issues Determined to be Less Than Significant

Upon review of the Proposed Project, the City of Inglewood determined that, due to the physical characteristics of the Project Site and the design of the Proposed Project, certain visual resources would not be affected by the Proposed Project and need not be further considered in the EIR.²

The discussions below provide brief statements of reasons for the City's determination that these issues do not warrant further consideration in the EIR.

The following significance criteria were found to address issues that would not be affected by the Proposed Project. With regard to significance criterion (1), as described under Environmental Setting, there are no scenic vistas on or near the Project Site. With regard to significance criterion (2), as presented in the Environmental Setting, the Project Site is not adjacent to or on any scenic highways or in proximity to scenic resources. The following discussion further addresses these criteria.

² Public Resources Code section 21003(e) states that “[t]o provide more meaningful public disclosure, reduce the time and cost required to prepare an environmental impact report, and focus on potentially significant effects on the environment of a proposed project, lead agencies shall, in accordance with Section 21100, focus the discussion in the environmental impact report on those potential effects on the environment of a proposed project which the lead agency has determined are or may be significant. Lead agencies may limit discussion on other effects to a brief explanation as to why those effects are not potentially significant.”

The Proposed Project would not have a substantial adverse effect on a scenic vista.

The City of Inglewood does not designate scenic vistas within its General Plan. The nearby County of Los Angeles recognizes the coastline, mountain vistas, hillsides, scenic viewsheds, and ridgelines as significant scenic resources.³ The nearby City of Los Angeles identifies scenic vistas as panoramic public view access to natural features, including views of the ocean, striking or unusual terrain, or unique urban or historic features.⁴ The Project Site is located in an entirely urban area. There are no scenic vistas that provide views of the coastline, mountain vistas, hillsides, scenic viewsheds, ridgelines, striking or unusual terrain. There are no unique urban or historic features on or near the Project Site. Because such scenic resources are not present and, thus, would not be affected by the Proposed Project, a substantial adverse effect on a scenic vista would not occur. Thus, there would be **no impact** of the Proposed Project related to this significance criterion.

The Proposed Project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

The Project Site is not within an officially designated State or county scenic highway as designated by the California Department of Transportation (Caltrans) and/or the County of Los Angeles.⁵ Additionally, the Project Site is not located within the closest scenic highway or scenic corridor, State Route (SR) 27, which was recently designated as a scenic highway (but is not yet mapped).⁶ The Project Site is not located within any designated scenic highway as listed in the Inventory of Designated Scenic Highways by the City of Los Angeles.⁷ The nearest designated scenic highway is the City of Los Angeles-designated Crenshaw Boulevard corridor from the 10 Freeway to Slauson Avenue, approximately 3.1 miles northeast of the Project Site. The Forum, a multi-purpose indoor arena built in 1967 and listed on the National Register of Historic Places and the California Register of Historical Resources, is visible to the north of the Project Site. However, The Forum is approximately 1-mile north of the Project Site, with intervening structures in between, including buildings and structures within the HPSP area under the Adjusted Baseline. Therefore, the Proposed Project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway. Consequently, the Proposed Project would have **no impact** related to this significance criterion.

Impacts and Mitigation Measures

Impact 3.1-1: Construction and operation of the Proposed Project could substantially degrade the existing visual character or quality of public views of the site and its surroundings, or could conflict with the City's zoning and regulations governing scenic quality. (Less than Significant)

Changes in the visual character or quality of a site are often perceived as subjective and individual. In an effort to provide a depiction of the visual changes to the Project Site and surrounding vicinity that would occur with implementation of the Proposed Project, Figure 3.1-2 through Figure 3.1-12, as described further below, provide a variety of public views of and across the Project Site under Adjusted Baseline conditions and with photo-simulations of the Proposed Project. As noted above, the photo-simulations for the Proposed Project were prepared to show, in as realistic a manner and context as possible, the physical massing of the primary elements of the Proposed Project from key viewpoints.

Viewpoint 1

Viewpoint 1 shows the Proposed Project from West Century Boulevard looking east near South Flower Street, west of the West Parking Garage Site (see **Figure 3.1-2**). The north and west facades of the six-story parking structure and the entrance to the new access road on the West Parking Garage Site would be the most prominent visual component of the Proposed Project from this vantage point. As shown, the façade of the parking structure would be broken into multiple horizontal segments that would help to break up the overall massing and scale of the building. In addition, though not depicted on the photo-simulation, corner stair elements would create visual interest and provide pedestrian-scale detail. While not depicted in detail on Figure 3.1-2, but shown on the preliminary landscaping plan for the Proposed Project depicted in Figure 2-18 in Chapter 2, Project Description, edge treatments, landscaped setbacks, and new street trees would be incorporated along the frontage of the parking structure and the new site access road, activating the visual and pedestrian environment along West Century Boulevard.

Viewpoint 1 also shows images of buildings within the southern portion of HPSP area immediately north of West Century Boulevard.

The West Parking Garage Site is vacant land surrounded by perimeter fencing and as such, has poor visual quality. Although taller than adjacent land uses, development of the proposed parking structure would be similar in form and design to other nearby existing parking structures such as the parking structure associated with the Hollywood Park Casino and would not be out of character with other nearby industrial, commercial, and entertainment uses.

Viewpoint 2

Viewpoint 2 shows the Proposed Project from the intersection of South Prairie Avenue and West Century Boulevard looking south (see **Figure 3.1-3**). As shown, the east façade of the proposed six-story parking structure on the West Parking Garage Site, the west façade of the proposed retail and community uses on the west side of the plaza, and the west side of the proposed Arena Structure would be visible. Also visible would be the proposed pedestrian bridge over South Prairie Avenue directly connecting the retail and community uses on the west side of the plaza to the parking structure.

As shown, the retail and community buildings along the east side of South Prairie Avenue would feature expansive multi-paned transparent storefront windows along the street frontage that would facilitate visual transparency into the retail and community uses. The multi-paned windows would slope from south to north, increasing in height closer to the corner of West Century Boulevard and South Prairie Avenue, thereby increasing visual interest as pedestrians and motorists approach the plaza.

The highly distinctive Arena Structure would be visible to the south of the retail and community uses. The Arena Structure, with a maximum height of 150 feet, would be an ellipsoid-shaped, multi-faceted structure with a grid-like façade and roof that would be highly visible, distinctive, and instantly recognizable due to a design unique in the City and the region, especially at night when it would be accentuated by distinctive lighting and signage.

Spanning South Prairie Avenue would be a pedestrian bridge linking the commercial/community buildings, plaza area, and Arena Structure with the parking structure within the West Parking Garage Site. The pedestrian bridge, which would be visible from views looking north and south on South Prairie Avenue, would be similar in design and materials to the adjacent structures and would serve to visually link the two buildings.

The West Parking Garage Site is vacant land surrounded by perimeter fencing and has limited landscaping and minimal pedestrian amenities. The Arena Site is largely vacant land surrounded by fencing, but does include a few structures. The limited development on the Arena Site visible from this viewpoint includes Church's Chicken Restaurant, Rodeway Inn & Suites, and Let's Have a Cart Party. As described earlier, these one and two-story commercial uses do not contain distinctive architecture or design elements and are fronted by surface parking and minimal landscaping. The Arena Structure, parking garage, and the proposed retail and community uses on the Arena Site would be greater in mass and scale than the existing built environment on the site, and implementation of the Proposed Project would introduce visually distinctive buildings within this view. As shown in the preliminary landscaping plan for the Proposed Project, depicted in Figure 2-18 in Chapter 2, Project Description, the Proposed Project would further enhance the streetscape and pedestrian environment with landscaping, setbacks, street trees, and edge and paving treatments that would be incorporated along the frontage of both sides of South Prairie Avenue. These improvements would provide visual interest to the pedestrian environment.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-3
Viewpoint 2: View of Proposed Project Site from the Intersection of South Prairie Avenue and West Century Boulevard Looking South

Viewpoint 3

Viewpoint 3 shows the Proposed Project near the intersection of South Prairie Avenue and West Century Boulevard looking southeast into the plaza and Arena Structure (see **Figure 3.1-4**). Though not depicted in detail on Figure 3.1-4, but shown in the preliminary landscaping plan for the Proposed Project, depicted in Figure 2-18 in Chapter 2, Project Description, the plaza would include landscaping, paving treatments, activity areas, stage, video screens, and lighting elements which would all be visually prominent from this viewpoint. Unique visual focal points, potentially consisting of sports-themed public art pieces and/or water features, would be visible within the plaza, and would add visual interest to the plaza area depicted in this view.

Also visible are commercial and community buildings within the plaza. As shown, the commercial uses would feature large storefront display windows that would visually enhance the plaza and surrounding street edges along South Prairie Avenue and West Century Boulevard.

A stage and activity areas would be located on the eastern edge of the plaza adjacent to the commercial uses. The stage would be equipped with video screens, and large-scale signage, including illuminated and animated signage and/or digital signage. South of the plaza would be the main entrance into the Arena Structure framed by large banner type digital signage and a distinct entryway. The façade of the Arena Structure would appear as an ellipsoid, curved open grid with panels that are open, glassed, or filled with other opaque materials.

The Arena Site is primarily vacant land surrounded by perimeter fencing, with a limited number of current commercial structures. The limited existing development on the Arena Site visible from this viewpoint includes Church's Chicken Restaurant and Rodeway Inn & Suites. As described earlier, the Church's Chicken Restaurant and Rodeway Inn & Suites are one-and two-story commercial uses are surrounded by surface parking, contain minimal landscaping, and do not contain unique architecture or design elements. While the Arena Structure and commercial/community buildings within the plaza would be greater in mass and scale than existing uses, implementation of the Proposed Project would introduce visually prominent new buildings to the currently visually vacant and underutilized Project Site. The plaza would be a new visually distinctive pedestrian-oriented open space area that would serve as a new visually interesting element along the highly developed South Prairie and West Century Boulevard corridors. Furthermore, the Proposed Project would enhance the streetscape and pedestrian environment in the area through new landscaping, setbacks, sidewalk treatments.

Viewpoint 4

Viewpoint 4 depicts the Proposed Project facing west on West Century Boulevard near the intersection with South Doty Avenue (see **Figure 3.1-5**). Due to distance and intervening development, the Arena Structure and Arena Site are not visually prominent in the foreground of this view. Buildings within the southern portion of HPSP area would be visible immediately north of West Century Boulevard. Within the distance, only limited features of the plaza, Proposed Project sign tower and the six-story West Parking Garage would be visible.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-5
Viewpoint 4: View of Proposed Project Site Facing West on
West Century Boulevard near the Intersection with South Doty Avenue

The West Parking Garage Site is currently vacant. The Arena Site is largely vacant, with the exception of Church's Chicken Restaurant, Rodeway Inn & Suites, the Let's Have a Cart Party building, and two warehouse and light manufacturing buildings. Therefore, due to its low profile, the Project Site is not highly visible from this viewpoint.

The Proposed Project would introduce new structures that would be taller in scale and massing than the existing built environment. However, from this viewpoint, the new structures would tend to blend and be visually compatible with the scale and style of adjacent commercial and industrial development that define the urban streetscape along West Century Boulevard. Furthermore, although not depicted in detail on Figure 3.1-5, but shown in the preliminary landscaping plan for the Proposed Project, depicted in Figure 2-18 in Chapter 2, Project Description, the streetscape and pedestrian environment along the street edges near the Project Site would be enhanced with new landscaping, setbacks, and sidewalk treatments.

Viewpoint 5

Viewpoint 5 depicts the Proposed Project facing southwest from the intersection of West Century Boulevard and South Doty Avenue (see **Figure 3.1-6**). Due to distance and intervening commercial and industrial development, only a portion of the roof of the Arena Structure is visible above the S.E.S. International Express building. Further to the west, the northern-most retail and community structures in the plaza, the proposed sign tower, and the West Parking Garage Site are visible near the intersection of West Century Boulevard and South Prairie Avenue. Thus, from Viewpoint 5, the Proposed Project buildings would not be out of scale or visually incompatible in comparison to other built development.

Viewpoint 6

Viewpoint 6 depicts the Proposed Project facing west from West 102nd Street near the proposed East Transportation and Hotel Site (see **Figure 3.1-7**). The eastern façade of the Arena Structure would be visible from this viewpoint and the south edge of surface parking lot on the East Transportation and Hotel Site is visible.

Currently, the view to the west on West 102nd Street is not visually cohesive, does not contain ample landscaping or pedestrian amenities, and includes vacant land and industrial uses on the north and residential and commercial uses on the south. With the Arena Structure constructed within the former street right-of-way, the continual streetscape view of West 102nd Street would be interrupted and substantially changed.

The Proposed Project would introduce a new ellipsoid, highly distinctive Arena Structure with a grid-like façade and roof, and the roof and appurtenances would rise no higher than 150 feet and would occupy an area that currently includes an existing city street. While taller at its peak height than surrounding development, the Arena Structure would have a multi-faceted façade and would be highly articulated from the ground level to the peak of the roof. As such, the design, shape, and scale of the Arena Structure would be visually distinctive and would create a new visual element along this street.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-7
Viewpoint 6: View of Proposed Project Site Facing West from
West 102nd Street near South Doty Avenue

Within this view, surface parking, a TNC staging area and ramp structure would be developed on the southern part of the East Transportation and Hotel Site. The introduction of the paved TNC staging area would be visually compatible along this corridor, which on the northern portion of the street is currently characterized by surface parking and loading areas associated with industrial uses, as well as vacant parcels. Although not depicted in detail on Figure 3.1-7, but shown in the preliminary landscaping plan for the Proposed Project, depicted in Figure 2-18 in Chapter 2, Project Description, the frontage of the surface parking uses associated with the East Transportation and Hotel Site would include new trees and landscaping along West 102nd Street. These new visual elements would tend to result in a more consistent visual environment along West 102nd Street.

Viewpoint 7

Viewpoint 7 depicts the Proposed Project facing west from West 102nd Street near South Doty Avenue (see **Figure 3.1-8**). This view represents the greatest visual exposure of the Proposed Project from the neighborhood to the south and east of the proposed Arena Structure. As shown, the eastern façade of the Arena Structure would be visible from this viewpoint. The Proposed Project would introduce a new ellipsoid, highly distinctive Arena Structure with a grid-like façade and roof, which would rise no higher than 150 feet above grade. The Arena Structure would be taller at its peak height than surrounding development, and the design, shape, and scale of the Arena Structure would be visually distinctive and would create a new identifiable visual element along this street. While the Arena Structure and associated street vacation would interrupt the continual streetscape view of West 102nd Street, as described earlier, this roadway is not a scenic corridor and does not contain ample landscaping or pedestrian amenities.

Viewpoint 8

Viewpoint 8 depicts the Proposed Project in the view looking north on South Prairie Avenue near West 103rd Street (see **Figure 3.1-9**). From this viewpoint, the eastern façade of the 6-story West Parking Garage, the western façade of the Arena Structure, and the western façade of the plaza retail and community uses would be visible. Also visible in this view would be the proposed sign tower and the proposed South Prairie Avenue pedestrian bridge connecting the proposed retail and community uses on the west side of the plaza to the proposed West Parking Garage.

The proposed Arena Structure would appear as a highly distinctive building with an ellipsoid shape and grid-like exterior façade and roof, that would feature (though not detailed on the photo-simulation in Figure 3.1-9) colorful signage and lighting. As shown, the retail and community buildings along the east side of South Prairie Avenue would feature expansive multi-paned transparent storefronts windows along the street frontage that would facilitate visual transparency into the retail and community uses.

Baseline View

Proposed View

5.17.13.01.00 - 1.4.2019.01.01 - 1.4.2019.01.01 - 1.4.2019.01.01 - 1.4.2019.01.01

Figure 3.1-8
Viewpoint 7: View of Proposed Project Site Facing West from
West 102nd Street near South Doty Avenue

Baseline View

Proposed View

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-9
Viewpoint 8: View Looking North on South Prairie Avenue near West 103rd Street

The West Parking Garage Site is vacant land surrounded by perimeter fencing. Although taller than nearby land uses, the West Parking Garage would blend with the existing streetscape and would be of comparable height and mass as taller buildings to the north and west, including Inglewood City Hall and Centinela Hospital. As shown on Figure 3.1-9, the proposed parking structure would not be out of character with other nearby industrial and commercial uses.

Spanning South Prairie Avenue, a pedestrian bridge would link the retail and community buildings and Arena Structure to the parking structure on the West Parking Garage Site. The pedestrian bridge would be similar in design and materials to the adjacent structures and would visually link the buildings. From the perspective provided in Viewpoint 8, the pedestrian bridge, combined with the retail and community buildings constructed in the plaza, would obstruct long range views north on South Prairie Avenue, including long range views of The Forum and the Hollywood Hills beyond. However, as pedestrians or motorists travel north past the Proposed Project structures from West Century Boulevard to the north, buildings and structures included in the HPSP Adjusted Baseline projects will have previously obstructed long-range views of The Forum and the Hollywood Hills from the Project Site.

The limited development on the Arena Site visible from this viewpoint includes the one-story Let's Have a Cart Party catering building. As described earlier, this building does not contain distinctive architecture or design elements, is surrounded by surface parking, and has minimal landscaping. While the proposed Arena Structure, parking garage, and retail and community uses on the Arena Site would be greater in mass and scale than existing conditions, implementation of the Proposed Project would introduce visually distinctive buildings within this view. Though not presented in detail on Figure 3.1-9, but shown in the preliminary landscaping plan for the Proposed Project, depicted in Figure 2-18 in Chapter 2, Project Description, the Proposed Project would further enhance the streetscape and pedestrian environment with landscaping, setbacks, street trees edge and paving treatments incorporated along the frontage of both sides South Prairie Avenue, providing visual interest to the pedestrian environment.

Viewpoint 9

Viewpoint 9 depicts the Proposed Project looking east on West 102nd Street near the West Parking Garage Site (see **Figure 3.1-10**). From this location, the south facade of the proposed 6-story West Parking Garage and the west facade of the Arena Structure facing South Prairie Avenue would be visible.

Under existing conditions, the West Parking Garage Site is currently vacant land surrounded by perimeter fencing. Although taller than nearby land uses, development of the parking structure would be similar in form and design to other nearby development including some of the larger structures north and west of the Project Site (e.g., Centinela Hospital and Inglewood City Hall) and would not be out of character with other nearby industrial and commercial uses.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-10
Viewpoint 9: View of Proposed Project Site Looking West on
West 102nd Street near the Proposed West Parking Garage Site

From this viewpoint, the Arena Structure would create a visually prominent terminus to West 102nd Street, altering the existing view which includes the eastern continuation of West 102nd Street. Combined with the view of the proposed parking structure, the view from the residences on West 102nd Street would be of an urban entertainment district of higher density than the immediately surrounding neighborhoods.

Viewpoint 10

Viewpoint 10 depicts the Proposed Project site looking east on West Century Boulevard towards the East Transportation and Hotel Site (see **Figure 3.1-11**). From this location, the north facade of the East Transportation and Hotel Site facing West Century Boulevard would be visible.

Under existing conditions, the East Transportation and Hotel Site consists of vacant parcels surrounded by vertical metal fencing and intermittent green screening. Visible through the fencing are barren areas with some patches of non-native grasses, ornamental plants, and trees.

Although taller than adjacent land uses, the East Transportation and Hotel Site would not be out of character with, other nearby industrial, commercial, and entertainment uses, including the Hollywood Park Casino and associated three-story parking structure on the north side of West Century Boulevard, directly north of the East Transportation and Hotel Site.

Viewpoint 11

Viewpoint 11 depicts the Proposed Project site looking west on West Century Boulevard towards the East Transportation and Hotel Site (see **Figure 3.1-12**). From this location, the north facade of the East Transportation and Hotel Site facing West Century Boulevard would be visible.

As described above under the description of Viewpoint 10, under existing conditions, the East Transportation and Hotel Site consists of vacant parcels surrounded by vertical metal fencing and intermittent green screening. Barren areas with some patches of non-native grasses, ornamental plants, and trees are visible through the fencing.

Also as described above under the description of Viewpoint 10, although taller than adjacent land uses, the East Transportation and Hotel Site would not be out of character with other nearby industrial, commercial, and entertainment uses, including the Hollywood Park Casino and associated three-story parking structure on the north side of West Century Boulevard, directly north of the East Transportation and Hotel Site.

toward the East Transportation and Hotel Site

Summary of Project Elements and Views

Arena Site

The Arena Structure, with a maximum height of 150 feet, would be an ellipsoid-shaped, multi-faceted structure with a grid-like façade and roof that would be highly visible, distinctive, and instantly recognizable due to a design unique in the City, especially at night when it would be accentuated by distinctive lighting and signage. The Arena Structure would be visible to varying degrees from public streets along West Century Boulevard, South Prairie Avenue, South Doty Avenue, and West 102nd Street. Other elements within the Arena Site, such as the three-story South Parking Garage, located immediately south of the Arena Structure, would be primarily visible from South Prairie Avenue, West 102nd Street and portions of West 104th Street.

The outdoor plaza would include landscaping and seating areas, public art, and an outdoor stage. Landscaping would include native drought resistant plants, with a palette that is coordinated to create continuity across the Project Site. The outdoor plaza would be comprised of hardscape and landscaped planters. Hardscape areas would feature use of a variety of paving materials and colors. Public art pieces would help to define the experience of the outdoor plaza area. The outdoor plaza and stage would be equipped with LED video boards directed to the interior of the plaza, speakers, lighting signage, including internally-illuminated static signage, and digital signage including static LED displays and LED video boards.

A marquee sign tower with a maximum height of 100 feet would be constructed at the southeast corner of West Century Boulevard and South Prairie Avenue, at the northwest corner of the plaza. Rooftop signage would be present on top of the Arena Structure.

Since it is at ground level, views of the plaza would be limited, with views of the plaza primarily available traveling from West Century Boulevard and South Prairie Avenue.

West Parking Garage Site

The West Parking Garage Site would include a new six-story concrete parking structure located along West Century Boulevard west of South Prairie Avenue. The perimeter of the parking structure would include landscaping, pedestrian pathways, edge treatments and new street trees to promote the visual compatibility of the new parking facilities and facilitate safe pedestrian access.

Views of the six-story parking structure would be most visible from West Century Boulevard, South Prairie Avenue, West 102nd Street and non-vacated portions of West 101st Street. Taller stories would be visible from residential streets such as West 104th Street, above intervening existing structures.

East Transportation and Hotel Site

The Proposed Project would include construction of a three-story parking garage on the northern portion of the East Transportation and Hotel Site, along West Century Boulevard. The ground level of the parking garage would connect to a surface parking lot/TNC staging area on the southern portion of the site. The perimeter of the parking garage and surface parking lot would

include landscaping, pedestrian pathways, edge treatments and new street trees to promote the visual compatibility of the new parking facilities and facilitate safe pedestrian access.

The proposed hotel would be approximately six stories, with a height of approximately 100 feet, consistent with the maximum allowable height in the MI-L zone and maximum allowable under FAA rules. The hotel building is anticipated to be constructed of varied materials, including but not limited to stucco, concrete, plaster, wood, masonry, glass, metal, tile, and/or stone. Outdoor gathering spaces for hotel guests may be provided through ground-level courtyards and/or upper level terraces. Landscaping and security lighting would be provided around the hotel and parking area. Building signage and directional signage may be provided on the site.

The proposed hotel would be of a potentially greater height (approximately 100 feet) than surrounding two to three-story development. Consequently, it would be visible from a greater distance along West Century Boulevard and West 102nd Street and would also be visible from portions of South Yukon Avenue, South Doty Avenue, with upper stories partially visible from West 104th Street above existing development.

Well Relocation Site

The Well Relocation Site is located at 3812 West 102nd Street, west of South Doty Avenue. The site is currently vacant, and characterized by barren weedy soil. It is surrounded by metal chain link fencing on the northern and eastern edges, a wrought iron fence along the southern boundary, and a building, half-block wall, and wrought iron fencing along the western boundary.

As part of the Proposed Project, the City-owned and operated Inglewood Water Well #6 would be removed. A new City-owned and City-operated well, Water Well #8, would be constructed to replace the existing water well. The new City-owned and operated Water Well #8 would be located on the southern third of the two-parcel Well Relocation Site, south of West 102nd Street and west of South Doty Avenue.

The well would include water pumps and associated infrastructure that would be visible above ground, similar to the existing Water Well #6. No buildings or lighting are proposed. The ground surface would be covered with gravel or crushed stone, with a 15-foot-wide paved driveway adjacent to the western side of the proposed well location for vehicle access. A 6-foot-tall concrete masonry unit security fence with automated sliding access gate would enclose the well site, with additional security provided via security cameras connected to the City of Inglewood via the pump station telemetry system.

Analysis

As a result of the Proposed Project, the visual character of the Project Site would undergo a transformation, as vacant parcels and single-story, smaller-scale development would be redeveloped into a large sports and mixed-use entertainment center with visually distinctive buildings and pedestrian open spaces. The addition of the Arena Structure, sign tower, plaza and retail, restaurant, community, and commercial buildings, parking structures, surface parking and

hotel uses would change the visual nature of the Project Site, as the site would become higher density in scale. The design, shape, and scale of the Arena Structure would create a new distinctive visual element observable from roadways and viewing areas surrounding the Project Site. The incorporation of edge treatments, landscaping, and new street trees would augment the visual environment along the street corridors, making the visual environment more interesting to pedestrians and motorists. The Arena Structure would be highly visible, distinctive, and instantly recognizable due to a design unique in the City, especially at night when it would be accentuated by distinctive lighting and signage.

The Proposed Project would result in a material change in the visual character of the Project Site, and would be prominent in views along West Century Boulevard, South Prairie Avenue, and West 102nd Street. Under Adjusted Baseline conditions, these changes would occur within a fully urbanized part of Inglewood and would be consistent with the visual character of the developed project vicinity. The Proposed Project buildings, public spaces, and landscaping would replace fenced, vacant parcels, and a number of small-scale commercial structures with visually distinctive, higher-scale structures that would add interest to views in the vicinity that will have undergone change as a result of HPSP Adjusted Baseline projects, including the highly prominent NFL Stadium.

As described above, the Proposed Project would be subject to a design and site plan review process to ensure that site layout, building orientation, architectural design, neighborhood compatibility, landscaping, signs, and other applicable design considerations are consistent with City requirements established for and/or applicable to the Proposed Project.

By replacing vacant lots and aged and older structures, the Proposed Project would be consistent with the City of Inglewood General Plan Land Use Element Commercial Goal that the visual appearance and economic condition of the existing arterial commercial development along Inglewood's major streets be improved. Further, as depicted on Figure 2-18 in Chapter 2, Project Description, the Proposed Project would include a major publicly-accessible landscaped plaza, as well as extensive perimeter and interior landscaping, consistent with the City of Inglewood General Plan Open Space Element Policy 1.

For the reasons presented above, the Proposed Project would not substantially degrade the existing visual character or quality of the site and its surroundings or conflict with the City's zoning and regulations governing scenic quality. This impact is considered **less than significant**.

Mitigation Measures

None required.

Impact 3.1-2: Construction and operation of the Proposed Project could create a new source of substantial light or glare which could adversely affect day or nighttime views in the area. (Less than Significant with Mitigation)

Construction

Over the course of the construction of the Proposed Project, the length of workdays would vary in range from 8 hours to continuous 24 hours, with the level of activity fluctuating throughout any given day. Consequently, nighttime construction lighting would be required.

Under existing conditions, the area surrounding the Project Site has a relatively high level of ambient lighting, particularly along West Century Boulevard, South Prairie Avenue and Yukon Avenue, as those streets are well-lit, active transportation corridors. Nighttime construction activities would add to the existing ambient light levels on and in the area surrounding the Project Site.

The daily duration of construction lighting would vary based on the season, with the longest duration of construction lighting occurring during winter months, when there are fewer hours of daylight, and the shortest duration of construction lighting during the summer months, when there are the most hours of daylight.

Nighttime lighting sources during construction would consist mainly of floodlights that would be focused on the work area. Security lighting could also be used on construction sites but would tend to be focused on the Project Site. Because this lighting is intended to light the Project Site to allow for nighttime construction and to provide security to the site, it would tend to be directed away from nearby adjacent properties, reducing the potential for spillover lighting effects. Nonetheless, to varying degrees, project construction-related lighting could be directly visible to nearby sensitive receptors residing in nearby residences and to drivers of vehicles on roadways in the vicinity of the Project Site.

Construction Lighting at Project Site Locations

During the building construction phase of the Arena Structure, a majority of the construction days would be 10-, 12-, and 16-hour workdays, though some activities could also require 24-hour workdays (e.g., well drilling, foundation concrete pours, or delivery of large project materials that would disrupt daytime traffic conditions). Consequently, it is anticipated that the greatest volume and duration of light production during the construction phase of the Proposed Project would occur during construction of the Arena Structure. Construction lighting for the Arena Structure would be most directly visible to nearby sensitive receptors residing in nearby residences to the west and south of the Arena Site and to drivers of vehicles on roadways in the vicinity, including West Century Boulevard, South Prairie Avenue, West 102nd Street, and South Doty Avenue.

During the construction of the West Parking Garage, construction periods would be anticipated to be 10- to 12-hour workdays; it is not anticipated that 24-hour overnight work would take place on the West Parking Garage Site. Construction lighting for the West Parking Garage would be directly visible to nearby sensitive receptors residing in adjacent residences to the north, west, and

south of the West Parking Garage site and to drivers of vehicles on roadways in the vicinity of the West Parking Garage site, including West Century Boulevard, West 102nd Street, West 101st Street, and South Prairie Avenue.

During the construction at the East Transportation and Hotel Site, construction days would be anticipated to be 8- to 10-hour workdays; it is not anticipated that 24-hour overnight work would take place on the East Transportation and Hotel Site. Construction lighting at the East Transportation and Hotel Site would be directly visible to residences to the south of the East Transportation and Hotel Site, across West 102nd Street, and to drivers of vehicles in the vicinity of the East Transportation and Hotel Site, including West Century Boulevard and West 102nd Street.

During the construction phase at the Well Relocation Site, construction days would be anticipated to be 8- to 10-hour workdays, but could also include 24-hour overnight construction activities during the 21-day period in which the well drilling would take place. Construction lighting for the Well Relocation Site would be directly visible at residences to the south and east of the Well Relocation Site, and to drivers of vehicles in the vicinity of the Well Relocation Site, including West 102nd Street.

Permanent sound barriers and temporary construction barriers that would be built in the initial phase of project construction, and, as construction progresses, newly constructed intervening structures, would incrementally block light and obscure views of construction sites from nearby residences and local streets. However, high-brightness construction lights could be directly visible from residential uses, especially those of two or more stories, or other affected light-sensitive uses. Such spillover light could result in substantial changes to existing artificial light conditions or interfere with off-site activities. Therefore, impacts related to construction lighting would be **potentially significant**.

Operation

As described in Chapter 2, Project Description, the Proposed Project would include extensive and varied lighting and signage. The type of lighting and its intensity on the Project Site would vary, depending on how the Proposed Project arena is being used at any given time. It is anticipated that the most intense lighting on the Project Site would be within the Arena Site which would be brightly lit during major spectator events such as basketball games and concerts, and for similar events or activities. In addition to plaza lighting provided for security and to increase visibility for visitors, the interior of the Arena Site would be lit with directed theatrical lighting in the Arena Structure around the stage during events, as well as light from LED video boards, other digital displays, and illuminated signage. Interior lighting within the Arena Structure itself may be seen through transparent facets (glass or perforated materials) on the Arena Structure façade.

The vertical surfaces of the Arena Structure and its adjacent commercial, office, and community facility buildings would be illuminated in a manner that highlights its architecture and creates distinct street edges along West Century Boulevard and South Prairie Avenue. The parking areas,

the pedestrian bridge, and the hotel would be illuminated to highlight circulation paths and landscape features, and to enhance pedestrian safety. Additional way-finding lighting would be provided to help orient people around the Project Site.

Perimeter and architectural lighting, as well as illuminated signage, would be limited in areas adjacent to existing residential uses, and in some areas would be blocked or screened from direct view by sound or security walls, including a proposed 15-foot-high permanent sound wall that would be constructed along the southern boundary of the Arena Site, permanent 12-foot-high sound walls that would be constructed along the shared boundaries of the Arena Site and the residences located at 10204 South Prairie Avenue and 10226 South Prairie Avenue, a proposed 12-foot-high sound wall along the shared boundary of the Arena Site and the Airport Park View Hotel, and an 8-foot-high permanent sound wall proposed at the southeast corner of the Arena Site and West 102nd Street. All lighting would be directed into the interior of the Project Site, and away from offsite areas.

Several new street lights would be installed adjacent to public roadways surrounding the Project Site, including along West Century Boulevard, South Prairie Avenue, and West 102nd Street. Street lights would be installed at regular intervals along street rights-of way, with heights and lighting intensities in compliance with City standards.

The Proposed Project would include a variety of signs of different types and sizes placed throughout the Project Site. The general type and potential location of signs anticipated to be included in the Proposed Project are illustrated in Figure 2-20 in Chapter 2, Project Description. Project signage would be provided to promote the LA Clippers and the proposed Arena, building activities and events, building and team sponsors, civic activities and events, dining and retail establishments within the Project Site, and other products and services. The Proposed Project would also include hotel, retail, and restaurant building identification signage; public parking entry and loading dock entry identification signs; pedestrian and vehicle wayfinding signage; and other informational signage. Such signs may be digital displays using LED or LED video boards, internally illuminated static wall signs or channel letter signs, externally illuminated supergraphic signs or banners, projections onto glass or solid surfaces, monument signs, kiosks, and pylon signs. The digital display signage may use LED technology to convey changing messages, pictures, and full motion graphics or videos, or could use other similar display technology that may emerge in the future.

As shown in Figure 2-20, signs may be mounted on the exterior of the Arena Structure or integrated into façade of the structure itself, as well as mounted on the buildings surrounding the plaza, the three parking structures, pedestrian circulation areas, and the hotel. Signage may be oriented to the major thoroughfares of West Century Boulevard and South Prairie Avenue, or to the visitors within the plaza and other pedestrian and vehicle circulation areas within the Project Site. Within the Arena Site, large, high-resolution LED video boards are proposed on the Arena Structure and at the rear of the plaza stage, oriented to pedestrian visitors in the plaza. Other signage throughout the Project Site could include free-standing signage and interactive liquid

crystal display (LCD) kiosks within the plaza and pedestrian circulation areas, including the parking structures and pedestrian bridge. An up to 100-foot-tall illuminated marquee sign tower with a digital display would be stand at the northwest corner of the plaza and an internally-illuminated rooftop sign would be located on top of the Arena Structure.

As discussed above, light impacts are considered significant if an exterior light source from the Proposed Project would cause more than 2 foot-candles of lighting intensity or generate direct glare onto any residential property, or if a sign from the Proposed Project would be illuminated in such a manner as to produce a light intensity of greater than 3 foot-candles above ambient lighting, as measured at the property line of the nearest residentially zoned property. Based on the threshold of significance, the City does not consider increased operational nighttime illumination on non-residential uses, such as commercial or industrial uses, from the Proposed Project to be significant unless the increased illumination would create a safety hazard or otherwise interfere with the regular operation of the non-residential use.

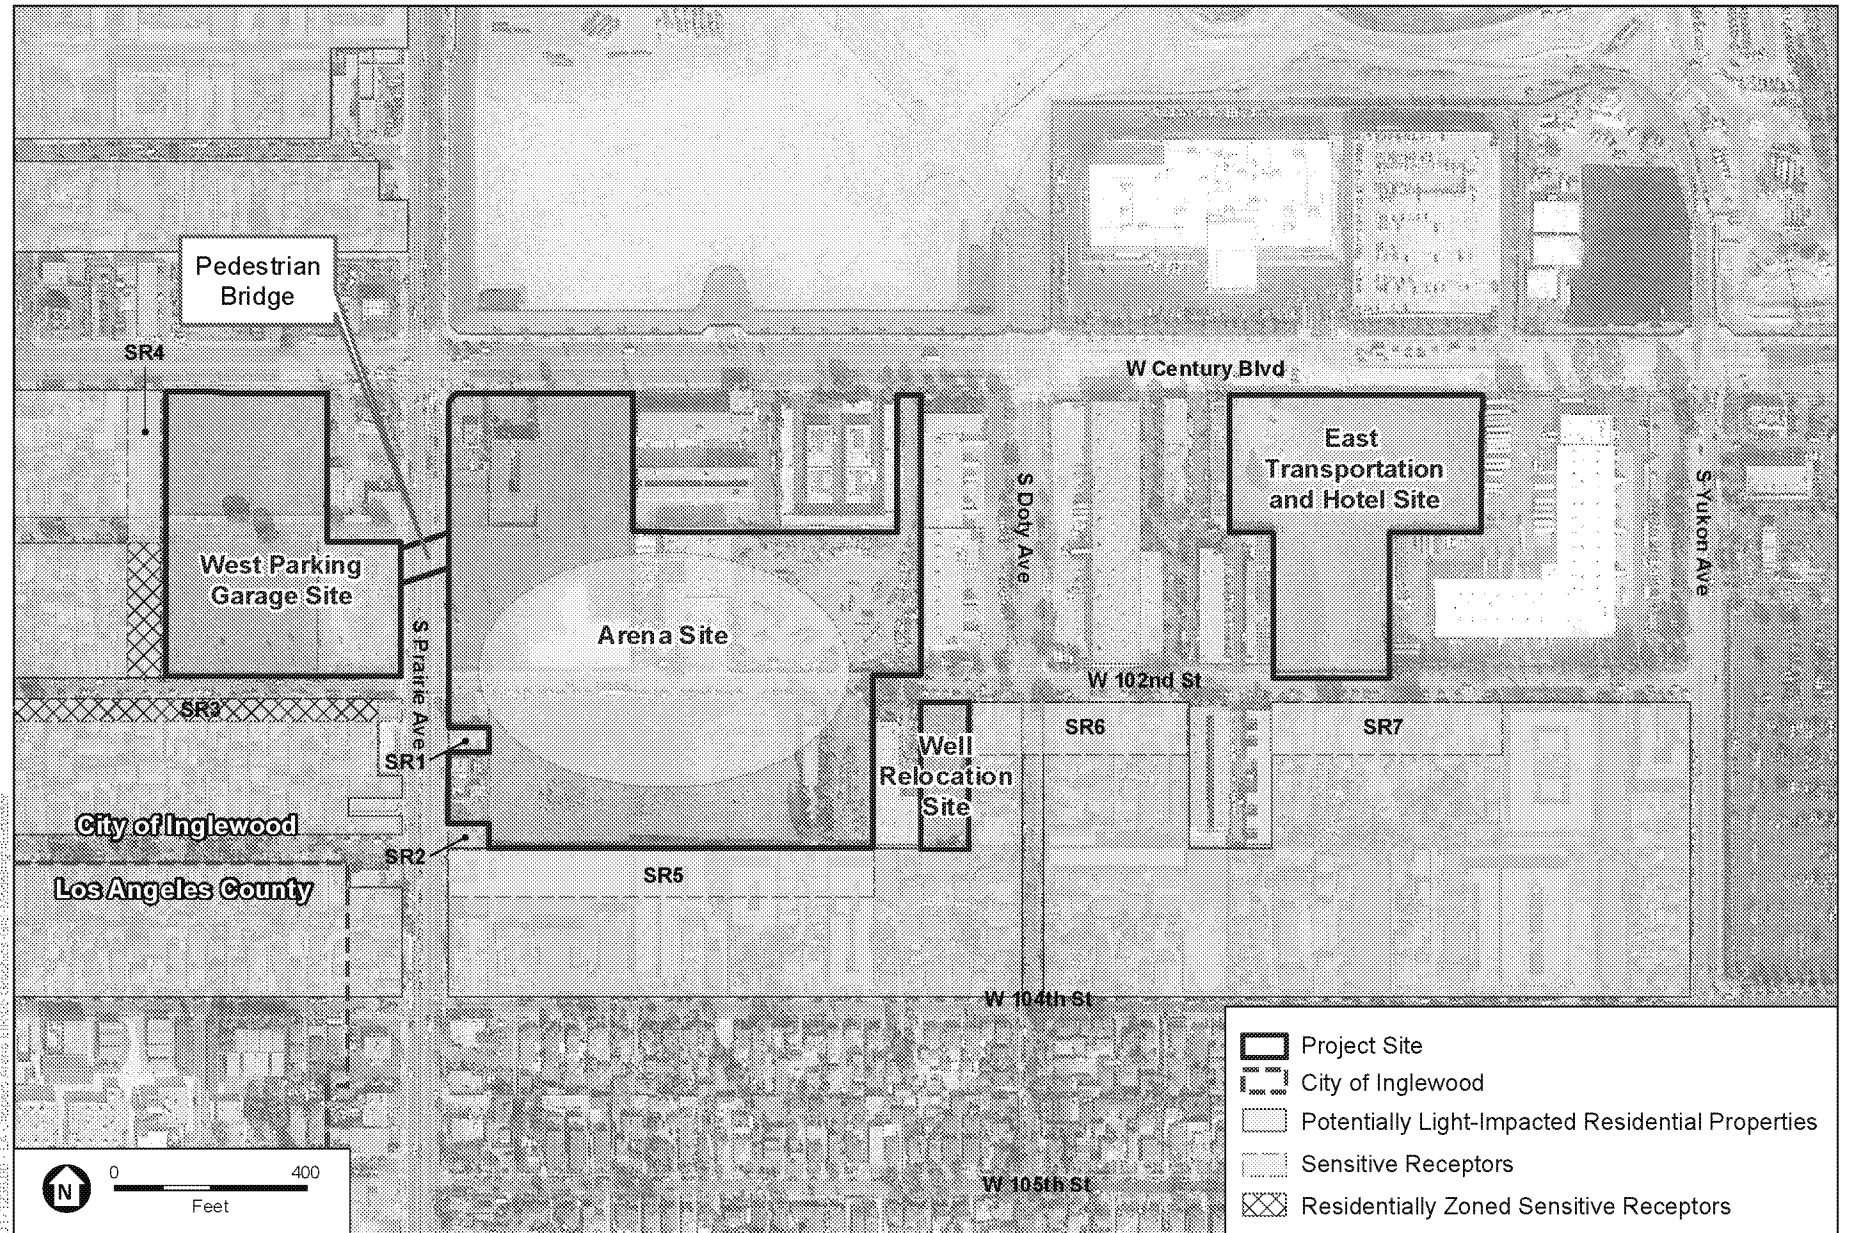

Using the above threshold, the LDA lighting analysis report prepared to evaluate the light effects of the Proposed Project identified the residential properties in the vicinity of the Project Site that could experience increases in nighttime light generated by the Proposed Project (see Appendix C). The lighting analysis report identified seven sensitive receptors where lighting from the Proposed Project could potentially exceed the significance thresholds identified above. The residential properties in the vicinity of the Project Site that would experience increases in nighttime light generated by the Proposed Project and the identified sensitive receptors are shown on **Figure 3.1-13**. The sensitive receptors and potential Proposed Project light effects to the sensitive receptors are described below:

Sensitive Receptor (SR) 1 – 10204 South Prairie Avenue

This residence is a series of smaller joined units with three residential units located within a commercial zone. The lighting analysis determined that that under existing conditions the maximum light level on this site is 0.35 foot-candles at the west-facing façade. Under Proposed Project conditions, project-contributed lighting from LED light poles and lighted parking garage signage onto the site could range from 0.9 to 1.2 foot-candles at the west-facing façade, 1.3 to 2.4 foot-candles at north-facing façade, and 2.3 to 2.6 foot-candles at east-facing façade, which would exceed the threshold of significance for lighting intensity.

SR 2 – 10226 South Prairie Avenue

This residence is a single unit and is located within a commercial zone. The residence is immediately situated between a lit outdoor advertising display on the north and on the south a street light on South Prairie Avenue at its intersection with West 103rd Street. The lighting analysis report determined that under existing conditions maximum lighting at the SR 2 location was 3.03 foot-candles at the north-facing façade of the residence. Thus, this residence is already adversely impacted under existing conditions. Under Proposed Project conditions, project-contributed lighting from LED light poles and lighted parking garage signage onto the site would range from 1.0 to 1.5 foot-candles at east façade, and from 2.0 to 3.3 foot-candles at north façade. Although this sensitive receptor already experiences significant light levels under existing conditions, because the Proposed Project would increase maximum light levels on this residential property over existing levels, it would exceed the threshold of significance for lighting intensity.

SOURCE: Lighting Design Alliance, Inc., 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-13
Light-Sensitive Receptors

SR 3 – Residential Block on West 102nd Street

This residential and residentially zoned block. The residences would have a clear view of the West Parking Garage, a partial view of the west elevation of the Arena Structure, and a partial view of the plaza. The lighting analysis report determined that with project-contributed light, light levels would increase from 0.02 to 1.19 foot-candles at the north-facing façade under existing conditions and contributed light would range from 0.1 to 0.7 foot-candles with the Proposed Project. Thus, the overall light level would not be anticipated to exceed the threshold of significance for lighting intensity at this location.

SR 4 – Residential Block Adjacent to West Parking Garage building

These residences are located in a residential zone, and would have a direct view to the back side of the West Parking Garage building. The residences located at the southern portion of this block may have minimal views of the west elevation of the Arena Structure. Although existing light levels were not measured at this location due to lack of property access, it is reasonable to assume that they are below the significance threshold of 2.0 foot-candles due to the distance of these homes to West Century Boulevard and South Prairie Avenue. The lighting analysis report determined that project-contributed lighting from illuminated signage on the southwest façade of the parking structure facing towards the residences would range from 0.5 to 2.1 foot-candles at east-facing façade, which would exceed the 2.0 foot-candle threshold for light at residential property boundaries, but would be below the 3-foot-candle threshold on residentially zoned properties threshold for illuminated signs. Thus, existing light levels combined with project-contributed light would exceed the threshold of significance for lighting intensity at this location.

SR 5 – Residential Block on West 103rd Street

This is residential block. The residences would be located behind a proposed sound wall south of the proposed Arena Structure and South Parking Garage. The lighting analysis report determined that the Proposed Project would contribute 0.0 foot-candles of light at this location because the proposed sound wall would block all project-contributed light. Thus, project-contributed light would not exceed the threshold of significance for lighting intensity at this location.

SR 6 – Residential Block on West 102nd Street and South Doty Avenue

This is a residential block. These residences would have a direct view to the east elevation of the Arena Structure and would have a view of the southern portion of the East Hotel and Transportation Site. The lighting analysis report determined that existing light levels ranged from 0.15 to 0.27 foot-candles at the north-facing façade, and that the Proposed Project would contribute light ranging from 0.1 to 0.2 foot-candles at that same location. Thus, project-contributed light would not exceed the threshold of significance for lighting intensity at this location.

SR 7 -- Residential Block on West 102nd Street

This residential block. These residences would have a direct view to the east elevation of the Arena Structure and would have a view of the southern portion of the East Hotel and Transportation Site. The lighting analysis report determined that existing light levels were 0.15 foot-candles at the north-facing façade, and that project-contributed light would range from 0.0 to 0.1 foot-candles at that location. Thus, project-contributed light would not exceed the threshold of significance for lighting intensity at this location.

In summary, at three locations around the Project Site (identified as SR 1, SR 2, and SR 4) existing light levels combined with project-contributed light would exceed the threshold of significance for lighting.

As discussed in the Regulatory Setting above, lighting and signage is regulated by the City of Inglewood Municipal Code, which includes standards intended to safeguard life, health, property, and the public welfare by regulating and controlling the design, quality of materials, construction, size, height, location, and maintenance of all signs, sign structures, and other exterior advertising devices. Except as it may be amended to reflect the Proposed Project signage and lighting plans, the Proposed Project would be required to comply with all other requirements pertaining to lighting and signage in the Inglewood Municipal Code, including provisions intended to ensure that illuminated signage on the proposed South Prairie Avenue pedestrian bridge or other locations within the Project Site would not present hazards related to vehicular travel. The Proposed Project would be subject to review by City of Inglewood through a design and site plan review process to ensure that site layout, building orientation, architectural design, neighborhood compatibility, signs, and other applicable design considerations are consistent with applicable City requirements.

Nonetheless, based on the thresholds used in this Draft EIR, the Proposed Project would result in a **significant impact** related to excessive nighttime illumination levels on the residential uses identified as SR 1, SR 2, and SR 4 and as shown on Figure 3.1-13.

Health Effects of Light

LED lights are electric lights that produce light using one or more light-emitting diodes (LEDs). LED lights have a substantially longer lifespan than traditional incandescent lamps and are more efficient than most fluorescent lamps. The use of LED lighting for street and outdoor lighting has increased steadily in recent decades in numerous cities on the U.S, in part because LED lights are significantly more energy efficient than other types of lighting.

As the use of LED lighting has increased in recent years, there have been studies that address the potential effects of LED lighting as compared to incandescent, fluorescent, or other conventional lighting types; the results of these studies is that there is no consensus on the potential effects on human health of such lighting. The various studies are discussed below.

In June 2016, the American Medical Association (AMA) Council on Science and Public Health (CSAPH) issued a report on the potential effects of high-intensity LED community lighting (e.g., street lights) based on a survey of reports published between 2005 and 2016.⁸ The report states that, depending on the design, a relatively higher percent of the spectrum of light produced by white LED lights is emitted as “blue light” than for other lighting types such as incandescent lights or high pressure sodium lights.

The AMA report states that unshielded LED lighting can cause discomfort from glare, and suggests that LED street lights could impair nighttime driving vision and have harmful effects on wildlife, including nocturnal animals, birds and insects. Addressing human health effects, the AMA report further observes, based in part on studies regarding on tablet computer screens,

⁸ American Medical Association, 2016. *Human and Environmental Effects of Light Emitting Diode (LED) Community Lighting*, June 2016.

backlit e-readers, and room light typical of residential settings, that exposure to electric lights can affect transition to nighttime physiology, can result in short term disruptions of circadian rhythms or sleep patterns, and that a short-term detriment to sleep quality has been associated with exposures to short wavelength or blue light before bedtime. Regarding sleep patterns and electric lighting, the AMA report states that “although data are still emerging, some evidence supports a long-term increase in the risk for cancer, diabetes, cardiovascular disease and obesity from chronic sleep disruption or shiftwork and associated with exposure to brighter light sources in the evening or night” and suggests that “street lighting patterns could also contribute to the risk of chronic disease” where LED streetlights have been installed.⁹

The AMA report focused on the first generation of LED street lights, which had correlated color temperature (CCT) index ratings (i.e., a measure of the color temperature of light sources reported in degrees Kelvin) in the 4000K and 5000K range. LED lights are now available with lower kelvin ratings that result in relatively less blue light as a percentage of the spectrum of light emitted as compared to the first generation LED streetlights.

The outcome of the report was that the AMA adopted Policy H-135.927 regarding community lighting or street lighting, which states that the AMA:¹⁰

- Supports the proper conversion to community-based Light Emitting Diode (LED) lighting, which reduces energy consumption and decreases the use of fossil fuels;
- Encourages minimizing and controlling blue-rich environmental lighting by using the lowest emission of blue light possible to reduce glare; and
- Encourages the use of 3000K or lower lighting for outdoor installations such as roadways. All LED lighting should be properly shielded to minimize glare and detrimental human and environmental effects, and consideration should be given to utilize the ability of LED lighting to be dimmed for off-peak time periods.

Some researchers and professional organizations disagree with the underlying scientific research and the summary of other reports in the AMA report, and challenge specific claims made in the report. In a paper issued by the Lighting Research Center (LRC) at Rensselaer Polytechnic Institute in June 2016, researchers noted, among other findings, that predictions of health consequences from light exposure depend upon an accurate characterization of the physical stimulus as well as the biological response to that stimulus. Without fully defining both the stimulus and the response, the LRC researchers argue, nothing meaningful can be stated about the health effects of any light source.¹¹

The Illuminating Engineering Society (IES) disagrees with the AMA report on the basis that chromaticity, or CCT is inadequate for the purpose of evaluating possible health outcomes; and

⁹ American Medical Association, 2016. *Human and Environmental Effects of Light Emitting Diode (LED) Community Lighting*, June 2016, pp. 2–4.

¹⁰ American Medical Association, 2016. *Human and Environmental Effects of Light Emitting Diode (LED) Community Lighting*, June 2016, p. 6.

¹¹ Rea, Mark S., PhD and Mariana G. Figueiro, PhD, 2016. *Response to the 2016 AMA Report on LED Lighting*. June 30, 2016.

that the AMA report failed to take into account multi-variable inputs to light dosing that affect sleep disruption, including the quantity of light at the retina of the eye and the duration of exposure to that light. The IES states that the upper CCT limit of 3000 K recommended by the AMA lacks scientific foundation and does not assure the public of any certainty of health benefit or risk avoidance. The IES concludes that “given the state of current knowledge, it is not possible to weigh the probabilities of health care concerns regarding light-at-night and its effect on sleep disruption from outdoor and roadway lighting against the needs of nighttime driver and pedestrian safety, but such deliberations should precede any policy statement that affects both concerns.”¹²

Terry K. McGowan of the International Dark-Sky Association noted that while it is true that excessive exposure to blue light through LEDs can pose health problems, this is not the case for all types of blue light. McGowan asserts that the CCT metric used by AMA to determine which sources emit blue light is harmful, which measures the visual color or color temperature of the light using degrees Kelvin, provides no indication regarding the melanopic content of the light, which, he states, is the actual part of the light spectrum that suppress melatonin and can cause disruption to sleep patterns. McGowan also states that the AMA report overlooks the “dose” of blue light, and that this measure of when and how much blue light reaches the eye is a key determinant of whether it will produce harmful health effects.¹³

Consequently, the health effects of the use of LED lights remain subject to disagreement as of the publication of this Draft EIR, and there is no scientific consensus regarding the health effects of exposure to LED lights. As a result of the lack of scientific consensus on the issue of health effects of exposure to LED lights, further analysis would be speculative. CEQA Guidelines section 15145 states that “[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact.”

Glare

Glare is caused by direct light sources as well as reflections from pavement, vehicles, and building materials such as reflective glass and polished surfaces. During daylight hours, the amount of reflected glare depends on the intensity and direction of sunlight. At night, artificial lighting can cause glare from reflective surfaces. Glare can create hazards to motorists and nuisances for pedestrians and other viewers.

Although the final design of the Proposed Project parking structures and surface parking facilities has not been completed, it is anticipated that the parking structures would be faced with non-reflective surfaces, and would not contain windows. Therefore, operation of these uses would not

¹² PS-09-17: IES Board Position on AMA CSAPH Report 2-A-16, Human and Environmental Effects of Light Emitting Diode (LED) Community Lighting. <https://www.ies.org/about-outreach/position-statements/ies-board-position-on-ama-csaph-report-2-a-16-human-and-environmental-effects-of-light-emitting-diode-led-community-lighting/>. Accessed August 10, 2019.

¹³ The Construction Specifier, 2017. *Lighting experts refute American Medical Association report on blue light*. April 17, 2017.

be anticipated to contribute to glare. However, temporary features such as parked cars could introduce new sources of daytime and nighttime glare. Project features such as landscaping treatments would help to reduce glare, once fully matured.

Because of the ellipsoid-shaped, multi-faceted design of the Arena Structure, the movement of the sun would create the potential for glare from reflected sunlight in a multitude of directions, but would tend to make glare from any particular facet on the building façade a short-term occurrence, lasting only a short time from any particular orientation due to the movement of the sun. The façade and roof of the Arena Structure would be comprised of a range of textures and materials, including metal and glass, with integrated solar panels in the most exposed locations. From the adjacent streets, individual facets or panels on the building façade could create glare under certain sun angles. These potentially glare-producing facets would be most visible to motorists traveling along South Prairie Avenue as a result of the proximity of the Arena Structure to that street; glare would be much less likely along West Century Boulevard due to the distance the Arena Structure would be set back from that street, as well as the interruption of views due to intervening structures and landscaping in the plaza area. Thus, the potential glare impacts associated with the Arena Structure are considered **less than significant**.

The plaza retail and community buildings would be constructed of materials, including glass display windows, which are typical of street fronting retail uses in the region. Because of their relatively low profile, any glare that would be reflected from these buildings would be short lived and not likely to create hazardous conditions. The West Parking Garage and the East Transportation Hub would be designed and largely constructed of non-reflective materials that would not generate substantial glare. Thus, the potential glare impacts associated with the plaza buildings, West Parking Garage, and East Transportation Hub are considered **less than significant**.

The hotel would be approximately six stories, with a height of approximately 100 feet. Although a detailed design has yet to be submitted to the City, the hotel building would be anticipated to be constructed of varied materials, including but not limited to stucco, concrete, plaster, wood, masonry, glass, metal, tile, and/or stone. Landscaping and security lighting would be provided around the hotel and parking area, and building signage and directional signage may be provided on the site. In the absence of a more definitive and detailed design, it is assumed that the proposed hotel could reach up to 100-feet in elevation and could employ a modern design that includes extensive use of building materials, such as reflective glass and polished surfaces, that could create glare that could result in a public hazard or a substantial annoyance to nearby receptors. Thus, the potential glare impacts associated with the hotel are considered **potentially significant**.

As discussed above, the Proposed Project would be subject to a City design and site plan review process. However, lacking a more detailed design, it is assumed that proposed hotel could employ a modern design that includes extensive use of building materials such as reflective glass and polished surfaces that could create glare that could result in a public hazard or a substantial annoyance to nearby receptors. Consequently, the impact of glare produced by the Proposed Project hotel is considered **potentially significant**.

Mitigation Measure 3.1-2(a)

Construction Lighting. The project applicant shall implement the following measures to avoid or minimize disturbances related to construction lighting:

- *Require construction contractors use construction-related lighting only where and when necessary for completion of the specific construction activity.*
- *Require construction contractors to ensure that all temporary lighting related to construction activities or security of the Project Site is shielded or directed to avoid or minimize any direct illumination onto light-sensitive properties located outside of the Project Site.*
- *Designate a Community Affairs Liaison and conspicuously post this person's number around the project site, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding to any local complaints about disturbances related to construction or security lighting. The Community Affairs Liaison shall receive all public complaints and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem. The Community Affairs Liaison shall coordinate with a designated construction contractor representative for the purpose of investigating the complaint and undertaking all feasible measures to protect public health and safety.*
- *Adjacent residents within 500 feet of the Project Site shall be notified of the construction schedule, as well as the name and contact information of the project Community Affairs Liaison.*

Mitigation Measure 3.1-2(b)

Lighting Design Plan. Prior to issuance of a building permit, the project applicant shall submit to the City a Lighting Design Plan, based on photometric data, that demonstrates that project-contributed lighting from light-emitting diode (LED) lights, illuminated signs, or any other project lighting onto the light-sensitive receptor properties identified as SR 1, SR 2, and SR 4 in the LDA lighting analysis report would not result in more than 2 foot-candles of lighting intensity or generate direct glare onto the property so long as those sites are occupied by light-sensitive receptor uses, or that an illuminated sign from the Project would produce a light intensity of greater than 3 foot-candles above ambient lighting on residentially zoned property. Where existing conditions exceed these levels, the Lighting Design Plan shall avoid exacerbating existing conditions, but need not further reduce light levels on light-sensitive receptor properties.

Measures to ensure that the lighting and illuminated signage from the Project would not exceed the identified thresholds may include but are not limited to relocating and or/shielding pole- or building-mounted LED lights; directing illuminated signage away from residential properties; implementing a screening material for parking garages or other structures to allow ventilation while reducing the amount of spill light; designing exterior lighting to confine illumination to the Project Site; restricting the operation of outdoor lighting to certain hour after events are completed; limiting the luminosity of certain lights or signs; and/or providing structural and/or vegetative screening from sensitive uses.

Mitigation Measure 3.1-2(c)

Hotel Design. The design of the proposed hotel shall be prohibited from using (1) reflective glass that exceeds 50 percent of any building surface and on the bottom three floors, (2) mirrored glass, (3) black glass that exceeds 25 percent of any surface of any building, and (4) metal building materials that exceed 50 percent of any street-facing surface of a building.

Level of Significance After Mitigation: Mitigation Measure 3.1-2(a) requires the project applicant to implement measures to avoid or reduce adverse effects of construction and security lighting on light-sensitive receptors outside of the Project Site, thereby ensuring that nuisances or hazards resulting from construction light sources would be avoided or minimized. Mitigation Measure 3.1-2(b) requires the project applicant to provide to the City a lighting design plan that demonstrates that project-contributed lighting would not result in lighting intensity or glare onto the residential properties identified as SR 1, SR 2, and SR 4 to exceed appropriate levels. Mitigation Measure 3.1-2(c) prohibits the use or positioning of materials in the proposed hotel that would produce excessive or hazardous glare. With implementation of Mitigation Measures 3.1-2(a), 3.1-2(b), and 3.1-2(c), this impact would be **less than significant**.

Impact 3.1-3: Construction and operation of the Proposed Project could cast shadows on shadow-sensitive uses for more than three hours between the hours of 9:00 AM and 3:00 PM PST on either the summer or winter solstice. (Less than Significant)

The Proposed Project would add new structures that would introduce new shade and shadow patterns within and immediately adjacent to the Project Site. As noted above, shade and shadow impacts would be considered significant if shadow-sensitive uses would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM PST on either the summer or winter solstice. Shadow-sensitive uses include residential uses or outdoor spaces associated with residential or recreational uses or existing solar panels. Commercial and industrial properties, parking uses, streets, sidewalks, and other such land uses are not considered to be sensitive for the purposes of the analysis of shade and shadow effects.

There are no existing solar panels within the Project Site. Solar panels are located in two areas adjacent to the Project Site: on the roofs of the two-story Extra Space Storage commercial buildings at 3846 West Century Boulevard, adjacent to the Arena Site, and on the roofs of the one-story multi-tenant business center immediately west of the East Transportation and Hotel Site.

A shade and shadow study prepared for the Proposed Project evaluated two dates during the year: the summer and winter solstices (see Figures 3.1-14 through 3.1-19). These dates were selected because the sun is at its farthest north on the summer solstice and farthest south on the winter solstice. Further, on the winter solstice, the sun rises latest and sets earliest during the year, resulting in the longest possible shadows cast between the hours of 9:00 AM and 3:00 PM. The shade and shadow study determined that the proposed six-story West Parking Garage, the proposed Arena Structure, and the proposed hotel would introduce new daytime shade and shadow patterns to shadow-sensitive uses adjacent to the Project Site in for different periods of the day at different times of the year.

Summer Solstice Shadows

Residential and Recreational Uses

As shown on **Figure 3.1-14**, the shade and shadow study determined that, during morning hours on the summer solstice, the proposed West Parking Garage would create shade and shadow on homes immediately to the west, including 4052 West 101st Street, 4049 West 102nd Street, and 4053 West 102nd Street. Between 9:00 AM and 3:00 PM, shadows on these homes would occur for less than three hours, as shown on **Figure 3.1-15** and **Figure 3.1-16**. No other residential uses or outdoor spaces associated with residential or recreational uses would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM PST on the summer solstice.

Solar Panels

As shown on Figures 3.1-14 through 3.1-16, the shade and shadow study determined that project-related structures would not cast shade and shadow on the solar panels on the roofs of the two-story Extra Space Storage commercial buildings adjacent to the Arena Site for any period between the hours of 9:00 AM and 3:00 PM PST on the summer solstice.

As shown on Figure 3.1-14, the shade and shadow study determined that the proposed hotel could create shade and shadow on solar panels on the roofs of the one-story multi-tenant business center immediately west of the East Transportation and Hotel Site during the morning hours on the summer solstice. Shadows on these solar panels would occur for less than three hours, as shown on Figure 3.1-15 and Figure 3.1-16. No other solar panels would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM PST on the summer solstice.

Winter Solstice Shadows

Residential and Recreational Uses

As shown on **Figure 3.1-17**, during morning hours on the winter solstice, the shade and shadow study determined that the proposed West Parking Garage would create shade and shadow on homes to the west, including 4062 West Century Boulevard, 4052 West 101st Street, 4055 West 101st Street, 4056 West 101st Street, 4061 West 101st Street, 4049 West 102nd Street, 4053 West 102nd Street, and 4057 West 102nd Street. Between 9:00 AM and 3:00 PM, shadows on these homes would occur for less than three hours, as shown on **Figure 3.1-18** and **Figure 3.1-19**. No other residential uses or outdoor spaces associated with residential or recreational uses would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM PST on the winter solstice.

Solar Panels

As shown on Figure 3.1-17, the shade and shadow study determined that the proposed hotel could create shade and shadow on solar panels on the roofs of the one-story multi-tenant business center immediately west of the East Transportation and Hotel Site during the morning hours on the winter solstice. Shadows on these solar panels would occur for less than three hours, as shown on Figure 3.1-18 and Figure 3.1-19.

SOURCE: AECOM, 2019

Inglewood Basketball and Entertainment Center

Figure 3.1-19
Winter Solstice Shadows: December 21, 3:00 PM

As shown on Figure 3.1-19, during the afternoon hours on the winter solstice, the shade and shadow study determined that the proposed Arena Structure could create shade and shadow on solar panels on the southern portion of the roofs of the two-story Extra Space Storage commercial buildings adjacent to the Arena Site on the winter solstice. Shadows on these solar panels would occur for less than three hours, as shown on Figure 3.1-16 and Figure 3.1-17. No other solar panels would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM PST on the summer solstice.

Conclusion

While the Proposed Project would introduce new shade and shadow on shadow-sensitive uses for limited periods, the shade and shadow study determined that no shadow-sensitive uses would be shaded by project-related structures for more than three hours between the hours of 9:00 AM and 3:00 PM PST on either the summer or winter solstice. Therefore, shade and shadow impacts from the Proposed Project would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

The cumulative context for changes in the visual character of the project vicinity is generally limited to projects within a similar viewshed or along the same roadways within close proximity of the Project Site. The project vicinity is characterized by a mix of retail/commercial, industrial, and residential uses housed in buildings generally ranging from one to three stories. In addition to the Proposed Project, the only other active cumulative projects in the immediate vicinity is the proposed development associated within the HPSP area not already included in the Adjusted Baseline in this EIR, and the planned renovation of the Airport Park View Hotel at 3900 West Century Boulevard.

The cumulative context for lighting is the developed areas surrounding the Project Site that affect views of the night sky, while the cumulative context for spillover light would be other development that could add to the spillover light effects of the Proposed Project.

The cumulative context for shade and shadow impacts would be other development that could add to the shade and shadow effects of the Proposed Project. However, because there are no development projects in the vicinity of the Proposed Project add to the shade and shadow effects of the Proposed Project, there is no cumulative impact, and this topic is not discussed further.

Impact 3.1-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could substantially degrade the existing visual character or quality of public views of the site and its surroundings, or conflict with the City's zoning and regulations governing scenic quality. (Less than Significant)

The addition of the Proposed Project and cumulative development within the HPSP area, along with the renovation of the Airport Park View Hotel, would intensify the existing urban visual character along West Century Boulevard and South Prairie Avenue. The change in visual character would continue the trend of modernization and intensification in this location which was initiated with the initial approval of the HPSP in 2009 and the passage of the City of Champions Initiative in 2015. The Proposed Project, development in the HPSP area, and the renovated Airport Park View Hotel would be visually complementary projects as all would intensify and make more cohesive the visual character and pedestrian environment along West Century Boulevard and South Prairie Avenue with the addition of new landscaping and street trees, sidewalk improvements and the development of new mixed-use development. The highly visible corner of South Prairie Avenue and West Century Boulevard would be a key visual entryway into the area, and as such, both the Proposed Project and the other close-by cumulative projects would highlight the intersection with new signature entryway treatments, and key landscaping treatments, entryway signage, and entry monuments.

The Proposed Project and cumulative development in the immediate vicinity would activate and improve the visual quality of the South Prairie Avenue and West Century Boulevard corridors. Although the visual character of this area would change to reflect more modern and intensive urban development with greater amounts of signage and lighting, the addition of cumulative development, including the Proposed Project, would be subject to compliance with applicable City policies and regulations pertaining to architectural design and compatibility with adjacent uses to ensure that the new development would not degrade the visual character of the Project Site and surrounding area. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.1-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could cumulatively create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. (Less than Significant with Mitigation)

Night Sky Lighting Effects

Although cumulative new development or redevelopment could include direct illumination of structures, features, and public places in the areas surrounding the Project Site, the increase in ambient nighttime lighting levels in these areas would only rise minimally because a significant amount of ambient lighting currently exists due to the urbanized nature of the city as a whole.

Increases in nighttime lighting that would occur under cumulative development would not significantly affect nighttime views of the sky because such views are already limited. Because nighttime views of the sky are already limited due to the glow created by urban development in the City and the larger Los Angeles region, cumulative development within the areas surrounding the Project Site, in combination with development of the Proposed Project, is not anticipated to result in the creation of new sources of light that would negatively affect nighttime sky views. Therefore, the cumulative impact associated with ambient nighttime lighting and night sky effects would be **less than significant**.

Spillover Light

As noted above, the cumulative context for spillover light would be other development that could add to the spillover light effects of the Proposed Project. Spillover light is a site-specific effect that could only be added to by other projects in the immediate vicinity of the affected property. As discussed above, the Proposed Project would result in potentially significant impacts related to construction lighting and excessive nighttime illumination levels on the residential uses identified as SR 1, SR 2, and SR 4 and as shown on Figure 3.1-13. None of the cumulative projects included in Table 3.0-2 would be situated so as to add to the light case on the project-impacted sensitive receptors, nor would any of the cumulative projects be situated so as to contribute additional light at sensitive receptors at which the Proposed Project would result in less-than-significant impacts. The one cumulative project that is most proximate to the Proposed Project, the renovation and slight expansion of the Airport Park View Hotel, is located on West Century Boulevard and is surrounded by uses that are not light sensitive. Nonetheless, because Proposed Project construction and operational spillover light impacts are potentially significant, the cumulative impact would be **potentially significant**.

Glare

The cumulative context for glare is the geographic area where glare that is generated by the Proposed Project is also exposed to glare from other cumulative projects. This would primarily include projects along the same roadways within close proximity of the Project Site. In addition to the Proposed Project, the only other active cumulative project in the vicinity is the proposed development associated within the HPSP area not already included in the Adjusted Baseline in this EIR. It should be noted that glare is a project-specific effect, caused by individual occurrences that do not necessarily lead to cumulative effects. The cumulative effects would typically be annoyance and awareness that glare is recurring in an area. As discussed above under Impact 3.1-2, the Proposed Project would be subject to a City of Inglewood design and site plan review process to consider architectural design, neighborhood compatibility, and other applicable design considerations. However, as discussed under Impact 3.1-2, lacking a detailed design, it is assumed that proposed hotel could employ a modern design that includes extensive use of building materials such as reflective glass and polished surfaces that could create glare that could result in a public hazard or a substantial annoyance to nearby receptors. Consequently, because impacts related to glare produced by the proposed hotel are potentially significant, the cumulative impact would be **potentially significant**.

Mitigation Measure 3.1-5

Implement Mitigation Measures 3.1-2(a), 3.1-2(b), and 3.1-2(c). Construction Lighting, Lighting Design Plan, and Hotel Design.

Level of Significance After Mitigation: Mitigation Measure 3.1-2(a) requires the project applicant to implement measures to avoid or reduce adverse effects of construction and security lighting on light-sensitive receptors outside of the Project Site, thereby ensuring that nuisances or hazards resulting from construction light sources would be avoided or minimized. Mitigation Measure 3.1-2(b) requires the project applicant to provide to the City a lighting design plan that demonstrates that project-contributed lighting would not result in lighting intensity or glare onto the residential properties identified as SR 1, SR 2, and SR 4 to exceed appropriate levels. Mitigation Measure 3.1-2(c) prohibits the use or positioning of materials in the proposed hotel that would produce excessive or hazardous glare. With implementation of Mitigation Measures 3.1-2(a), 3.1-2(b), and 3.1-2(c), the Proposed Project's contribution to glare impacts would be less than cumulatively considerable, and the cumulative impact of spillover light and glare would be **less than significant**.

This page intentionally left blank

3.2 Air Quality

This section describes and evaluates the pollutant emission and related air quality impacts that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing land uses as they pertain to air emissions, as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, State, and local regulations related to air quality, including those set forth within the South Coast Air Quality Management District's (SCAQMD) Air Quality Management Plan (AQMP), and applicable City of Inglewood (City) plans; and (3) an analysis of the potential impacts related to air quality associated with the implementation of the Proposed Project, as well as identification of potentially feasible measures that could mitigate significant impacts.

Comments received in response to the NOP for the EIR regarding air quality can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to air quality that were raised in comments on the NOP are analyzed within this section.

The analysis included in this section was developed based on project-specific construction and operational characteristics of the Proposed Project described in Chapter 2, Project Description, project-specific information included in the Assembly Bill (AB) 987 application,¹ and information provided by the project applicant.

3.2.1 Environmental Setting

The Project Site is located within the South Coast Air Basin (Air Basin). The Air Basin covers approximately 6,745 square miles and is bounded by the Pacific Ocean to the west and south and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east (see **Figure 3.2-1**). The air basin includes all of Orange County; the non-desert portions of Los Angeles, Riverside, and San Bernardino counties; and the San Geronio Pass area in Riverside County.

The Air Basin has some of the worst air pollution in the country. The air pollution problems are a consequence of the combination of emissions from the nation's second largest urban area, meteorological conditions unfavorable to the dispersion of those emissions, and mountainous terrain surrounding the Air Basin that traps pollutants as they are pushed inland with the sea breeze. Southern California also has abundant sunshine, which drives the photochemical reactions that form pollutants such as ozone (O₃) and a significant portion of particulate matter with an aerodynamic diameter less than or equal to 2.5 (PM_{2.5}).²

Pollutants and Related Health Effects

Criteria Air Pollutants

Elevated concentrations of certain air pollutants in the atmosphere have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants. In the United States, such pollutants have been identified and are regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the United States Environmental Protection Agency (US EPA) and are subject to emissions control requirements adopted by federal, State and local regulatory agencies. These pollutants are referred to as “criteria air pollutants” as a result of the specific standards, or criteria, which have been adopted pertaining to them. The EPA established the National Ambient Air Quality Standards (NAAQS) to “provide public health protection, including protecting the health of ‘sensitive’ populations such as asthmatics, children, and the elderly,”³ allowing “an adequate margin of safety.”⁴ California Ambient Air Quality Standards (CAAQS) were “established to protect the health of the most sensitive groups in our communities” and “defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment”.⁵ NAAQS and CAAQS for each of the monitored pollutants and their effects on health are discussed below.

Ozone (O₃): Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_x) in the presence of sunlight under certain meteorological conditions, such as high temperature and stagnation episodes. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable.

According to the US EPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath.⁶ Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways; aggravate lung diseases such as asthma, emphysema and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease.⁷

Long-term exposure to ozone is linked to aggravation of asthma and is likely to be one of many causes of asthma development. Long-term exposures to higher concentrations of ozone may also be

⁷ US Environmental Protection Agency, Health Effects of Ozone Pollution, <https://www.epa.gov/ground-level-ozone-pollution/health-effects-ozone-pollution>, last updated October 10, 2018. Accessed March 27, 2019.

linked to permanent lung damage, such as abnormal lung development in children.⁸ According to the California Air Resources Board (CARB), inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms, and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath.⁹

The US EPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers.¹⁰ Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure.¹¹ According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults.¹² Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures.¹³ Further research may be able to better distinguish between health effects in children and adults.¹⁴

Volatile Organic Compounds (VOCs): VOCs are organic chemical compounds of carbon and are not “criteria” air pollutants themselves; however, in combination with NO_x they form ozone, and are regulated to prevent the formation of ozone.¹⁵ According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone. Potential health effects of ozone exposure are discussed above. Other VOCs can result in adverse health effects from direct exposure and are classified by the State of California as toxic air contaminants (TACs) or Hazardous Air Pollutants (HAPs) by the US EPA.¹⁶ The health effects of VOCs, as TACs/HAPs, are discussed more thoroughly below.

VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids. Fuel combustion can occur in internal combustion sources, such as motor vehicle usage, landscape and other portable equipment, and stationary generators, or external combustion,

such as for water and space heating. Evaporation sources include fueling operations, consumer products (e.g., cleaning solutions), and architectural coatings.¹⁷

Nitrogen Dioxide (NO₂) and Nitrogen Oxides (NO_x): NO_x is a term that refers to a group of compounds containing nitrogen and oxygen. As mentioned above, NO_x combines with VOCs to form ozone. The health effects associated with the formation of ozone were discussed above under Ozone. The primary compounds of air quality concern include NO₂ and nitric oxide (NO). Ambient air quality standards have been promulgated for NO₂, which is a reddish-brown, reactive gas.¹⁸

The principal form of NO_x produced by combustion is NO, but NO reacts quickly in the atmosphere to form NO₂, creating the mixture of NO and NO₂ referred to as NO_x. Major sources of NO_x include emissions from cars, trucks and buses, power plants, and off-road equipment. The terms NO_x and NO₂ are sometimes used interchangeably. However, the term NO_x is typically used when discussing emissions, usually from combustion-related activities, and the term NO₂ is typically used when discussing ambient air quality standards. Where NO_x emissions are discussed in the context of the thresholds of significance or impact analyses, the discussions are based on the conservative assumption that all NO_x emissions would oxidize in the atmosphere to form NO₂.

According to the US EPA, short-term exposures to NO₂ can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms while longer exposures to elevated concentrations of NO₂ may contribute to the development of asthma and potentially increase susceptibility to respiratory infections.¹⁹ According to CARB, controlled human exposure studies that show that NO₂ exposure can intensify responses to allergens in allergic asthmatics.²⁰

In addition, a number of epidemiological studies have demonstrated associations between NO₂ exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses.²¹ Infants and children are particularly at risk from exposure to NO₂ because they have disproportionately higher exposure to NO₂ than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.²²

CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO₂ and there is only limited information for NO and NO_x, as well as large uncertainty in relating health effects to NO or NO_x exposure.²³

Carbon Monoxide (CO): CO is primarily emitted from combustion processes and motor vehicles due to the incomplete combustion of fuel, such as natural gas, gasoline, or wood, with the majority of outdoor CO emissions from mobile sources.²⁴

According to the US EPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death.²⁵ Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease since these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress.²⁶ In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina.²⁷

According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain.²⁸ For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance.²⁹ Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO.³⁰

Sulfur Dioxide (SO₂): According to the US EPA, the largest source of SO₂ emissions in the atmosphere is the burning of fossil fuels by power plants and other industrial facilities while smaller sources of SO₂ emission include industrial processes such as extracting metal from ore;

natural sources such as volcanoes; and locomotives, ships and other vehicle and heavy equipment that burn fuel with a high sulfur content.³¹ In 2006, California phased-in the ultra-low-sulfur diesel regulation limiting vehicle diesel fuel to a sulfur content not exceeding 15 parts per million, down from the previous requirement of 500 parts per million, substantially reducing emissions of sulfur from diesel combustion.³²

According to the US EPA, short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult.³³ According to CARB, health effects at levels near the State one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO₂ (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality.³⁴ Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO₂.^{35,36}

Particulate Matter (PM₁₀ and PM_{2.5}): Particulate matter air pollution is a mixture of solid particles and liquid droplets found in the air.³⁷ Some particles, such as dust, dirt, soot, or smoke, are large or dark enough to be seen with the naked eye while other particles are so small they can only be detected using an electron microscope.³⁸ Particles are defined by their diameter for air quality regulatory purposes: inhalable particles with diameters that are generally 10 micrometers and smaller (PM₁₀); inhalable particles with diameters that are 2.5 micrometers or less (PM_{2.5}).³⁹ Thus, PM_{2.5} comprises a portion or a subset of PM₁₀.

Sources of PM₁₀ emissions include dust from construction sites, landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands.⁴⁰

⁴⁰ California Air Resources Board, Inhalable Particulate Matter and Health (PM_{2.5} and PM₁₀), <https://www.arb.ca.gov/research/aaqs/common-pollutants/pm/pm.htm>, last reviewed August 10, 2017. Accessed January 2, 2019.

Sources of PM_{2.5} emissions include combustion of gasoline, oil, diesel fuel, or wood.⁴¹ PM₁₀ and PM_{2.5} may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO₂, NO_x, and certain organic compounds.⁴²

According to CARB, both PM₁₀ and PM_{2.5} can be inhaled, with some depositing throughout the airways; PM₁₀ is more likely to deposit on the surfaces of the larger airways of the upper region of the lung, while PM_{2.5} is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation.⁴³ Short-term (up to 24 hours duration) exposure to PM₁₀ has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits.⁴⁴ The effects of long-term (months or years) exposure to PM₁₀ are less clear, although studies suggest a link between long-term PM₁₀ exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer.⁴⁵

Short-term exposure to PM_{2.5} has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. Long-term exposure to PM_{2.5} has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children.⁴⁶ According to CARB, populations most likely to experience adverse health effects with exposure to PM₁₀ and PM_{2.5} include older adults with chronic heart or lung disease, children, and asthmatics. Children and infants are more susceptible to harm from inhaling pollutants such as PM₁₀ and PM_{2.5} compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems.⁴⁷

Lead (Pb): Major sources of lead emissions include ore and metals processing, piston-engine aircraft operating on leaded aviation fuel, waste incinerators, utilities, and lead-acid battery manufacturers.⁴⁸ In the past, leaded gasoline was a major source of lead emissions; however, the

removal of lead from gasoline has resulted in a decrease of lead in the air by 98 percent between 1980 and 2014.⁴⁹

Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems and the cardiovascular system, and affects the oxygen carrying capacity of blood.⁵⁰ The lead effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or kidney damage.⁵¹ Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain.^{52,53}

Air Toxics

Toxic Air Contaminants

TACs, or HAPs as defined by the US EPA, are defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard.⁵⁴ For consistency within this document they will be referred to as TACS. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. TACs may exist as PM10 and PM2.5 or as vapors (gases).⁵⁵ TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources. The emission of a TAC does not automatically create a health hazard. Other factors, such as the amount of the TAC, its toxicity, how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. Emissions of TACs into the air can be damaging to human health and to the environment. Human exposure to TACs at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. TACs deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists

⁴⁹ US Environmental Protection Agency, Lead Air Pollution, <https://www.epa.gov/lead-air-pollution/basic-information-about-lead-air-pollution>, last updated November 29, 2017. Accessed March 27, 2019.

⁵³ While the SCAQMD CEQA Air Quality Handbook contains numerical indicators of significance for lead, project construction and operation would not include sources of lead emissions and would not exceed the numerical indicators for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from commercial land use projects such as the Project. As a result, lead emissions are not further evaluated in this Draft EIR.

⁵⁴ US Environmental Protection Agency, Hazardous Air Pollutants, <https://www.epa.gov/haps>. Accessed April 25, 2019.

⁵⁵ US Environmental Protection Agency, Hazardous Air Pollutants: Sources and Exposure, <https://www.epa.gov/haps/hazardous-air-pollutants-sources-and-exposure>, Accessed April 25, 2019.

currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer.⁵⁶

The public's exposure to TACs is a significant public health issue in California. The Air Toxics "Hotspots" Information and Assessment Act is a State law requiring facilities to report emissions of TACs to air districts.⁵⁷ The program is designated to quantify the amounts of potentially HAPs released, the location of the release, the concentrations to which the public is exposed, and the resulting health risks. The State Air Toxics Program (AB 2588) identified over 200 TACs, including the 188 TACs identified in the Clean Air Act (CAA).⁵⁸

The US EPA has assessed this expansive list and identified 21 TACs as Mobile Source Air Toxics (MSATs).⁵⁹ MSATs are compounds emitted from highway vehicles and non-road equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. US EPA also extracted a subset of these 21 MSAT compounds that it now labels as the nine priority MSATs: 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (DPM)/diesel exhaust organic gases, ethylbenzene, naphthalene, and polycyclic organic matter (POM). While these nine MSATs are considered the priority transportation toxics, US EPA stresses that the lists are subject to change and may be adjusted in future rules.⁶⁰

Diesel Exhaust

According to the California Almanac of Emissions and Air Quality, the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from the exhaust of diesel-fueled engines, i.e., DPM.⁶¹ DPM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances.

Diesel exhaust is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of many of the urban HAPs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra-fine diesel particulates are of the greatest health concern and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on-

⁶¹ California Air Resources Board. *The California Almanac of Emissions and Air Quality.* <https://www.arb.ca.gov/aqd/almanac/almanac.htm>. Accessed April 25, 2019.

road diesel engines of trucks, buses and cars and the off-road diesel engines that include locomotives, marine vessels and heavy-duty equipment. Although DPM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present.

The most common exposure to DPM is breathing air that contains diesel exhaust. The fine and ultra-fine particles are respirable (similar to PM_{2.5}), which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. Exposure to DPM comes from both on-road and off-road engine exhaust that is either directly emitted from the engines or lingering in the atmosphere.

Diesel exhaust causes health effects from long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to only DPM, but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes chronic health effects as well as having cancer-causing potential.

Because it is part of PM_{2.5}, DPM also contributes to the same non-cancer health effects as PM_{2.5} exposure. These effects include premature death, hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma, increased respiratory symptoms, and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies. Those most vulnerable to non-cancer health effects are children whose lungs are still developing and the elderly who often have chronic health problems.⁶²

Gasoline Exhaust

Similar to diesel exhaust, gasoline is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of the same HAPs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra-fine diesel particulates are of the greatest health concern and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Gasoline exhaust is primarily emitted from light-duty passenger vehicles. The compounds in the gas and particles phases can cause health effects from short- and long-term exposures.

⁶² California Air Resources Board, Overview: Diesel Exhaust & Health. <https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health>. Accessed January 2, 2019.

Visibility Reducing Particles

Visibility-reducing particles are any particles in the atmosphere that obstruct the range of visibility by creating haze.⁶³ These particles vary in shape, size and chemical composition, and come from a variety of natural and manmade sources including windblown metals, soil, dust, salt, and soot. Other haze-causing particles are formed in the air from gaseous pollutant (e.g., sulfates, nitrates, organic carbon particles) which are the major constituents of fine PM, such as PM_{2.5} and PM₁₀, and are caused from the combustion of fuel. CARB's standard for visibility reducing particles is not based on health effects, but rather on welfare effects, such as reduced visibility and damage to materials, plants, forests, and ecosystems. The health impacts associated with PM_{2.5} and PM₁₀ are discussed above under Particulate Matter.

Existing Conditions

Regional Air Quality

The Air Basin's meteorological conditions, in combination with regional topography, are conducive to the formation and retention of ozone. Pollutant concentrations in the Air Basin vary with location, season, and time of day. Concentrations of ozone, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Air Basin and adjacent desert.⁶⁴ The worst air pollution conditions throughout the Air Basin typically occur from June through September.

Attainment Status

California Health and Safety Code section 39607(e) requires CARB to establish and periodically review area designation criteria. **Table 3.2-1** provides a summary of the attainment status of the Los Angeles County portion of the Air Basin with respect to the federal and State standards. As shown in Table 3.2-1, the Air Basin is designated under federal or State ambient air quality standards as nonattainment for ozone, PM₁₀, and fine particulate matter PM_{2.5}. It is noteworthy to mention that air quality in the Air Basin has improved substantially over the years, primarily due to the impacts of air quality control programs at the federal, State and local levels. The ozone and PM levels have fallen significantly compared to the worst years and are expected to continue to trend downward in the future despite increases in the economy and population in the Air Basin.⁶⁵

With respect to the State-identified criteria air pollutants (sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride) present in Table 3.2-1, the Proposed Project would either not use these pollutants in the day to day operations or during construction and therefore would not have emissions of those pollutants (hydrogen sulfide, vinyl chloride, and lead), or such emissions would be accounted for as part of the pollutants estimated in this analysis (visibility reducing particles are associated with particulate matter emissions, and sulfates are associated with SO₂). Vinyl chloride is used in the process of making polyvinyl chloride (PVC) plastic and

NOTES:

N/A = not applicable

^a The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.^b Partial Nonattainment designation – Los Angeles County portion of the Air Basin only for near-source monitors.^c In 1990, CARB identified vinyl chloride as a TAC and determined that it does not have an identifiable threshold. Therefore, CARB does not monitor or make status designations for this pollutant.SOURCE: US EPA, The Green Book Non-Attainment Areas for Criteria Air Pollutants, <https://www.epa.gov/green-book>; CARB, Area Designations Maps/State and National, <http://www.arb.ca.gov/desig/adm/adm.htm>. Accessed April 2019.

vinyl products and is primarily emitted from industrial processes.⁶⁶ Vinyl chloride would not be emitted directly during operations or during construction; therefore, there would be no project emissions of vinyl chloride. In addition, CARB determined there is not sufficient scientific evidence available to support the identification of a threshold exposure level for vinyl chloride, therefore, CARB does not monitor or make status designations for this pollutant.⁶⁷

Types of Sources

As detailed in the AQMP, the major sources of air pollution in the Air Basin are divided into four major source classifications: point and area stationary sources, and on-road and off-road mobile sources. Point and area sources are the two major subcategories of stationary sources.⁶⁸ Point sources are permitted facilities that contain one or more emission sources at an identified location (e.g., power plants, refineries, emergency generator exhaust stacks). Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, restaurant charbroilers and permitted sources such as large boilers), which are distributed across

⁶⁸ South Coast Air Quality Management District, 2017. *Final 2016 Air Quality Management Plan*, p. 3-32. March 2017.

the region. Mobile sources consist of two main subcategories: On-road sources (such as cars and trucks) and off-road sources (such as heavy construction equipment).

Local Area Conditions

Existing Ambient Air Quality in the Surrounding Area

In order to measure and establish ambient pollutant concentrations, SCAQMD maintains a network of air quality monitoring stations located throughout the Air Basin. The monitoring station most representative of the Project Site is the LAX-Hastings Monitoring Station, located at 7201 West Westchester Parkway, Los Angeles (LAX-Hastings). Since PM2.5 data are not available at the LAX-Hastings station, the monitoring data collected at the station located at 3648 N Long Beach Blvd Long Beach (Long Beach North) are used for it being relatively close to and having similar surroundings as the Proposed Project. The most recent data available from SCAQMD for these two monitoring stations are from years 2015 to 2017.⁶⁹ The pollutant concentration data for ozone, NO₂, CO, SO₂, PM10, and PM2.5 for these years are summarized in **Table 3.2-2**. As shown in Table 3.2-2, the CAAQS and NAAQS were exceeded in the vicinity of the Project Site for O₃ and PM2.5 and the CAAQS exceeded for PM10 between 2015 and 2017.

**TABLE 3.2-2
 AMBIENT AIR QUALITY IN THE PROJECT VICINITY**

Pollutant/Standard^{a,b,c}	2015	2016	2017	2018

Samples > NAAQS (35 µg/m ³)	3	0	4	N/A
Fine Particulate Matter, PM_{2.5} (Annual)				
Annual Arithmetic Mean (12 µg/m ³) ^e	10.8	10.4	10.9	N/A

NOTE:

- ^a ppm = parts per million; µg/m³ = micrograms per cubic meter
- ^b The monitoring station most representative of the Project Site is the LAX-Hastings Monitoring Station, which is used to establish ambient NO₂, CO, SO₂, and PM₁₀ levels. Since PM_{2.5} data are not available at the LAX-Hastings station, the monitoring data collected at the station Long Beach North monitoring station are used. The most recent data available from SCAQMD for these two monitoring stations are from years 2015 to 2017.
- ^c CAAQS are based on a not to exceed standard. NAAQS are based on a 3-year average of the annual 4th highest daily maximum 8-hour concentration for ozone; 98th percentile of 1-hour daily maximum concentrations averaged over 3 years for 1-hr NO₂; and not to be exceeded more than once per year on average over 3 years for 24-hr PM.
- ^d State annual average (AAM) PM₁₀ standard is > 20 µg/m³. Federal annual PM₁₀ standard (AAM > 50 µg/m³) was revoked in 2006.
- ^e Both Federal and State standards are annual average (AAM) > 12.0 µg/m³.

Existing Health Risk in the Surrounding Area

As discussed above, EPA and CARB recognize that exposure to elevated levels of ground-level ozone and PM can be a cause of respiratory and cardiovascular health effects. Respiratory health impacts include throat irritation, reduced lung function, emphysema, bronchitis, chronic obstructive pulmonary disease (COPD), and possibly lung cancer. A strong correlation between long-term exposure to air pollutants, such as ozone and NO₂, to the aggravation of asthma is widely recognized, and these pollutants are believed to be one of many causes of asthma development. Other common asthma triggers include indoor and outdoor allergens and irritants,

such as tobacco smoke, mold, pets, dust, dust mites, oxides of nitrogen and wood smoke, chemicals and cleaning solvents.^{70,71}

The Los Angeles County Department of Public Health tracks many health indicators, such as cancer, diabetes, heart disease and stroke, infectious diseases, and respiratory diseases, such as COPD.⁷² This data represents occurrence rates and does not attribute causation to the incidence rate. Regardless of cause, the latest data indicate that public health in Los Angeles County is largely at the same or slightly better than national and state-wide norms for health indices such as adults with heart disease, lung and bronchus cancer rates, emergency room (ER) visits due to COPD, death rate due to lung cancer, death rate due to heart attack, and death rate due to stroke. Los Angeles County hospitalization rates due to heart failure and heart attacks exceed State rates, as do ER visits and hospitalization rates due to asthma in adults and children.⁷³

A subset of these health indices is tracked at the sub-regional level. For example, according to health surveys conducted in 2016-2017, the rate of asthma in the adult population is 13.2 percent in Los Angeles County, and 13.9 percent in Service Planning Area (SPA) 8, which includes Inglewood and other South Bay cities. The same survey reports the State adult asthma incidence rate to be 15 percent and the national rate to be 14 percent;⁷⁴ however, the CDC, relying on a different survey, reports the rate of asthma in adults to be approximately 12 percent nationwide.⁷⁵

In 2015, SCAQMD issued the Multiple Air Toxics Exposure Study (MATES IV),⁷⁶ which estimated long-term inhalation carcinogenic exposure risks from more than 30 air pollutants, including both gases and particulates, for the Air Basin. The monitoring study was accompanied by a computer modeling study in which SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. The predictive study based on computer modeling concluded a background cancer risk of approximately 1,023 in one million. A population-weighted average risk was determined to be approximately 997 in one million based on actual monitored data measured throughout the Air Basin.

These estimates used the cancer risk calculation methods adopted by the California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) in 2015. This methodology supersedes the 2003 guidelines and takes into account the

sensitivity of children to TAC emissions, breathing rates, and time spent at home since children have higher breathing rates compared to adults and would likely spend more time at home resulting in longer exposure durations.⁷⁷

Under the updated OEHHA methodology, the relative reduction in the overall cancer risk from the MATES IV results compared to MATES III would be about 65 percent and 57 percent, respectively. Based on the online MATES IV Carcinogenic Risk Interactive Map, the background increase in cancer risk due to exposure to airborne TACs in the vicinity of the Project Site to be 1,000 in one million.⁷⁸ The factors that lead to the development of cancer are complex, and include age, genetics, lifestyle (obesity, tobacco use, alcohol use, etc.), and exposure to carcinogens. According to recent studies, approximately 38.4 percent of American men and women will be diagnosed with cancer from all causes at some point during their lifetimes (based on 2013–2015 data).⁷⁹ For comparison sake, this can be expressed as a 384,000 in one million cancer risk, and the incremental increase in an individual's lifetime cancer risk due to airborne TACs in the Basin to be an increase of approximately 0.26 percent.

According to the MATES IV, approximately 68 percent of the airborne carcinogenic risk in the Air Basin is attributed to DPM emissions, approximately 22 percent is attributed to other toxics associated with mobile sources (including benzene, butadiene, and formaldehyde), and approximately 10 percent is attributed to stationary sources (which include industries and certain other businesses, such as dry cleaners and chrome plating operations).⁸⁰ Generally, the risk from air toxics is lower near the coastline and increases inland, with higher risks concentrated near large diesel sources (e.g., freeways, airports, and ports).

Existing Project Site Emissions

The Project Site is comprised of approximately 28 acres of land. All but six of the parcels that make up the Project Site are currently vacant, undeveloped or are streets. The six developed parcels, all within the Arena Site, and include a fast food restaurant, a motel, two warehouse/light manufacturing facilities, a commercial catering business, and a groundwater well and related facilities.

Operation of these existing on-site businesses result in the emission of air pollutants associated with vehicle trips to and from the Project Site, on-site combustion of natural gas for heating and cooking, and fugitive emissions of VOCs from the use of aerosol products and coatings and landscaping. However, data with respect to the exact activity level (i.e., utility consumptions) at each business may not be obtainable, so existing emissions were based on default values from the

California Emissions Estimator Model software (CalEEMod®).⁸¹ CalEEMod was developed for the California Air Pollution Officers Association (CAPCOA) in collaboration with the California Air Districts. CalEEMod is a Statewide land use emission computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria air pollutant and GHG emissions from a variety of land use projects. CalEEMod is the SCAQMD-recommended model for quantifying air quality and GHG impacts from land use projects throughout California.⁸²

CalEEMod was used to estimate the existing on-site emissions from natural gas appliances and equipment, and fugitive VOC emissions. Defaults were used for area sources with a historical (pre-2005) electricity and natural gas usage rate based on building land use and square footage since the existing buildings on the Project Site were built before 2005.⁸³ Mobile source emissions associated with existing Project Site operations were calculated outside of CalEEMod using EMFAC2017 emission factors and estimated VMT for existing uses as presented in Section 3.14, Transportation and Circulation. Emissions modeling was conducted using the vehicle fleet mix for the Air Basin as provided in the EMFAC model, and Air Basin-specific vehicle fleet emission factors for 2024. **Table 3.2-3** presents the regional and localized (which excludes mobile) emissions from the existing development on the Project Site.

**TABLE 3.2-3

Existing Off-Site Uses Relocating to Project Site

In addition to the existing Project Site uses, there are existing off-site activities to be relocated to the Project Site which result in existing emissions of air pollutants. Off-site operational uses include the existing LA Clippers team offices, located in downtown Los Angeles at 1212 South Flower Street, and the existing LA Clippers practice and athletic training facility, located in Playa

Air Quality Sensitive Receptors and Locations

Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others.⁸⁵ As a result, certain land uses that are occupied by these population groups, such as residences, schools, playgrounds and childcare center, hospitals, rehabilitation centers, convalescent centers, and retirement homes are considered to be air quality sensitive land uses, i.e., air quality sensitive receptors.

The Proposed Site encompasses four subareas where different features of the Proposed Project will be located: Arena Site, West Parking Garage Site, East Transportation and Hotel Site, and Well Relocation Site. The Project Site is primarily surrounded by sensitive receptors to the south,

⁸⁴ California Air Pollution Control Officers Association, California Emissions Estimator Model User’s Guide, 2017. http://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4, Accessed April 25, 2019.

⁸⁵ South Coast Air Quality Management District, 1993. *CEQA Air Quality Handbook*. November 1993.

west, and north, as shown in **Figure 3.2-2**. Land uses and the nearest air quality sensitive receptors surrounding the Project Site are described below.

Arena Site

To the north of the Arena Site and across West Century Boulevard is the Hollywood Park Specific Plan (HPSP) project. Residential uses will be located within the HPSP project approximately 900 feet north of the Arena Site. Additional residential uses are located adjacent to the Arena Site, to the west, as well as on the west side of South Prairie Avenue. Adjacent to the Arena Site to the south is a religious facility with a childcare center as well as residential uses.

The nearest air quality sensitive receptors to the Arena Site would be the residential uses located along the east side of South Prairie Avenue between West 102nd Street and West 103rd Street to the west (adjacent to the site) and the Inglewood Southside Christian Church and residential uses along West 104th Street to the south (adjacent to the site). Typically places of worship like the Inglewood Southside Christian Church are not considered air quality sensitive receptors; however, an early childhood education use that provides other family support services is located on the Inglewood Southside Christian Church site, where children between the ages of 3 years of age and 5 years of age attend.

West Parking Garage Site

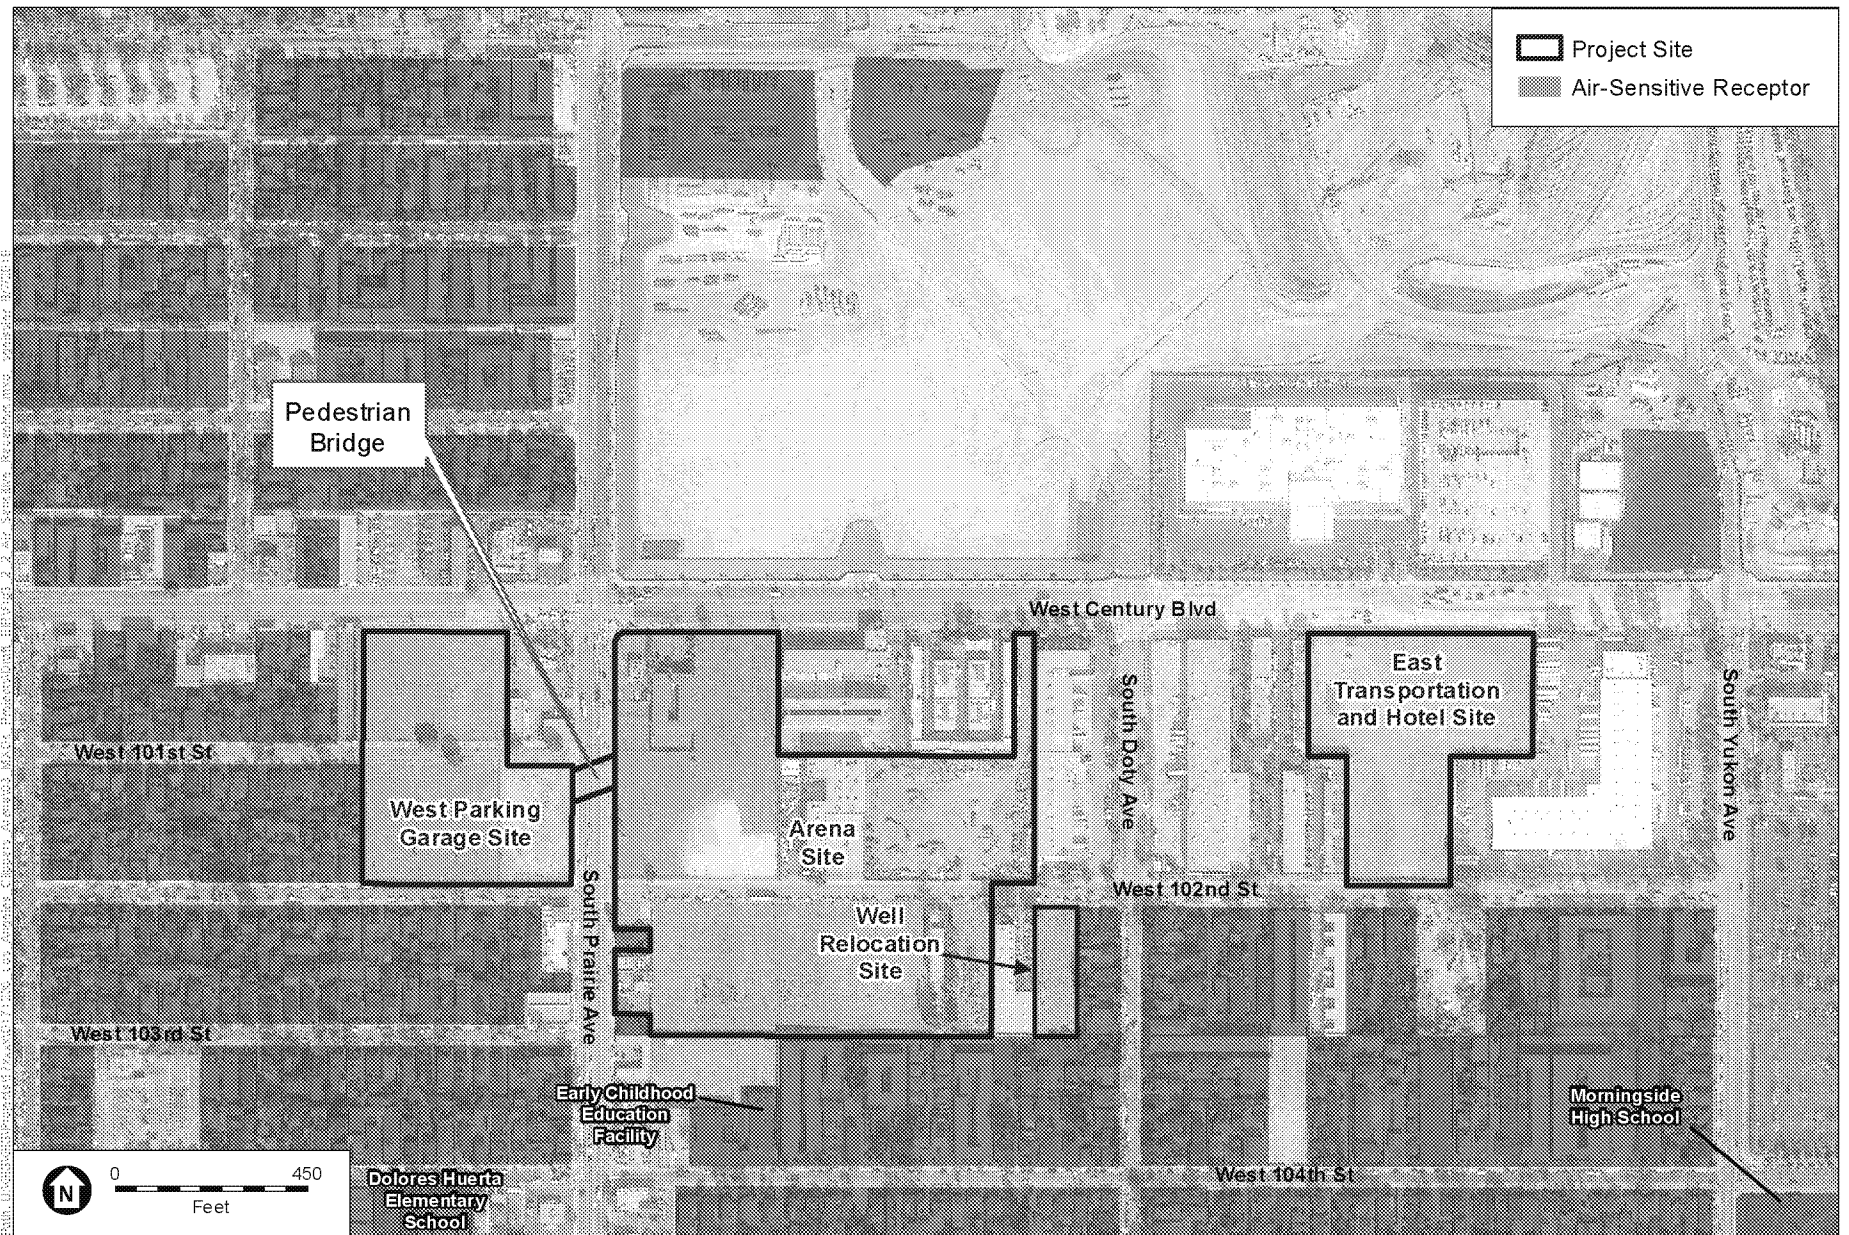

To the north of the West Century Boulevard are commercial uses, Holly Crest Hotel, and Motel 6. Commercial uses are located immediately to the east, a religious facility and residential uses are located to the south, and a motel, religious facility, and residential uses are located to the west. The nearest air quality sensitive receptors to the West Parking Garage Site would be residential uses to the west (adjacent to the site) and south (approximately 50 feet) of the site.

East Transportation and Hotel Site

The Hollywood Park Casino is located to the north of the East Transportation and Hotel Site, north of West Century Boulevard. To the west is an aquarium/pet store. To the south of the site are residential and commercial uses. A United Parcel Service (UPS) facility is located to the east of the East Transportation and Hotel Site. The nearest air quality sensitive receptors would be the residential uses located approximately 50 feet to the south of the Project Site on the south side of West 102nd Street.

Well Relocation Site

To the north of the Well Relocation Site is an occupied warehousing and shipping company. To the east of the site are residential uses. A vacant lot and residential uses are located to the south. To the west of the site is an occupied commercial use. The nearest air quality sensitive receptors would be the residential uses to the east and south, adjacent and approximately 60 feet from the site, respectively.

 Air-Sensitive Receptors

3.2.2 Adjusted Baseline Environmental Setting

Section 3.2, Air Quality, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to air quality, the changes associated with the HPSP Adjusted Baseline projects, currently under development and anticipated to be operational prior to construction of the Proposed Project, include operational air emissions associated with new uses in the HPSP area.

The HPSP Adjusted Baseline projects would emit air pollutants associated with vehicle trips, maintenance operations, energy consumption, etc., from all of its operational land uses. Specifically, vehicle trips associated with activities at the HPSP would begin taking place during mid-2020 when the NFL Stadium begins operations and uses are operating on the site and would have an impact on local and regional air quality. Accordingly, the air pollutant emissions associated with this development within the HPSP area are considered as part of the Adjusted Baseline. The nearest air quality sensitive receptors in the HPSP area under the Adjusted Baseline would be residences located approximately 950 feet north of the Project Site. No other changes to the existing environmental setting related to air quality would occur under the Adjusted Baseline.

3.2.3 Regulatory Setting

This section provides a summary of pertinent federal, State, and local statutes, regulations, plans, and policies that have been adopted that address air quality.

Federal

The 1963 CAA was the first federal legislation regarding air pollution control and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990. At the federal level, US EPA is responsible for implementation of certain portions of the CAA including mobile source requirements.

The CAA establishes federal air quality standards and specifies future dates for achieving compliance. The CAA also mandates that the State submit and implement a State Implementation Plan (SIP) for areas not meeting these standards. SIPs must include pollution control measures that demonstrate how the NAAQS will be met. The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA that are most applicable to the Proposed Project include Title I (Nonattainment Provisions).

Title I requirements are implemented for the purpose of attaining NAAQS for the following criteria air pollutants: O₃; NO₂; CO; SO₂; PM₁₀; and lead. The NAAQS were amended in July 1997 to include an 8-hour standard for O₃ and to adopt a NAAQS for PM_{2.5}. The NAAQS were also amended in September 2006 to include an established methodology for calculating PM_{2.5} as well as revoking the annual PM₁₀ threshold. **Table 3.2-5** shows the NAAQS currently in effect for each criteria air pollutant.

**TABLE 3.2-5
AMBIENT AIR QUALITY STANDARDS**

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
O ₃ ^h	1 Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry

 AMBIENT AIR QUALITY STANDARDS**

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
Visibility Reducing Particles ⁿ	8 Hour	Extinction coefficient of 0.23 per kilometer — visibility of 10 miles or more (0.07 — 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70%. Method: Beta Attenuation and Transmittance through Filter Tape.		No Federal Standards		
Sulfates (SO ₄)	24 Hour	25 µg/m ³	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m ³)	Ultraviolet Fluorescence			
Vinyl Chloride ^l	24 Hour	0.01 ppm (26 µg/m ³)	Gas Chromatography			

NOTES:

- ^a California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM₁₀, PM_{2.5}, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in section 70200 of Title 17 of the California Code of Regulations.
- ^b National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms/per cubic meter (µg/m³) is equal to or less than one. For PM_{2.5}, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
- ^c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- ^d Any equivalent procedure which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.
- ^e National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
- ^f National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- ^g Reference method as described by the US EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the US EPA.
- ^h On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
- ⁱ To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb.
- ^j On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
- ^k On December 14, 2012, the national annual PM_{2.5} primary standard was lowered from 15 µg/m³ to 12.0 µg/m³.
- ^l CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- ^m The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
- ⁿ In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

SOURCE: CARB, Ambient Air Quality Standards (10/1/15), Accessed April 2019.

State

California Clean Air Act

The CCAA, signed into law in 1988, requires all areas of the State to achieve and maintain the CAAQS by the earliest practical date. The CAAQS are established to protect the health of the most sensitive groups and apply to the same criteria air pollutants as the federal CAA and also includes State-identified criteria air pollutants, which are sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride.⁸⁶ Table 3.2-5, provided above, shows the CAAQS currently in effect for each of the federally identified criteria air pollutants as well as state recognized pollutants, such as sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride.

Mobile Source Regulations

Mobile sources are a significant contributor to the air pollution in California. CARB has established exhaust emission standards for automobiles, which are more stringent than the federal emissions standards.

Through its Mobile Sources Program, CARB has developed programs and policies to reduce emissions from on-road heavy-duty diesel vehicles. Specifically, the On-Road Heavy-Duty Diesel Vehicle Regulation requires diesel trucks and buses that operate in the State to be upgraded to reduce emissions. By January 1, 2023, nearly all vehicles must have engines certified to 2010 model year engines or equivalent. The Innovative Clean Transit Program (ICT) sets emissions reduction standards for new public transit vehicles and requires major transit agencies to only purchase zero emission (ZE) buses after 2029. The Solid Waste Collection Vehicle Regulation requires solid waste collection vehicles and heavy diesel-fueled on-road single engine cranes to be upgraded. The Rule for On-Road Heavy-Duty Diesel-Fueled Public and Utility Fleets requires fleets to install emission control devices on vehicles or purchase vehicles that run on alternative fuels or use advanced technologies to achieve emissions requirements by specified implementation dates. CARB also established an In-Use Off-Road Diesel-Fueled Fleets Regulation to impose limits on idling and require fleets to retrofit or replace older engines.

California Air Resources Board On-Road and Off-Road Vehicle Rules

In 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In 2008 CARB approved the Truck and Bus Regulation to reduce NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California. The requirements were amended in December 2010 and apply to nearly all diesel fueled trucks and busses with a gross vehicle weight

⁸⁶ California Air Resources Board, California Ambient Air Quality Standards, <https://ww2.arb.ca.gov/resources/california-ambient-air-quality-standards>. Accessed June 24, 2019.

rating greater than 14,000 pounds. For the largest trucks in the fleet (i.e., those with a gross vehicle weight rating greater than 26,000 pounds), there are two methods to comply with the requirements. The first method is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over eight years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the State subject to this option would need to meet or exceed the 2010 engine emission standards for NO_x and PM by 2023. The second option, if chosen, requires fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters achieving at least 85 percent removal efficiency, so that by January 1, 2016, their entire fleet is equipped with diesel particulate filters. However, diesel particulate filters do not typically lower NO_x emissions. Thus, fleet owners choosing the second method must still comply with the 2010 engine emission standards for their trucks and busses by 2020. Beginning January 1, 2020, this requirement will be enforced by the California Department of Motor Vehicles (DMV). Senate Bill 1 (SB1), the Road Repair and Accountability Act of 2017, was signed into law on April 28, 2017. SB1 authorizes the DMV to check that vehicles are compliant with or exempt from CARB's Truck and Bus Regulation. If a vehicle is not compliant with the rule, DMV will no longer register that vehicle starting January 1, 2020.

In addition to limiting exhaust from idling trucks, CARB promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models. Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with the largest fleets to begin compliance by January 1, 2014. Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (e.g., engine retrofits) on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits be fully implemented by 2023 in all equipment in large and medium fleets and across 100 percent of small fleets by 2028.

Sustainable Communities and Climate Protection Act of 2008 (SB 375)

Senate Bill 375 (SB 375) directs CARB to set regional targets for reducing greenhouse gas emissions from cars and light trucks.⁸⁷ As part of the transportation planning process, each region's Metropolitan Planning Organization (MPO) is responsible for preparing a Sustainable Communities Strategies (SCS) that integrates transportation, land-use, and housing policies to plan for achievement of the emissions target for their region. Specifically, SB 375 focuses on reducing vehicle miles traveled (VMT) and encouraging more compact, complete, and efficient communities. Further, SB 375 established CEQA streamlining and relevant exemptions for

⁸⁷ Office of Planning and Research, 2011. Senate Bill 375 CEQA Provision Flow Charts. February 2011.

projects that are determined to be consistent with the land use assumptions and other relevant policies of an adopted SCS.

Assembly Bill 987 (AB 987)

AB 987 was signed by Governor Jerry Brown on September 30, 2018. The bill added section 21168.6.8 to the California Public Resources Code (PRC) and provides for expedited judicial review in the event that the adequacy of this EIR is challenged, so long as certain requirements are met. The discussion of AB 987 below is focused on the provisions of PRC section 21168.6.8 that addresses air emission, specifically criteria air pollutants and TACs. A full description of AB 987 is provided in Chapter 1, Introduction.

AB 987 is described in this chapter under Regulatory Setting because it potentially applies to the Proposed Project and addresses issues related to air pollutant emissions. However, it is not a regulatory statute, per se, in that the Proposed Project is not required to comply with the provisions of PRC 21168.6.8. Rather, AB 987 established provisions by which the project applicant for the Proposed Project may voluntarily decide to attempt to qualify under the provisions of the statute, and if certified as qualified by the Governor's Office, then it would be afforded certain benefits of expedited judicial review for any action brought to challenge the certification of this EIR or the approval of the Proposed Project. In the event that the Proposed Project does not qualify under the provisions of AB 987, the Proposed Project could still be reviewed and approved by the City, but judicial review would occur under the standard provisions of CEQA.

The provisions of PRC section 21168.6.8 are similar to the provisions of the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900; PRC sections 21178–21189.3), as subsequently amended, which established expedited judicial review of certified Environmental Leadership Development Projects. In order to qualify for expedited judicial review under AB 987, the Proposed Project would have to achieve certain vehicle trip reduction goals and achieve a “no net new” greenhouse gas emissions standard, both of which would also result in reductions in criteria air pollutants and TACs.⁸⁸ Further, as a condition of approval of the Proposed Project, the lead agency must require the project applicant, in consultation with SCAQMD, to implement measures that will achieve criteria air pollutant and TAC reductions over and above any reductions required by other laws or regulations in communities surrounding the Project Site, consistent with emission reduction measures that may be identified for those communities pursuant to Health and Safety Code section 44391.2. At a minimum, these measures must reduce NO_x emissions by 400 tons and PM_{2.5} emissions by 10 tons over 10 years following the commencement of construction of the Proposed Project, with a minimum reduction of 130 tons of NO_x and 3 tons of PM_{2.5} achieved within the first year following commencement of construction. If the project applicant can demonstrate and verify to SCAQMD that it has invested at least thirty million dollars (\$30,000,000) to achieve those reduction requirements, the requirements shall be deemed met, so long as one-half of the reductions are met.

⁸⁸ Office of the Governor, 2018. Assembly Bill 987 Signing Message. September 30, 2018.

Regional

South Coast Air Quality Management District

SCAQMD has jurisdiction over air quality planning for all of Orange County, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Air Basin is a subregion within SCAQMD jurisdiction. While air quality in the Air Basin has improved, the Air Basin requires continued diligence to meet the air quality standards.

Air Quality Management Plan

SCAQMD has adopted a series of AQMPs to meet the CAAQS and NAAQS, the 2012 and the 2016 AQMPs. While the 2016 AQMP is the most recent and was adopted by SCAQMD and CARB, it has not received full US EPA approval for inclusion in the SIP. Therefore, until such time as the 2016 AQMP is completely approved by the US EPA, the 2012 AQMP remains the applicable AQMP; however, this analysis considers both the 2012 and 2016 AQMPs as appropriate.

The 2012 AQMP includes a comprehensive strategy aimed at controlling pollution from all sources, including stationary sources, and on-road and off-road mobile sources. It highlights the significant amount of emission reductions needed and the urgent need to identify additional strategies, especially in the area of mobile sources, to meet all federal criteria air pollutant standards within the timeframes allowed under the CAA.⁸⁹

The key undertaking of the 2012 AQMP is to bring the Air Basin into attainment with the NAAQS for the 24-hour PM_{2.5} standard. It also intensifies the scope and pace of continued air quality improvement efforts toward meeting the 2024 8-hour O₃ standard deadline with new measures designed to reduce reliance on the CAA section 182(e)(5) long-term measures for NO_x and VOC reductions. SCAQMD expects exposure reductions to be achieved through implementation of new and advanced control technologies as well as improvement of existing technologies.

The SCAQMD Governing Board adopted the 2016 AQMP on March 3, 2017.⁹⁰ CARB approved the 2016 AQMP on March 23, 2017. Key elements of the 2016 AQMP include implementing fair-share emissions reductions strategies at the federal, state, and local levels; establishing partnerships, funding, and incentives to accelerate deployment of ZE and near-zero-emissions (NZE) technologies; and taking credit from co-benefits from greenhouse gas, energy, transportation and other planning efforts.⁹¹ The strategies included in the 2016 AQMP are intended to demonstrate attainment of the NAAQS for the national non-attainment pollutants ozone and PM_{2.5}.⁹²

⁹² South Coast Air Quality Management District, 2016. *NAAQS/CAAQS and Attainment Status for South Coast Air Basin*. 2016.

South Coast Air Quality Management District CEQA Guidelines

SCAQMD's CEQA guidelines are voluntary initiatives recommended for consideration by local planning agencies. The *CEQA Air Quality Handbook* (Handbook) published by SCAQMD provides local governments with guidance for analyzing and mitigating project-specific air quality impacts.⁹³ SCAQMD is currently updating some of the information and methods in the Handbook, such as the screening tables for determining the air quality significance of a project and the on-road mobile source emission factors. While this process is underway, SCAQMD recommends using other approved models to calculate emissions from land use projects, such as CalEEMod.⁹⁴

The SCAQMD *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning* considers impacts to air quality sensitive receptors from TAC-emitting facilities.⁹⁵ SCAQMD's siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for air quality sensitive receptors proposed in proximity to freeways and high-traffic roads, and the same siting criteria for distribution centers and dry cleaning facilities).

The SCAQMD *Final Localized Significance Threshold Methodology and Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM2.5 Significance Thresholds* provides guidance when evaluating the localized effects of emissions in the CEQA evaluation.^{96,97} These guidance documents were promulgated by the SCAQMD Governing Board as a tool to assist lead agencies to analyze localized impacts associated with project-specific level proposed projects. The guidance documents establish mass emission rate "look up tables" as significance thresholds for projects that are five acres or less. For projects that are larger than five acres, such as the Proposed Project, it is recommended that project-specific air quality dispersion modeling is completed to determine localized air quality (see the discussion on Air Dispersion Modeling, below, for more details).

South Coast Air Quality Management District Rules and Regulations

Several SCAQMD rules adopted to implement portions of the 2012 and 2016 AQMPs may apply to the Proposed Project. The Proposed Project may be subject to the following SCAQMD rules and regulations:

Regulation IV – Prohibitions: This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/

⁹³ South Coast Air Quality Management District, 1993. *CEQA Air Quality Handbook*. November 1993.

⁹⁴ South Coast Air Quality Management District, Air Quality Modeling, <https://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-modeling>. Accessed June 24, 2019.

⁹⁵ South Coast Air Quality Management District, 2005. *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning*. May 06, 2005.

⁹⁶ South Coast Air Quality Management District, 2008. *Final Localized Significance Threshold Methodology*. June 2003, Revised July 2008.

⁹⁷ South Coast Air Quality Management District, 2006. *Final – Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds*. October 2006.

shutdown exemptions and breakdown events. The following is a list of rules which apply to the Proposed Project:

- **Rule 401 – Visible Emissions:** This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.
- **Rule 402 – Nuisance:** This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
- **Rule 403 – Fugitive Dust:** This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to a project property line, restricts the net PM10 emissions to less than 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures, which may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities.

Regulation XI – Source Specific Standards: Regulation XI sets emissions standards for specific sources. The following is a list of rules which may apply to the Proposed Project:

- **Rule 1113 – Architectural Coatings:** This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.
- **Rule 1138 – Control of Emissions from Restaurant Operations:** This rule specifies PM and VOC emissions and odor control requirements for commercial cooking operations that use chain-driven charbroilers to cook meat.
- **Rule 1146.2 – Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters:** This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_x emissions from natural gas-fired water heaters, boilers, and process heaters as defined in this rule.
- **Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations:** This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Regulation XIII – New Source Review (NSR): Regulation XIII sets requirements for preconstruction review required under both federal and state statutes for new and modified sources located in areas that do not meet the Clean Air Act standards ("non-attainment" areas). NSR applies to both individual permits and entire facilities. Any permit that has a net increase in emissions is required to apply BACT. Facilities with a net increase in emissions are required to offset the emission increase by use of Emission Reduction Credits (ERCs). The regulation provides for the application, eligibility, registration, use and transfer of ERCs. For low emitting facilities, SCAQMD maintains an internal bank that can be used to provide

the required offsets. In addition, certain facilities are subject to provisions that require public notice and modeling analysis to determine the downwind impact prior to permit issuance.

Regulation XIV – Toxics and Other Non-Criteria Air Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria air pollutants. The following is a list of rules which may apply to the Proposed Project:

- **Rule 1401 – New Source Review of Toxic Air Contaminants:** This rule regulates new or modified facilities to limit cancer and non-cancer health risks from facilities located within SCAQMD jurisdiction.
- **Rule 1402 – Control of Toxic Air Contaminants from Existing Sources:** This rule regulates facilities that are already operating in order to limit cancer and non-cancer health risks. Rule 1402 incorporates the requirements and methodology of the AB 2588 Air Toxics "Hot Spots" program.
- **Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities:** This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials (see Section 3.8, Hazards and Hazardous Materials).
- **Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines:** This rule applies to stationary compression ignition (CI) engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

The Southern California Association of Governments (SCAG) is the Metropolitan Planning Organization for the region in which the City of Inglewood is located. In April 2016, SCAG adopted the *2016 Regional Transportation Plan/Sustainable Communities Strategy: A Plan for Mobility, Accessibility, Sustainability and a High Quality of Life (RTP/SCS)*, which is an update to the previous 2012 RTP/SCS.⁹⁸

The 2016 RTP/SCS considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs. The 2016 RTP/SCS describes how the region can attain the GHG emission-reduction targets set by CARB by achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 18 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Although the focus of the 2016 RTP/SCS is on GHG emission-reduction, compliance with and implementation of 2016 RTP/SCS

⁹⁸ Southern California Association of Governments, 2016. *2016 Regional Transportation Plan/Sustainable Communities Strategy*. April 2016.

policies and strategies would also have co-benefits of reducing per capita criteria air pollutant and TAC emissions associated with reduced per capita vehicle miles traveled (VMT). Improved air quality with implementation of the 2016 RTP/SCS policies would decrease reactive organic gases (ROG) by 8 percent, CO by 9 percent, NO_x by 9 percent, and PM_{2.5} by 5 percent.⁹⁹

SCAG's 2016 RTP/SCS builds on the land use policies that were incorporated into the 2012 RTP/SCS, and provides specific strategies for successful implementation. These strategies include development of "complete communities," defined as mixed-use districts that concentrate housing, employment, and a mix of retail and services in close proximity to each other; encouraging employment development around current and planned transit stations and neighborhood commercial centers; encouraging the implementation of a "complete streets" policy that meets the needs of all users of the streets, roads and highways including bicyclists, children, persons with disabilities, motorists, electric vehicles, movers of commercial goods, pedestrians, users of public transportation, and seniors; and supporting alternative fueled vehicles. The 2016 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in infill areas well served by transit.

In addition, the 2016 RTP/SCS includes goals and strategies to promote active transportation and improve transportation demand management (TDM). The 2016 RTP/SCS strategies support local planning and projects that serve short trips, increase access to transit, expand understanding and consideration of public health in the development of local plans and projects, and support improvements in sidewalk quality, local bike networks, and neighborhood mobility areas. The 2016 RTP/SCS proposes to better align active transportation investments with land use and transportation strategies, increase competitiveness of local agencies for federal and state funding, and to expand the potential for all people to use active transportation.

In June 2016, CARB accepted SCAG's quantification of GHG emission reductions from the 2016 RTP/SCS and the determination that the 2016 RTP/SCS would, if implemented, achieve the 2020 and 2035 GHG emission reduction targets established by CARB.¹⁰⁰

As described in Section 3.14, Transportation and Circulation, the Proposed Project would include shuttles to and from Metro stations during major Project events to reduce vehicle trips by spectators, event-day staff, and employees through the use of alternate modes of transportation including transit, shuttles, ridesharing, walking, and biking.

The consistency of the Proposed Project with the 2016 RTP/SCS is evaluated in more detail in Section 3.5, Energy Demand and Conservation, and Section 3.7, Greenhouse Gas Emissions.

⁹⁹ Southern California Association of Governments, 2016. *2016 Regional Transportation Plan/Sustainable Communities Strategy*. April 2016.

¹⁰⁰ California Air Resources Board, 2016. *Southern California Association of Governments' (SCAG) 2016 Sustainable Communities Strategy (SCS) ARB Acceptance of GHG Quantification Determination*. June 2016.

Local

City of Inglewood General Plan

The City of Inglewood General Plan sets forth goals, objectives, and policies for the future development of the City and designates the location of desired future land uses within the City.

The following goal from the Land Use Element¹⁰¹ of the City of Inglewood General Plan are relevant to air pollutant emissions.

Circulation Goal: Promote and support adequate public transportation within the City and the region.

Circulation Goal: Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

As described in Chapter 2, Project Description, the Proposed Project constitutes a large-scale development integrating commercial, office, hotel, entertainment uses that supports public transportation. The Proposed Project would include provisions that would promote the use of public transportation as a means of travel to and from the Proposed Project, including a Transportation Hub at the East Transportation and Hotel Site, shuttle stops on South Prairie Avenue, and a shuttle system for large events that would connect the Proposed Project to nearby Metro stations.

The consistency of the Proposed Project with the City of Inglewood General Plan is discussed under Impact 3.2-1 in Section 3.2.4, Analysis, Impacts and Mitigation.

City of Inglewood Energy and Climate Action Plan

The Inglewood Energy and Climate Action Plan (ECAP) presents the City's community and municipal inventories, emission forecasts, and recommended reduction targets for emissions to mitigate the City's impact on air quality and climate change.¹⁰² Although the strategies within the ECAP are primarily directed towards GHG emission-reductions, as are discussed in further detail in Section 3.7, Greenhouse Gas Emissions, the measures in the ECAP would also achieve co-benefits of reducing criteria air pollutants and TACs. The ECAP's reduction strategies focus on actions within, or associated with activity in, the City that can result in a break from business-as-usual energy use and/or emissions. The City's GHG emission reduction targets are 15 percent below 2005 levels by 2020 and 32.5 percent below 2005 levels by 2035. The ECAP quantifies GHG reductions from five implementation strategies and actions: leading by example, increasing energy efficiency, supporting renewable energy generation, improving transportation options, and reducing consumption and waste, all of which are described in detail in the Local Regulatory Setting under Section 3.7, Greenhouse Gas Emissions. The following two of the five strategies and their related actions also have the potential for co-benefits of reducing criteria air pollutants and TACs:

¹⁰¹ City of Inglewood, Department of Community Development and Housing, 1980. Land Use Element of the Inglewood General Plan. January 1980. Amended September 14, 2016.

¹⁰² City of Inglewood, 2013. Inglewood Energy and Climate Action Plan. March 2013.

Strategy 1 – Lead by Example with Municipal Government Actions

- Accelerate city vehicle fleet replacement
- Continue commute trip reduction program
- Planning for electric vehicle infrastructure

Strategy 4: Improve Transportation Options and Manage Transportation Demand

- Make roadways more efficient
- Improve transit
- Improve bicycle facilities
- Make parking more efficient
- Reduce commute trips
- Encourage land use intensification and diversity

The consistency of the Proposed Project with the ECAP is discussed under Impact 3.2-1 in Section 3.2.4, Analysis, Impacts and Mitigation, as well as in Impact 3.7-2 of Section 3.7, Greenhouse Gas Emissions.

3.2.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts from emissions of air pollutants. The following threshold of significance is consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Conflict with or obstruct implementation of the applicable air quality plan;
2. Result in a cumulatively considerable net increase of any criteria air pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard;¹⁰³
3. Expose sensitive receptors to substantial pollutant concentrations; or
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Regional Criteria Air Pollutant Emissions Thresholds

SCAQMD has established numerical significance thresholds for regional emissions during construction and operation. The numerical significance thresholds are based on the recognition that the Air Basin is a distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health.¹⁰⁴

¹⁰³ For the purposes of this Draft EIR, the City has included analysis of all regulated criteria pollutants, regardless of attainment status, for exceedances of applicable federal or state ambient air quality standards.

¹⁰⁴ South Coast Air Quality Management District, 1993. CEQA Air Quality Handbook, November 1993.

Given that construction impacts are temporary, SCAQMD has established significance thresholds specific to construction activity. Based on the indicators in the SCAQMD CEQA Air Quality Analysis Handbook,¹⁰⁵ the Proposed Project would potentially cause or contribute to an exceedance of an ambient air quality standard if the following would occur:

Regional construction emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed daily emissions thresholds:¹⁰⁶

- 75 pounds a day for VOC
- 100 pounds per day for NO_x
- 550 pounds per day for CO
- 150 pounds per day for SO_x
- 150 pounds per day for PM₁₀
- 55 pounds per day for PM_{2.5}

SCAQMD has also established numeric significance thresholds for operations. SCAQMD has established significance thresholds in part based on CAA section 182(e), which identifies 10 tons per year of VOC and NO_x as a significance level for stationary source emissions in extreme non-attainment areas for ozone. The numeric significance thresholds for other pollutants are also based on federal major source thresholds, which vary depending on regional attainment status. For example, the Air Basin is in attainment for carbon monoxide, which yields a corresponding major source threshold of 100 tons per year, or 550 pounds per day.¹⁰⁷ These “major source” significance thresholds were developed under the Federal Title V Operating Permit Program.¹⁰⁸ SCAQMD converted these significance levels to pounds per day. The attainment status designation is based on the healthfulness of air quality and the corresponding significance thresholds are intended to be health protective.¹⁰⁹

A similar approach is applied to PM_{2.5}, where the daily limit of 55 pounds per day is based on the US EPA proposed rule to implement a PM_{2.5} NAAQS, with a significant emission rate of 10 tons per year.¹¹⁰

¹¹⁰ South Coast Air Quality Management District, 2006. *Final – Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds*, October 2006.

The Proposed Project would potentially cause or contribute to an exceedance of an ambient air quality standard if regional operational emissions exceed any of the following SCAQMD prescribed daily emissions thresholds:¹¹¹

- 55 pounds a day for VOC,
- 55 pounds per day for NO_x,
- 550 pounds per day for CO,
- 150 pounds per day for SO_x,
- 150 pounds per day for PM₁₀, and
- 55 pounds per day for PM_{2.5}.

SCAQMD has set its CEQA significance threshold for NO_x and VOC at 10 tons per year (expressed as 55 lb/day). because the federal CAA defines a major stationary source for extreme ozone nonattainment areas such as SCAQMD as one emitting 10 tons/year.¹¹² Under the federal CAA, such sources are subject to enhanced control requirements,¹¹³ so SCAQMD determined that 55 lb/day was an appropriate threshold for making a CEQA significance finding and requiring feasible mitigation. As, SCAQMD has stated:

“... a project source that emits 10 tons/year of NO_x or VOC is small enough that its regional impact on ambient ozone levels may not be detected in the regional air quality models that are currently used to determine ozone levels. Thus, in this case it would not be feasible to directly correlate project emissions of VOC or NO_x with specific health impacts from ozone.”¹¹⁴

Therefore, lead agencies that use SCAQMD thresholds of significance may determine that projects have a significant air quality impact and correspondingly are required to implement all feasible mitigation measures, yet are not able to correlate the project impact to quantifiable health effects.

Localized Significance Thresholds

SCAQMD published its Final Localized Significance Threshold Methodology in June 2003, (revised July 2008) and Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM_{2.5} Significance Thresholds in October 2006, recommending that all air quality analyses include a localized assessment of both construction and operational impacts on the air quality of nearby air quality sensitive receptors.^{115,116} LSTs represent the maximum emissions from a project site that are not expected to result in an exceedance of a NAAQS or CAAQS. LSTs are based on the

¹¹⁴ South Coast Air Quality Management District, Amicus Brief in Support of Neither Party, *Sierra Club v. County of Fresno*, 2015.

¹¹⁵ South Coast Air Quality Management District, 2008. *Final Localized Significance Threshold Methodology*. June 2003, revised July 2008.

¹¹⁶ South Coast Air Quality Management District, 2008. *Final Localized Significance Threshold Methodology*. June 2003, revised July 2008.

ambient concentrations of that pollutant within the Source Receptor Area (SRA) where a project is located and the distance to the nearest air quality sensitive receptor. LSTs are only applicable to the following criteria air pollutants: NO_x, CO, PM₁₀, and PM_{2.5}. The Project Site is located in the central portion of SRA 3 (Southwest Los Angeles County Coastal).¹¹⁷

The Basin is in attainment for NO₂ and CO, meaning their ambient concentrations are below their respective air quality standards. When evaluating localized impacts for NO₂ and CO, the local ambient concentrations and the Proposed Project related concentrations are summed and then compared to the NAAQS and CAAQS. If the sum of the ambient concentrations and Proposed Project concentrations are greater than the air quality standard, this would result in a significant impact.

The Basin is in nonattainment for PM₁₀ and PM_{2.5}, meaning their ambient concentrations are above their respective air quality standards. If ambient levels already exceed a NAAQS or CAAQS, then project impacts may be considered significant if they increase ambient concentrations in excess of the allowable increase established by SCAQMD. This would apply to PM₁₀ and PM_{2.5}, both of which are nonattainment pollutants in the Basin. For these latter two pollutants, the significance criteria are the pollutant concentration thresholds presented in SCAQMD Rules 403 and 1301. The Rule 403 threshold of 10.4 µg/m³ applies to construction emissions (and may apply to operational emissions at aggregate handling facilities). The Rule 1301 threshold of 2.5 µg/m³ applies to non-aggregate handling operational activities.

SCAQMD recommends that sites larger than 5 acres perform air dispersion modeling to determine localized air quality.¹¹⁸ Because the Project Site exceeds 5 acres, dispersion modeling was performed to determine if the pollutant concentrations from Proposed Project emissions would exceed relevant significance thresholds established by SCAQMD.

For the evaluation of localized impacts of the Proposed Project, SCAQMD has established air quality significance thresholds on a concentration basis. For attainment pollutants NO₂ and CO, a project is significant if, in combination with existing or future ambient concentrations, it causes or contributes to an exceedance of the standards listed in Table 3.2-5, above.

For PM_{2.5} and PM₁₀, a project is significant if the emissions result in exceedance of the following incremental increase thresholds:^{119,120}

- 10.4 µg/m³ (24-hour) and 1 µg/m³ of PM₁₀ (Annual) for construction,
- 10.4 µg/m³ (24-hour) of PM_{2.5} for construction,
- 2.5 µg/m³ (24-hour) and 1.0 µg/m³ (Annual) of PM₁₀ for operations, and
- 2.5 µg/m³ (24-hour) of PM_{2.5} for operation.

Toxic Air Contaminants Health Risk Thresholds

Based on the criteria set forth by SCAQMD, the Proposed Project would expose air quality sensitive receptors to substantial concentrations of TACs if the Proposed Project emits carcinogenic materials or TACs that exceed the maximum incremental cancer risk of ten in one million or an acute or chronic hazard index of 1.0. Similarly, the Proposed Project would result in a potentially significant impact if cancer burden corresponds to an increase in more than 0.5 excess cancer cases in areas where the Project-related increase in individual cancer risk exceeds 1 in 1 million.¹²¹

Currently, the health impact of a particular criteria air pollutant is analyzed by air districts on a regional scale based on how close the area is to attaining the NAAQS. Such an analysis has generally not been performed at the project level. In this instance, however, an HIA was conducted to estimate the extent to which the Proposed Project would result in an increase in the criteria air pollutant concentrations, and to analyze whether such an increase in criteria air pollutant concentrations could be correlated with specific health impacts.

Methodology and Assumptions

Regional Construction Emissions Methodology

Construction of the Proposed Project would have the potential to temporarily emit criteria air pollutant emissions through the use of heavy-duty construction equipment, such as excavators, cranes, and forklifts, and through vehicle trips generated from workers and haul trucks traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. As previously described, emissions of VOC, NO_x, CO, SO₂, PM₁₀, and PM_{2.5} emissions are included in this analysis. Construction emissions can vary substantially from day to day, depending on the intensity and specific type of construction activity. The maximum daily regional emissions are predicted values for the worst-case day and do not represent the emissions that would actually occur during every day of construction. The maximum daily regional mass emissions of pollutants were compared to the respective SCAQMD thresholds.

According to the Proposed Project construction schedule, as presented in **Table 3.2-6**, construction will begin July 2021 and be completed October 2024. Emission calculations assumed all construction occurs at the earliest feasible dates. If the onset of construction were to be delayed to a later year, construction emissions would be less than those presented. This would result from cleaner construction equipment and vehicle fleet mix expected as a result of State regulations that require cleaner construction equipment to be phased-in for heavy-duty equipment.¹²² Thus, should the Proposed Project commence construction on a later year than modeled in this air quality impact analysis, air quality impacts would be less than the impacts disclosed herein.

Sound Walls	July 2021	July 2021
Drilling and Casing	August 2021	December 2021
Utilities	January 2022	May 2022
Paving/Fencing	June 2022	June 2022

NOTE:

The emissions were estimated assuming construction begins at the earliest possible date (July 2021). This provides for a conservative emissions estimate as emission factors decline in future years. Construction of the Proposed Project may commence at a later date, which would generally result in similar or reduced emissions, primarily due to vehicles meeting more stringent emissions standards. If construction starts at a later date, emissions could occur in later calendar years; however, the emissions would be similar or reduced compared to the emissions disclosed herein.

SOURCE: ESA, 2019.

Construction activities would include demolition of any existing structures or improvements on site, site preparation, excavation and grading, building construction and interior finishing work, structure enclosure and architectural coating, and paving and exterior landscaping. Demolition activities are anticipated to generate approximately 7,607 tons of demolition debris (asphalt and general construction debris). The Proposed Project would export approximately 296,915 cubic yards of soil during grading and excavation activities. Heavy-duty equipment, vendor supply trucks and concrete trucks would be used during construction of foundations, parking structures, and buildings.

Daily regional criteria air pollutant emissions for the different phases of construction were forecasted based on construction activities, on-road and off-road mobile sources, and fugitive dust emission factors associated with the specific construction activity. Over the course of the construction schedule, the length of workdays would vary in range from 8 hours to 24 hours. Over the course of a day or shift, usage would vary depending on the equipment and type of work being performed. For example, during each 8-hour shift, equipment would be operating for seven hours per shift since the workday would include equipment downtime for lunch breaks and safety meetings. During the building construction phase of the Arena Structure, a majority of the construction days would be 16-hour workdays, but periodically days could also require 24-hour workdays. The 24-hour workdays would be required during a variety of activities, including but not limited to construction such as foundation concrete pours, well-drilling, and construction of portions of the arena bowl involving placement of precast segments on the Arena Site. The 24-hour workdays would be required for a number of reasons, including technical requirements of certain construction techniques, worker safety, labor rules, and avoidance of conflicts on City streets and highways in the vicinity. Details regarding workday assumptions can be found in Appendix D.

Off-road mobile source emissions would result from the use of heavy-duty construction equipment such as bulldozers, loaders, and cranes. These off-road mobile sources emit VOC, NO_x, CO, SO₂, PM₁₀, and PM_{2.5}. The emissions were estimated using CalEEMod (Version 2016.3.2) software, an emissions inventory software program recommended by SCAQMD. CalEEMod is based on outputs from the OFFROAD model and Emission FACTor (EMFAC) model, which are emissions estimation models developed by CARB and used to calculate emissions from construction activities, heavy-duty off-road equipment, and on-road vehicles. Activities parameters, such as number of pieces of equipment and equipment usage hours were provided by the applicant.

Fugitive dust emissions (using PM₁₀ as a surrogate) during construction activities were estimated in CalEEMod, which are based on the methods described in the US EPA AP-42 Compilation of Air Pollutant Emission Factors.¹²³ During the application of architectural coatings, evaporation of solvents contained in surface coatings result in VOC emissions. CalEEMod was used to calculate VOC emissions based on the building surface area and the default VOC content provided by the

¹²³ US Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emissions Factors, Chapter 13: Miscellaneous Sources, <https://www3.epa.gov/ttn/chief/ap42/ch13/index.html>. Accessed April 25, 2019.

air district or CARB's statewide limits. Asphalt paving of parking areas are another source of VOC emissions. CalEEMod was used to calculate VOC off-gassing emissions based on the parking lot size and SCAQMD default emission factor.

On-road mobile sources also have the potential to generate temporary criteria air pollutant emissions through workers and haul trucks traveling to and from the Project Site during construction. Daily truck trips and trip lengths were based on information provided by the project applicant. Emission factors for passenger vehicles and heavy-duty trucks used the regional emission factors generated from the EMFAC model 2017 (EMFAC2017), the most recently approved version by the US EPA. EMFAC2017 "represents [California Air Resources Board's] current understanding of motor vehicle travel activities and their associated emission levels."¹²⁴ Mobile emission factors vary by speed where vehicles traveling at low speeds have higher emission rates, as seen in the EMFAC2017 data. Additional information is provided in Appendix D. On-road mobile sources related to project construction activities were conservatively assumed to travel at 5 miles per hour (mph) within the local study area (refer to section below, Localized Emissions and Analysis Methodology, for a discussion of the local study area). The 5 mph corresponds to the slowest speeds and the highest emission rates, as seen in the EMFAC2017 data. On-road mobile sources outside of the local study area were assumed to travel at an average speed for all vehicle travel as calculated through the EMFAC2017 model for the SCAQMD region. The total mobile source emissions from traveling to and from the Project Site were calculated using the trip rates, trip length, and emission factors. Although CARB restricts idling times to no more than 5 minutes at any one location, it was conservatively assumed that truck idling activities would total 15 minutes per trip, representing three separate 5-minute idling occurrences: check-in to the Project Site or queuing at the site boundary upon arrival, on-site idling during loading/unloading, and check-out of the Project Site or queuing at the site boundary upon departure.¹²⁵

Regional Operational Emissions Methodology

Operation of the Proposed Project would generate criteria air pollutant emissions from Project-generated vehicle trips traveling to and from the Project Site, energy sources such as natural gas combustion, and area sources such as operation of landscaping equipment and use of consumer products, including solvents used in non-industrial applications which emit VOCs during their product use, such as cleaning supplies, kitchen aerosols, cosmetics and toiletries. The Proposed Project would also produce criteria air pollutant emissions from on-site diesel-fueled emergency generators, charbroilers, cooling tower, delivery trucks, and transport refrigeration units (TRUs) used in delivery trucks. Operational impacts were assessed for the full Proposed Project buildout year of 2024, as well as the existing uses.¹²⁶ Daily maximum criteria air pollutant emissions were compared with SCAQMD thresholds for operation to determine the operational impacts of the Proposed Project. Regional operational air quality impacts of the Proposed Project air emissions

¹²⁴ California Air Resources Board, Mobile Source Emissions Inventory, <https://www.arb.ca.gov/emfac/2017/>. Accessed April 25, 2019.

¹²⁵ California Air Resources Board, 13 CCR Section 2485, 2016. Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling, September 2016.

¹²⁶ Proposed Project operations would begin July 2024 resulting in approximately six months of Arena operations during 2024.

were assessed based on the incremental increase in emissions compared to existing conditions. While air pollutant emissions from the demolition of the existing groundwater well and related facilities on site and the construction of the relocated groundwater well and related facilities was calculated and included as net new, the operational emissions of the relocated groundwater well and related facilities “net out” since operations will not change once relocated.

The on-road mobile sources related to the operation of the Proposed Project would include passenger and employee vehicles, Transportation Network Company (TNC) vehicles, shuttles for event attendees, employees, players and supporting staff, delivery trucks, media vans, charter buses, micro-transit vehicles, and paratransit vehicles, and vehicles associated with the ancillary land uses, including the hotel and restaurant/retail land uses.

VMT data, which takes into account mode (vehicle trip types including private attendee vehicles, transportation network company vehicles, employees, shuttles, and miscellaneous vehicles), ridership (occupancy per vehicle), and trip lengths, was developed for the transportation analysis presented in Section 3.14, Transportation and Circulation, and is provided in Appendix K. Emissions from motor vehicles are dependent on vehicle type. Thus, the emissions were calculated using a representative motor vehicle fleet mix for the Proposed Project based on information provided in Appendix K and EMFAC default fuel type.

For vehicle trips associated with the proposed Arena, the vehicle trips associated with spectators, event-day staff, and employees would be primarily passenger vehicles, so the default SCAQMD fleet mix was adjusted for a passenger fleet mix of light-duty autos, motorcycles, light duty trucks, and medium-duty vehicles to estimate passenger fleet-average emission factors. For trips associated with TNC vehicles, the default SCAQMD fleet mix was adjusted for a TNC vehicle fleet mix of light-duty autos, light duty trucks, and medium-duty vehicles to estimate TNC fleet-average emission factors. For vehicle trips associated with shuttles used to transport attendees and employees, the default SCAQMD fleet mix was adjusted for a shuttle fleet mix of light-heavy duty trucks to estimate shuttle fleet-average emission factors. For vehicle trips associated with miscellaneous vehicles, the default SCAQMD fleet mix was adjusted for a miscellaneous vehicle fleet mix of medium-heavy duty and heavy-heavy duty trucks to estimate miscellaneous vehicle fleet-average emission factors. For ancillary land uses, including the hotel and restaurant/retail land uses, the default SCAQMD fleet mix was used to estimate fleet-average emission factors.

For the Proposed Project Arena and associated events, trips lengths were also separated into three trip length segments with different vehicle speeds. As stated above, vehicles traveling at low speeds have higher emission rates on a gram per mile basis.

The first trip length segment was defined as the distance each vehicle trip travelled on residential and business district roadways to and from freeways from the point of the trip origin to the nearest freeway. These vehicles were modeled traveling at a speed of 25 mph, the lowest (and

most conservative for emissions) posted speed limit typical on these roadways.¹²⁷ This length was modeled as 5 miles because Los Angeles County census data and Geographic Information System mapping shows that 98 percent of the Los Angeles county population lives within 5 miles of a freeway.¹²⁸

The second trip length segment was defined as the distance each event-related vehicle trip travelled on freeways to the Project Site. Emissions were modeled based on freeway speed data from the California Department of Transportation (Caltrans) Performance Measurement System (PeMS) for the freeways closest to the Project Site. These vehicles were calculated to travel at a speed of approximately 40 mph.¹²⁹ This trip length varied since it was the total trip lengths of the various trip types (attendee vehicles/attendee TNC vehicles, employee vehicles/employee TNC vehicles, attendee shuttles/employee shuttles, and miscellaneous vehicles) minus the first trip length segment of 5 miles and the last trip segment lengths of 1.3 miles. The 1.3-mile segment trip length is defined as the distance within the local study area and is further described in the next paragraph. Both the first segment of 5 miles and the last segment of 1.3 miles are the same for all trip types for every Proposed Project event type, except for attendee/employee shuttles (based on information in Appendix K).¹³⁰ This method was applied to all 40 mph trip length segments (e.g., for an NBA game event, attendee vehicles/attendee TNC vehicle trip types have a total trip length of 22.2 miles and subtracting the first segment of 5 miles and last segment of 1.3 miles, results in a second segment trip length of 15.9 miles). The trip length segment derivations for the other trip types analyzed are detailed in Appendix D.

The third trip length segment was defined as the distance each vehicle would travel in the local study area (refer to section below, Localized Emissions and Analysis Methodology, for a discussion of the local study area), where vehicles were conservatively assumed to travel at 5 mph corresponding to slowest speeds and the highest emission rates, as seen in the EMFAC2017 dataset, conservatively representing pre-event traffic congestion conditions. This

¹²⁷ California Department of Motor Vehicles, California Driver Handbook-Laws and Rules of the Road, https://www.dmv.ca.gov/portal/dmv/detail/pubs/hdbk/speed_limits+. Accessed June 25, 2019.

¹²⁸ The average distance used for the first trip length segment was determined by ESA using GIS where it was determined that 98 percent of the Los Angeles County population lives within 5 miles of a freeway. Los Angeles County Enterprise GIS, Los Angeles County GIS Data Portal, 2019, <http://egis3.lacounty.gov/egis/>. Accessed July 22, 2019. ¹²⁹ The average speed for the third trip length was determined by averaging the vehicle speeds on the closest freeways (I-405-N, I-405-S and I-105-E) to the Project Site at the peak rush hour of 5 to 6 P.M hour to account for slower freeway hour traffic for the 2018 year based on Caltrans Performance Measurement System (PeMS) data. Caltrans, PeMs, I-405-N Post Mile 22.68, I-405-N Post Mile 29.5; I-105-E Post Mile 2.82, I-105-E Post Mile 7.2; I-405-S Post Mile 22, I-405-S Post Mile 29.5. In addition, the average speed for travel on freeways around Downtown Los Angeles was also evaluated (I-110 N, I-110-S and I-10-E and I-10-W) at the peak rush hour of 5 to 6 P.M hour to account for slower freeway hour traffic for the 2018 year based on Caltrans PeMs data. Caltrans, PeMS, I-110-N Post Mile 15.1 to 24.46, I-110-S Post Mile 15.36 to Post Mile 23.8, I-10-E Post Mile 12.95 to 17.6, I-10-W Post Mile 12.95 to Post Mile 17.57. <http://pems.dot.ca.gov/>. Accessed June 27 and July 27, 2019.

¹³⁰ Events types at the Proposed Project include NBA Games, Concerts (small, medium, and large), Family Shows, Corporate/Community Events, Other Events and Plaza Events (see Appendix K).

length was modeled as 1.3 miles and is based on the distribution of vehicles travelling on roads from the east west, north, and south directions from the Arena.

To account for round trips, the same logic is applied to the three segment types, starting with the Local Study Area and ending with the 5 miles from freeway to the final destination. Vehicles emissions from the Proposed Project non-arena land uses were modeled using the average speed for all vehicle travel in the SCAQMD region as determined through EMFAC2017 (see Appendix K).

CARB's EMFAC2017 was used to generate emissions factors for all operational mobile sources based on speed. The model was run in the emissions mode (also referred to as the "Burden" mode) to generate SCAQMD-specific vehicle fleet emission factors in units of grams per mile. The speed-specific emission factors were then applied to the project-specific daily VMT to obtain daily mobile source emissions in grams per day.¹³¹

The operational area and energy emissions from the Proposed Project were estimated using the CalEEMod software. Energy source emissions were based on natural gas (building heating and water heaters) and area source emissions are based on architectural coatings, landscaping equipment, and consumer product usage rates provided in CalEEMod. Natural gas usage factors in CalEEMod were based on the California Energy Commission California Commercial End Use Survey (CEUS) data set, which provides energy demand by building type and climate zone.¹³² However, since the data from the CEUS is from 2002, correction factors were incorporated into CalEEMod to account for the most recent 2019 Title 24 Building Energy Efficiency Standards that would be applicable to the Proposed Project.¹³³ Default parameters were used when Project-specific data was not available. Because lighting and air handling will be controlled by zone within the Arena, it is estimated that large events (12,000 or more attendees) required full arena energy demand and generate 100 percent of the area emissions of a full Arena, medium events (between 5,000 and 10,000 attendees) required 80 percent of the full arena energy demand and generate 80 percent of the area emissions of a full Arena, and small events (less than 5000 attendees) required 25 percent of the full arena energy demand and generate 25 percent of the area emissions of a full Arena. For plaza events, the Arena would not be in use, and such events would only include a plaza activity.

Stationary-source emissions were estimated separately outside of the CalEEMod software as certain stationary sources such as restaurant charbroilers are not accounted for in CalEEMod. Charbroiling emissions were calculated based on emissions factors available from SCAQMD. In order to provide a conservative analysis, it was assumed that the restaurant uses would charbroil meat with relatively high emission factors (i.e., hamburger meat and chicken). The quantity of meat charbroiled in the restaurant uses were based on survey data from SCAQMD and San

¹³¹ Project-specific emission factors do not account for reductions in mobile source air pollutant emissions that would result from all required on- and off-site GHG emission reduction measures set forth in Mitigation Measure 3.7-1(a). Thus, the emission factors may result in a slight overstatement of emissions from mobile sources during Project operations.

¹³² California Energy Commission, California Commercial End-Use Survey, <http://capabilities.itron.com/CeusWeb/Chart.aspx>. Accessed March 22, 2018.

¹³³ California Energy Commission, 2018. 2019 Building Energy Efficiency Standards, March 2018.

Joaquin Valley Air Pollution Control District. The estimated emissions account for reductions from compliance with emissions control requirements consistent with SCAQMD Rule 1138.

Stationary sources would also include an on-site cooling towers to assist in dissipating heat from commercial processes of the Proposed Project, and would utilize 4,800,000 gallons annually (refer to the Water Supply Assessment prepared for the Proposed Project and Appendix M). Emissions from the cooling tower occur as a result of air containing chemical impurities passing through the cooling water in the tower where some of the liquid water is entrained into the air stream and carried out of the tower as “drift” droplets where the particulate matter constituent of the drift droplets may be classified as an emission. Large drift droplets often settle out of the tower exhaust air stream and deposit near the tower, while other drift droplets may evaporate before being deposited in the area surrounding the tower, and they also can produce PM emissions. To estimate daily emissions, particulate matter emission factors for wet cooling towers calculated by the US EPA were used, conservatively assuming it would operate 24 hours a day, every day of the year using the above-mentioned daily flow rate.¹³⁴

Additionally, the Arena Site would include up to two stationary emergency generators with an estimated total capacity rated at approximately 2,400 kilowatts (kW) to provide emergency power primarily for lighting and other emergency building systems and two emergency fire pumps with an estimated total capacity rated of 300 kW to provide water for the fire suppressant system. Emergency generator and fire pump emissions were calculated based on compliance with applicable federal emissions standards and compliance with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. This analysis also assumed that the emergency generators and fire pumps would operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit).

Delivery truck emissions generated from traveling to and from the Project Site, as well as on-site idling were based on the proposed loading dock capacity at the Arena and emission factors from EMFAC2017. The maximum number of delivery trucks were assumed with half of the delivery trucks consisting of TRUs to account for trucks transporting goods that require refrigeration. Delivery trucks emissions were based on one hour of operation per truck per day and emission factors from CARB.^{135,136}

Localized Emissions and Analysis Methodology

Localized construction and operations related NO_x, CO, PM10, and PM2.5 emissions concentrations were estimated to determine if the Proposed Project would generate significant

localized air quality impacts that could substantially affect air quality sensitive receptors in the vicinity of the Project Site.

The localized off-site emissions analysis focused on an approximately 1.3 mile radius from the Project Site, which is referred to in this analysis as the local study area, rather than the full trip length assumed under the regional construction and operational emission calculations.¹³⁷ The local study area was the focus of this analysis because it would result in the highest incremental increase in ambient air pollutant concentration due to capturing the emissions from the Proposed Project on-site site construction, on-site operations, and the four intersections experiencing the maximum traffic volumes surrounding the Project Site. The local study area was assumed to capture the maximum localized emissions because vehicles associated with construction and operations tend to dissipate the farther they travel from the Project Site while increasing speed, thus reducing emission rates with increased distance.

Similar to the regional impact analysis, CARB's EMFAC2017 was used to generate emissions factors for construction and operational mobile sources for the localized impact analyses. The mobile emissions associated with the Proposed Project in the local study area were calculated using the fleet mix information provided in Appendix K and the average vehicle speed assumption of 5 mph to account for reduced vehicle speeds due to traffic congestion.¹³⁸ The mobile source emissions from the post-event hour were assumed to be the highest based on the expected number of vehicles on the road, increased traffic congestion, and associated low vehicle speeds. As previously mentioned, vehicles traveling at low speeds have higher emission rates. Detailed information regarding vehicle fleet mix and emission factors by speed is provided in Appendix D.

The Proposed Project localized construction and operations emissions were then apportioned into the US EPA AMS/EPA Regulatory Model (AERMOD) model to generate concentrations of NO_x, CO, PM₁₀, and PM_{2.5} at receptor locations surrounding the Project Site (see *Air Dispersion Modeling*, below, for more details). In addition, to evaluate the contribution to future localized levels of CO and NO₂ from future traffic activity associated with the HPSP Adjusted Baseline projects (including events at the NFL Stadium) and events at The Forum, emissions were calculated generally following the methodology presented above for the Proposed Project-related mobile sources assumed to operate in the local study area.

The ambient pollutant concentrations of NO_x, CO, PM₁₀, and PM_{2.5} surrounding the Project Site are listed in Table 3.2-2, above, for years 2015–2017, and were established based on measurements from the most representative SCAQMD Monitoring stations in the SRA 2 receptor area. As mentioned above, the LAX-Hastings Monitoring Station is the most representative of the

¹³⁷ In compliance with PRC § 21151.8 (a)(2).

¹³⁸ City/County Association of Government of San Mateo County, 2014. Appendix B-Traffic Level of Service Calculation Methods, 2014.

air quality conditions surrounding the Project Site and was used to determine ambient levels of NO_x and CO.

As described in Section 3.2.1, since the Air Basin is non-attainment for the PM₁₀ and PM_{2.5} standards, SCAQMD has established incremental increase thresholds of 10.4 µg/m³ (for construction) and 2.5 µg/m³ (for operations), and ambient background levels are not required.

As described in Section 3.2.1, ambient levels for CO and NO_x at the Project Site are below the NAAQS and CAAQS. The Proposed Project is considered to have a significant impact if local levels of these pollutants from future Project-related emissions in addition to ambient concentrations of CO and NO_x under Adjusted Baseline conditions result in an exceedance of one or more of the CO and NO_x NAAQS and CAAQS. Details regarding the modeling methodology can be found in *Intersection Hotspot Analysis*, below.

During construction of the Proposed Project, the highest localized air quality impacts were assumed to occur when the NFL Stadium and The Forum would experience full-capacity events overlapping with construction of the Proposed Project. To estimate the highest potential impacts from the Proposed Project, construction was assumed to occur simultaneously with a major event at the NFL Stadium and a concert at The Forum on the same day. This infrequent but potential occurrence would be expected to result in the highest construction localized air quality impacts. As discussed in Project Design Feature-3.2-1, heavy duty construction trucks (import, export, delivery, etc.) would be prohibited from traveling to and from the Project Site during the pre-and post-event hours on days with major events at the NFL Stadium and/or The Forum.

During operation of the Proposed Project, the potentially highest localized air quality impacts are expected to occur when the Project Site hosts a major event (i.e., sold-out concert) and the NFL Stadium and The Forum experience full-capacity events on the same day. This scenario was analyzed by applying the maximum peak hour volumes for a major event at the Project Site, major events at The Forum and NFL Stadium, and maximum peak hour volumes for the ancillary uses at the HPSP. It was assumed these maximum peak hour volumes would occur simultaneously within the local study area. This scenario is expected to represent the highest operational localized air quality impacts from event attendees and normal traffic.

For pollutants with annual concentration standards—NO₂ and PM₁₀—annual Proposed Project construction and operations were modeled concurrently with the presumed annual event schedules for the NFL Stadium and The Forum as described in Section 3.14, Transportation and Circulation. The analyses listed in **Table 3.2-7** were conducted for localized construction and operational impacts.

Air Dispersion Modeling

To evaluate local impacts for construction and operation of the Proposed Project, air dispersion modeling was completed using the AERMOD model with five years of meteorological data from the Hawthorne Airport (SCAQMD Station ID KHHR), the closest and most representative meteorological monitoring station. The AERMOD model was used to simulate the movement of Proposed Project-related air pollutants from construction and operation activities through the air, and to generate concentrations of those pollutants at numerous receptor locations surrounding the Project Site. Similarly, the AERMOD model was used to simulate the movement of vehicle trips associated with Adjusted Baseline CO and NO_x emissions and generate air concentrations at the receptor locations surrounding the Project Site. The estimated concentrations provide conservative estimates and tend to overestimate actual impacts and therefore may not represent actual occurrences.¹³⁹ The modeled concentration values were compared to the regional and localized thresholds, as discussed above in *Localized Emissions and Analysis Methodology*, as well as the health risk assessment calculations that are discussed below.

The AERMOD model requires the placement of receptors, which represent the geographic locations where impacts from the Proposed Project emissions were calculated. **Figure 3.2-3** shows the receptor network used in the localized significance threshold analysis. Receptors were located outside of the Proposed Project boundaries. A dense receptor grid was generated pursuant to Table B in the *SCAQMD Modeling Guidance for AERMOD* and the *Transportation Project-Level Carbon Monoxide Protocol (CO Protocol)* in order to adequately characterize the Proposed Project off-site impacts.¹⁴⁰

The methodology follows SCAQMD modeling guidance for AERMOD.¹⁴¹ **Table 3.2-8** lists the general model assumptions used in the localized significance threshold assessment.

Each of the emission sources that were included in the AERMOD air dispersion model consist of a particular emission source representation. The following definitions were used in defining the emission source representations referred to in **Table 3.2-9** and **Table 3.2-10**.

- Line area source: a series of area sources along a path (example: vehicular traffic along a street or freeway);
- Point source: a single identifiable local source of emissions; it is approximated in the AERMOD air dispersion model as a mathematical point in the modeling region with a location and emission characteristics such as height of release, temperature, etc. (example: a stack from a standby generator or a stack from a motor vehicle such as a truck);
- Area source: a large area where emissions are assumed to be uniformly distributed in the horizontal and vertical directions (example: parking area).

SOURCE: ESA, 2019.

Construction Modeling Assumptions – Local Air Quality Assessment

Table 3.2-9 summarizes the emission source characteristics during construction. For the unmitigated scenario, it was assumed that construction equipment would be in the “on” position for 8 hours or less, but ranged from 4 hours to 21 hours per day per day to conservatively estimate the Proposed Project maximum emissions.¹⁴² The construction was assumed to occur six days per week. Construction worker, hauling, and vendor truck trip rates are based on information provided by the applicant.

Operational Model Assumptions – Local Air Quality Assessment

The Project-specific operational information used in the AERMOD air dispersion model are provided in the Table 3.2-10. The facility operations assumed were represented in the model to demonstrate worst-case conditions.

Intersection Hotspot Analysis

Operation of the Proposed Project has the potential to generate traffic congestion and increase delay times at intersections within the local study area. The pollutant of primary concern when assessing the Proposed Project impacts at local intersections is CO because elevated concentrations of this pollutant tends to accumulate near areas of heavy traffic congestion and where average vehicle speeds are low. Tailpipe emissions are of concern when assessing localized impacts of CO along paved roads.

An adverse concentration of CO, known as a “hotspot,” would occur if there was an exceedance of the NAAQS or CAAQS. SCAQMD does not currently have guidance for conducting intersection hot spot analysis. However, Caltrans has guidance for evaluating CO hot spots in their Transportation Project-Level Carbon Monoxide Protocol (CO Protocol) (Caltrans, 1997). Detailed guidance discussing which modeling programs to use, calculating emission rates, receiver placement, calculating 1-hour and 8-hour concentrations, and utilizing background concentrations are provided in the Caltrans’ CO Protocol.

As recommended in the CO Protocol, hotspot modeling utilized Caltrans’ CALINE4 model and emission rates obtained from CARB’s EMFAC2017 to determine the maximum potential pollutant concentrations generated by the Proposed Project. Hotspot modeling was conducted for the Adjusted Baseline and three scenarios with the Proposed Project.

A detailed review of the traffic data presented in Section 3.14, Transportation and Circulation, identified the four intersections in the vicinity of the Project Site that demonstrated the most degraded Level of Service (LOS) and highest vehicle volumes associated with the Proposed Project. Logically, if these four intersections demonstrate CO concentrations less than the required thresholds, all other affected intersections would also be below the thresholds and thus not create hotspots. Additionally, SCAQMD conducted CO modeling for the 2003 AQMP for the

¹⁴² Construction equipment would not operate in the “on” position for the full duration of a workday. Equipment would not be operating during safety meetings, breaks, and lunch hours. Details on the types of workdays and equipment usage hours are found in Appendix D.

four worst-case intersections in the Air Basin: (1) Wilshire Boulevard and Veteran Avenue; (2) Sunset Boulevard and Highland Avenue; (3) La Cienega Boulevard and West Century Boulevard; and (4) Long Beach Boulevard and Imperial Highway. The evidence provided in the 2003 AQMP shows that the peak modeled CO concentration due to vehicle emissions at these four intersections would not exceed the NAAQS.

As previously stated, CO emission rates increase, and ground-level concentrations tend to accumulate when speeds are low. Therefore, three speed bins were analyzed (5, 10, and 15 miles per hour) extending out for a total distance of 500 feet from each intersection. As the CO Protocol states, “[t]he recommended length for approach and departure links is 150 meters [approximately 500 feet].” Existing background concentrations obtained from the nearest monitoring station were included within the modeling input parameters. Additionally, the CO Protocol recommends the following, “receptor locations for a 1-hour analysis should be 3 meters [approximately 10 feet].” Therefore, receptors were placed around intersections at worst-case curbside locations, approximately 10 feet from the edge of roadway, and within locations accessible to the public.

The results of the hotspot modeling were compared to the applicable NAAQS and CAAQS to determine if the operation of the Proposed Project in addition to background concentrations and mobile sources assumed to operate in the local study area (i.e., traffic generated from neighboring NFL games and other events at The Forum) would create a hotspot at intersections.

Health Risk Assessment

The Proposed Project would emit TACs during construction and operation, exposure to which may result in an increase in carcinogenic and non-carcinogenic health risks on the residents and other air quality sensitive receptors in the vicinity. An HRA was prepared to evaluate the risk of potential negative health outcomes (cancer, or other acute or chronic conditions) related to TACs exposure from airborne emissions during Proposed Project construction and operation. Non-cancer health risks are shorter-term in nature, and were assessed separately for construction and operation. However, the incremental increase in lifetime cancer risk is assessed over longer exposure time periods (i.e., 30-year for residential receptors). Thus, the potential effects of Project-related carcinogenic TACs included the combination of exposure to construction-related activities and those from the exposure of operation-related activities.

The HRA followed the procedure and methods provided in the *Guidance Manual for Preparation of Health Risk Assessments* issued by Office of Environmental Health Hazard Assessment (OEHHA) in 2015, as well as the methods the SCAQMD’s *Risk Assessment Procedures for Rule 1401, 1401.1, and 212, version 8.1*, used in conjunction with the associated *SCAQMD Permit Application Package “N.”*^{143,144,145} The procedure involved emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure

¹⁴³ Office of Environmental Health Risk Assessment, 2015. Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015.

¹⁴⁴ South Coast Air Quality Management District, 2017. Risk Assessment Procedures for Rule 1401, 1401.1, and 212, Version 8.1, September 1, 2017.

¹⁴⁵ South Coast Air Quality Management District, 2017. Permit Application Package “N”, September 1, 2017.

routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels. The revised 2015 OEHHA Guidance takes into account the sensitivity of children to TAC emissions, breathing rates, and time spent at home since children have higher breathing rate compared to adults and would likely spend more time at home resulting in longer exposure durations.

The TAC emissions of the Proposed Project were generated from mobile sources including gasoline powered passenger vehicles and diesel-powered heavy-duty trucks, emergency generators, and emergency fire pumps. These sources generate total organic gases (TOG) and PM10 from combustion of gasoline and diesel fuels. Gasoline and diesel TOG and PM10 emissions are composed of MSATs in varying distributions resulting in a speciation profile. The speciation profile represents the MSAT's weight fraction of TOG and PM10. In order to determine a MSAT's contribution to health impacts, the weight fraction of an MSAT is multiplied by the total TOG or PM10 emissions. For example, diesel exhaust PM10 emissions (DPM) contain arsenic and arsenic has a weight fraction of 5×10^{-6} . Therefore, the total arsenic emissions equal total DPM emissions multiplied by the weight fraction of arsenic. All MSAT emissions were derived using this method. Weight fractions for MSATs were based on information from Caltrans' CT-EMFAC and CARB speciation profiles.^{146,147}

For construction, the potential emission sources of MSATs and DPM were diesel-fueled heavy-duty equipment, on-road travel and idling emissions from diesel-fueled haul trucks, and on-road travel emissions from gasoline-fueled worker vehicles. For operation, the potential emission sources were on-site diesel-fueled emergency generators and fire pumps, diesel-fueled delivery trucks, diesel-fueled delivery truck TRUs, and gasoline-fueled passenger vehicles travelling to and from the Project Site. Since MSATs and DPM have cancer and non-cancer health effects, the impacts of being exposed to these emissions during construction and operation were evaluated on a short term and annual basis.

As described in detail above in *Localized Emissions and Analysis Methodology*, air dispersion model runs were conducted to simulate annual air concentrations at air quality sensitive receptors for the duration of construction and for the following years of operation of the Proposed Project. Annual air concentrations were compared to OEHHA's Cancer Potency Factor (CPF) to evaluate the incremental increase in lifetime cancer risk and Recommended Exposure Level (REL) to evaluate acute and chronic health effects. The receptor with the highest annual concentration was identified and the associated incremental increase in lifetime cancer risk and hazard index was calculated as described below. The maximum incremental increase in lifetime cancer risk is compared to the SCAQMD threshold of 10 in one million and the maximum hazard index is compared to the SCAQMD threshold for Acute and Chronic Hazard Indices (1.0). The cancer burden is compared to the SCAQMD threshold of 0.5 excess cancer cases in areas where the

¹⁴⁶ California Air Resources Board, Speciation Profiles Used in ARB Modeling, January 2018, <https://www.arb.ca.gov/ei/speciate/speciate.htm#specprof>. Accessed June 23, 2019.

¹⁴⁷ California Department of Transportation, Project Level Air Quality Analysis, <http://www.dot.ca.gov/env/air/air-analysis.html>. Accessed June 23, 2019.

project-related incremental increase in lifetime cancer risk equals or exceeds 1 in one million. The SCAMD's thresholds for incremental increases in lifetime cancer risk and Hazard Indices apply to all regions of the Basin, regardless of the existing risks posed by exposure to ambient levels of airborne TACs. For example, as discussed above, the individual increase in cancer risk due to TAC exposure in the project vicinity is 1,000 in one million and the lifetime risk of cancer, regardless of cause, to the general population is 384,000 in one million.

The incremental increase in lifetime cancer risk values for TAC emissions consider exposure via the inhalation pathway. The potential exposure through other pathways (e.g., ingestion) requires substance and site-specific data, and the specific parameters for DPM are not known for these pathways.¹⁴⁸ The OEHHA Guidance recommends the incorporation of several factors to quantify the carcinogenic compound dose via the inhalation pathway. Once determined, the dose is multiplied by the compound-specific inhalation cancer potency factor to derive the incremental increase in lifetime cancer risk estimate. The dose takes into account the concentration at an air quality sensitive receptor. The cancer potency factor is compound specific. In performing health risk calculations, carcinogenic compounds are not considered to have threshold levels (i.e., dose levels below which there are no risks). Any exposure, therefore, will have some associated risk.

Incremental health risks associated with exposure to carcinogenic compounds is defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. Under a deterministic approach (i.e., point estimate methodology), the incremental increase in lifetime cancer risk probability is determined by multiplying the chemical's annual concentration by its unit risk factor (URF). For example, the URF for DPM recommended by the Scientific Review Panel¹⁴⁹ is 3.0×10^{-4} per microgram per cubic meter ($\mu\text{g}/\text{m}^3$). This value corresponds to a Cancer Potency Factor (CPF) of 1.1 per milligram/kilogram (body weight) per day ($\text{mg}/\text{kg}(\text{bw})\text{-day}$). The URF for DPM means that for receptors with an annual average concentration of $1 \mu\text{g}/\text{m}^3$ in the ambient air, the probability of contracting cancer over a lifetime of exposure is 300 in one million. This approach for calculating the incremental increase in lifetime cancer risk is intended to result in conservative (i.e., health protective) estimates of health impacts and is used for assessing risks to air quality sensitive receptors. The estimation of health risks is calculated as follows:

Equation 1: $\text{Dose}_{\text{RESIDENT}} (\text{mg}/\text{kg}/\text{day}) = C_{\text{AIR}} \times \text{DBR} \times A \times \text{EF} \times \text{CF}$ where:

- C_{air} = concentration in air ($\mu\text{g}/\text{m}^3$)
- DBR = daily breathing rate normalized to body weight (L/kg body weight-day)
- A = inhalation absorption factor (1 for DPM, unitless)
- EF = exposure frequency (unitless) (days/365 days)
- CF = 10^{-6} , correction factor, micrograms to milligrams conversion, liters to cubic meters conversion

¹⁴⁸ California Air Resources Board, 1998. Report to the Air Resources Board on the Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, April 22, 1998.

¹⁴⁹ The Scientific Review Panel is charged with evaluating the risk assessments of substances proposed for identification as TACs by CARB, OEHHA, and the Department of Pesticide Regulation (DPR), and the review of guidelines prepared by OEHHA.

Equation 2: $\text{Risk}_{\text{INH-RESIDENT}}$ (in one million) = $\text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \text{ED/AT} \times \text{FAH} \times \text{CCF}$
 where:

- Dose_{AIR} = daily inhalation dose (mg/kg-day)
- CPF = cancer potency factor (mg/kg-day)⁻¹
- ASF = age sensitivity factor (unitless)
- ED = exposure duration (years)
- AT = averaging time for lifetime cancer risk (years)
- FAH = fraction of time spent at home (unitless)
- $\text{CCF} = 10^6$, cancer conversion factor to represent risk in chances per million

Equation 3: $\text{Dose}_{\text{WORKER-STUDENT}}$ (mg/kg/day) = $[\text{C}_{\text{AIR}} \times \text{WAF}] \times \text{DBR} \times \text{A} \times \text{EF} \times \text{CF}$ where:

- C_{air} = concentration in air (µg/m³)
- WAF = worker adjustment factor (unitless), $\text{WAF} = (\text{H}_{\text{residential}} / \text{H}_{\text{source}}) \times (\text{D}_{\text{residential}} / \text{D}_{\text{source}}) = (24/8) \times (7/6) = 3.5$
- DBR = daily breathing rate normalized to body weight (L/kg body weight-day)
- A = inhalation absorption factor (1 for DPM, unitless)
- EF = exposure frequency (unitless) 0.68 (250 days / 365 days). Equivalent to workdays per year
- $\text{CF} = 10^{-6}$, correction factor, micrograms to milligrams conversion, liters to cubic meters conversion

Equation 4: $\text{Risk}_{\text{INH- WORKER-STUDENT}}$ (in one million) = $\text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \text{ED/AT} \times \text{CCF}$
 where:

- Dose_{AIR} = daily inhalation dose (mg/kg-day)
- CPF = cancer potency factor (mg/kg-day)⁻¹
- ASF = age sensitivity factor (unitless)
- ED = exposure duration (years)
- AT = averaging time for lifetime cancer risk (years)
- $\text{CCF} = 10^6$, cancer conversion factor to represent risk in chances per million

A summary of the exposure parameters used under this methodology are shown in **Table 3.2-11**.

Age Sensitivity Factors

The estimated excess incremental increase in lifetime cancer risks for residential receptors (including the early-in-life exposure) were adjusted using the ASFs recommended in Cal/EPA OEHHA Technical Support Document and 2015 OEHHA guidance. This approach accounts for an “anticipated special sensitivity to carcinogens” of infants and children. The incremental increase in lifetime cancer risk estimates were weighted by a factor of 10 for exposures that occur

from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from 2 to 15 years of age. No weighting factor (i.e., an ASF equal to one, which is equivalent to no adjustment) was applied to ages 16 to 30 years.

**TABLE 3.2-11
 CANCER RISK EXPOSURE PARAMETERS**

Parameter	Residential				School (Child)	Early Childhood Education (Child)	Worker (Adult)
	3rd Trimester	0 < 2 years	2 < 16 years	16 < 30			
C_{AIR} ($\mu\text{g}/\text{m}^3$)	Based on AERMOD dispersion modeling results						
DBR ^a (L/kg BW-day)	361	1090	572	261	631	631	230
A ^b (unitless)	1	1	1	1	1	1	1
EF ^b (unitless)	0.96	0.96	0.96	0.96	0.68	0.68	0.68
CF ^b (unitless)	10 ⁻⁶	10 ⁻⁶	10 ⁻⁶	10 ⁻⁶	10 ⁻⁶	10 ⁻⁶	10 ⁻⁶
CPF ^b (mg/kg/day) ⁻¹	Pollutant Specific						
ASF ^b (unitless)	10	10	3	1	3	3	1

Cancer Risk Calculation

Excess incremental increase in lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to carcinogens. The risk is expressed as a unitless probability and was calculated as the number of cancer incidences per million individuals in the HRA. The incremental increase in lifetime cancer risk for each chemical was calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the CPF. The OEHHA-recommended CPFs are provided in **Table 3.2-12**.

For incremental increase in lifetime cancer risk, SCAQMD guidance identifies a significant impact if a project would result in an incremental increase in lifetime cancer risk that is greater than 10 per million for any receptor.

Chronic and Acute Health Impacts

Non-cancer effects of chronic (i.e., long-term) TAC exposures were evaluated using the Hazard Index (HI) approach consistent with the OEHHA guidance. The chronic HI was calculated by dividing the modeled annual average concentration by the Reference Exposure Level (REL). The REL is the concentration at or below which no adverse health effects are anticipated. The RELs for MSATs were obtained from OEHHA. The OEHHA-recommended chronic and acute RELs are provided in **Table 3.2-13**. SCAQMD guidance identifies a significant impact if a project would result in an incremental chronic and acute HI that is greater than 1.0.

The process of assessing health risks and impacts includes a degree of uncertainty. The level of uncertainty depends on the availability of data and the extent to which assumptions must be relied upon in cases where the data are incomplete or unknown. All HRAs rely upon scientific studies to reduce the level of uncertainty; however, it is not possible to eliminate uncertainty from the analysis. Where assumptions are used to substitute for incomplete or unknown data, it is standard practice in performing HRAs to err on the side of health protection to avoid underestimating or underreporting the risk to the public. In general, sources of uncertainty that may lead to an overestimation or an underestimation of the risk include extrapolation of toxicity data in animals to humans and uncertainty in the exposure estimates. In addition to uncertainty, there exists “a natural range or variability in measured parameters defining the exposure scenario,” and that “the greatest quantitative impact is variation among the human population in such properties as height, weight, food consumption, breathing rates, and susceptibility to chemical toxicants.”¹⁵⁰ As mentioned previously, it is typical to err on the side of health protection by assessing risk on the most sensitive populations, such as children and the elderly, by modeling potential impacts based on high-end breathing rates, by incorporating age sensitivity factors, and by not taking into account exposure reduction measures, such as mechanical air filtration building systems.

These conservative assumptions were implemented in the analysis contained within this Draft EIR and as detailed in Appendix D.

Population-Wide Risks (Cancer Burden)

If an incremental increase in a lifetime cancer risk from the Proposed Project exceeds the SCAQMD regulatory threshold of an incremental increase of 1 in one million, then an estimate of population level cancer burden is required.¹⁵¹ This is distinct from the cancer risk, which is the risk probability for an exposed individual. The burden calculations are conservative estimates of the number of cancer cases that could occur in the exposed populations. The impacts are considered significant if more than 0.5 cases are calculated for the Proposed Project.¹⁵²

¹⁵¹ South Coast Air Quality Management District. 2017. Risk Assessment Procedures for Rule 1401, 1401.1, and 212, Version 8.1, September 1, 2017.

¹⁵² South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>, revised March 2015. Accessed March 21, 2018.

Proposed Project risks for construction and operation impacts were evaluated for a 70-year residential scenario in order to determine population-wide risks.¹⁵³ The zone of impact is the area surrounding the Project Site that encompasses cancer risk values greater than or equal to 1 in one million and would be determined by modeling. The population-wide risks would be estimated for persons living within the zone of impact.

A census block group is a statistical area within a census tract that is assigned a population number. The 2019 population by block group was based on the 2010 census population available from the U.S. Census and then cross-referenced with the calculated cancer risks.¹⁵⁴ When multiple grid points were located within a block group, cancer risk was calculated as the average within the block group. The total cancer burden for the Proposed Project was determined as the sum of the individual census block group cancer burdens.

Health Impact Assessment (HIA)

Typically, the health impact of a particular criteria pollutant is analyzed by air districts on a regional scale based on how close the area is to attaining the NAAQS. Because air districts' attainment plans and supporting air model tools are regional in nature, they are not typically used to evaluate the impacts to ambient concentrations of criteria air pollutants, or to correlate those impacts to the potential resultant impacts to public health effects, from an individual project. The complex nature of criteria air pollutant dispersion and the complex atmospheric chemistry that occurs (especially in the case of ozone and fine particulate matter) limit the usefulness of applying the available models to predict health impacts on a project-level.

Nonetheless, it is recognized, for example, that health effects from ozone are correlated with increases in the ambient level of ozone in the air a person breathes.¹⁵⁵ Thus, to correlate the project-related change in regional air emissions of the Proposed Project to specific types of health effects, regional-level tools, like the US EPA's Community Multiscale Air Quality (CMAQ) model and the US EPA's Environmental Benefits Mapping and Analysis Program – Community Edition (BenMAP-CE) model, were integrated into a quantitative health impact assessment (HIA), where feasible, to provide information on possible health effects that may result from Proposed Project criteria air pollutants emissions.^{156,157} The current version of the US EPA BenMAP-CE model only has health impact functions associated with ozone and PM_{2.5}; therefore, the quantitative HIA only analyzed those two pollutants quantitatively and addressed the other criteria pollutants qualitatively. For this reason, it was infeasible to perform a quantitative analysis of other criteria air pollutant emissions based on existing modeling tools.

In order to determine the potential health impacts, mass emission rates from operation of the Proposed Project were distributed spatially and temporally. The dispersion of these pollutants was predicted using a photochemical grid model and meteorological data for a representative year to evaluate “worst case” dispersion of criteria pollutant emissions. A “baseline” model was run using SCAQMD emissions inventory data from their AQMP efforts to represent pollutant dispersion and corresponding health effects (like asthma-related or respiratory-related hospital admissions, etc.) without contribution from the Proposed Project. The criteria pollutant emissions from the Proposed Project were then combined spatially and temporally with the SCAQMD emission inventory data and run in a second model run. The two sets of results were then compared to analyze the difference in health impacts and the corresponding contribution from the operation of the Proposed Project.

The quantitative HIAs were performed for emissions of ozone (including precursor pollutants, NO_x and VOC) and PM_{2.5} (primary and secondary). These analyses used CMAQ, a photochemical grid model (PGM), to predict the potential increases in the regional ambient air concentrations of ozone and PM_{2.5} due to implementation of the Proposed Project. The modeling effort included developing meteorology, emissions, a chemical transport model, and other environmental conditions using third-party models and processing tools in order to model impacts in CMAQ. For meteorology, a regional model – the weather research and forecasting (WRF) model – and a chemistry interface processors (MCIP) was used in conjunction with CMAQ. Additional emissions and initial and boundary conditions models were used with CMAQ to calculate resulting ozone and PM_{2.5} concentrations. Proposed Project construction emissions were less than operation emissions on an average annual basis, localized and very small over the life of the Proposed Project (e.g., total construction emissions as compared to 30-year operation emissions is about 12 percent for NO_x and VOC, and less than 2 percent for PM), and therefore not included in the quantitative HIAs.

Daily PM_{2.5}, NO_x, and VOC emissions profile for an annual period were established by analyzing the estimated normal operational scenarios and schedule at the Project Site. To conservatively generate the worst-case incremental concentrations that could be induced by the Proposed Project, the HIA used the existing conditions sources for the year 2018 instead of Adjusted Baseline Environmental Setting sources. Contributions from the Adjusted Baseline would yield higher concentrations of NO₂ and VOC in the region of the Project Site, which could reduce the rate of formation of ozone from the Proposed Project. Studies, like that performed by the University of Michigan, have demonstrated that ozone formation increases with increasing NO_x emissions when ambient NO₂ is lower, and ozone can decrease with increasing NO_x emissions when ambient NO₂ is high.¹⁵⁸ Therefore, including the contribution from the Adjusted Baseline to background ambient concentrations could produce a less conservative analysis (i.e., smaller incremental ozone emissions than if using existing conditions sources).

¹⁵⁸ University of Michigan, Overview: Tropospheric ozone, smog and ozone-NO_x-VOC sensitivity, <http://www-personal.umich.edu/~sillman/ozone.htm>. Accessed July 22, 2019.

This analysis required comprehensive traffic data as provided in Appendix K for the Proposed Project. Regional emission inventories used for SIP purposes, which include spatial and temporal allocations of emissions, were provided by SCAQMD to represent background regional emissions. The inventory was provided for planning year 2025 and applied to the first year of Proposed Project operation, year 2024. This approach is conservative because regional concentrations of precursors NO₂ and VOC are expected to be reduced over time. As discussed above, an environment with lower ambient NO₂ concentrations could potentially result in increased ozone formation due to emissions from the Proposed Project. Proposed Project operation year 2024 is expected to observe the highest levels of emissions because emissions are expected to reduce over time as vehicle emission rates reduce. Emissions from the Proposed Project were allocated spatially and temporally and then added to the SCAQMD inventories.

Meteorological year 2014 was used for WRF modeling because it aligns with available data and the highest background regional concentrations of ozone; therefore, it was assumed to represent the most conservative meteorological year.

Next, the analyses used the US EPA's BenMAP-CE (version 1.5.0) model to estimate the resulting health impacts from minor changes in regional ambient PM_{2.5} and ozone concentrations. BenMAP-CE outputs included ozone- and PM- related health endpoints such as mortality, hospital admissions, and emergency room visits. As there are currently no guidance or thresholds for significance determination regarding health effects, the analysis compared the BenMAP-CE results to background (or baseline) health incident rates. Thus, the analyses do not conclude whether the predicted health effects are significant for CEQA purposes; rather, the predicted health effects are provided for informational purposes so as to enhance the understanding of the effects of impacts determined to be significant (e.g., Impacts 3.2-1 and 3.2-2) based on other measureable criteria.

The BenMAP-CE modeling used air quality grids that match the CMAQ modeling grids, and used BenMAP-CE – ready population datasets (generated using the EPA's PopGrid software based on the 2010 United States Census data) corresponding to these modeling grids. Besides the model's default parameters, datasets, and EPA standard health impact functions, southern California region-specific data were used to the extent possible to obtain health endpoint results that reflect the population and demographic characteristics of the region around the Project Site. In addition, the default pooling method was applied to synthesize the estimated incidence changes predicted by several studies for the same pollutant-health endpoint group combination. The quantitative HIA results are presented in Appendix D.

Project Design Features

The Proposed Project would include several project design features to reduce air pollutant emissions from Project construction and Project operations. Although these features are part of the Proposed Project, these features are expected to be incorporated as conditions of approval so that they will be enforceable by the City:

Construction Project Design Feature 3.2-1

The project applicant will implement the following construction equipment features for equipment operating at the Project Site, as well as the following construction protocols. These features and protocols would be included in applicable bid documents, and successful contractor(s) must demonstrate the ability to supply such equipment and comply with such protocols. Construction features would include the following:

- *The Project shall utilize off-road diesel-powered construction equipment that meets or exceeds the California Air Resources Board (CARB) and United States Environmental Protection Agency (US EPA) Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 horsepower (hp) or greater. Such equipment shall be outfitted with Best Available Control Technology (BACT) which means a CARB certified Level 3 Diesel Particulate Filter or equivalent.*
- *During plan check, the Project representative will make available to the lead agency and South Coast Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.*
- *Equipment such as concrete/industrial saws, pumps, aerial lifts, material hoist, air compressors, and forklifts must be electric or alternative-fueled (i.e., non-diesel). Pole power shall be utilized at the earliest feasible point in time, and shall be used to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel- or gasoline-powered generators, must be operated continuously, such equipment must be located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.*
- *To control dust emissions during soil disturbing phases such as demolition, site preparation, and grading and excavation, the Project shall apply water at least every 2 hours per day on active areas of disturbance and paved roads.*
- *Contractors will maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.*
- *Construction activities must be discontinued during second-stage smog alerts. Records of discontinued construction activities due to second stage smog alerts will be maintained on site by the contractor.*
- *Heavy duty construction trucks (import, export, delivery, etc.) would be prohibited from traveling to and from the Project Site during the pre-and post-event hours on major event days at the NFL Stadium and/or The Forum.*
- *All haul truck trips would be prohibited from leaving the site after 3:00 PM.*

Operations Project Design Feature 3.2-2

The project applicant will implement the following operational equipment requirements and operation protocols for equipment operating at the Project Site. These features would be included in applicable bid documents, and successful contractor(s) must demonstrate the ability to supply such equipment and comply with such protocols. Operation features would include the following:

- *All emergency generators used for Project operations shall be selected from the SCAQMD certified generators list and meet applicable federal standards for diesel emissions. For after-treatment of engine exhaust air, a diesel particulate filter shall be provided to meet the emission level requirements of SCAQMD. The Project would have two emergency generators and two fire pumps, each could operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit) to ensure reliability in the case of a power outage. Testing of the generators for maintenance and operations purposes would be permitted only during non-event days.*
- *Heavy-duty delivery trucks would be prohibited from traveling to and from the Project Site during the two hours before and one hour after an event at the Project of more than 9,500 attendees, and during pre-and post-event hours during major event days at the NFL Stadium and/or The Forum.*

Impacts and Mitigation Measures

Impact 3.2-1: Construction and operation of the Proposed Project would conflict with implementation of the applicable air quality plan. (Significant and Unavoidable)

The following analysis addresses consistency of the Proposed Project with applicable plans and policies that regulate air quality. In particular, the analysis addresses consistency with SCAQMD's AQMP, which, as discussed above, is an air quality plan that includes strategies for achieving attainment of applicable ozone, PM10, and PM2.5 standards. In addition, consistency with the air quality related policies in the City of Inglewood General Plan Land Use Element are also addressed. Finally, this analysis addresses consistency with the City's ECAP, which includes strategies to mitigate the City's impacts on air quality and climate change.

Air Quality Management Plan

As discussed above, SCAQMD has adopted a series of AQMPs to lead the Air Basin into compliance with several criteria air pollutant standards and other federal requirements, while taking into account construction and operational emissions associated with population and economic growth projections provided by SCAG's 2016 RTP/SCS.¹⁵⁹ SCAQMD recommends that, when determining whether a project is consistent with the relevant AQMPs, the lead agency should assess whether the project would directly obstruct implementation of the plans by impeding SCAQMD's efforts to achieve attainment with respect to any criteria air pollutant for which it is currently not in attainment of the NAAQS and CAAQS (e.g., ozone, PM10, and

¹⁵⁹ Southern California Association of Governments, 2016. *2016 Regional Transportation Plan/Sustainable Communities Strategy*. April 2016.

PM2.5) and whether it is consistent with the demographic and economic assumptions (typically land use related, such as employment and population/residential units) upon which the plan is based.¹⁶⁰ SCAQMD guidance indicates that projects whose growth is included in the projections used in the formulation of the AQMP are considered to be consistent with the plan and would not interfere with its attainment.¹⁶¹

Construction

Control Strategies

During construction, the Proposed Project would comply with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, including the ATCM to limit heavy duty diesel motor vehicle idling to no more than 5 minutes at any given time, and with SCAQMD's regulations such as Rule 403 for controlling fugitive dust and Rule 1113 for controlling VOC emissions from architectural coatings. Furthermore, the Proposed Project would comply with fleet rules to reduce on-road truck emissions (i.e., 13 CCR section 2025, CARB Truck and Bus regulation). In addition, as included in Project Design Feature 3.2-1, the Proposed Project would require the use of off-road diesel-powered construction equipment that meets or exceeds CARB and US EPA Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 horsepower (hp) or greater. Compliance with these measures and requirements would be consistent with and meet or exceed the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities. Nonetheless, as discussed further below in the analysis for Impact 3.2-2, even though the Proposed Project would be consistent with applicable strategies in the AQMP, local and state regulations, and other voluntary measures designed to reduce non-attainment pollutants, regional emissions during construction of the Proposed Project would exceed the significance threshold for NO_x. Emissions of VOCs, PM10, and PM2.5 during construction of the Proposed Project are not predicted to exceed regional mass emission thresholds.

Growth Projections

The Proposed Project would result in an increase in short-term employment compared to existing conditions. Although the Proposed Project would generate construction workers on the Project Site during the construction process, construction-related jobs generated by the Proposed Project would likely be filled by employees within the construction industry within the City of Inglewood and the greater Los Angeles County region. Construction industry jobs generally have no regular place of business, as construction workers commute to job sites throughout a given region, which may change several times a year. Moreover, these jobs would be temporary in nature. Therefore, the construction jobs generated by the Proposed Project would not conflict with the long-term employment or population projections upon which the AQMPs are based.

¹⁶⁰ South Coast Air Quality Management District, Air Quality Analysis Handbook, pp. 12-2, 12-3, <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook>. Accessed April 16, 2019.

¹⁶¹ South Coast Air Quality Management District, 1993. CEQA Air Quality Handbook, p. 12-1. November 1993.

Operation

Control Strategies

As discussed above, the SCAQMD AQMPs includes land use and transportation strategies from the SCAG 2016 RTP/SCS that are intended to reduce VMT and resulting regional mobile source emissions. The applicable land use strategies include planning for growth around livable corridors; providing more options for short trips/neighborhood mobility areas; supporting ZE vehicles & expanding vehicle charging stations; supporting local sustainability planning. The applicable transportation strategies include managing through the Transportation Demand Management (TDM) Program and the Transportation System Management (TSM) Plan including advanced ramp metering, and expansion and integration of the traffic synchronization network; promoting active transportation. The majority of the transportation strategies are to be implemented by cities, counties, and other regional agencies such as SCAG and SCAQMD, although some can be furthered by individual development projects.

The location, design, and land uses of the Proposed Project would support land use and transportation strategies related to reducing vehicle trips for patrons and employees by increasing commercial and hotel density near public transit. The Proposed Project is considered an “urban infill” project, as it would replace existing low density commercial and light manufacturing/warehouse uses with a high-density, mixed-use development that would include an 18,000 fixed seat arena, office uses, a training facility, a sports medicine clinic, retail, restaurant, commercial uses, a hotel, and community spaces. The Proposed Project proposes higher density, consistent with compact growth, on infill urban land accessible to and well served by public transit including frequent and comprehensive transit services. New job growth, as a result of the completed Proposed Project, is focused in an infill area well served by transit.

The Project Site is located within one-quarter mile of eight existing Metro bus stops along the following three Metro routes, 117, 211/215, and 212/312. In addition, local transit service to the Project Site would be provided by Metro in the form of future below- and at-grade light rail on the Metro Crenshaw/LAX line, which is currently under construction and expected to be complete and operational in mid-2020. During operation of the Proposed Project, a shuttle pick-up and drop-off shuttle service will be provided at the following two Metro rail stations: the existing Metro Green Line – Hawthorne/Lennox Station and the future Metro Crenshaw/LAX Line – Downtown Inglewood Station. The Project Site’s proximity to these publicly available transit services enable the Proposed Project to potentially reduce vehicle trips, VMT, and associated transportation-related emissions compared to a project without these characteristics.

The Proposed Project land use characteristics (including increased density, location efficiency, increased land use diversity and mixed-uses, etc.), many of which overlap the strategies in the AQMPs, have been shown by CAPCOA, in its guidance document entitled *Quantifying Greenhouse Gas Mitigation Measures*,¹⁶² to support a relative reduction in vehicle trips and VMT

¹⁶² California Air Pollution Control Officers Association (CAPCOA), 2010. *Quantifying Greenhouse Gas Mitigation Measures*. August 2010.

in comparison to a project that does not include these land use characteristics, and corresponding vehicle emissions, further supporting consistency with the AQMPs. In particular, the Proposed Project would increase the Project Site density from 4.25 jobs per acre to 38.82 jobs per acre.¹⁶³ In addition, the Project Site is an urban location within the City of Inglewood and would be developed on an infill site that is located in a highly urbanized part of the SCAG region and is accessible to numerous transit lines, and would be located immediately adjacent to another major mixed use project that is under development (Hollywood Park Specific Plan). Furthermore, the Proposed Project would co-locate complementary arena, office, retail/restaurant, commercial, and hotel uses in close to proximity to existing off-site commercial and residential uses. The Project Site is adjacent to three LA Metro bus routes (lines 117, 211/215, and 212/312 stop at the intersection of West Century Boulevard and South Prairie Avenue) and is also within one half mile of a Metro bus route (the combined 740/40 line stops at the intersection of West Century Boulevard and La Brea/Hawthorne Boulevard). These Metro bus routes provide frequent service during peak commute hours. As described in Section 3.0, Introduction to the Analysis, the Inglewood Transit Connector (ITC) (Cumulative Project #74) is a planned 1.8-mile electric train system with a station near the intersection of West Century Boulevard and South Prairie Avenue, adjacent to the Project Site; if approved and constructed, the ITC would provide close connections from the Project Site and the adjacent HPSP development to the LA Metro Crenshaw line Downtown Inglewood station. Additionally, as discussed above, the Proposed Project would provide shuttle pick-up and drop-off service at two LA Metro rail stations.

As demonstrated above, the Proposed Project would support land use and transportation strategies in the AQMPs. Nevertheless, as discussed further below in the analysis for Impact 3.2-2, regional emissions during operation of the Proposed Project would exceed the regional significance thresholds for those criteria air pollutants for which the Air Basin is not in attainment (i.e., VOC, NO_x, PM₁₀, and PM_{2.5}).

Growth Projections

As discussed in Section 3.12, Population, Employment, and Housing, the Project Site is mostly vacant, and is partially developed with a fast-food restaurant, a motel, two warehouse/light manufacturing facilities, a commercial catering business, and a groundwater well and related facilities. Existing employment at the Project Site totals approximately 119 people. Operation of the Proposed Project would include permanent employment associated with the operations of the Arena and other uses included in the Proposed Project. The Proposed Project would eliminate the current uses and jobs at the Project Site (approximately 119 jobs) and would generate 768 permanent jobs at the Project Site as well as an additional 319 full-time equivalent jobs to support arena and/or plaza events throughout the year. Combined with the 768 permanent jobs, the Proposed Project would result in a total of 1,087 jobs, for a net increase of 968 jobs within the City.

¹⁶³ Existing jobs per acre = 119 existing employees / 28 acres = 4.25 jobs per acre; proposed jobs per acre = 768 non-event jobs plus 319 full-time-equivalent annual event-related jobs for a total of 1,087 full-time employees / 28 acres = 38.82 jobs per acre.

As described in Section 3.12, Population, Employment, and Housing, the City of Inglewood's total employment in 2017 exceeded that projected by the 2016 RTP/SCS for 2020, and even additional employment projections through 2040.¹⁶⁴ Therefore, any project that includes employment would exceed the 2016 RTP/SCS forecasts for the City. As is discussed in Section 3.12, the SCAG employment projections were undertaken in 2012, during a period of economic recession, and have not been updated to reflect current and anticipated conditions in Inglewood. While this employment growth was not necessarily forecasted within SCAG's projection horizon, which could cause additional people to move into the area beyond what was planned, there is sufficient infrastructure planned (as detailed within Section 3.13, Public Services, and Section 3.15, Utilities and Service Systems) to accommodate the additional growth, and there would be no further environmental effects, including those related to air quality, beyond those described in the analysis of criteria pollutant emissions presented under Impact 3.2-2. In addition, as discussed in Section 3.12, Population, Employment, and Housing, the City of Inglewood has established several goals and policies to foster redevelopment of infill sites that would support healthy economic development. Moreover, as addressed under Section 2.4, Project Site Existing Conditions, and Section 3.10, Land Use and Planning, the Project Site is intended to support employment uses. Therefore, while the Proposed Project would require amendments to the General Plan and the Inglewood Municipal Code, and would introduce more jobs to the Project Site than may have resulted under existing zoning, this growth is consistent with the City of Inglewood General Plan.

SCAG 2016 RTP/SCS

Goal 6 of the 2016 RTP/SCS aims to improve air quality and encourage active transportation. The TDM programs as described above would be designed to reduce vehicle trips through a variety of TDM components. This would reduce GHG, criteria pollutant, and TAC emissions from transportation, and would therefore improve air quality impacts from Project-related transportation. In addition, as described above, the TDM Program would encourage active transportation and alternative modes of travel; for example, the Proposed Project would include 23 visitor and 60 employee on-site bike parking spaces. This would further support Goal 6 of the RTP/SCS.

Goal 7 of the 2016 RTP/SCS aims to actively encourage and create incentives for energy efficiency. The Proposed Project would utilize energy efficiency appliances and equipment, as required by Title 24, and it would provide EV charging stations to support the future use of electric and hybrid-electric vehicles by employees and visitors traveling to and from the site. In addition, the Proposed Project would be designed and constructed to meet LEED Gold certification requirements, which would require the incorporation of energy efficiency measures. The Proposed Project would also comply with Title 24 energy efficiency requirements, use 100 percent LED lighting indoors and outdoors throughout the site, and install high efficiency HVAC systems. In addition, the Proposed Project design would include compliance with CALGreen Code Voluntary Tier 1, and is estimated to achieve a reduction in energy consumption

¹⁶⁴ Southern California Association of Governments, 2016. RTP/SCS Growth Forecast by Jurisdiction, p. 1. 2016.

greater than Title 24 2019 standards based on the preliminary design of the Proposed Project. These actions would support Goal 7 of the 2016 RTP/SCS.

General Plan Air Quality-Related Policies

As discussed above, the City of Inglewood General Plan Land Use Element includes a goal relevant to air pollutant emissions.

Circulation Goal: Promote and support adequate public transportation within the City and the region.

As described in Chapter 2, Project Description, the Proposed Project constitutes a large-scale development integrating commercial, office, hotel, and entertainment uses that support public transportation. The Proposed Project would include provisions that would promote the use of public transportation as a means of travel to and from the Proposed Project, including a transportation hub at the East Transportation and Hotel Site, shuttle stops on South Prairie Avenue, and a shuttle system for large events that would connect the Proposed Project to nearby Metro Crenshaw and Green Line rail stations. For these reasons, the Proposed Project would be consistent with Inglewood General Plan policies related to air quality.

Air Quality-Related Policies from the Inglewood Energy and Climate Action Plan

As described above, the City's ECAP includes strategies to mitigate the City's impacts on air quality and climate change. While these strategies are primarily directed towards GHG emission-reductions, the measures in the City's ECAP would also achieve co-benefits of reducing criteria air pollutants and TACs. These strategies include:

Strategy 1: Lead by Example with Municipal Government Actions

- Accelerate city vehicle fleet replacement
- Continue commute trip reduction program
- Planning for electric vehicle infrastructure

Strategy 4: Improve Transportation Options and Manage Transportation Demand

- Make roadways more efficient
- Improve transit
- Improve bicycle facilities
- Make parking more efficient
- Reduce commute trips
- Encourage land use intensification and diversity

Although the actions presented under Strategy 1 are for the City to implement, the Proposed Project would support implementation of these actions as the Proposed Project would be designed to achieve LEED Gold certification. This would serve to reduce energy use in the proposed

buildings as well as require the installation of electric vehicle charging stations. The Proposed Project would also be consistent with Strategy 4 as the Proposed Project would incorporate shuttles would serve to facilitate multi-modal travel to and from events at the Project Site in a safe and efficient manner during event days. The Proposed Project would provide shuttle pick-up and drop-off service at the following two Metro rail stations: the existing Metro Green Line – Hawthorne/Lennox Station and the future Metro Crenshaw/LAX Line – Downtown Inglewood Station. The Proposed Project would include the installation of bicycle parking facilities. Furthermore, the Proposed Project would provide a dense mix of entertainment, office, retail, restaurant, community, and hotel uses on parcels of infill urban land accessible to and served by public transit and near existing and planned housing. For the reasons described above, the Proposed Project would be consistent with the City’s ECAP.

Conclusion

As provided in the analysis above, the Proposed Project would be consistent with the air quality-related policies in the City’s General Plan as well as the air quality related policies in the City’s ECAP as the Proposed Project supports public transportation and improving transportation options and demand to the Project Site. In addition, the Proposed Project would be consistent with the overall control strategies of the AQMPs during construction of the Proposed Project. Nevertheless, construction and operation of the Proposed Project would generate emissions of nonattainment pollutants or precursors (i.e., VOC, NO_x, PM10, and PM2.5), that would exceed the applicable significance thresholds. Therefore, impacts related to consistency with air quality plans during construction and operation of the Proposed Project would be **potentially significant**.

Mitigation Measure 3.2-1(a)

Implement Mitigation Measure 3.14-2(b). Implementation of a comprehensive Transportation Demand Management (TDM) program.

Mitigation Measure 3.2-1(b)

Implement Mitigation Measure 3.2-2(b). Emergency Generator and Fire Pump Generator Maintenance & Testing.

Mitigation Measure 3.2-1(c)

Implement Mitigation Measure 3.2-2(c). Construction Emissions Minimization Plan.

Mitigation Measure 3.2-1(d)

Implement Mitigation Measure 3.2-2(d). Incentives for vendors and material delivery trucks to use ZE or NZE trucks during operation.

Level of Significance After Mitigation: Because regional emissions during construction and operation of the Proposed Project would exceed the significance thresholds for those criteria air pollutants for which the Air Basin is not in attainment (i.e., VOC, NO_x, PM10, and PM2.5), the Proposed Project would have a significant impact regarding consistency with the AQMP.

Regarding construction emissions, the Applicant has agreed to use off-road diesel-powered construction equipment that meets or exceeds CARB and US EPA Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 hp or greater. Such equipment will be outfitted with BACT devices including, but not limited to, a CARB certified Level 3 Diesel Particulate Filters. Based on registration data, over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the State are model year 2010 or newer.

All construction equipment and vehicles shall maintain compliance with the manufacturer's recommended maintenance schedule and the Applicant will maintain maintenance records. The Applicant will strive to use ZE or NZE heavy-duty haul trucks during construction, and no idling signs will be posted upon entry and throughout the Project Site during construction. In addition, the project applicant will restrict vehicle idling time to no longer than five minutes and will post signs at the entrance and throughout the site stating that idling longer than five minutes is not permitted. Even with implementation of Project Design Feature 3.2-1 and Mitigation Measure 3.2-1(c), construction-related daily emissions would exceed the SCAQMD significance threshold for NO_x. Therefore, short-term regional construction emissions would be considered **significant and unavoidable**.

Regarding operational emissions, feasible mitigation in line with the VMT-reduction targets of the AQMP and the City's ECAP to reduce regional emissions during operation of the Proposed Project have been developed. Implementation of Mitigation Measure 3.2-1 would require the implementation Mitigation Measure 3.14-2(b), which involves the implementation of a TDM program, consistent with the transportation strategies noted in the 2016 RTP/SCS. In particular, the TDM program would be designed to provide transportation services and incentives that encourage and support the use by employees, event attendees and customers of alternative modes of transportation and the reduction of vehicle trips, including by increasing average vehicle occupancy. The Proposed Project TDM program would include a variety of components, including programs to encourage alternative modes of transportation (rail, public bus, and vanpool), including event-day dedicated shuttle services; programs to carpools and ZE vehicles, active transportation, employee vanpools, a park-n-ride program, and information services; and programs to reduce on-site parking demand, including event-day local microtransit service.

As demonstrated in Appendix K, the TDM program would result in a reduction of vehicle trips. Potential trip reductions are based on estimates of vehicle trips for LA Clippers home basketball games and other non-NBA basketball game events to be hosted at the Project Site, as well as LA Clippers employees who will use the LA Clippers practice and training facility and the LA Clippers offices, and vehicle trips by employees and patrons of the sports medicine clinic, retail, restaurant, community space and hotel uses included at the Project Site. The TDM program would be designed to achieve and maintain a reduction in the number of vehicle trips, on an annual basis, by attendees, employees, visitors, and customers as compared to trips generated by Project operations absent the TDM program. The implementation of this mitigation measure would reduce single-occupancy vehicle trips and encourage the use of other modes of transportation besides automobiles, thereby reducing Project-related emissions during operation of the Proposed Project. However, as the timing and efficacy of these measures cannot be determined with certainty at this time, the regional operational emissions would continue to exceed the significance thresholds for those criteria air pollutants and precursors for which the Air Basin is not in attainment (i.e., VOC, NO_x, PM₁₀, and PM_{2.5}). As such, even with

implementation of Mitigation Measure 3.14-2(b), the Proposed Project would not be consistent with the control strategies in the AQMPs.

The Applicant has agreed to conduct maintenance and/or testing on the emergency generators or fire pump generators on three separate non-event days. Each emergency generator shall be tested on a separate non-event day and the two fire pump generators may be tested together on a separate non-event day. As shown in Table 3.2-24, below, NO_x emissions during operations would be reduced to less-than-significant levels during Non-Event days. However, NO_x, CO, PM₁₀, and PM_{2.5} emissions would remain in excess of the SCAQMD significance thresholds on certain Event days. In addition, the Applicant has agreed to provide incentives to vendor delivery trucks that use ZE or NZE trucks during project operations. As previously stated, registration data indicates over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the state are model year 2010 or newer. Thus, there are no additional feasible mitigation strategies to further reduce the maximum daily regional emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} during operations and the Proposed Project would continue to be above the SCAQMD regional significance thresholds and impacts would be **significant and unavoidable**.

The Proposed Project would be consistent with the air quality related policies in the City's General Plan and ECAP. However, even with implementation of all feasible mitigation, regional Proposed Project emissions of nonattainment pollutants would remain in excess of applicable thresholds, and this impact would be considered **significant and unavoidable**.

Impact 3.2-2: Construction and operation of the Proposed Project would result in a cumulatively considerable net increase in NO_x emissions during construction, and a cumulatively considerable net increase in VOC, NO_x, CO, PM₁₀, and PM_{2.5} during operation of the Proposed Project. (Significant and Unavoidable)

Construction

Construction of the Proposed Project has the potential to temporarily emit criteria air pollutant emissions through the use of heavy-duty construction equipment, and through vehicle trips generated from workers and haul trucks traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. Mobile source emissions, primarily NO_x and PM emissions (i.e., PM₁₀ and PM_{2.5}), would result from the use of diesel powered on-and off-road vehicles and equipment.

Construction emissions would vary substantially from day to day, depending on the level of activity and the specific type of construction activity. The maximum daily construction emissions for the Proposed Project were estimated for each construction phase. Some individual construction phases could potentially overlap; therefore, the estimates of maximum daily emissions included these potential overlaps by combining the relevant construction phase emissions. Detailed calculations for all individual phases and all overlap scenarios modeled are included in Appendix D.

The results of the criteria air pollutant calculations are presented in **Table 3.2-14**. The calculations used to develop the values presented in Table 3.2-14 incorporate compliance with

applicable project design features including Project Design Feature 3.2-1, which requires the use of off-road diesel-powered construction equipment that meets or exceeds CARB and US EPA Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 hp or greater, dust control measures required to be implemented during each phase of construction by SCAQMD Rule 403 (Control of Fugitive Dust), and fugitive VOC control measures required to be implemented by architectural coating emission factors based on SCAQMD Rule 1113 (Architectural Coatings).

TABLE 3.2-14
MAXIMUM REGIONAL CONSTRUCTION EMISSIONS (POUNDS PER DAY)

Year	VOC	NO _x	CO	SO ₂	PM10 ^a	PM2.5 ^a
2021	10	126	208	1	21	9

^a Emissions include fugitive dust control measures consistent with SCAQMD Rule 403.

SOURCE: ESA, 2019.

As shown in Table 3.2-14, with implementation of Project Design Feature 3.2-1, construction-related daily emissions would exceed the SCAQMD significance threshold for NO_x. Therefore, short-term regional construction emissions would be considered **potentially significant**.

In addition to implementation of project design features, as discussed in Chapter 2, the applicant has submitted an application to seek certification of the Proposed Project pursuant to AB 987. Certification under AB 987 requires that the Proposed Project must achieve reduction of 400 tons of NO_x and 10 tons of PM2.5 over 10 years following the commencement of construction of the Proposed Project. However, AB 987 provides that if the project applicant can demonstrate and verify to the SCAQMD that it has invested at least \$30,000,000 to achieve the reduction requirements, reductions of at least 200 tons of NO_x and 5 tons of PM2.5 over 10 years would be deemed to meet the requirements of AB 987. This analysis conservatively does not include these reductions as required by AB 987 because the specific method and timing of achieving these reductions in the 10 years following the commencement of construction is uncertain at this time.

Operation

Operation of the Proposed Project would generate criteria air pollutant emissions from Project-generated vehicle trips traveling to and from the Project Site, energy sources such as natural gas combustion, and area sources such as landscaping equipment and consumer products usage. The Proposed Project would also produce criteria air pollutant emissions from delivery trucks,

charbroilers, cooling towers, and on-site diesel-fueled emergency generators. The on-road mobile sources related to the operation of the Proposed Project include passenger vehicles for workers, players and supporting staff, event attendees, customers to the commercial uses, hotel guests, media vans and trucks delivering to and from the Project Site. VMT data, which takes into account ridership, mode, and distance on freeways and local streets is provided in Appendix K.

Regional air emissions from the Proposed Project were assessed based on the incremental increase in emissions compared to existing baseline conditions (i.e., existing on-site or off-site Project-related emissions), consistent with SCAQMD methodology. This methodology measures the incremental project contributions and so the Adjusted Baseline conditions are not relevant to the mass emissions threshold. Analysis of localized emissions under Impact 3.2-3 includes consideration of the Adjusted Baseline condition, because as explained below, the standards against which localized emissions are compared are cumulative in nature.

Projected emissions resulting from operational activities of the Proposed Project under an 18,000-attendee basketball game scenario are presented in **Table 3.2-23** and include emissions from a regular season basketball game as well as associated office uses, practice facilities, and other ancillary uses. The analysis is based on the Proposed Project planned first operations taking place in 2024. This is the most conservative assumption as years after 2024 account for lower emission factors, improved energy efficiency, and reduced number of vehicles trips, which would result in lower emissions as compared to emission in 2024.

Project emissions resulting from operational activities during potential non-event day and event day scenarios for the Proposed Project are presented in **Tables 3.2-15** through **3.2-22**. Similar to the regular season basketball game scenario, these other scenarios that were analyzed also include emissions from the event, as applicable, as well as associated office uses, practice hours, and other ancillary uses.

The calculations in Tables 3.2-15 through 3.2-23 incorporate compliance with applicable project design features including Project Design Feature 3.2-2, which would serve to reduce emissions from operation of the emergency generators. In addition, the Proposed Project would incorporate a shuttle program on major event days, which would serve to facilitate multi-modal travel to and from events at the Project Site and LA Metro Crenshaw and Green Line stations during event days. The Proposed Project would also be designed and constructed to meet LEED Gold certification requirements, which could include a 700 kW PV system, Title 24 compliance, use of 100 percent LED lighting indoors and outdoors throughout the site, and implementation of high efficiency HVAC systems. In addition, the Proposed Project design would include compliance with CalGreen Code Voluntary Tier 1, which is estimated to achieve a reduction in energy consumption greater than Title 24 2019 standards based on the preliminary design of the Proposed Project. Implementation of these design features would serve to reduce air quality emissions during operation of the Proposed Project.

SOURCE: ESA, 2019.

The calculations in Tables 3.2-15 through 3.2-23 incorporate compliance with applicable project design features including Project Design Feature 3.2-2, which would serve to reduce emissions from operation of the emergency generators. In addition, the Proposed Project would incorporate a shuttle program on major event days, which would serve to facilitate multi-modal travel to and from events at the Project Site and LA Metro Crenshaw and Green Line stations during event days. The Proposed Project would also be designed and constructed to meet LEED Gold certification requirements, which could include a 700 kW PV system, Title 24 compliance, use of 100 percent LED lighting indoors and outdoors throughout the site, and implementation of high efficiency HVAC systems. In addition, the Proposed Project design would include compliance with CalGreen Code Voluntary Tier 1, which is estimated to achieve a reduction in energy consumption greater than Title 24 2019 standards based on the preliminary design of the Proposed Project. Implementation of these design features would serve to reduce air quality emissions during operation of the Proposed Project.

As identified in Table 3.2-15, operational emissions for the Proposed Project for the non-event day (ancillary uses only) scenario would not exceed SCAQMD daily operational thresholds for VOC, CO, SO_x, PM10, and PM2.5 emissions, and would only exceed SCAQMD daily operational thresholds for NO_x on days when emergency generators are tested. Emergency generator testing would occur at a maximum of twice a month, pursuant to Mitigation Measure 3.2-2(b), discussed below. On all other non-event days when there is no emergency generator testing, there would be no exceedance of any mass emissions thresholds. However, as identified in Tables 3.2-16 through 3.2-23, operational emissions for the Proposed Project on certain event

days would exceed SCAQMD daily operational thresholds for all criteria air pollutants with the exception of SO_x. The VOC regional operational impact would be primarily related to the anticipated use of consumer products (e.g., cleaning solutions) and landscaping. The NO_x, CO, PM₁₀, and PM_{2.5} regional operational impacts would result from vehicular trips to and from the Project Site and operation of emergency generators.

Even with implementation of the project design features discussed above, operational VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions would exceed the applicable regional emissions significance threshold for an 18,500-attendee concert event day, which has the highest number of attendees, as well as for the 18,000-attendee basketball game, 14,500-attendee concert, 9,500-attendee concert, 8,500-attendee family show, and 7,500-attendee other event scenario. Emissions on these event days would result in **potentially significant impacts**.

Health Impacts Assessment – Regional Effects

Impact 3.2-2 concludes that during construction, the Proposed Project would emit a criteria air pollutant (NO_x) in an amount that exceeds the mass emission threshold that is recommended for this pollutant by SCAQMD. In addition, during operations, under various operational scenarios, the Proposed Project would emit criteria air pollutants (VOC, NO_x, CO, PM₁₀, and PM_{2.5}) in amounts that would exceed the applicable mass emission thresholds recommended by SCAQMD. These exceedances would occur for the 18,500-attendee concert scenario, which has the highest number of attendees, as well as for the 18,000-attendee basketball game, 14,500-attendee concert, 9,500-attendee concert, 8,500-attendee family show, 7,500-attendee other event, and non-event day (with generator testing) scenarios. The analysis therefore concludes that, for this reason, the Proposed Project's emissions are significant with respect to these criteria air pollutants. The types of adverse health effects known to occur as a result of exposure to these pollutants and the potential secondary formed ozone have been discussed in "Pollutants and Related Health Effects" under Section 3.2.1, above, and also summarized below:

- VOCs are organic chemical compounds of carbon. Some VOCs are highly reactive and play a critical role in the formation of ozone. Other VOCs can result in adverse health effects from direct exposure and are classified by the TACs or HAPs by the US EPA.
- NO_x is a term that refers to a group of compounds containing nitrogen and oxygen. The primary compounds of air quality concern include NO₂ and NO. There are no health-based ambient air quality standards specifically for NO; however, NO can oxidize in the atmosphere to form NO₂. As discussed previously in Section 3.2.1, NO₂ can potentially irritate the nose and throat, aggravate lung and heart problems, and may increase susceptibility to respiratory infections, especially in people with asthma. Emissions of NO_x are a precursor to the formation of ground-level ozone, which occurs due to complex photochemical reactions of these pollutants in the atmosphere in the presence of sunlight. NO₂ can also potentially contribute to the secondary formation of particulate matter (PM₁₀ and PM_{2.5}) from conversion in the atmosphere.
- Ozone is a respiratory irritant that can cause the following health effects: irritate respiratory system; reduce lung function; breathing pattern changes; reduce breathing capacity; inflame and damage cells that line the lungs; make lungs more susceptible to infection; aggravate

asthma; aggravate other chronic lung diseases; cause permanent lung damage; some immunological changes; and/or increase mortality risk.

- CO emissions normally have only short and localized potential impact because CO transport is extremely limited, and CO disperses rapidly with distance from the source under normal meteorological conditions. High CO concentrations are typically associated with roadways or intersections operating at unacceptable levels of service or with very high traffic volumes. Breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain. The most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain. For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle may lead to chest pain and decreased exercise tolerance. Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO.

As demonstrated in detail below in the "Intersection CO Hotspot Analysis" section for Impact 3.2-3, the Proposed Project plus the background CO concentrations would be below the health-protection-based state and federal air quality standards. CO hotspots are not anticipated as a result of traffic-generated emissions by the Proposed Project in combination with other anticipated developments in the area. Therefore, emissions of CO from the Proposed Project are not anticipated to cause identifiable health effects.

- Particulate matter (PM10 and PM2.5) can cause the following health effects from short-term (hours/days) exposure: irritation of the eyes, nose, throat; coughing; phlegm; chest tightness; shortness of breath; aggravate existing lung disease, causing asthma attacks and acute bronchitis; and/or those with heart disease can suffer heart attacks and arrhythmias.

Heretofore, air districts and CEQA lead agencies around California regarded this analysis as sufficient disclosure of the adverse impacts of a project's criteria air pollutant emissions. In December 2018, however, the California Supreme Court issued a decision holding that, in order to be adequate, an EIR must contain a further discussion that correlates the specific health effects that will occur as a result of a project's significant criteria air pollutant emissions, or explain why such a further discussion is infeasible.¹⁶⁵

The Supreme Court's decision presents significant challenges. Generally, models that correlate criteria air pollutant concentrations with specific health effects focus on regulatory decision-making that will apply throughout an entire air basin or region. These models focus on the region-wide health effects of pollutants so that regulators can assess the costs and benefits of adopting a proposed regulation that applies to an entire category of air pollutant sources, rather than the health effects related to emissions from a specific proposed project or source. Because of the scale of these analyses, any one project is likely to have only very small incremental effects which may be difficult to differentiate from the effects of air pollutant concentrations in an entire air basin. In addition, such modeling efforts are costly, and the value of a project-specific analysis may be modest in relation to that cost. Furthermore, the results, while costly to produce, may not

¹⁶⁵ Sierra Club v. County of Fresno (2018) 6 Cal.5th 502, 517-522.

be particularly useful. For regional pollutants, it is difficult to trace a particular project's criteria air pollutant emissions to a specific health effect. Moreover, the modeled results may be misleading because the margin of error in such modeling is large enough that, even if the modeled results report a given health effect, the model is sufficiently imprecise that the actual effect may differ from the reported results; that is, the modeled results suggest precision, when in fact available models cannot be that precise on a project level.

Nevertheless, in an effort to respond to the Supreme Court's decision, an HIA of the estimated Proposed Project criteria air pollutant emissions has been prepared. The analysis uses available models to attempt to correlate the Proposed Project criteria air pollutant emissions to elevated concentrations of such pollutants in the region, and then to identify health effects that may occur as a result of any predicted increased concentrations. There may, in time, be ways to perform this analysis with greater precision or accuracy. At this juncture, however, the following analysis reflects a good faith attempt to address the Supreme Court's direction. In reviewing this analysis, the reader is cautioned to bear in mind its limitations and qualifications, as described throughout the analysis.

As discussed above, the mass emissions thresholds developed by SCAQMD and used by CEQA lead agencies throughout southern California to determine potential significance of project-related regional changes in the environment are not directly indicative of exceedances of applicable ambient air standards. Meteorology, the presence of sunlight, and other complex chemical factors all combine to determine the ultimate concentration and location of ozone or PM. The effects on ground-level ambient concentrations of pollutants that may be breathed by people are also influenced by the spatial and temporal patterns of the emission sources. In other words, the effect on ozone and PM concentrations from a given mass of pollutants emitted in one location may vary from the effect if that same mass of pollutants was emitted in an entirely different location in the Air Basin. The same effect may be observed when the daily and seasonal variation of emissions is taken into account. Regional-scale photochemical modeling, typically performed only for NAAQS attainment demonstration and rule promulgation, account for these changes in the spatial, temporal, and chemical nature of regional emissions. Emissions from the construction and operation of the Proposed Project would vary by time of day, month, and season, and the majority of Project-related emissions, being generated by mobile sources (cars and trucks) driving to and from the site, would be emitted throughout a wide area defined by the origins and destinations of people travelling to and from the Proposed Project. As SCAQMD has stated "it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region."¹⁶⁶

The Proposed Project criteria air pollutant emissions would contribute to regional health impacts. As described above, emissions from the Proposed Project are expected at levels in excess of mass emissions thresholds for NO_x emissions during construction, and for VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions during a number of operational event and non-event scenarios. As stated earlier,

¹⁶⁶ South Coast Air Quality Management District, Amicus Brief in Support of Neither Party, *Sierra Club v. County of Fresno*, 2015.

the mass emission thresholds were established primarily in conjunction with federal permitting “major source” thresholds. If emissions were below these “de minimis” emission rates, then the Proposed Project is presumed to conform with the NAAQS.¹⁶⁷ While based on the status of an air basin level of attainment of the health-based NAAQS, emissions in excess of the mass emission thresholds from one project does not mean the air basin would experience measurably higher ground level concentrations, or more frequent occurrences of ground level concentrations in exceedance of standards, or delay timely attainment of a particular NAAQS. The effect on ambient concentrations of emissions from one project, which in turn may influence air pollutant-based health impacts, can only be determined through dispersion modeling, and as appropriate, health effects modeling. The following analysis is provided for information purposes, to determine the extent the criteria air pollutant emissions from the Proposed Project would result in (1) changes in the concentration of criteria air pollutants in the atmosphere, and (2) correlative health effects that may occur as a result of those changes in air pollutant concentrations.

As previously discussed, the current version of the US EPA BenMAP-CE model only has health impact functions associated with ozone (including precursors, NO_x and VOC) and PM_{2.5}, so those were the criteria pollutants for which health effects were quantified in this study. Although exposure to high levels of CO and NO₂ is recognized to result in negative health effects, the applicable NAAQS are widely recognized to be health protective, even for sensitive populations (see discussion under Impact 3.2-3). US EPA guidance recommends that a Gaussian dispersion model, such as AERMOD, is the appropriate model to predict the dispersion and accumulation of NO₂ and CO in the atmosphere since those pollutants are nonreactive (unlike ozone and secondary PM formation). Generally, as nonreactive pollutants travel away from the source, their concentrations diminish rather quickly. Thus, health impacts from exposure to NO₂ and CO are localized in nature; refer to the health impacts discussion under Impact 3.2-3 below.

This assessment evaluates the potential for the Proposed Project to contribute to regional ozone formation and ozone health impacts along with primary and secondary particulate matter health impacts. The Proposed Project contribution to a regional concentration of ozone and PM_{2.5} were modeled in the photochemical grid model, CMAQ, and the corresponding endpoint health effects were modeled in BenMAP-CE. The analysis was performed in consultation with SCAQMD.

Dispersion modeling performed using CMAQ predicts slight increases in the maximum ozone and PM_{2.5} concentrations with the Proposed Project emissions as compared to the baseline emissions. Both baseline and Proposed Project scenarios used SCAQMD controlled emissions inventory for year 2025, the first full year of Project operations, provided by SCAQMD for the Proposed Project. The baseline scenario used only the re-gridded SCAQMD 2025 dataset, while the Proposed Project dataset added incremental project emissions to the SCAQMD dataset.

The CMAQ result for the baseline as compared to the baseline plus Proposed Project shows a maximum increase of 0.0109 ppb, or 0.021 percent, at the most affected node for maximum daily

¹⁶⁷ US Environmental Protection Agency. Frequent Questions about General Conformity. Available: <https://www.epa.gov/general-conformity/frequent-questions-about-general-conformity>. Accessed July 2019.

8-hour average ozone, and $0.0011 \mu\text{g}/\text{m}^3$, or 0.0082 percent, for PM_{2.5}. Note that these estimated increases are for the most affected node; thus, the estimated changes at all other nodes will be less. These results generally validate the prediction that the addition of locally generated emissions could result in incremental increases in nearby ground level concentrations of ozone and PM_{2.5}. However, these differences are very small, well within the normal gross margin of error of the CMAQ model performance.

In this project-level analysis, the regional model results also observed some small negative model differences in grid cells when adding the Project emissions. As confirmed by the photochemistry model experts of the SCAQMD and the San Joaquin Valley Air Pollution Control District (SJVAPCD), such results are to be expected when applying regional models to local changes in emissions, especially taken in the context of the project emissions are magnitudes smaller than that of the regional emissions typically used in such regional models and also considering the specific atmospheric chemistry condition of the Project area.¹⁶⁸ For example, based on its recent experiences applying regional scale models to relatively small increase in emissions, SCAQMD stated in its Amicus Brief in the *Sierra Club v. County of Fresno* case: “[A] project emitting only 10 tons per year of NO_x or VOC is small enough that its regional impact on ambient ozone levels may not be detected in the regional air quality models that are currently used to determine ozone levels.”¹⁶⁹ With the margin of error, and variability in results between the baseline and baseline plus Proposed Project model runs due to photochemical processes and other factors, the small negative model differences predicted for this project-level analysis are expected.

Overall, with the very small air pollutant concentration difference between the modeled Proposed Project scenario and the baseline scenario, no meaningful conclusion on project health impacts can be obtained from the analysis. Thus, the health impacts may in fact be zero, and still be well within the model’s margin of error. Nevertheless, for informational purposes only, the CMAQ modeling results were imported into BenMAP-CE to model the potential health effects of the Proposed Project, given the changes in ozone and PM_{2.5} concentrations predicted by the CMAQ modeling.

Based on the BenMAP-CE output, regional health effects incidence associated with the emissions of ozone precursors and corresponding formation of ozone in the atmosphere associated with the operation of the Proposed Project included less than 0.1 incidence per year of respiratory-related hospital admissions (0.016 incidence), mortality (<0.02 incidence), and asthma-related emergency room visits (0.087 incidence) for all studied age groups combined. The amount of estimated incremental health effects incidence is less than 0.0001 percent of the baseline number of health effects incidences in the study area. The baseline is the actual health effects occurrences measured in the regional population (about 20 million people) of the modeling domain without

¹⁶⁸ Phone consultation with SCAQMD’s Sang-Mi Lee and SJVAPCD’s Leland Villalvazo on August 9, 2019.

¹⁶⁹ South Coast Air Quality Management District, Amicus Brief in Support of Neither Party, *Sierra Club v. County of Fresno*, 2015. p. 13.

the emissions produced by the Proposed Project.¹⁷⁰ The modeling performed is highly conservative, since it adds Proposed Project emissions to the air basin-wide inventory, as if all Proposed Project-related emissions are net new, whereas it has been documented in this section, and in Sections 3.14, Transportation and Circulation, and 3.7, Greenhouse Gas Emissions, that a substantial percentage of the Proposed Project-related travel demand and related emissions currently occur, and as such would have been included in SCAQMD's 2025 inventory, although attributed to the current location(s) of emission. Nonetheless, the very small increase in health effects incidence, relative to the substantially larger number of baseline health effects incidences, demonstrates that the Proposed Project would have a negligible impact on specific health effects.

The BenMAP-CE default includes 23 health endpoints (adverse health effects) for PM_{2.5}. Due to the very small changes in ambient PM_{2.5} concentrations as modeled by CMAQ, however, the incremental health incidences for all health endpoints were negative values, further confirming that the modeled PM_{2.5} concentrations are within the model's margin of error. Therefore, no conclusions can be reached on the specific health effects that may be caused by the Proposed Project ozone precursor and PM_{2.5} emissions. The health impacts may in fact be zero, and they would still be well within the models' margin of error. Please refer to Appendix D for more information.

As many regional-scale health impact assessments and this project-level analysis demonstrate, performing a quantitative HIA is complex and difficult, but it is possible to perform such analyses. Nevertheless, the limits of such analyses should be noted. The model outputs provide precise values. It would be inappropriate, however, to assume that these values, though seemingly precise, give an accurate understanding of the project's actual impacts. The imprecision of such analyses is inherent and unavoidable.

The modeling performed to estimate a single project's contribution to ambient concentrations of pollutants requires assumptions about many variables, both about the Proposed Project, and about the meteorological and other characteristics of the air basin into which the pollutants are emitted. Models often rely on assumptions that may not capture fully or accurately the complexity or dynamism of the physical world. There has been much research on sensitivities and uncertainties regarding the evaluation of environmental models.^{171,172,173} It is widely recognized that validation of a chemical transport model, such as the CMAQ model used in this analysis, is impossible because natural systems are never closed, and results are always unique. Thus a model can be

¹⁷⁰ Based on the 2010 census data, the EPA's PopGrid software generates the Ben-MAP ready population dataset for the modeling domains, which is 17,612,933 for the 2 km modeling grid (the modeling domain is a 174-mile x 99-mile = 17,297-square-mile area). Based on the 2010 population dataset generated by PopGrid, BenMAP-CE predicts the 2025 population for the modeled domain increases to 20,168,163 and used that in the health impact calculations.

Meteor.*, 40, 117-136, [https://doi.org/10.1175/1520-0450\(2001\)040<0117:UIEOMS>2.0.CO;2](https://doi.org/10.1175/1520-0450(2001)040<0117:UIEOMS>2.0.CO;2).

¹⁷³ Baker, K. R. and J. O. Bash (2012). Regional Scale Photochemical Model Evaluation of Total Mercury Wet Deposition and Speciated Ambient Mercury. *Atmospheric Environment*. 49(3):1-424.

evaluated by comparisons with real-world observations, but it can never be precisely validated because the full array of possible scenarios cannot be included. Each step in the modeling process, and each assumption incorporated into the model, adds a degree of uncertainty into the reported results. These inputs include air pollutant emission estimates, ambient air concentration modeling, and health impact calculations using various health impact functions. The combination and compounding of the uncertainties from each step of the modeling analysis, in the context of the very small increments of change that are predicted, could result in large margins of error for the overall modeled outcomes.

That does not mean the modeled results are invalid or meaningless. Rather, it means that one should not have undue confidence in the seeming precision of the reported outcome. Stated another way, the modeled results may be valid, but they should not be misinterpreted as an exact calculation of something as complex as criteria air pollutant dispersion modeling, or as correlating a given level of emissions with specific health effects. That is particularly true where, as here, regional models have been adapted for use at the project level. In this case, the calculated impact may be smaller than the reasonable margin of errors of such analyses. For example, the summation of modeled PM_{2.5}-related incremental health effects incidences are negative values, while the summation of modeled ozone-related incremental health effects incidences are positive values. Negative incremental values at a set location for a set period of time arise when the predicted concentration with Project emissions are lower than the baseline value. For example, the baseline PM_{2.5} value at a particular point in space and time might be reported as 13 µg/m³. With an error range of 20 percent, the result could more accurately be reported as 10.4 to 15.6 µg/m³. The PM_{2.5} concentration with Project emissions at that same point may be reported as 12.5 µg/m³, which could more accurately be reported as 10.0 to 15.0 µg/m³. When comparing the two ranges, one can see how both negative and positive incremental increases are possible. The narrower the error range is, the more likely the results will reflect the true trend.

Performance of this quantitative HIA using the best available tools and guidance demonstrates that applying state-of-the art models and methods designed to predict the health effects of large changes in air basin-wide emissions does not result in statistically significant results with respect to emissions increases at the project level. Therefore, no meaningful conclusion can be drawn with respect to potential health effects from the criteria pollutant emissions of the Proposed Project.

Conclusion

As discussed above, the Proposed Project would result in operational VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions that would exceed the applicable regional emissions significance threshold for the 18,500-attendee concert scenario, which has the highest number of attendees, as well as for the 18,000-attendee basketball game, 14,500-attendee concert, 9,500-attendee concert, 8,500-attendee family show, and 7,500-attendee other event scenario, as well as the non-event day with generator testing scenario. The impact of emissions on these days would be **potentially significant**.

Mitigation Measure 3.2-2(a)

Implement Mitigation Measure 3.14-2(b).

Mitigation Measure 3.2-2(b)

Emergency Generator and Fire Pump Generator Maintenance & Testing. The Applicant shall conduct maintenance and/or testing of the emergency generators or fire pump generators on three separate non-event days. Each emergency generator shall be tested on a separate non-event day and the two fire pump generators may be tested together on a separate non-event day.

Mitigation Measure 3.2-2(c)

The project applicant shall prepare and implement a Construction Emissions Minimization Plan. Before a construction permit is issued, the project applicant shall submit this plan to the City Department of Public Works for review and approval. The plan shall detail compliance with the following requirements:

- 1) The Plan shall set forth in detail how the project applicant will implement Project Design Feature 3.2-1.*
- 2) The Plan shall require construction contractor(s) to use off-road diesel-powered construction equipment that meets or exceeds California Air Resources Board (CARB) and US Environmental Protection Agency (EPA) Tier 4 off-road emissions standards for equipment rated at 50 horsepower or greater. Such equipment shall be outfitted with Best Available Control Technology (BACT) devices including, but not limited to, a CARB certified Level 3 Diesel Particulate Filters. This requirement shall be included in applicable bid documents, and the successful contractor(s) shall be required to demonstrate the ability to supply compliant equipment prior to the commencement of any construction activities. A copy of each unit's certified tier specification and CARB or South Coast Air Quality Management District operating permit (if applicable) shall be available upon request at the time of mobilization of each applicable unit of equipment. The City shall require quarterly reporting and provision of written documentation by contractors to ensure compliance, and shall conduct regular inspections to ensure compliance with these requirements.*
- 3) The project applicant shall require, at a minimum, that operators of heavy-duty haul trucks visiting the Project during construction commit to using 2010 model year or newer engines that meet CARB's 2010 engine emission standards of 0.01 grams per brake horsepower-hour (g/bhp-hr) for particulate matter (PM) and 0.20 g/bhp-hr of NO_x emissions or newer, cleaner trucks. In addition, the project applicant shall strive to use zero-emission (ZE) or near-zero-emission (NZE) heavy-duty haul trucks during construction, such as trucks with natural gas engines that meet CARB's adopted optional NO_x emissions standard of 0.02 g/bhp-hr. Contractors shall be required to maintain records of all trucks visiting the Project, and such records shall be made available to the City upon request.*
- 4) The project applicant shall ensure all construction equipment and vehicles are in compliance with the manufacturer's recommended maintenance schedule. The project applicant shall maintain maintenance records for the construction phase of the Project and all maintenance records shall remain on site for a period of at least 2 years from completion of construction.*

- 5) *The project applicant shall enter into a contract that notifies all construction vendors and contractors that vehicle idling time will be limited to no longer than 5 minutes or another timeframe as allowed by California Code of Regulations Title 13, section 2485, Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling, unless exempted by this regulation. For any vehicle that is expected to idle longer than 5 minutes, the project applicant shall require the vehicle's operator to shut off the engine. Signs shall be posted at the entrance and throughout the site stating that idling longer than 5 minutes is not permitted.*

Mitigation Measure 3.2-2(d)

The project applicant shall provide incentives for vendors and material delivery trucks that would be visiting the Proposed Project to encourage the use of ZE or NZE trucks during operation, such as trucks with natural gas engines that meet CARB's adopted optional NO_x emissions standard of 0.02 grams per brake horsepower-hour (g/bhp-hr). At a minimum, incentivize the use of 2010 model year delivery trucks.

Level of Significance After Mitigation: The Applicant has agreed to use off-road diesel-powered construction equipment that meets or exceeds CARB and US EPA Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 hp or greater. Based on registration data, over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the state are model year 2010 or newer. Even with implementation of Project Design Feature 3.2-1 and Mitigation Measure 3.2-1(c) discussed below, construction-related daily emissions would exceed the SCAQMD significance threshold for NO_x. Therefore, short-term regional construction emissions would be **significant and unavoidable**.

With regard to regional operational emissions, under Mitigation Measure 3.2-2(a) the Proposed Project would implement Mitigation Measure 3.14-2(b), which would require the Proposed Project to develop a TDM program which would be designed to reduce vehicle trips by spectators, event-day staff, and employees through the use of alternate modes of transportation including public transit, shuttles, ridesharing, walking, and biking. The TDM program would be required to demonstrate a reduction in vehicle trips produced by the Proposed Project. Potential trip reductions are based on estimates of vehicle trips for LA Clippers home basketball games and other non-NBA basketball game events to be hosted at the Project Site, as well as LA Clippers employees who would use the LA Clippers practice and training facility and the LA Clippers offices, and vehicle trips by employees and patrons of the sports medicine clinic, retail, restaurant, community space, and hotel uses included at the Project Site. The TDM program would be designed to reduce single-occupancy vehicle trips and to use other modes of transportation besides automobile to travel to basketball games and other events hosted at the Proposed Project. The implementation of this mitigation measure would serve to further reduce mobile emissions during operation of the Proposed Project, as well as any negligible related health effects. Because the efficacy of these measures to reduce trips cannot be determined with certainty at this time, maximum daily regional emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} during operation of the Proposed Project would continue to be above the SCAQMD regional significance thresholds and impacts would be **significant and unavoidable**.

As shown in **Table 3.2-24**, with Mitigation Measure 3.3-2(b), NO_x emissions during operations would be reduced to less-than-significant levels during Non-Event days.

However, VOC, NO_x, CO, PM10, and PM2.5 emissions would remain in excess of the SCAQMD significance thresholds on certain event days, therefore impacts would be **significant and unavoidable**.

**TABLE 3.2-24

Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in Appendix D.

SOURCE: ESA, 2019.

With Mitigation Measure 3.3-2(c), the Applicant has agreed to use off-road diesel-powered construction equipment that meets or exceeds CARB and US EPA Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 hp or greater, will strive to use ZE or NZE heavy-duty haul trucks during construction, and no idling signs will be posted upon entry and throughout the Project Site during construction. Based on registration data, over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the state are model year 2010 or newer. Thus, there are no additional feasible mitigation strategies to further reduce the maximum daily regional emissions of VOC, NO_x, CO, PM10, and PM2.5 during construction and the Proposed Project would continue to be above the SCAQMD regional significance thresholds and impacts would be **significant and unavoidable**.

With Mitigation Measure 3.3-2(d), the Applicant has agreed to provide incentives to vendor delivery trucks that use ZE or NZE trucks during project operations. Based on registration data, over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the state are model year 2010 or newer. Thus, there are no additional feasible mitigation strategies to further reduce the maximum daily regional emissions of VOC, NO_x, CO, PM10, and PM2.5 during operations and the Proposed Project would continue to be above the SCAQMD regional significance thresholds and impacts would be **significant and unavoidable**.

Impact 3.2-3: Construction and operation of the Proposed Project could expose sensitive receptors to substantial pollutant concentrations. (Less than Significant)

Local Air Quality

Construction

Potential localized impacts from short-term construction activities were analyzed using an air dispersion model (AERMOD) to generate concentrations of NO₂, CO, PM₁₀, and PM_{2.5} at air quality sensitive receptor locations surrounding the Project Site. As discussed in Project Design Feature 3.2-1, heavy duty construction trucks (import, export, delivery, etc.) would be prohibited from traveling to and from the Project Site during the pre-and post-event hours on days with major events at Hollywood Park and/or The Forum.

Particulate Matter

Project-generated incremental increases of PM₁₀ and PM_{2.5} were then compared to SCAQMD’s allowable incremental increase thresholds. The results of the PM analysis are presented in **Table 3.2-25**. As shown in Table 3.2-24, localized maximum daily construction emissions would not exceed the allowable 24-hour or annual incremental increase in PM₁₀ or PM_{2.5}. Therefore, the emissions of PM during construction would be less than significant.

**TABLE 3.2-25
 ASSESSMENT OF LOCALIZED PM EMISSIONS DURING CONSTRUCTION**

Pollutant	Averaging Time, units	Project Local Increase	Threshold	Total Impact Exceeds Threshold
PM10	24 hour, µg/m ³	7.0	10.4	No
	Annual, µg/m ³	0.64	1.0	No
PM2.5	24 hour, µg/m ³	4.3	10.4	No

NOTES:

SOURCE: ESA 2019.

Nitrogen Dioxide and Carbon Monoxide

To compare the Proposed Project construction emission concentrations of NO₂ and CO to applicable NAAQSs, existing concentrations of these pollutants from nearby monitors (see Table 3.2-2, above) and the future contribution to ambient concentrations resulting from the Adjusted Baseline must be included, as detailed on **Table 3.2-26**. As described in Project Design Feature 3.2-1, on days when major events are held at NFL Stadium and The Forum, the project applicant would not allow trucks to travel to or from the project construction site during the pre-event and post-event hours. As detailed on Table 3.2-25, annual emissions were modeled to demonstrate compliance with the annual NO₂ NAAQS.

**TABLE 3.2-26
 ASSESSMENT OF LOCALIZED NO₂ AND CO IMPACTS DURING CONSTRUCTION**

^a Background data for CO and nitrogen dioxide derived as the highest air quality measured data over a 3-year rolling average from 2015-2017.

^b The location of the maximum total impacts may vary due to contributions from Proposed Project and Adjusted Baseline.

^c Totals may not add up exactly due to rounding in the modeling calculations.

^d The 1-hour standard/threshold differs between the State and National analyses. The State threshold is based on a not-to-exceed value of modeled concentration impacts whereas the National threshold is based on a 98th percentile value.

SOURCE: ESA 2019.

As shown in Table 3.2-26, localized maximum daily construction emissions, added to existing ambient conditions and projected future contributions from the Adjusted Baseline, would not exceed the applicable NO₂ or CO standards and construction would not expose sensitive receptors to substantial pollutant concentrations. Therefore, the localized impact of construction emissions would be **less than significant**.

Operation

Localized impacts from operation of the Proposed Project were analyzed using air dispersion modeling to generate concentrations of NO₂, CO, PM10, and PM2.5 at receptor locations surrounding the Project Site. Project-generated incremental increases of PM10 and PM2.5 were then compared to SCAQMD’s allowable incremental increase thresholds. The results of the PM analysis are presented in Table 3.2-27.

Particulate Matter

As shown in Table 3.2-27, localized maximum daily operational emissions would not exceed the allowable incremental increase in PM10 or PM2.5. Therefore, impacts would be **less than significant**.

**TABLE 3.2-27
 ASSESSMENT OF LOCALIZED PM EMISSIONS DURING OPERATION**

Nitrogen Dioxide and Carbon Monoxide

To compare the Proposed Project operational concentrations of NO₂ and CO to applicable NAAQSs, existing concentrations of these pollutants from nearby monitors (see Table 3.2-2, above) and the future contribution to ambient concentrations resulting from the Adjusted Baseline must be included, as detailed in Table 3.2-28. As described above, on days when major events are held at NFL Stadium and The Forum, the project applicant would not allow delivery trucks to travel to or from the Project Site during the two hours before and one hour after an event of more than 9,500 attendees at the Project Site. Therefore, to assess the potential for maximum localized impacts in the vicinity of the Project Site within the applicable pollutant standard averaging times (i.e., 1 hour for NO₂ and CO NAAQS and 8 hours for CO NAAQS), two scenarios were modeled. The first includes the Proposed Project major event emissions (excluding delivery truck activity in the pre- and post- event hours) concurrent with emissions from ancillary HPSP uses, a major event at the NFL Stadium, and a concert at The Forum. The second localized scenario includes Project operational emissions for a 9,500 or less person event which includes delivery truck activity in the two pre-event hours and one post-event hour concurrent with a major event at the NFL Stadium, a concert at The Forum, and ancillary uses of HPSP. As detailed on Table 3.2-28, annual emissions were modeled to demonstrate compliance with the annual NO₂ NAAQS.

As shown in Table 3.2-28, localized maximum daily operational emissions, added to existing ambient conditions and projected future contributions from the Adjusted Baseline, would not result in an exceedance of applicable NAAQS for NO₂. Therefore, the impact of operational emissions would be **less than significant**.

TABLE 3.2-28
ASSESSMENT OF LOCALIZED NO₂ AND CO IMPACTS DURING OPERATION

Intersection CO Hotspot Analysis

SCAQMD recommends that a local CO hotspot analysis be conducted if the intersection meets one of the following criteria: (1) the intersection is at LOS D or worse and where the project would increase the volume to capacity ratio by 2 percent, or (2) the project would decrease Level of Service (LOS) at an intersection from C to D. A decrease in LOS, i.e., from C to D, means that there is more traffic and more delay at the intersection. A detailed review of the Proposed Project intersection data, as presented in Appendix K, identified the four intersections in the vicinity of the Project Site that would represent the most degraded LOS and highest vehicle volumes with the Proposed Project. CO hotspot modeling was conducted for the four intersections that would experience the highest traffic volumes for each scenario within each condition. Logically, if these four intersections demonstrate CO concentrations below the required thresholds, all other affected intersections would also be below thresholds and thus not create hotspots. LOS and traffic volumes for the four worst intersections within the local study area with the Proposed Project is shown in **Table 3.2-29**.

TABLE 3.2-29

SOURCE: Fehr & Peers 2019.

Hotspot modeling was conducted utilizing Caltrans’ CALINE4 model and emission rates obtained from CARB’s EMFAC2017 to determine the maximum potential pollutant concentrations generated by the Proposed Project. Hotspot modeling was conducted for the following scenarios: Adjusted Baseline, Adjusted Baseline Plus the Proposed Project, and Adjusted Baseline Plus events occurring at The Forum and the NFL Stadium Plus the Proposed Project.

Table 3.2-30 shows estimated CO concentrations for future 2024 conditions for the Adjusted Baseline Environmental Setting, Adjusted Baseline Plus the Proposed Project and Adjusted Baseline with The Forum and the NFL Stadium Plus the Proposed Project. Additionally, estimated emission concentrations are provided in Table 3.2-28. As shown therein, the estimated 1-hour and 8-hour average CO concentrations from the Proposed Project plus the background concentrations would be below the state and federal standards. CO hotspots are not anticipated due to traffic-generated emissions by the Proposed Project in combination with other anticipated developments in the area. Therefore, the mobile emissions of CO from the Proposed Project are not anticipated to contribute substantially to an existing or projected air quality violation of CO. Therefore, according to this criterion, air pollutant emissions during operation would result in a **less-than-significant impact**.

**TABLE 3.2-30
 CARBON MONOXIDE CONCENTRATIONS AT INTERSECTIONS**

Condition	CO Concentration (ppm)	Hawthorne and West Century	South Prairie and West Century	Crenshaw and West Century	South Prairie and Imperial	State Standard (ppm)	Exceed State Standard?
Adjusted Baseline 2024	1 hour	2.1	2.1	1.9	2.1	20	No
	8 hour	1.3	1.3	1.1	1.3	9	No
Adjusted Baseline Plus Project	1 hour	2.2	2.1	1.9	2.1	20	No
	8 hour	1.3	1.3	1.1	1.3	9	No
Adjusted Baseline with NFL Stadium and The Forum Plus Project	1 hour	2.3	2.3	1.9	2.1	20	No
	8 hour	1.4	1.4	1.1	1.3	9	No

NOTES:

- ppm = parts per million
- A significant impact would occur if the estimated CO concentration is over the 1-hour State standard of 20 ppm or the 8-hour State/Federal standard of 9 ppm.

SOURCE: ESA 2019.

Health Impacts Assessment –Localized Effects

Potential health effects from exposure to CO include fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain, and at extremely high levels, asphyxiation. Short-term exposures to NO₂ can potentially lead to respiratory symptoms (such as coughing, wheezing or difficulty breathing), and at extreme levels result in hospitalization. Nonetheless, NAAQS and CAAQS for these pollutants are widely recognized as adequately health protective. For example, OSHA has established the permissible level for daily employee exposure to CO at 50 ppm 8-hour average, while the US EPA has established an ambient standard of 9 ppm 8-hour average, not to be exceeded once per year. Clearly the NAAQS is highly conservative as compared to OSHA’s health protective standard. As shown in Tables 3.2-6 and 3.2-8, concentrations of CO and NO₂ resulting from the combination of ambient sources, the adjusted baseline, and project-related emissions are below applicable NAAQS and CAAQS. Therefore, with the Proposed Project localized emissions below the health-protective ambient concentration thresholds, the direct emissions from localized construction and operation would not be expected to cause or contribute to identifiable health effects.

As discussed above, NO_x and PM contribute to the formation of secondary ozone and particulate matter (indirection emissions), the accumulation of which can happen at greater distances from the source. Thus, potential health effects from these pollutants (both direct emission and associated secondary formations of other air pollutant) are most appropriately evaluated at the regional level. Please see the discussion above in Impact 3.2-2, where a quantitative HIA for ozone and PM_{2.5} was prepared for informational purposes and considered both the direction emissions and secondary atmospheric formations associated with NO_x and PM. Localized construction and operational emissions are not only relatively much smaller (e.g., only fractions

of the Proposed Project regional operational emissions), but also are localized and short term in nature; correspondingly, health effects associated with localized construction and operational emissions are expected to be smaller than those negligible (if not zero) regional health effects that were disclosed in Impact 3.2-2, above.

Toxic Air Contaminants

Health Risk Assessment

Lifetime Cancer Risk

Excess lifetime cancer risk is estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to carcinogens. As the individual incremental increase in lifetime cancer risk is assessed over long exposure time periods (i.e., 30-year for residential receptors), the potential effects of Proposed Project-related carcinogenic TAC emissions must include the combination of exposure to construction-related activities and exposure to operation-related activities. For cancer risk, SCAQMD guidance identifies a significant impact if a project would result in an incremental cancer risk that is greater than 10 in one million for any receptor.

The TAC emissions of the Proposed Project would be generated from mobile sources, including gasoline powered passenger vehicles, diesel-powered heavy-duty trucks, and emergency generators/emergency fire pumps. These sources generate TOG and PM10 from combustion of gasoline and diesel fuels. Gasoline and diesel TOG and PM10 emissions are composed of MSATs in varying distributions resulting in a speciation profile. The speciation profile represents the MSAT's weight fraction of TOG and PM10.

For construction, the potential emission sources of MSATs and DPM would be diesel-fueled heavy-duty equipment, on-road travel and idling emissions from diesel-fueled haul trucks, and on-road travel emissions from gasoline-fueled worker vehicles. For operation, the potential emission sources would be gasoline-fueled passenger vehicles travelling to and from the Project Site, diesel-fueled delivery trucks, diesel-fueled delivery truck with TRUs, and diesel-fueled emergency generators and emergency fire pumps.

A dense receptor grid around the Project Site and surrounding roadways that would carry the Proposed Project traffic, captures the maximum health risk impacts to exposed air quality sensitive receptors. The same meteorological, terrain, and other modeling input options as described in the section for the LST modeling analysis were used to characterize air dispersion and measure health risk impacts at air quality sensitive receptors.

Table 3.2-31 presents the estimated incremental cancer risks for the exposure scenario that starts from Proposed Project construction for air quality sensitive receptors over a maximum 30-year exposure in line with OEHHA guidance starting with the first year of construction of the Proposed Project. The EMFAC model assumes that engines get cleaner over time, resulting in reduced emission rates; therefore, using 2024 emission levels for Proposed Project operational emissions is the “worst-case” scenario and thus conservative. As shown in Table 3.2-31, the

Proposed Project would not exceed SCAQMD’s cancer risk significance threshold of an incremental increase of 10 in a million. Therefore, the lifetime cancer risk that would result from construction and operation of the Proposed Project would be a **less-than-significant impact**.

TABLE 3.2-31
ESTIMATED CANCER RISK, EXPOSURE DURATION STARTING FROM BEGINNING OF PROJECT CONSTRUCTION

Receptor Type	Total Exposure Time (years)	Incremental Increase in Cancer Risk During Project Construction (risk/million)	Incremental Increase in Cancer Risk During Project Operation (risk/million)	Total Incremental Increase in Cancer Risk ^a (risk/million)	SCAQMD Cancer Risk Significance Threshold (risk/million)	Exceeds Threshold?
Residential	30	7.6	2.1	9.7	10	No
Worker	25	0.6	3.2	3.8	10	No

SOURCE: ESA 2019. Health risk calculations are provided in Appendix D.

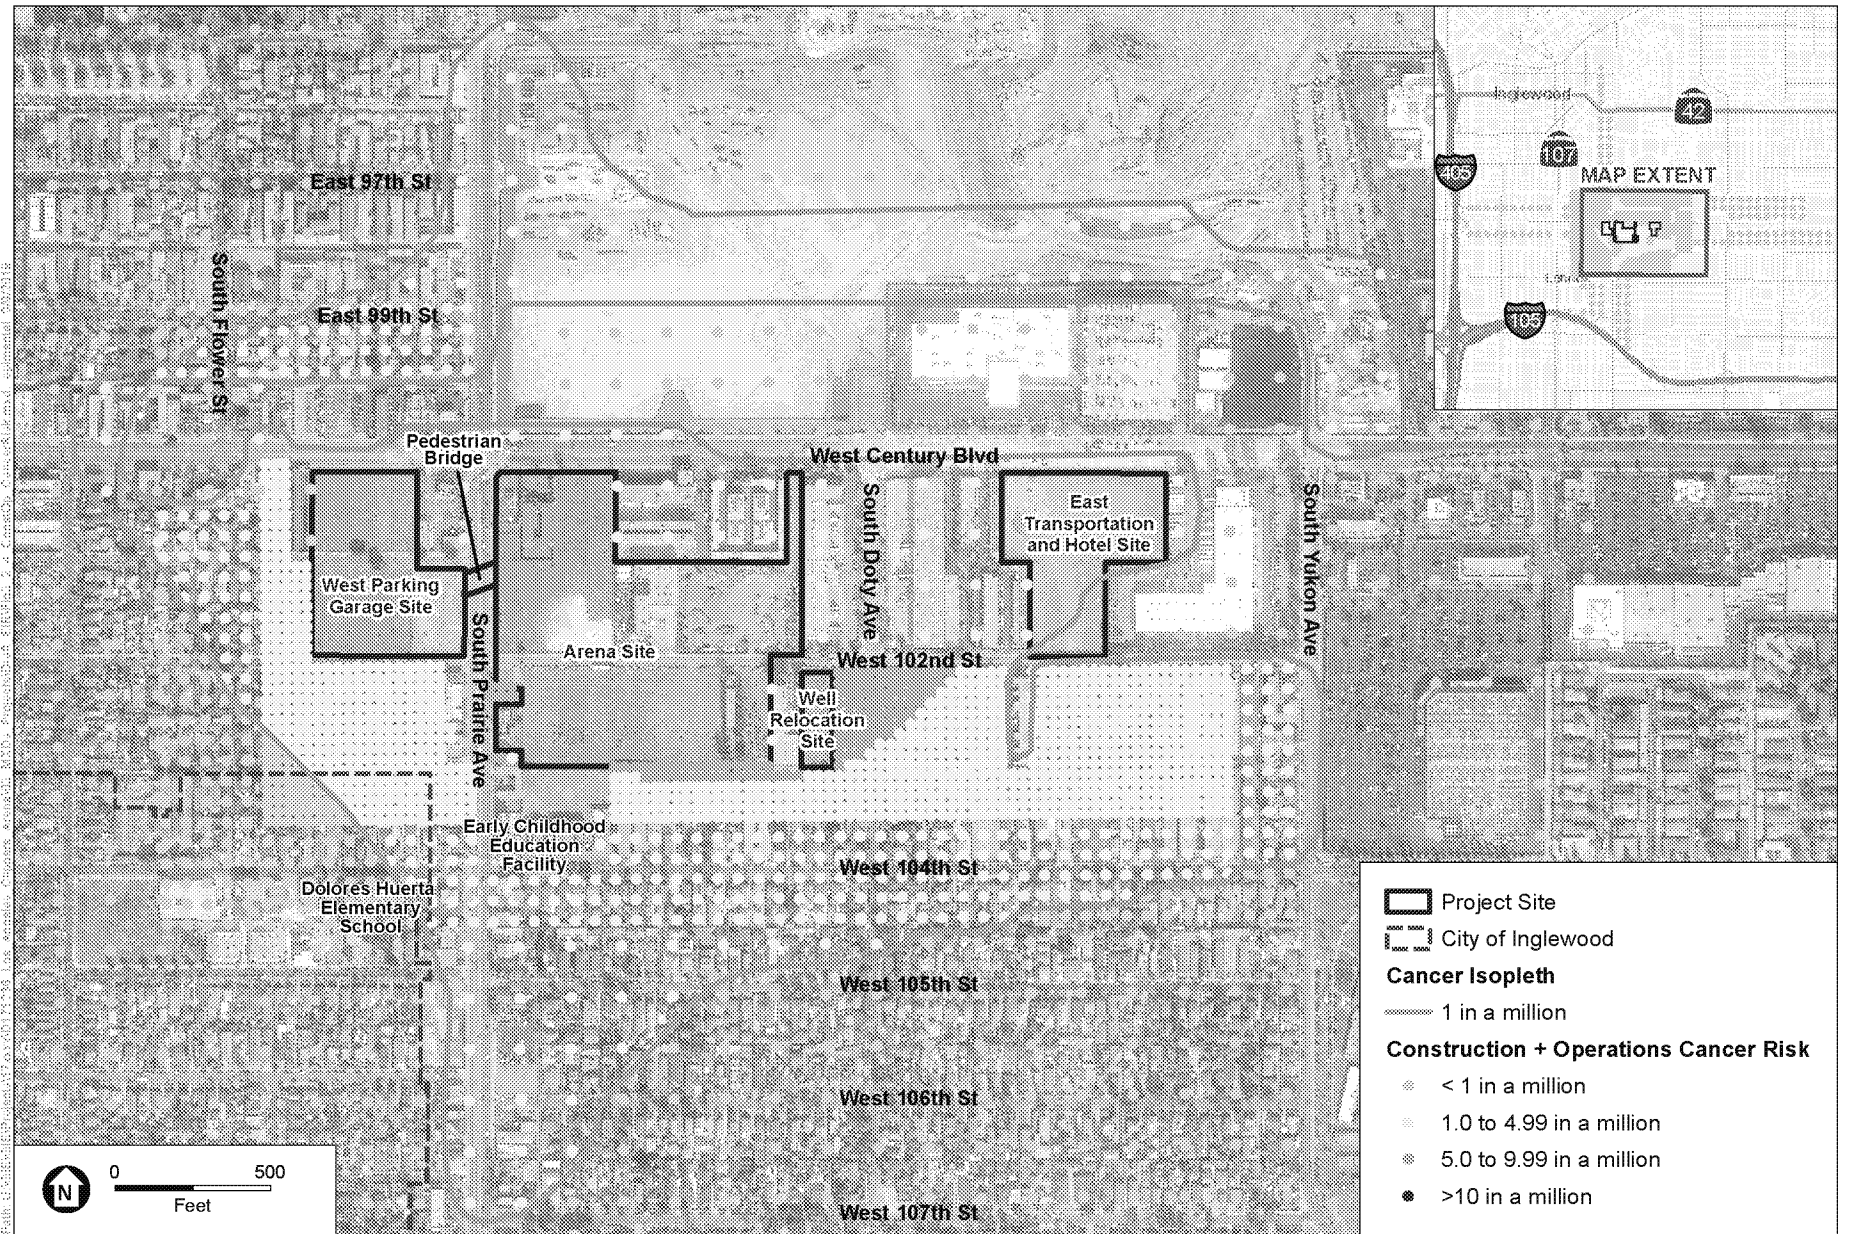

A graphical representation of the incremental increase in cancer risk due to construction and operation emissions is shown in **Figure 3.2-4**.

Non-carcinogenic Health Risk (Chronic and Acute) – Construction

As previously discussed, an HRA was prepared to evaluate the risk of potential non-carcinogenic negative health outcomes related to TACs exposure from airborne emissions during the construction of the Proposed Project. For construction, the potential TAC emission sources were heavy-duty equipment used during demolition, grading and excavation, and building construction activities. The HRA followed the procedures and methods provided in the *Guidance Manual for Preparation of Health Risk Assessments* issued by OEHHA in 2015 as well as the methods in the SCAQMD’s *Risk Assessment Procedures for Rule 1401, 1401.1, and 212, version 8.1*, used in conjunction with the associated *SCAQMD Permit Application Package “N.”* Non-cancer effects of chronic (i.e., long-term) and acute (i.e., short-term) TAC exposure were evaluated using the HI approach consistent with the OEHHA and SCAQMD guidance.

A chronic HI equal to or greater than 1.0 represents a significant chronic health hazard. A chronic health effect could include irritation to eyes, throat, lungs or neurological damage. The Proposed Project related TACs with known or suspected chronic health effects emitted during construction could include DPM, acetaldehyde, benzene, 1,3-butadiene, formaldehyde and nickel.¹⁷⁴

SOURCE: TerraServer, 2018; ESA, 2019.

Inglewood Basketball and Entertainment Center
Figure 3.2-4
 Construction + Operations Cancer Risk

An acute HI equal to or greater than 1.0 represents a significant acute health hazard. An acute health effect could include irritation to eyes, throat, or lungs, sensory irritation, or coughing, chest pain or vomiting. The Proposed Project related TACs with known or suspected acute health effects emitted during construction could include acetaldehyde, benzene, 1,3-butadiene and formaldehyde.¹⁷⁵ There can also be acute effects associated with the speciation of DPM, which are addressed in more detail in Appendix D.

The maximum chronic non-carcinogenic health risks are presented in **Table 3.2-32**. As shown in Table 3.2-33, the Proposed Project would result in non-carcinogenic health risk that would be below the significance threshold of a chronic HI of 1.0 for the maximum impacted resident, worker, school (child), and early childhood education (child) receptors and, this, this impact would be **less than significant**.

TABLE 3.2-32
MAXIMUM CHRONIC NON-CARCINOGENIC HEALTH RISK DURING CONSTRUCTION

Receptor Location	TAC Resulting in Maximum Impact (8HR/Annual)	Target Organ	8-Hour Hazard Index	Annual Chronic Hazard Index

Worker	Formaldehyde/DPM	Respiratory	0.12	0.009
School (Child)	Formaldehyde/DPM	Respiratory	0.02	0.0003
Early Childhood Education (Child)	Formaldehyde/DPM	Respiratory	0.05	0.002
Hazard Index Threshold	—	—	1.0	1.0
Exceeds Threshold?	—	—	No	No

SOURCE: ESA 2019. Health risk calculations are provided in Appendix D.

In addition, the maximum acute non-carcinogenic health risks are presented in **Table 3.2-33**. As shown in Table 3.2-33, the Proposed Project would result in non-carcinogenic health risk that would be below the significance threshold of an acute HI of 1.0 for the maximum impacted residential, worker, school (child), and early childhood education (child) receptors and impacts would be **less than significant**.

Non-carcinogenic Health Risk (Chronic and Acute) – Operation

Exposure to MSAT emissions during the Proposed Project operations could also result in chronic and acute health risks. The maximum chronic non-carcinogenic health risks are presented in **Table 3.2-34**. As shown, the Proposed Project would result in chronic non-carcinogenic health risk that would be below the significance threshold of a chronic and acute HI of 1.0 for the

¹⁷⁵ Office of Environmental Health Hazard Assessment, 2008. Appendix D. Individual Acute, 8-Hour, and Chronic Reference Level Summaries. December 2008, updated July 2014.

maximum exposed individual receptor (i.e., residential, worker, school (child), early childhood education (child) receptors). This impact would therefore be **less than significant**.

Population-Wide Risks (Cancer Burden)

If incremental individual cancer risk from the Proposed Project would exceed the SCAQMD regulatory threshold of an incremental increase of 1 in one million, then an estimated determination of population level risks is required. For the cancer burden analysis, the Proposed Project risks from construction and operation impacts are evaluated for a 70-year residential scenario.¹⁷⁶ Cancer risks were estimated at the geographical center (centroid) of census tracts that are within the study area of the HRA and multiplied by the corresponding population number. A cancer burden greater than 0.5 is considered a significant cancer burden. As presented in **Table 3.2-36**, for the 70-year exposure duration, the cancer burden is estimated to be 0.04 individuals that were estimated to have a cancer risk of 1 in a million or more. Therefore, the Proposed Project would not exceed SCAQMD's cancer burden significance, and thus, this impact would be **less than significant**.

**TABLE 3.2-36
CANCER BURDEN, 70-YEAR EXPOSURE DURATION**

Scenario	Cancer Burden
Construction + Operations Population Cancer Burden	0.04
Cancer Burden Threshold	0.5
Exceeds Threshold?	No

Conclusion

For all criteria pollutants studied impacts related to potentially exposing air quality sensitive receptors to substantial pollutant concentrations would be below applicable thresholds, and no mitigation is required. Emissions of TACs would result in carcinogenic, and acute- and chronic-noncarcinogenic health risks below applicable standards, the impacts related to such exposures are less than significant. Therefore, the impacts related to exposing air quality sensitive receptors to substantial pollutant emissions would be **less than significant**.

Mitigation Measures

None required.

¹⁷⁶ South Coast Air Quality Management District, 2017. Risk Assessment Procedures for Rule 1401, 1401.1, and 212, Version 8.1, September 1, 2017.

Impact 3.2-4: Construction and operation of the Proposed Project could result in other emissions (such as those leading to odors). (Less than Significant)

Construction

Potential sources that may emit odors during construction activities include the use of architectural coatings and solvents. SCAQMD Rule 1113 (Architectural Coatings) limits the amount of VOCs from architectural coatings and solvents. According to the SCAQMD CEQA Air Quality Handbook, construction equipment is not a typical source of odors. Odors from the combustion of diesel fuel would be minimized by complying with the CARB ATCM, adopted in 2004, that limits diesel-fueled commercial vehicle idling to 5 minutes at any given location. The Proposed Project would also comply with SCAQMD Rule 402 (Nuisance), which prohibits the emissions of nuisance air contaminants or odorous compounds. Through adherence with mandatory compliance with SCAQMD Rules and State measures, construction activities and materials would not create objectionable odors. Construction of the Proposed Project would not be expected to generate nuisance odors at nearby air quality sensitive receptors. With respect to odors, the impact would be **less than significant**.

Operations

The Proposed Project land uses involve the operation of an arena, offices, retail/restaurant uses, parking, and hotel uses, none of which would be uses that are typically expected to be substantial sources of other emissions, including odors. According to the SCAQMD CEQA Air Quality Handbook, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Proposed Project would not involve elements related to these types of uses. The Proposed Project would include various trash receptacles associated with the proposed arena, office, retail/restaurant, commercial, and hotel uses. On-site trash receptacles used by the Proposed Project would be covered and properly maintained to prevent adverse odors. With proper housekeeping practices, trash receptacles would be maintained in a manner that promotes odor control, and no adverse odor impacts are anticipated from the uses. Impacts with respect to odors would be **less than significant**.

Mitigation Measure

None required.

Cumulative Impacts

The following cumulative impact analysis is based on the recommendations provided by SCAQMD in the *Potential Control Strategies to Address Cumulative Impacts from Air Pollution White Paper*. SCAQMD's guidance for assessing a project's cumulative impacts recommends the use of two alternative methodologies: (1) that project-specific air quality impacts be used to determine the project's potential cumulative impacts to regional air quality; or (2) that a project's consistency with the AQMPs are used to determine its potential cumulative impacts. Under SCAQMD's guidance, "[p]rojects that exceed the project-specific significance thresholds are

considered by SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.”¹⁷⁷ Therefore, consistent with this guidance, the potential for the Proposed Project to results in cumulative impacts from regional emissions is assessed based on SCAQMD thresholds.

Impact 3.2-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in inconsistencies with implementation of applicable air quality plans. (Significant and Unavoidable)

As described above under Impact 3.2-1, construction and operation of the Proposed Project would not be consistent with the AQMP as the Proposed Project would generate emissions of nonattainment pollutants or precursors (i.e., VOC, NO_x, PM10, and PM2.5) that exceed the applicable significance thresholds. Based on SCAQMD guidance, the exceedance of these thresholds indicates that the Proposed Project would have a considerable contribution to a significant impact. Therefore, the Proposed Project would result in a **potentially significant cumulative impact**.

Mitigation Measure 3.2-5(a)

Implement Mitigation Measure 3.14-2(b). (Implementation of a comprehensive Transportation Demand Management (TDM) program)

Mitigation Measure 3.2-5(b)

Implement Mitigation Measure 3.2-2(b). (Emergency Generator and Fire Pump Generator Maintenance & Testing)

Mitigation Measure 3.2-5(c)

Implement Mitigation Measure 3.2-2(c). (Construction Emissions Minimization Plan)

Mitigation Measure 3.2-5(d)

Implement Mitigation Measure 3.2-2(d). (Incentives for vendors and material delivery trucks to use ZE or NZE trucks during operation)

Level of Significance After Mitigation: Because Proposed Project regional emissions during construction and operations would exceed the significance thresholds for those criteria air pollutants for which the Air Basin is not in attainment (i.e., VOC, NO_x, PM10, and PM2.5), the Proposed Project would have a considerable contribution to a significant cumulative inconsistency with the AQMPs. As discussed above, the Proposed Project would implement Mitigation Measures 3.2-5(a-d), which would require the project applicant to use off-road diesel-powered construction equipment that meets or exceeds the CARB and US EPA Tier 4 Final off-road emissions standards or equivalent for all equipment rated at 50 hp or greater and implement a Construction Emissions Minimization Plan during project construction.

¹⁷⁷ South Coast Air Quality Management District, 2003. White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution. August 2003. Appendix D, p. D-3.

Implementation of a TDM program would serve to reduce Project-related mobile emissions during operation of the Proposed Project. Maintenance and/or testing of emergency generators or fire pump generators will be conducted on three separate non-event days. Each emergency generator shall be tested on a separate non-event day and the two fire pump generators may be tested together on a separate non-event day. As demonstrated in Table 3.2-24, NO_x emissions during operations would be reduced to less-than-significant levels during Non-Event days. However, VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions would remain in excess of the SCAQMD significance thresholds on certain event days. In addition, the Applicant has agreed to provide incentives to vendor delivery trucks that use ZE or NZE trucks during project operations. As previously stated, registration data indicates over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the state are model year 2010 or newer. Thus, there are no additional feasible mitigation strategies to further reduce the regional emissions generated during operation of the Proposed Project, based on the above, construction and operation of the Proposed Project would contribute to a **significant and unavoidable cumulative impact** as it relates to consistency with the applicable air quality plan.

Impact 3.2-6: Construction and operation Proposed Project, in conjunction with other cumulative development, would result in cumulative increases in short-term (construction) and long-term (operational) emissions. (Significant and Unavoidable)

Construction

The SCAQMD CEQA Air Quality Handbook states: “[f]rom an air quality perspective, the impact of a project is determined by examining the types and levels of emissions generated by the project and its impact on factors that affect air quality. As such, projects should be evaluated in terms of air pollution thresholds established by the District.”¹⁷⁸ As shown in Table 3.2-14, provided under Impact 3.2-2, above, regional emissions during construction of the Proposed Project would exceed the SCAQMD significance threshold for NO_x. Thus, based on SCAQMD methodology, the Proposed Project construction emissions would represent a considerable contribution to a cumulative impact, resulting in a **potentially significant cumulative impact**.

Operation

As discussed under Impact 3.2-2, above, and shown in Tables 3.2-15 through 3.2-22, regional emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} emissions during operation of the Proposed Project would exceed the SCAQMD significance thresholds. Thus, based on SCAQMD methodology, the Proposed Project operational emissions would represent a considerable contribution to a cumulative impact, resulting in a **potentially significant cumulative impact**.

Mitigation Measure 3.2-6(a)

Implement Mitigation Measure 3.14-2(b). Implementation of a comprehensive Transportation Demand Management (TDM) program.

¹⁷⁸ South Coast Air Quality Management District, CEQA Air Quality Handbook, 1993, p. 6-1.

Level of Significance After Mitigation: As discussed above under Mitigation Measure 3.2-2(c), there would be no feasible mitigation measures to further reduce NO_x emissions during construction. Thus, consistent with SCAQMD guidance, the Proposed Project NO_x emissions during construction of the Proposed Project would be cumulatively considerable, resulting in a **significant and unavoidable cumulative impact**.

Implementation of Mitigation Measure 3.14-2(b) would reduce regional and localized emissions for all pollutants during operation of the Proposed Project. However, even after implementation of the required TDM Program, emissions are predicted to remain in excess of applicable thresholds. Thus, consistent with SCAQMD recommendations, the Proposed Project contribution to VOC, NO_x, CO, PM10, and PM2.5 emissions during operation of the Proposed Project would remain cumulatively considerable, resulting in a **significant and unavoidable cumulative impact**.

Mitigation Measure 3.2-6(b)

Implement Mitigation Measure 3.2-2(b). Emergency Generator and Fire Pump Generator Maintenance & Testing.

Level of Significance After Mitigation: As shown in Table 3.2-24, NO_x emissions during operations would be reduced to less-than-significant levels during Non-Event days. However, VOC, NO_x, CO, PM10, and PM2.5 emissions would remain in excess of the SCAQMD significance thresholds on certain event days, therefore cumulative impacts would be **significant and unavoidable**.

Mitigation Measure 3.2-6(c)

Implement Mitigation Measure 3.2-2(c). Prepare and implement a Construction Emissions Minimization Plan.

Level of Significance After Mitigation: As discussed above under Mitigation Measure 3.2-2 (c), there would be no feasible mitigation measure to further reduce the maximum daily regional emissions of NO_x during construction and the Proposed Project would cumulatively be above the SCAQMD regional significance thresholds for NO_x, and cumulative impacts would be **significant and unavoidable**.

Mitigation Measure 3.2-6(d)

Implement Mitigation Measure 3.2-2(d). Incentivize use of ZE or NZE trucks.

Level of Significance After Mitigation: The Applicant has agreed to provide incentives to vendor delivery trucks that use ZE or NZE trucks during project operations. Based on registration data, over 75 percent of heavy-duty diesel vehicles (i.e., vendor and haul trucks) in the state are model year 2010 or newer. Thus, there are no additional feasible mitigation strategies to further reduce the maximum daily regional emissions of VOC, NO_x, CO, PM10, and PM2.5 during operations and the Proposed Project would cumulatively be above the SCAQMD regional significance thresholds and cumulative impacts would be **significant and unavoidable**.

Impact 3.2-7: Construction and operation Proposed Project, in conjunction with other cumulative development, could contribute to a cumulative exposure of sensitive receptors to substantial pollutant concentrations. (Less than Significant)

Localized construction and operational impacts for PM10, PM2.5, NO₂, and CO, as described above under Impact 3.2-3, are cumulative in nature as they consider the ambient levels of these pollutants as well as concurrent Proposed Project construction and operation with a major sold-out event at the NFL Stadium and The Forum. As discussed further above, localized construction and operational impacts for annual and one-hour emissions were found to be less than significant. Therefore, construction and operation of the Proposed Project would result in a **less-than-significant cumulative impact**.

To evaluate potential cumulative CO impacts from roadway sources, cumulative scenarios (Cumulative, Cumulative Plus the Proposed Project, and Cumulative with The Forum and the NFL Stadium Plus the Proposed Project), were also modeled to determine if a CO hotspot would occur. CO hotspot modeling was conducted for the four intersections that experience the highest traffic volumes for each scenario within each scenario. Logically, if these four intersections demonstrate CO concentrations below the required thresholds, all other affected intersections would also be below thresholds and thus not create hotspots. LOS and traffic volumes for the four worst intersections within the local study area with the Proposed Project is shown in **Table 3.2-37**.

**TABLE 3.2-37
CUMULATIVE TRAFFIC INTERSECTIONS LEVEL OF SERVICE**

Condition	Scenario	Hawthorne Boulevard and West Century Boulevard		South Prairie Avenue and West Century Boulevard		Crenshaw Boulevard and West Century Boulevard		South Prairie Avenue and Imperial Highway	
		LOS	Traffic Volumes	LOS	Traffic Volumes	LOS	Traffic Volumes	LOS	Traffic Volumes
Cumulative	WD Pre-E	E	5,898	F	6,041	D	5,580	D	5,795
	WD Post-E	C	3,007	C	2,919	C	2,891	C	3,085
	WD Pre-E	D	5,328	E	5,417	E	5,743	D	5,187
Cumulative Plus Project	WD Pre-E	F	7,627	F	8,025	F	6,970	E	6,085
	WD Post-E	F	5,741	F	5,412	E	4,834	D	4,210

SOURCE: Fehr & Peers 2019.

Table 3.2-38 shows estimated CO concentrations for future 2024 Cumulative, Cumulative with Plus the Proposed Project, and Cumulative with the NFL Stadium and The Forum Plus the Proposed Project estimated emission concentrations. As shown therein, the estimated 1-hour and 8-hour average CO concentrations from project-generated and cumulative traffic plus the background concentrations are below the state and federal standards. No CO hotspots are anticipated because of traffic-generated emissions by the Proposed Project in combination with other anticipated development in the area. Therefore, the mobile emissions of CO from the Proposed Project are not anticipated to contribute substantially to an existing or projected cumulative air quality violation of CO. Therefore, according to this criterion, air pollutant emissions during operation would result in a **less-than-significant cumulative impact**.

**TABLE 3.2-38
 CUMULATIVE CARBON MONOXIDE CONCENTRATIONS AT INTERSECTIONS**

Condition	CO Concentration (ppm)	Hawthorne and West Century	South Prairie and West Century	Crenshaw and West Century	South Prairie and Imperial	State Standard (ppm)	Exceed State Standard?
Cumulative	1 hour	2.1	2.1	1.9	2.1	20	No
	8 hour	1.3	1.3	1.1	1.3	9	No
Cumulative Plus Project	1 hour	2.4	2.1	1.9	2.1	20	No
	8 hour	1.4	1.3	1.1	1.3	9	No
Cumulative with NFL Stadium and The Forum Plus Project	1 hour	2.4	2.3	1.9	2.2	20	No
	8 hour	1.4	1.4	1.1	1.3	9	No

NOTES:

- ppm = parts per million
- A significant impact would occur if the estimated CO concentration is over the 1-hour State standard of 20 ppm or the 8-hour State/Federal standard of 9 ppm.

SOURCE: ESA 2019.

With regard to localized construction and operational impacts for PM10 and PM2.5, the SCAQMD’s ambient air quality thresholds for PM10 and PM2.5 are project-specific because the Air Basin is in nonattainment, as described in Section 3.2.4. Because the Air Basin is in nonattainment, based on SCAQMD Rule 403, the thresholds are designed to regulate an allowable change in concentration.¹⁷⁹ Therefore, background concentration is irrelevant, and a cumulative analysis is not necessary. In addition, as it relates to the health risk analysis provided above under Impact 3.2-3, the lifetime cancer risk as well as the non-carcinogenic health risk (chronic and acute) for construction and operation has thresholds designed to analyze a project’s potential impact on individual health risk, without consideration for any background

¹⁷⁹ Note that the ambient air quality thresholds for PM10 and PM2.5 is different than the ambient air quality thresholds for NO₂ and CO, pollutants for which the Air Basin is in attainment. It is necessary to analyze the contribution from background sources for NO₂ and CO.

concentrations or risk, or the contribution from other reasonable foreseeable projects in the vicinity. Therefore, a cumulative analysis is not necessary.

Mitigation Measures

None required.

Impact 3.2-8: Construction and operation Proposed Project, in conjunction with other cumulative development, could result in cumulative increases of other emissions (such as those leading to odors). (Less than Significant)

As discussed under Impact 3.2-4, above, during construction, the Proposed Project would implement applicable SCAQMD regulations including SCAQMD Rule 1113, which would limit the amount of VOCs from architectural coatings and solvents, and SCAQMD Rule 402, which prohibits the emissions of nuisance air contaminants or odorous compounds. Through adherence with mandatory compliance with SCAQMD Rules and State measures, construction activities and materials would not create objectionable odors.

The Proposed Project would not involve elements related to those land uses described in the SCAQMD CEQA Air Quality Handbook that would typically be associated with odor complaints. None of the cumulative projects identified in Section 3.0, Introduction to the Analysis, indicate the intent to construct and operate uses that would typically be associated with odor complaints. It can also be reasonably assumed that the related projects in the vicinity of the Project Site would also comply with applicable SCAQMD Rules and State measures to reduce odors during construction and operation. Therefore, increases in other emissions from the Proposed Project and other cumulative development would result in a **less-than-significant cumulative impact**.

Mitigation Measures

None required.

3.3 Biological Resources

This section describes and evaluates potential effects related to biological resources that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing environmental setting for biological resources as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, State, and local regulations related to biological resources; and (3) an analysis of potential impacts to biological resources associated with the implementation of the Proposed Project, as well as identification of potentially feasible measures that could mitigate significant impacts.

Comments received in response to the NOP for the EIR can be found in Appendix B, though no specific comments regarding biological resources were provided.

The analysis included in this section was developed based upon a review of potentially occurring special-status species,¹ as well as existing wildlife habitats, vegetation communities, and jurisdictional resources based on the results of a field reconnaissance visit conducted by ESA biologists on May 10, 2018, and a review of available information related to biological resources in the vicinity of the Project Site. A database query of the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDDB)² and the California Native Plant Society (CNPS) Inventory of Rare and Endangered Vascular Plants of California³ was conducted to identify special-status wildlife and plant species that have been recorded in the region. The database queries included the US Geological Survey (USGS) 7.5-minute quadrangle and the surrounding eight quadrangles for Inglewood: Beverly Hills, Hollywood, Los Angeles, Venice, South Gate, Long Beach, Torrance, and Redondo Beach. In addition, the US Fish and Wildlife Service (USFWS) Information for Planning and Consultation (IPaC) database⁴ was also queried, which identifies federally-listed species that have been recorded in the region was also conducted.

3.3.1 Environmental Setting

Regional Setting

The Project Site is located in the City of Inglewood, just south of the Hollywood Park along West Century Boulevard, within Los Angeles County. Regional geographic features in the surrounding area include the Los Angeles Basin. The City of Inglewood is located approximately 9.5 miles south of the Santa Monica Mountains and about 6 miles east of the Pacific Ocean.

¹ Species that are protected pursuant to Federal or State endangered species laws, or have been designated as Species of Special Concern by the CDFW, or species that are not included on any agency listing but meet the definition of rare, endangered or threatened species of the CEQA Guidelines section 15380, are collectively referred to as “special-status species.”

² California Department of Fish and Wildlife, 2019. California Natural Diversity Database RareFind 5 personal computer program. <http://www.dfg.ca.gov/biogeodata/cnddb/mapsanddata.asp>. Accessed June 26, 2019. Data set expires December 1, 2019.

³ California Native Plant Society, 2019. *Inventory of Rare and Endangered Plants (online edition, v7-13)*. <http://www.rareplants.cnps.org/>. Accessed June 27, 2019.

⁴ US Fish and Wildlife Service, 2019. Information for Planning and Consultation (IPaC). <https://ecos.fws.gov/ipac/>. Accessed June 26, 2019.

The climate in the region is Mediterranean, with dry summers and cool winters; however, the region has experienced periodic drought conditions. Generally, the Los Angeles Basin receives most of its precipitation between November and March. Annual precipitation averages around 14 inches a year.

Plant communities and diverse habitats are limited in the vicinity of the Project Site due to extensive urbanization and development. “[T]he complete urbanization of Inglewood has appreciably limited any remaining natural resources to be conserved.”⁵ Plant communities that occur within urbanized areas in the region typically consist of maintained ornamental landscaping.

Project Site Overview

The entirety of the Project Site was surveyed for biological resources. Adjacent areas are completely developed and urbanized; therefore, adjacent areas did not need to be assessed for their potential to support special-status species.

Arena Site

The approximately 17-acre Arena Site is the largest contiguous part of the Project Site and is located at the southeast corner of the intersection of West Century Boulevard and South Prairie Avenue. The site is previously disturbed and mostly barren dirt (non-vegetated) with portions that are developed with concrete slab or buildings. There are some portions of the Project Site that contain sparse non-native grasses and ornamental plants, and are surrounded by residential, commercial and institutional development, including sidewalks and adjacent roadways lined by ornamental trees.

West Parking Garage Site

The approximately 5-acre West Parking Garage Site is located at the southwest corner of the intersection of West Century Boulevard and South Prairie Avenue. It is previously disturbed and dominated by non-native grasses and ornamental plants. Four street trees are located in the middle of this site along West 101st Street. The site is surrounded by an urban/developed landscape and adjacent land uses include residential and commercial developments.

East Transportation and Hotel Site

The approximately 5-acre East Transportation and Hotel Site is located along West Century Boulevard between South Doty Avenue and Yukon Avenue South. The site consists of a disturbed lot that is currently barren with some patches of non-native grasses and ornamental plants with nine ornamental trees. Commercial development is adjacent to this site.

Well Relocation Site

The 0.7-acre Well Relocation Site is located near the southwest corner of West 102nd Street and South Doty Avenue intersection. The Well Relocation Site has been previously disturbed and is

⁵ City of Inglewood General Plan, Conservation Element (adopted October 21, 1997), p. 5.

comprised of mostly non-native grasses and ornamental plants. Seven ornamental trees are also found within this site. The site is surrounded by commercial and residential land uses.

Plant Communities and Land Cover Types

Plant communities are assemblages of plant species that occur together in a given area and are defined by species composition and relative abundance. The plant communities and land cover types described in this section were classified according to CDFW's *A Guide to Wildlife Habitats*.⁶

Barren

Barren land cover type is defined by the absence of vegetation (less than two percent total vegetation cover by herbaceous species and less than 10 percent cover by tree or shrub species). Barren habitats occupying the Arena Site include graveled areas or bare ground and total approximately 3.06 acres (roughly 11 percent of the total Project Site).

Disturbed

Disturbed land cover type are areas that have been previously disturbed by grading, vehicle use, and/or vegetation clearing and maintenance. Disturbed land cover consists of approximately 20.72 acres, or 74 percent, of the total Project Site. All components of the Project Site contain some disturbed habitat. Due to the extent of historical and current disturbance, these areas remain sparsely vegetated by assemblages of introduced non-native, weedy species that are adapted to regular disturbance. Total herbaceous cover is greater than two percent, so this land cover type does not qualify as barren. Dominant plant species observed within these disturbed areas include ripgut brome (*Bromus diandrus*), red brome (*Bromus madritensis* ssp. *rubens*), wild oat (*Avena fatua*), Bermuda grass (*Cynodon dactylon*), redstem filaree (*Erodium cicutarium*), wild barley (*Hordeum spontaneum*), and cheeseweed (*Malva parviflora*).

Urban/Developed

Urban/developed land cover type comprise approximately 4.35 acres of the Project Site (approximately 15 percent of the total Project Site), including landscaped areas that occur throughout the Project Site. Urban/developed land cover type consist of buildings, roadways, and other built infrastructure. Typically, vegetation associated with urban/developed areas consists of non-native, ornamental landscaping, including lawns, shrubs, shade trees and hedges. Ornamental trees that occur on the Project Site or along the streets abutting the site include such species as: tree of heaven (*Ailanthis altissima*), carrotwood (*Cupaniopsis anacardioides*), Chinese banyan (*Ficus macrocarpa*), London planetree (*Platanus x acerifolia*), Peruvian pepper tree (*Schinus molle*), Brazilian pepper tree (*Schinus terebinthifolius*), and Mexican fan palm (*Washingtonia robusta*). One native tree species, coast live oak (*Quercus agrifolia*), occurs as an ornamental species within the Project Site and along the streets abutting the Project Site as further discussed in the Protected Trees section below.

⁶ Mayer, Kenneth E., and W.F. Laudenslayer, Jr. 1988. *A Guide to Wildlife Habitats of California*. State of California Resources Agency, Department of Fish and Game. Sacramento, CA. <https://www.wildlife.ca.gov/Data/CWHR/Wildlife-Habitats>. Accessed October 14, 2018.

Common Wildlife Species

Barren land cover type provides limited opportunities for wildlife. Common wildlife species observed in the disturbed and urban/developed areas during the site visit include white-throated swift (*Aeronautes saxatalis*), California scrub jay (*Aphelocoma californica*), cedar waxwing (*Bombycilla cedrorum*), house finch (*Carpodacus mexicanus*), rock pigeon (*Columba livia*), American crow (*Corvus brachyrhynchos*), common raven (*Corvus corax*), barn swallow (*Hirundo rustica*), hooded oriole (*Icterus cucullatus*), western gull (*Larus occidentalis*), northern mockingbird (*Mimus polyglottos*), cliff swallow (*Petrochelidon pyrrhonota*), bushtit (*Psaltriparus minimus*), black phoebe (*Sayornis nigricans*), Allen's hummingbird (*Selasphorus sasin*), Cassin's kingbird (*Tyrannus vociferans*), and mourning dove (*Zenaida macroura*). Non-native herbaceous cover may provide habitat for common urban species such as rock pigeon, house sparrow (*Passer domesticus*), house finch, and mourning dove.

Common wildlife species that were not observed but may be expected to occur include opossum (*Didelphis virginiana*) and common rodents such as deer mice (*Peromyscus maniculatus*). However, certain wildlife species are highly adapted to urbanization and are known to use barren (gravelly) habitat; such species include killdeer (*Charadrius vociferus*). Although this species was not observed during the survey, there is a high potential for it to occur.

Special-Status Species

Special-status species are legally protected under the State and Federal Endangered Species Acts or other regulations, or are species that are considered sufficiently rare by the scientific community to qualify for such listing. These species are in the following categories:

1. Species listed or proposed for listing as threatened or endangered under the Federal Endangered Species Act (FESA) (50 Code of Federal regulations [CFR] 17.12 [listed plants], 17.11 [listed animals] and various notices in the Federal Register [FR] [proposed species]);
2. Species that are candidates for possible future listing as threatened or endangered under the federal Endangered Species Act (61 FR 40, February 28, 1996);
3. Species listed or proposed for listing by the State of California as threatened or endangered under the California Endangered Species Act (CESA) (14 California Code of Regulations [CCR] 670.5);
4. Plants listed as rare or endangered under the California Native Plant Protection Act (California Fish and Game Code, Section 1900 et seq.);
5. Animal species of special concern to CDFW;
6. Animals fully protected under Fish and Game Code (California Fish and Game Code, Sections 3511 [birds], 4700 [mammals], and 5050 [reptiles and amphibians]);
7. Species that meet the definitions of rare and endangered under CEQA. CEQA Section 15380 provides that a plant or animal species may be treated as "rare or endangered" even if not on one of the official lists (CEQA Guidelines section 15380); and

8. Plants considered under the CNPS to be “rare, threatened or endangered in California” (Rank 1A, 1B, and 2 in CNPS, 2013) as well as CNPS Rank 3 and 4⁷ plant species.

A list of special-status species that have the potential to occur within the vicinity of the Project Site was compiled based on data in the CNDDDB,⁸ and the CNPS Inventory of Rare and Endangered Plants.⁹ A list of special-status species relevant to the Project Site, their general habitat requirements, and their potential to occur within the vicinity of the Project Site is provided in Appendix E. All recorded observations of special-status species within the USGS Inglewood quadrant and the surrounding 8 quadrants are included within the table.¹⁰ The full list of species is presented in Appendix E. The following criteria was used to determine the potential for a special-status species to occur in the Project Site and immediate surrounding area:

- **Unlikely:** The Project Site and/or surrounding area do not support suitable habitat for a particular species, or the Project Site is outside of the species known range. In addition, the species has not otherwise been reported to exist on the Project Site;
- **Low Potential:** The Project Site and/or immediate area only provide limited amounts and low quality habitat for a particular species. In addition, the known range for a particular species may be outside of the immediate project vicinity. In addition, the species has not otherwise been reported to exist on the Project Site;
- **Medium Potential:** Although the species has not been reported to exist on the Project Site, the site and/or immediate area provide suitable habitat for a particular species; or
- **High Potential:** The Project Site and/or immediate area provide ideal habitat conditions for a particular species and/or known populations occur in immediate area and/or within the Project Site.

The CNDDDB and CNPS database queries identified 59 special-status plant species having been recorded in the region. All of the 59 special-status plant species were determined to be Unlikely to occur in Project Site due to lack of suitable habitats and soils. None of the 59 special-status plant species has been reported to exist on the Project Site. None of these species was observed during the on-site survey.

⁷ Rank 3 and 4 plants may be analyzed under CEQA §15380 if sufficient information is available to assess potential impacts to such plants. Factors such as regional rarity versus statewide rarity should be considered in determining whether cumulative impacts to a Rank 3 or 4 plant are significant even if individual project-level impacts are not. CNPS Rank 3 and 4 may be considered regionally significant if, for example, the occurrence is located at the periphery of the species’ range, or exhibits unusual morphology, or occurs in an unusual habitat/substrate. For these reasons, CNPS Rank 3 and 4 plants have been included in the special-status species analysis. Rank 3 and 4 plants are also included in the California Natural Diversity Database Special Plants, Bryophytes, and Lichens List. [Refer to the current published list available at: <http://www.dfg.ca.gov/biogeodata>.]

⁸ California Department of Fish and Wildlife, 2019. California Natural Diversity Database RareFind 5 personal computer program. <http://www.dfg.ca.gov/biogeodata/cnddb/mapsanddata.asp>. Accessed June 26, 2019. Data set expires December 1, 2019.

⁹ California Native Plant Society, 2019. *Inventory of Rare and Endangered Plants (online edition, v7-13)*. <http://www.rareplants.cnps.org/>. Accessed June 27, 2019.

¹⁰ California Department of Fish and Wildlife, 2019. California Natural Diversity Database RareFind 5 personal computer program. <http://www.dfg.ca.gov/biogeodata/cnddb/mapsanddata.asp>. Accessed June 26, 2019. Data set expires December 1, 2019.

The database queries also identified 35 special-status wildlife species that have been recorded in the region. Based on the biological resource reconnaissance, it was determined that all of the 35 special-status wildlife species are unlikely to be present because the Project Site lacks suitable habitat for these 35 wildlife species, and/or the Project Site is outside of the species' known range. In addition, none of these 35 wildlife species has been reported to have been observed there, and none was observed during the on-site survey.

Sensitive Natural Communities

Six sensitive natural communities/habitats have been reported within the Inglewood USGS quadrangle map and the eight surrounding USGS quadrangles queried of the CNDDDB and CNPS databases or have been reported to the USFWS IPaC database (Appendix E) within the vicinity of the Project Site. The six sensitive natural communities that have the potential to occur within the vicinity are: California walnut woodland, southern coast live oak riparian forest, southern coastal bluff scrub, southern dune scrub, southern sycamore alder riparian woodland, and walnut forest. During the field reconnaissance, it was determined that none of these sensitive habitats exist within, or adjacent to, the Project Site and they are therefore excluded from further discussion.

Designated Critical Habitat

USFWS designates critical habitat for certain species listed by the agency as threatened or endangered. "Critical habitat" is defined in FESA Section 3(5)(A) as those lands within a listed species' current range that contain the physical or biological features considered essential to the species' conservation, as well as areas outside the species' current range that are determined to be essential to its conservation. The Project Site and the surrounding adjacent areas do not contain any designated critical habitat for any federally listed species.

Jurisdictional Resources

Depressions, channels, or other aquatic features that hold or convey water can fall under the jurisdiction of agencies that regulate activities within these resources. When such features exist on a Project Site, a jurisdictional delineation may be prepared to determine the extent of federal or state jurisdiction. A jurisdictional delineation was not conducted for the Proposed Project because, based on the biological field reconnaissance, there were no features or conditions present on Project Site that would potentially be subject to the jurisdiction of the US Army Corps of Engineers or the Los Angeles Regional Water Quality Control Board, and/or CDFW.

Wildlife Movement Corridors

Wildlife movement corridors can provide favorable locations for wildlife to travel between different habitat areas such as foraging sites, breeding sites, cover areas, and preferred summer and winter range locations. They may also function as dispersal corridors allowing animals to move between various locations within their range. Wildlife movement corridors are considered important ecological resources and adverse impacts to such movement corridors can be determined to be significant. Areas of human disturbance or urban development can fragment wildlife habitats and impede wildlife movement between areas of suitable habitat. This

fragmentation creates isolated “islands” of vegetation that may not provide sufficient area to accommodate sustainable populations, and can adversely affect genetic and species diversity.

No wildlife movement corridors were identified within or immediately adjacent to the Project Site, as the surrounding areas are highly fragmented by urban development and the site itself is largely developed and/or disturbed.

Protected Trees

As stated in the City's Tree Preservation Ordinance, “[t]rees that are properly maintained increase property values, maintain the natural ecology, temper the effects of extreme temperatures, reduce runoff, prevent erosion of topsoil, and help create and maintain the identity and visual character of the City. Trees can help to provide protection from flooding and risks of landslides. They also increase oxygen output, which helps to combat air pollution.” They also sequester carbon, which may help offset greenhouse gas emissions from other sources (Chapter 12, Article 32, of the Inglewood Municipal Code).

According to a tree inventory conducted for the Project Site¹¹ (Appendix E), there are a total of 72 trees present on the Project Site that are considered “protected trees” under the City’s tree ordinance. These trees consist of city street trees, native trees, and trees with a minimum diameter at breast height (DBH) of 8 inches. Additionally, there are 37 trees within the Project Site that are not considered “protected trees” under the City’s tree ordinance because they do not fall into one of the categories in the City’s ordinance (i.e., they are not a street tree, a native tree, a tree with a minimum DBH of 8 inches, or otherwise protected trees under the ordinance). All of the trees that occur within the Project Site consist of the following species: floss silk tree (*Ceiba speciosa*), Tasmanian blue gum (*Eucalyptus globulus*), silver dollar gum (*Eucalyptus polyanthemos*), Indian laurel fig (*Ficus microcarpa*), unidentified pine (*Pinus* spp.), Queensland pittosporum (*Pittosporum rhombifolium*), coast live oak (*Quercus agrifolia*), Brazilian pepper tree (*Schinus terbinthifolia*), and Mexican fan palm (*Washingtonia robusta*).

3.3.2 Adjusted Baseline Environmental Setting

Section 3.3, Biological Resources, assumes the HPSP Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Due to the urban nature of the areas within the HPSP area, it is anticipated that sensitive biological resources located within the HPSP area are limited to trees that are protected in accordance with the City of Inglewood Tree Preservation Ordinance, which is similar to the extent of sensitive biological resources that exist on the Project Site.

¹¹ AECOM Technical Services, Inc., 2018. Preliminary Landscape Plan, Tree Survey.

3.3.3 Regulatory Setting

Federal

Federal Endangered Species Act

Species are listed as either endangered or threatened under FESA Section 4, which defines as “endangered” any plant or animal species that is in danger of extinction throughout all or a significant portion of its range, and as “threatened” any species that is likely to become endangered in the foreseeable future. FESA Section 9 prohibits “take” of listed endangered species, and may be extended to threatened species by rule. The term “take” means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in such conduct. Harm under the definition of “take” includes disturbance or loss of habitats used by a threatened or endangered species during any portion of its life history. Under FESA Section 10, “take” may be authorized when it is incidental to, but not the purpose of, an otherwise lawful act.

The Migratory Bird Treaty Act of 1918

Under the Migratory Bird Treaty Act (MBTA) (US Code Title 16 Sections 703–711) it is prohibited, except as permitted by regulations, “to pursue, take, or kill any migratory bird, or any part, nest or egg of any such bird ...” The MBTA protects over 800 species, including geese, ducks, shorebirds, raptors, songbirds, and many relatively common species. Permits for take of nongame migratory birds can be issued only for specific activities, such as scientific collecting, rehabilitation, propagation, education, taxidermy, and protection of human health and safety and personal property.

State

California Endangered Species Act

The CESA and implementing regulations in the Fish and Game Code, Sections 2050–2089, include provisions for the protection and management of plant and animal species listed as endangered or threatened, or designated as candidates for such listing. Incidental take of an endangered species is permitted by CDFW only under certain conditions and provided that the proper federal permits have been obtained and notifications made to the CDFW.

Pursuant to Section 2081 of the Code, the CDFW may authorize individuals or public agencies to import, export, take, or possess, any state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through permits or Memoranda of Understanding if: (1) the take is incidental to an otherwise lawful activity; (2) impacts of the authorized take are minimized and fully mitigated; (3) the permit is consistent with any regulations adopted pursuant to any recovery plan for the species; and (4) the applicant ensures adequate funding to implement the measures required by CDFW. The CDFW makes this determination based on available scientific information and considers the ability of the species to survive and reproduce.

California Fish and Game Code

Fully Protected Species

Certain species are considered *fully protected*, meaning that the code explicitly prohibits all take of individuals of these species except for take permitted for scientific research. Section 5050 lists fully protected amphibians and reptiles, Section 5515 lists fully protected fish, Section 3511 lists fully protected birds, and Section 4700 lists fully protected mammals.

Nesting Birds

Under California Fish and Game Code Section 3503, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 of the code prohibits take, possession, or destruction of any birds in the orders Falconiformes (hawks) or Strigiformes (owls), or of their nests and eggs. Migratory non-game birds are protected under Section 3800, while other specified birds are protected under Section 3505.

Native Plant Protection Act

The California Native Plant Protection Act (NPPA) directs the CDFW to “preserve, protect, and enhance endangered plants in this state.” The NPPA provides the California Fish and Wildlife Commission the power to designate native plants as endangered or rare and to require permits for collecting, transporting, or selling such plants. CESA expanded on the original NPPA and provided enhanced legal protection for plants. CESA established threatened and endangered species categories, and grandfathered all rare animals—but not rare plants—into the act as threatened species. Thus, three listing categories for plants are employed in California: rare, threatened, and endangered.

California Native Plant Society

The CNPS maintains a list of plant species native to California that have low numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the Inventory of Rare and Endangered Vascular Plants of California. Potential impacts to populations of CNPS-listed plants may receive consideration under CEQA review. The following identifies the definitions of the CNPS listings:

- Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere.
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere.
- Rank 2A: Plants presumed extirpated in California, but more common elsewhere.
- Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere.
- Rank 3: Plants about which more information is needed - A Review List.
- Rank 4: Plants of limited distribution - A Watch List.

This EIR considers the potential presence of all CNPS listed plants.

Local

City of Inglewood General Plan

The City of Inglewood's General Plan does not identify any goals or policies related specifically to the protection of biological resources.

The City of Inglewood General Plan's Conservation Element contains policies promoting the conservation, protection and effective use of natural resources other than biological resources. Because these policies are addressed elsewhere in this EIR, this chapter does not address the consistency of the Proposed Project with these policies.

City of Inglewood Tree Preservation Ordinance

City Municipal Code Chapter 12, Article 32¹², includes provisions to protect trees located on both public and private land in the City. The following trees are considered "protected trees" under the ordinance: (1) all trees having a minimum DBH of 8 inches; (2) street trees or other required trees such as those required as a condition of approval, Use Permit, or other zoning requirement; (3) memorial trees dedicated by an entity recognized by the City, and all specimen trees that define a neighborhood or community; (4) trees of the following species that are at least 4 inches diameter at breast height: big leaf maple (*Acer macrophyllum*), California buckeye (*Aesculus californica*), madrone (*Arbutus menziesii*), western dogwood (*Cornus nuttallii*), California sycamore (*Platanus racemose*), coast live oak (*Quercus agrifolia*), canyon live oak (*Quercus chrysolepis*), blue oak (*Quercus douglassii*), Oregon white oak (*Quercus garryana*), California black oak (*Quercus kelloggii*), valley oak (*Quercus lobate*), interior live oak (*Quercus wislizenii*), and California bay (*Umbellularia californica*); and (5) a tree or trees of any size planted as a replacement for a protected tree (Ord. 12-06 5-8-12, sec. 12-113).

No person shall remove, destroy, perform cutting of branches over one inch in diameter, or disfigure or cause to be removed or destroyed or disfigured any protected tree without having first obtained a permit to do so. All protected trees shall require a permit for removal, relocation, cutting or reshaping. All removed or disfigured trees shall also require replacement with like-size, like-kind trees or an equal value tree or trees as determined by the City's Master Plan or the Parks, Recreation and Library Services Department. If a replacement tree is unavailable in like size or kind, the value of the original protected tree shall be determined using the latest edition of Guide for Plant Appraisal by the International Society of Arboriculture. The valuation is used to determine the number and size of replacement trees required. The replacement trees must be located on site wherever possible. Where there is not sufficient room on site for the replacement trees, another site may be designated (Ord. 12-06 5-8-12, sec. 12-116).

¹² City of Inglewood. *Municipal Code Chapter 12 Article 32, Tree Preservation*. www.qcode.us/codes/inglewood. Accessed October 10, 2018.

3.3.4 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to biological resources. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service;
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service;
3. Have a substantial adverse effect on state or federally protected wetlands (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
5. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or
6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Methodology and Assumptions

The impact analysis focuses on foreseeable changes to the baseline condition in the context of the significance criteria presented above. In conducting the following impact analysis, the following criteria were considered:

- Magnitude of the impact (i.e., substantial versus not substantial);
- Uniqueness of the affected resource (i.e., rarity of the resource); and
- Susceptibility of the affected resource to perturbation (i.e., sensitivity of the resource).

The evaluation of the significance of the following construction and operational impacts considered the interrelationship of these three components. For example, a relatively small magnitude impact to a State or federally listed species would be considered significant because the species is very rare and is believed to be very susceptible to disturbance. Conversely, a plant community such as California annual grassland is not necessarily rare or sensitive to disturbance. Therefore, a much larger magnitude of impact would be required to result in a significant impact.

Issues Determined to be Less Than Significant

Upon review of the Proposed Project, the City of Inglewood determined that due to the physical characteristics of the Project Site and the Proposed Project, several biological resources issues would involve issues or resources that would not be affected by the Proposed Project and need not be further considered in the Draft EIR.¹³ The discussions below provide brief statements of reasons for the City's determination that these issues do not warrant further consideration in the EIR.

The following significance criteria were found to address issues that would not be affected by the Proposed Project. With respect to significance criterion 2, as described under Environmental Setting, the Project Site does not contain any riparian habitat or other sensitive natural community. With respect to significance criterion 3, as described under Environmental Setting, no federally or state-protected wetlands or waters occur on the Project Site or in the vicinity of the Project Site. With respect to significance criterion 6, as described under Environmental Setting, the Project Site is not located within the boundaries of a habitat conservation plan (HCP), natural communities conservation plan (NCCP), or any other applicable conservation plan. The following discussion further addresses these criteria.

The Proposed Project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service. (No Impact)

The Project Site does not contain any riparian habitat and does not contain any streams or water courses necessary to support riparian habitat. The majority of the Project Site is vacant, undeveloped land that has been previously developed and cleared, is heavily disturbed and regularly maintained, with the remaining parts of the Project Site being developed with uses. These conditions do not support any other sensitive natural communities. The nearest open space with natural communities is the Kenneth Hahn State Recreation Area, located approximately 4.5 miles northwest of the Project Site. As a result of these conditions, the Proposed Project would not have any effect on riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations by CDFW or USFWS. Thus, there would be **no Project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not have a substantial adverse effect on state or federally protected wetlands (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. (No Impact)

Based on the 2018 biological reconnaissance survey, there were no wetlands or other aquatic features that could potentially be protected by federal or state regulations. Therefore, construction

¹³ Public Resources Code section 21003(e) states that “[t]o provide more meaningful public disclosure, reduce the time and cost required to prepare an environmental impact report, and focus on potentially significant effects on the environment of a proposed project, lead agencies shall, in accordance with Section 21100, focus the discussion in the environmental impact report on those potential effects on the environment of a proposed project which the lead agency has determined are or may be significant. Lead agencies may limit discussion on other effects to a brief explanation as to why those effects are not potentially significant.”

and operation of the Proposed Project would not be anticipated to impact federal or state jurisdictional resources, including wetlands. Thus, there would be **no Project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan. (No Impact)

The Project Site is not located within the boundaries of, or in the vicinity of, any HCP or NCCP. The closest designated HCP (the City of Rancho Palos Verdes HCP) is located approximately 10 miles south/southwest from the Project Site.¹⁴ Since there would be no interaction between the Proposed Project and an approved HCP or NCCP, the Proposed Project would not conflict with the provisions of any adopted conservation plan. Thus, there would be **no Project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

Impacts and Mitigation Measures

Impact 3.3-1: Construction and operation of the Proposed Project would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service. (No Impact)

As noted in the list of common wildlife species observed within the Project Site in the Environmental Setting Section and the Special Status Species section above, no species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the USFWS or CDFW occur within the Project Site. No suitable habitats for special-status species occur within the Project Site. Additionally, as noted in the Potential to Occur Table in Appendix E, there is no potential for such species to occur adjacent or in proximity to the Project Site where construction or operation of the Proposed Project would result in direct or indirect impacts. Therefore, implementation of the Proposed Project, during both construction and operation, would result in **no impact** to sensitive or protected species.

Mitigation Measures

None required.

¹⁴ City of Rancho Palos Verdes, 2004. Natural Communities Conservation Planning Subarea Plan, Figure 2-1. Available: https://pvplc.org/_lands/docs/NCCP.pdf. Accessed September 24, 2018.

Impact 3.3-2: Construction of the Proposed Project could have the potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Less than Significant with Mitigation)

Construction

Trees on and around the Project Site would be removed and replaced to accommodate development of the Proposed Project. The mature trees on site could provide marginal nesting habitat for resident or migratory avian species. The removal of any trees or shrubs on site and construction activities could also indirectly disturb nesting avian species that can be found in the vicinity of the Project Site. The common avian species observed during the on-site survey are white-throated swift, California scrub jay, cedar waxwing, house finch, rock pigeon, American crow, common raven, barn swallow, hooded oriole, western gull, northern mockingbird, cliff swallow, bushtit, black phoebe, Allen's hummingbird, Cassin's kingbird, and mourning dove. No nests for these species were observed during the on-site survey. Such nests could be established in the future.

No raptors were observed during the survey. In addition, no raptor nests were observed. There is, however, the potential for nests to be built in the future, prior to the initiation of construction activities within the Project Site.

Direct impacts on nesting raptors or resident or migratory birds during the breeding season that may be potentially significant impacts include:

- Loss of breeding, foraging, roosting, and refuge habitat resulting from the removal of ornamental trees;
- Abandoned eggs or young and subsequent nest failure for raptors and resident or migratory birds as a result of construction-related noise and increased human presence; and
- Disruption of bird breeding and foraging behavior due to the introduction of nighttime lighting and noise.

These construction impacts would be **potentially significant**.

Operation

The Project Site itself is currently indirectly illuminated with existing nighttime lighting from streetlights, parking lots, and nearby shopping centers. The Proposed Project would introduce lighting associated with the arena, the outdoor plaza, and the parking areas, as well as an overall increased level of activity and noise. While the Proposed Project would result in removal of all existing street and Project Site trees, new landscaping would be installed and replacement of removed trees would occur (see Chapter 2.0, Figure 2-18, Preliminary Landscaping Plan). Trees planted on the Project Site would be regularly maintained during operation of the Proposed Project. The new trees and landscaped vegetation on the Project Site could be illuminated by nighttime lighting and would be located in a highly activated area. The new trees and landscaping may provide suitable foraging and nesting habitat for migratory and resident birds and raptors.

The increased lighting, noise, and general activity generated by the Proposed Project would not significantly affect the activities of birds within and in the vicinity of the Project Site due to its location in a highly urban area with an abundance of existing nighttime lighting sources. Additionally, birds that occur in the area are highly adapted to urbanization and the Proposed Project is consistent with the urbanized developments that surround the site. It is likely that the common, urbanized species, including migratory species, would continue to use the vegetation that exists within the urbanized areas that surround the Project Site. Therefore, the operation of the Proposed Project on resident or migratory avian species or raptors would be **less than significant**.

Mitigation Measure 3.3-2

The project applicant shall conduct tree removal activities required for construction of the Project outside of the resident or migratory bird and raptor breeding season (February 1 through August 31) where feasible. For construction activities or ground disturbing activities such as demolition, tree and vegetation removal, or grading that would occur between February 1 through August 31, the project applicant shall retain a qualified biologist to conduct preconstruction surveys not more than one week prior to the commencement of construction activities in suitable nesting habitat within the Project Site for nesting birds and raptors. This survey shall include areas located within 100 feet from construction to avoid indirect impacts to nesting birds. During the preconstruction survey, nests detected shall be mapped using global positioning system software, and species confirmed to be nesting or likely nesting will be determined.

If active nests for avian species protected under the Migratory Bird Treaty Act or California Fish and Game Code are found during the survey, the qualified biologist shall determine an appropriate buffer for avoiding the nest (where no work will occur) until the biologist is able to determine that the nest is no longer active. A minimum 100-foot no-work buffer shall be established around any active bird nest; however, the buffer distance may be adjusted by a qualified biologist depending on the nature of the work that is occurring in the vicinity of the nest, the known tolerance of the species to noises and vibrations, and/or the location of the nest. If, in the professional opinion of the qualified biologist, the Project would impact a nest, the biologist shall immediately inform the construction manager and work activities shall stop until the biologist delineates a suitable buffer distance and/or determines that the nest is no longer active.

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.3-2, construction of the Proposed Project would no longer have the potential to disturb active nests for nesting birds and raptors. Active nests would be identified and suitable buffers would be established to ensure that construction activities do not disturb nesting birds. Mitigation measures would thus ensure that the Proposed Project would not cause a substantial reduction in local population size or reduce reproductive success to birds and raptors. Thus, this impact would be considered **less than significant**.

Impact 3.3-3: Construction of the Proposed Project could have the potential to conflict with local policies or ordinances protecting biological resource, such as a tree preservation policy or ordinance. (Less than Significant with Mitigation)

There are 77 trees on the Arena Site, four trees on the West Parking Garage Site, nine trees on the East Transportation and Hotel Site, and seven trees on the Well Relocation Site, for a total of 97 trees. Twelve additional unprotected trees are located in association with some residences along South Doty Avenue that are not within the Project Site and would not be impacted by the Proposed Project. All 97 of the trees within the Project Site would be removed during construction activities. Of the 97 trees on the Project Site, a total of 72 of these trees are protected trees in accordance with the City of Inglewood Tree Preservation Ordinance (Inglewood Municipal Code Chapter 12, Article 32).

In accordance with the municipal code, the project applicant is required to plant replacement trees on site for every protected tree that would be removed by the Proposed Project, after having obtained a City-issued permit for removal. Replacement trees must be replaced at a 1:1 ratio and shall be like-size and species or an equal value tree (or trees) (Inglewood Municipal Code Chapter 12, Article 32). Due to compliance with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit must be filed for removal of all protected trees along with the inspection fee as specified in the City's Master Fee Schedule. The application must be filed and approved prior to any tree removal, relocation or cutting, per Inglewood Municipal Code Chapter 12, Article 32.

While the trees would be replaced at a 1:1 ratio pursuant to City requirements, impacts associated with the loss of protected trees would be **potentially significant**. Implementation of Mitigation Measure 3.3-3 would address the removal and the requirements for the replacement of the loss of protected trees as defined by the City's Tree Preservation Ordinance; therefore, impacts to trees removed on site would be reduced to a level of less than significant.

Additionally, activities associated with the Proposed Project could impact remaining street trees in close proximity to the Project Site (approximately 25 feet within Project activities) by encroaching the root zone (i.e., Tree Protective Zone) or by damaging above-ground parts (i.e., branches and trunk), or indirectly through changes in site hydrology or water quality, which would be **potentially significant**.

Mitigation Measure 3.3-3

- a) *To ensure that all new trees planted at a 1:1 ratio as required by the City's Tree Preservation Ordinance are of sufficient size, quantity, and quality, the following shall be implemented:*
- *Prior to any on-site tree disturbance or removal of any protected tree, a tree permit shall be obtained from the City of Inglewood in accordance with the City of Inglewood Tree Preservation Ordinance (Inglewood Municipal Code Chapter 12, Article 32). The tree permit shall identify the appropriate size of tree to be replaced (i.e., 36-inch box tree).*

- *All replacement mitigation trees shall be monitored by a certified arborist annually for minimum of 3 years following the completion of construction and planting, respectively. Monitoring shall verify that all encroached and replacement trees are in good health at the end of the 3-year monitoring period. Any encroached or replacement tree that dies within the 3-year monitoring period shall be replaced, and the replacement tree shall be monitored annually for 3 years. Annual monitoring reports shall be prepared by a certified arborist and submitted to the City. The monitoring report shall depict the location of each encroachment and replacement mitigation tree, including a description of the health of each tree based on a visual assessment.*
- b) *To ensure proper protection of trees to remain during project construction, the following shall be implemented.*
- *The Tree Protective Zone (TPZ) of protected trees to be retained and that are located within 25 feet from the grading limits, shall be enclosed with temporary fencing (e.g., free-standing chain-link, orange mesh drift fencing, post and wire, or equivalent). A smaller TPZ may be established in consultation with a certified arborist. The fencing shall be located at the limits of the TPZ and shall remain in place for the duration of construction activities in the area, or as determined by the City.*
 - *Prune selected trees to provide necessary clearance during construction and to remove any defective limbs or other parts that may pose a failure risk. All pruning shall be completed (or supervised) by a certified arborist and adhere to the Tree Pruning Guidelines of the International Society of Arboriculture. Trenching shall be routed so as to minimize damage to roots of protected trees roots if feasible. Any required trenching within the TPZ should be accomplished by the use of hand tools, to the extent feasible, while under the direct supervision of a certified arborist. If roots larger than 2 inches in diameter are encountered, the arborist shall provide recommendations for pruning or avoidance. Any major roots encountered should be conserved if feasible and treated as recommended by the arborist. If extensive disturbance to tree roots would occur such that tree health would be impacted as determined by the certified arborist, the tree shall be replaced at 1:1 per Mitigation Measure 3.3-3(a) above.*
 - *Any work conducted within the TPZ of a protected tree shall be monitored by a certified arborist. The monitoring arborist shall prescribe measures for minimizing or avoiding long-term impacts to the tree, such as selective pruning to minimize construction impacts.*
 - *No storage of equipment, supplies, vehicles, or debris should be allowed within the TPZ of a protected tree. No dumping of construction wastewater, paint, stucco, concrete, or any other clean-up waste should occur within the TPZ. No temporary structures should be placed within the TPZ.*

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.3-3, the Proposed Project would not conflict with local policies or ordinances, including Inglewood Municipal Code Chapter 12, Article 32, the City of Inglewood Tree Preservation Ordinance. Mitigation for the loss of protected trees would consist of replacement at a ratio determined in consultation with the City of Inglewood Parks, Recreation and Library Community Services Department pursuant to the Tree

Preservation Ordinance. Mitigation Measure 3.3-3 would ensure that construction-related impacts are minimized or avoided to trees that would be encroached and/or retained on the Project Site; therefore, impacts would be **less than significant**.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to biological resources varies for each resource. Regarding the movement of wildlife species, which are limited to common species found in urban environments as identified above, it is considered to be the vicinity surrounding the Project Site. Regarding protected trees, it is considered to be the City of Inglewood.

Impact 3.3-4: Construction and operation of the Proposed Project, in combination with other cumulative development, could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. (Less than Significant)

The cumulative context, in combination with other cumulative developments within the vicinity of the Project Site, for biological resources varies depending on the biological resource. For considering potential cumulative impacts to raptors, migratory birds, and nesting birds, the context includes vicinity of the Project Site. In most circumstances, the conversion of native habitats to urban development, including the loss of plant and wildlife species on a regional-level, could result in cumulative impacts when considering other proposed developments in the city. However, the Project Site is entirely disturbed and/or developed and supports limited biological resources, with the exception of trees and ornamental shrubs that may provide nesting habitat for birds, including trees that are protected in accordance with the local municipal code. While migratory birds may occur within the Project Site, the quality of the habitat within the Project Site is low due to the absence of native habitat and open space, the level of disturbance (existing levels of urban activity and lighting from adjacent uses), and a lack of suitable habitat in the vicinity. As such, migratory bird habitat within the Project Site and vicinity is limited to mainly non-native ornamental trees.

It is likely that the common, urbanized species, including migratory species, would continue to use the vegetation that exists within the urbanized areas that surround the Project Site. Therefore, the loss of trees on the Project Site would not result in a substantial or significant decline of bird nesting habitat in the region. Implementation of Mitigation Measure 3.3-2 would ensure that bird nests are avoided during the construction phase of the Proposed Project and the landscaping that would be associated with the Proposed Project would ensure that the urban habitat for birds is maintained.

Based on the above considerations, the Proposed Project, in conjunction with cumulative development within the larger region, Project construction or operational activities would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.3-5: Construction and operation of the Proposed Project, in combination with other cumulative projects, could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (Less than Significant)

In accordance with the City of Inglewood Tree Preservation Ordinance, as with the Proposed Project, any encroachment or removal of a City-protected tree for development projects would require a tree permit. City-protected trees that would be removed would be replaced in accordance with Municipal Code Chapter 12, Article 32. Because each cumulative project must comply with the Tree Preservation Ordinance requirements for like-kind, like-size or equivalent tree replacement, there would not be a cumulative loss of trees. Both the Proposed Project and cumulative projects would comply with the City's Tree Preservation Ordinance, including its replacement provisions. Based on the above considerations, the Proposed Project, in conjunction with cumulative development, implementation of the Proposed Project would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

This page intentionally left blank

3.4 Cultural and Tribal Cultural Resources

This section describes and evaluates potential impacts related to cultural resources that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing setting as it pertains to cultural resources, as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, state, and local regulations related to cultural resources; and (3) an analysis of the potential impacts related to cultural resources associated with the implementation of the Proposed Project, as well as identification of potentially feasible measures that could mitigate significant impacts.

Comments received in response to the NOP for the EIR regarding cultural resources can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to cultural resources that were raised in comments on the NOP are analyzed within this section.

The analysis in this section is based on the *Cultural Resources Assessment Report* prepared by ESA, which is included as Appendix F of this Draft EIR. Additional communication as part of Tribal consultation under Assembly Bill (AB) 52 is also provided in Appendix F.

3.4.1 Environmental Setting

Natural Setting

The Project Site is located within the fully urbanized City of Inglewood. The Project Site is surrounded by residential and commercial development to the west, south, and east, and the former Hollywood Park to the north (currently the Hollywood Park Specific Plan [HPSP] area). The HPSP Adjusted Baseline projects include the NFL Stadium, commercial, office, residential, civic, and open space uses. Prior to the development of the area, historic topographic maps dating to the 1920s and 1930s indicate a north-south-trending ephemeral drainage originating north from the Baldwin Hills and ending just north of the Project Site's northern boundary. The drainage was eventually impacted by the development of Hollywood Park in the 1940s.

Geological Setting

The Project Site is located in the Los Angeles Basin, a structural depression approximately 50 miles long and 20 miles wide in the northernmost Peninsular Ranges Geomorphic Province.¹ The Los Angeles Basin developed as a result of tectonic forces and the San Andreas fault zone, with subsidence occurring 18 million to 3 million years ago (Ma).² While sediments dating back to the Cretaceous (66 Ma) are preserved in the basin, continuous sedimentation began in the

middle Miocene (around 13 Ma).³ Since that time, sediments have been eroded into the basin from the surrounding highlands, resulting in thousands of feet of accumulation.⁴ Most of these sediments are marine, as they eroded from surrounding marine formations, until sea level dropped in the Pleistocene Era and deposition of the alluvial sediments that compose the uppermost units in the Los Angeles Basin began.

The Los Angeles Basin is subdivided into four structural blocks, with the Project Site occurring in the Central Block, where sediments range from 32,000 to 35,000 feet thick.⁵ The Central Block is wedge-shaped, extending from the Santa Monica Mountains in the northwest, where it is about 10 miles wide, to the San Joaquin Hills to the southeast, where it widens to around 20 miles across.⁶

Prehistoric Setting

Based on recent research in the region,⁷ the following prehistoric chronology has been divided into four general time periods: the Paleocoastal Period (12,000 to 8,000 before present [B.P.]), the Millingstone Period (8,000 to 3,000 B.P.), the Intermediate Period (3,000 to 1,000 B.P.), and the Late Period (1,000 B.P. to the time of Spanish Contact in anno Domini [A.D.] 1542).

Paleocoastal Period (12,000–8,000 B.P.)

While it is not certain when humans first came to California, their presence in Southern California by about 11,000 B.P. has been well documented. At Daisy Cave, on San Miguel Island, cultural remains have been radiocarbon dated to between 11,100 and 10,950 B.P.⁸ During this time period, the climate of Southern California became warmer and more arid and the human population, residing mainly in coastal or inland desert areas, began exploiting a wider range of plant and animal resources.⁹

Millingstone Period (8,000–3,000 B.P.)

During the Millingstone period, there is evidence for the processing of acorns for food and a shift toward a more generalized economy. The first definitive evidence of human occupation in the

Los Angeles area dates to at least 8,000 years B.P. and is associated with the Millingstone cultures.^{10,11}

Millingstone cultures were characterized by the collection and processing of plant foods, particularly acorns, and the hunting of a wider variety of game animals.¹²⁻¹³ Millingstone cultures also established more permanent settlements that were located primarily on the coast and in the vicinity of estuaries, lagoons, lakes, streams, and marshes where a variety of resources, including seeds, fish, shellfish, small mammals, and birds, were exploited. Early Millingstone occupations are typically identified by the presence of handstones (manos) and millingstones (metates), while those Millingstone occupations dating later than 5,000 B.P. contain a mortar and pestle complex as well, signifying the exploitation of acorns in the region.

Intermediate Period (3,000–1,000 B.P.)

During the Intermediate period, many aspects of Millingstone culture persisted, but a number of socioeconomic changes occurred.^{14,15,16} The native populations of Southern California were becoming less mobile and populations began to gather in small sedentary villages with satellite resource-gathering camps. Increasing population size necessitated the intensified use of existing terrestrial and marine resources.¹⁷ Evidence indicates that the overexploitation of larger, high-ranked food resources may have led to a shift in subsistence, towards a focus on acquiring greater amounts of smaller resources, such as shellfish and small-seeded plants.¹⁸

This period is characterized by increased labor specialization, expanded trading networks for both utilitarian and non-utilitarian materials, and extensive travel routes. Although the intensity of trade had already been increasing, it now reached its zenith, with asphaltum (tar), seashells, and steatite being traded from Southern California to the Great Basin. Use of the bow and arrow spread to the coast around 1,500 B.P, largely replacing the dart and atlatl.¹⁹ Increasing population

densities, with ensuing territoriality and resource intensification, may have given rise to increased disease and violence between 3,300 and 1,650 B.P.²⁰

Late Period (1,000 B.P.–A.D. 1542)

The Late Period is associated with the florescence of the people who later became known as the “Gabrielino,”²¹ and who are estimated to have had a population numbering around 5,000 in the pre-contact period. The Gabrielino occupied what is presently Los Angeles County and northern Orange County, along with the southern Channel Islands, including Santa Catalina, San Nicholas, and San Clemente.²² This period saw the development of elaborate trade networks and use of shell-bead currency. Fishing became an increasingly significant part of subsistence strategies at this time, and investment in fishing technologies, including the plank canoe, are reflected in the archaeological record.^{23,24} Settlement at this time is believed to have consisted of dispersed family groups that revolved around a relatively limited number of permanent village settlements that were located centrally with respect to a variety of resources.

Ethnographic Setting

Protohistoric Period (A.D. 1542–1771)

The Project Site is located in a region traditionally occupied by the Gabrielino Indians. The term “Gabrielino” is a general term that refers to those Native Americans who were administered by the Spanish at the Mission San Gabriel Arcángel. Their neighbors included the Chumash and Tataviam to the north, the Juañeno to the south, and the Serrano and Cahuilla to the east. The Gabrielino are reported to have been second only to the Chumash in terms of population size and regional influence.²⁵ The Gabrielino language is part of the Takic branch of the Uto-Aztecan language family.

At the time of Spanish contact in A.D. 1542, also the beginning of what is known as the Protohistoric Period (A.D. 1542 to 1771), many Gabrielino practiced a religion that was centered around the mythological figure Chinigchinich.²⁶ This religion may have been relatively new when the Spanish arrived, and at that time was spreading to other neighboring Takic groups. The Gabrielino practiced both cremation and inhumation of their dead. A wide variety of grave

²¹ The term “Gabrielino” is a general term that refers to those Native Americans who were administered by the Spanish at the Mission San Gabriel Arcángel. Prior to European colonization, the Gabrielino occupied a diverse area that included: the watersheds of the Los Angeles, San Gabriel, and Santa Ana rivers; the Los Angeles basin; and the islands of San Clemente, San Nicolas, and Santa Catalina. Some modern Tribes use alternative spellings.

offerings, such as stone tools, baskets, shell beads, projectile points, bone and shell ornaments, and otter skins, were interred with the deceased.

Coming ashore on Santa Catalina Island in October of 1542, Juan Rodriguez Cabrillo was the first European to make contact with the Gabrielino; the 1769 expedition of Portolá also passed through Gabrielino territory.²⁷ Native Americans suffered severe depopulation and their traditional culture was radically altered after Spanish contact. Nonetheless, Gabrielino descendants still reside in the greater Los Angeles and Orange County areas and maintain an active interest in their heritage.

Historic Setting

Spanish Period (A.D. 1769–1821)

Although Spanish explorers made brief visits to the region in 1542 and 1602, sustained contact with Europeans did not commence until the onset of the Spanish Period. In 1769 Gaspar de Portolá led an expedition from San Diego, passing through the Los Angeles Basin and the San Fernando Valley, on its way to the San Francisco Bay.²⁸ Father Juan Crespi, who accompanied the 1769 expedition, noted the suitability of the Los Angeles area for supporting a large settlement. This was followed in 1776 by the expedition of Father Francisco Garcés.²⁹

In the late 18th century, the Spanish began establishing missions in California and forcibly relocating and converting native peoples as well as exposing them to diseases that they had no resistance to. Mission San Gabriel Arcángel was founded on September 8, 1771, and Mission San Fernando Rey de España on September 8, 1797. By the early 1800s, the majority of the surviving Gabrielino had entered the mission system, either at San Gabriel or San Fernando. Mission life offered some degree of security in a time when traditional trade and political alliances were failing and epidemics and subsistence instabilities were increasing. This lifestyle change also brought with it significant negative consequences for Gabrielino health and cultural integrity.

A Gabrielino village, or “rancheria,” known as Guaspet, or Guasna or Gaucha, appears to have been located northwest of the Project Site. Based on mission baptism records, the rancheria appears to have been occupied from about 1790 to 1820.³⁰ At least 193 people are known to have lived at the rancheria and been baptized. Records suggest that recruitment into the mission system did not occur until native populations in closer proximity to Mission San Gabriel had been

assimilated, and after grazing expanded into the Project Site vicinity, bringing native inhabitants of the region into closer contact with Spanish-era ranchers.³¹

A 1937 map titled *The Kirkman-Harriman Pictorial and Historical Map of Los Angeles County 1860 A.D.–1937 A.D.* (Kirkman map) depicts approximate locations of Gabrielino villages in Los Angeles. It depicts the location of unnamed villages about 2 to 5 miles north of the Project Site but does not show any roads, landforms, or locations overlapping with the Project Site.

Mexican Period (A.D. 1821-1848)

After Mexico gained its independence from Spain in 1821, Los Angeles became the capital of the California territory in 1835.³² Mexico continued to promote settlement of California with the issuance of land grants. In 1833, Mexico began the process of secularizing the California missions, reclaiming the majority of mission lands and redistributing them as land grants throughout California. According to the terms of the Secularization Law of 1833 and Regulations of 1834, at least a portion of the lands would be returned to the Native populations, but this did not always occur.³³ Because of the disbursement that the Gabrielino populations suffered during the Mission period no land was returned to the Gabrielino Tribes.

During the Mexican Period many ranchos continued to be used by settlers for cattle grazing. Hides and tallow from cattle became a major export for Mexican settlers in California, known as Californios, many of whom became wealthy and prominent members of society. The Californios led generally easy lives, leaving the hard work to vaqueros and Indian laborers.^{34,35}

American Period (A.D. 1848-present)

Mexico ceded California to the United States as part of the Treaty of Guadalupe Hidalgo in 1848. California officially became one of the United States in 1850. While the treaty recognized the right of Mexican citizens to retain ownership of land granted to them by Spanish or Mexican authorities, the claimant was required to prove their right to the land before a patent was given. The process was lengthy and generally resulted in the claimant losing at least a portion of their land to attorney's fees and other costs associated with proving ownership.³⁶

When the discovery of gold in northern California was announced in 1848, an influx of people from other parts of North America flooded into California and the population of Los Angeles

tripled between 1850 and 1860. The increased population led to additional demand of the Californios' cattle. As demand increased, the price of beef skyrocketed and Californios reaped the benefits. However, a devastating flood in 1861, followed by droughts in 1862 and 1864, led to a rapid decline of the cattle industry; over 70 percent of cattle perished during these droughts.^{37,38} These natural disasters, coupled with the burden of proving ownership, caused many Californios to lose their lands during this period. Former ranchos were subsequently subdivided and sold for agriculture and residential settlement.^{39,40}

History of Inglewood

During the rancho period, the City of Inglewood was part of the *Rancho Aguaje de la Centinela* and the *Rancho Sausal Redondo*. A year after Mexico gained independence from Spain and control of California in 1822, Los Angeles resident Antonio Avila received a land grant for *Rancho Sausal Redondo* and grazed cattle there as well. The rancho encompassed the areas that are now the Cities of Redondo Beach, Inglewood, Hawthorne, El Segundo, Lawndale, Manhattan Beach and Hermosa Beach. In 1834 Ygnacio Machado, one of the original leather jacket soldiers that escorted settlers to Los Angeles, built the Centinela Adobe. The Centinela Adobe, located approximately 2.5 miles from the Project Site, was in the center of what became a 2,200-acre ranch on a portion of the *Rancho Sausal Redondo*. Machado had moved onto what he claimed was still public land, which was granted to him as the *Rancho Aguaje de la Centinela*. Soon after Machado traded the *Rancho Aguaje de la Centinela* for a keg of whiskey and a home in the Pueblo of Los Angeles. The property traded hands many times and was eventually acquired by a Scottish noble man named Robert Burnette who eventually added the much larger *Rancho Sausal Redondo* to his holdings, once again combining the ranchos. Burnette eventually returned to Scotland and leased the ranch to a Canadian immigrant who was considered by many to be the founding father of Inglewood: Daniel Freeman. In spite of drought and other hardship Freeman successfully farmed barley on the ranch, and purchased it from Burnette with gold in 1885. Freeman went on to become a major land developer in Inglewood.⁴¹

Centinela Springs (California Historical Landmark 363), or *Aguaje de Centinela*, was a valued source of spring water for the *Rancho Aguaje de la Centinela* and the spring is described as continuously existing since the Pleistocene Era. The spring is memorialized and is still located at the corner of Centinela Avenue and Florence Boulevard, approximately 2 miles north of the Project Site in the City of Inglewood.⁴²

Excursion trains from Los Angeles brought many prospective land buyers to Inglewood and it was able to grow to 300 residents by 1888. On May 21, 1888, a school opened with 33 students.

Around this time, businesses, including Mrs. Belden's Boarding House, two grocery stores, a drug store, a planning mill, a wagon repair shop, a plumbing shop, a livery stable, and five real estate offices, were built on Commercial Street (now La Brea).⁴³ With a population of about 1,200, Inglewood was incorporated on February 10, 1908. That same year, the high school building was completed.⁴⁴

On the evening of June 21, 1920, a large earthquake struck Inglewood. While there was a lot of damage to buildings, there was no loss of life. The next few days saw a large number of tourists coming to Inglewood to view the damage. The climate impressed the visitors who had previously never been to Inglewood, and as a result, many settled there. The population grew to 3,286 in 1920, and in the next two years, the population doubled, making Inglewood the fastest growing city in the nation at that time.⁴⁵

The 1932 Olympic Games were held in Los Angeles, and three Inglewood High School alumni won medals. Many buildings in Inglewood were used as training facilities, and the marathon route went through the town.⁴⁶ Until World War II, Inglewood had largely been supported by agricultural industry. The defense industries, in response to WWII, transformed Inglewood into an urban community when industrial activities brought more people to live in the city. In 1946, major airlines moved operations to the LAX airport and two new hangars needed to be constructed.⁴⁷ In 1949, the airport was designated as an intercontinental air terminal by the federal government.⁴⁸

In 1967, The Forum was opened as the home of the Los Angeles Lakers of the National Basketball Association and Los Angeles Kings of the National Hockey League. It also hosted a number of events such as concerts, rodeos, boxing, the circus, and ice shows.⁴⁹ The Forum is located approximately 1 mile north of the Project Site, near the intersection of South Prairie Avenue and Manchester Boulevard. The Forum underwent a rehabilitation, was listed on the National Register of Historic Places (National Register) and the California Register of Historical Resources (California Register), and reopened in 2014. Additionally, at that time, The Forum underwent an adaptation from an arena primarily designed for sporting events to an arena primarily used for music and entertainment events.

In the 1970s, a new health center was built on Manchester, north of the Project Site, and high-rise office buildings were constructed on La Brea, to the northwest of the Project Site.⁵⁰ A new civic center was dedicated in 1973. Airport Park View Hotel opened between Hollywood Park Race

Track and The Forum.⁵¹ Many senior housing developments were also built in Inglewood during the 1970s.

More recent developments include the closure of the Hollywood Park Race Track, in 2013, located adjacent and to the north of the Project Site, and demolition of the track in 2016. In 2015, a new NFL stadium was approved and is currently under construction on the site of the former race track, and a new Hollywood Park Casino was opened next door.

Architectural Themes

The following themes were developed to provide a context for evaluation of the existing buildings on the Project Site and their potential to qualify as historical resources: Hotels and Motels, and Apartment Hotels.

Hotels and Motels

In early America, lodging for travelers typically took the form of the public house or tavern, establishments that were granted licenses to serve alcohol in exchange for offering public lodging.⁵² Following the Revolution and the War of 1812, a new generation of American hotels emerged, with a boom in hotel construction from about 1820 to 1830. By 1840, the hotel was ubiquitous across the eastern half of the United States.⁵³ The first hotel in the City of Los Angeles was the Bella Union, built on Main Street in downtown Los Angeles in 1835. The Bella Union was typical of mid-19th century hotels in Los Angeles, which tended to be small operations in modest buildings. After the Civil War, larger and more luxurious hotels began to appear in downtown Los Angeles, including the Pico House Hotel built in 1864, and the Hotel Nadeau, which opened in 1882.⁵⁴

At the end of the 19th century, American tourism began to expand rapidly as a result of increased leisure time and the availability of long-distance transportation in the form of the railroad. By the first decades of the 20th century, Los Angeles was experiencing tremendous growth. In the first thirty years of the century, the population of Los Angeles grew from 100,000 to 1,000,000, surpassing San Francisco as the largest city in the state. In accordance with this impressive growth, Los Angeles moved away from its humble pueblo beginnings as the commercial core shifted south to the new major thoroughfares of Main, Spring, Broadway, Hill, and Olive streets. Major hotels in early 20th century Los Angeles included the Alexandria Hotel (1906), the Rosslyn Hotel (1914), and the Biltmore Hotel (1923).

The early 20th century also marked the beginning of a business model that would come to dominate the hotel industry by the postwar period: the chain hotel. Rather than catering to an elite class looking for luxurious accommodation, the chain hotels of the 20th century focused on

⁵¹ Waddingham, Gladys, 1994. *The History of Inglewood*. Historical Society of Centinela Valley. Los Angeles, California.

⁵² Sandoval-Strausz, A.K., 2007. *Hotel: An American History*. New haven: Yale University Press.

⁵⁴ Wallach, Ruth, Linda McCann, Dave Taube, Claude Zachary, and Curtis C. Roseman, 2008. *Historic Hotels of Los Angeles and Hollywood*. Images of America. California.

appealing to the masses. The rising importance of the automobile had a profound influence on the American hotel. Initially, car owners abandoned the hotel for “autocamping,” but the rise of the new motor hotel, or motel, offered the highway traveler a hotel experience along the roadside, often far from urban centers. By about 1940, motels outnumbered hotels in the United States and became the dominant form of lodging for the American traveler during the postwar years.⁵⁵

The middle of the 20th century also saw the rise of the hotel chain. Among the largest and most successful American hotel chains were Holiday Inn, Hilton, and Sheraton. Conrad Hilton entered the hotel business in Texas in 1919 and opened the first Hilton in Dallas in 1925. His company expanded across the nation and in 1943 Hilton became the first coast-to-coast hotel chain. Many smaller hotel chains also emerged during the postwar years. The Doric Company was a relatively small operator of hotels and motels in the western United States during this period. In 1963, operations included eight hotels or motels in Washington State, one in Oregon, three in Idaho, and eight in California. In contrast, while Holiday Inn had humble beginnings in the motor hotel sector it grew into a successful hotel chain in the second half of the 20th century.

Apartment Hotels

Apartment hotels are structures that provide a room or a suite of rooms, which include facilities for food preparation as well as amenities found in standard hotels such as traditional common spaces and housekeeping services. Buildings that were advertised as apartment hotels began to be built prior to World War I. Most of these structures were large, with around 100 units per building. They were fully furnished and usually located in central business districts.⁵⁶ The construction of apartment hotels tapered after the Great Depression and did not resume again after World War II because they were not well suited to the automobile. Their function was replaced with motels with kitchenettes after World War II.

3.4.2 Adjusted Baseline Environmental Setting

Section 3.4, Cultural and Tribal Cultural Resources, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to Cultural Resources, the changes associated with the HPSP Adjusted Baseline projects include excavation in the HPSP area and construction of new uses on the HPSP site.

There is no evidence that development in the HPSP area would affect the baseline for analysis of the archaeological or Tribal resources. No archaeological or Tribal resources have been discovered and documented during construction of the HPSP Adjusted Baseline projects that would provide additional information on the presence or sensitivity of these resources in the area. In addition, The Forum, which is listed on the National Register and the California Register, is currently visible from the Project Site, and these views will be obscured as a result of baseline

development in the HPSP area altering the baseline conditions with regards to architectural resources. This is considered as part of the impact analysis below.

3.4.3 Regulatory Setting

Numerous laws and regulations require state and local agencies to consider the effects a project may have on cultural resources. These laws and regulations define important cultural resources, stipulate a process for compliance, define the responsibilities of the various agencies proposing the action, and prescribe the relationship among other involved agencies.

State

California Environmental Quality Act

CEQA is the principal statute governing environmental review of projects occurring in the state and is codified at Public Resources Code (PRC) section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA (PRC section 21084.1), a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

The CEQA Guidelines (Title 14 California Code of Regulations [CCR] section 15064.5) recognize that historical resources include: (1) a resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register; (2) a resource included in a local register of historical resources, as defined in PRC section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC section 5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. The fact that a resource does not meet the three criteria outlined above does not preclude the lead agency from determining that the resource may be an historical resource as defined in PRC sections 5020.1(j) or 5024.1.

If a lead agency determines that an archaeological site is a historical resource, the provisions of CEQA section 21084.1 and CEQA Guidelines section 15064.5 apply. If an archaeological site does not meet the criteria for a historical resource contained in the CEQA Guidelines, then the site may be treated in accordance with the provisions of section 21083, which is as a unique archaeological resource. As defined in PRC section 21083.2, a "unique" archaeological resource is an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;

- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or,
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Pursuant to PRC section 21083.2, if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place (PRC section 21083.1(a)). If preservation in place is not feasible, mitigation measures are required. The CEQA Guidelines note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment (CEQA Guidelines section 15064.5(c)(4)).

A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines section 15064.5(a). Substantial adverse change is defined as “physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired” (CEQA Guidelines section 15064.5(b)(1)). According to CEQA Guidelines section 15064.5(b)(2), the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that:

- A. Convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
- B. Account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the PRC or its identification in a historical resources survey meeting the requirements of PRC section 5024.1(g), unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- C. Convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a lead agency for purposes of CEQA.

In general, a project that complies with the *Secretary of the Interior’s Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings* (Standards)⁵⁷ is considered to have mitigated its impacts to historical resources to a less-than-significant level (CEQA Guidelines section 15064.5(b)(3)).

California Register of Historical Resources

The California Register is “an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change” (PRC section 5024.1(a)). The criteria for eligibility for the California

⁵⁷ Weeks, Kay D., and Anne E. Grimmer, 1995. *The Secretary for the Interior’s Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring & Reconstruction Historic Buildings*. U.S. Department of the Interior. Washington, D.C.

Register are based upon National Register criteria (PRC section 5024.1(b)). Certain resources are determined by the statute to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register.

To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, state, and/or federal level under one or more of the following four criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

A resource eligible for the California Register must meet one of the criteria of significance described above, and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (OHP) and have been recommended to the State Historical Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historical resources contributing to historic districts; and
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

Public Resources Code Section 5097.98

PRC section 5097.98, as amended by AB 2641, provides procedures in the event human remains of Native American origin are discovered during project implementation. PRC section 5097.98

requires that no further disturbances occur in the immediate vicinity of the discovery until certain required steps have been taken, that the discovery is adequately protected according to generally accepted cultural and archaeological standards, and that further activities take into account the possibility of multiple burials. PRC section 5097.98 further requires the NAHC, upon notification by a County Coroner, designate and notify a Most Likely Descendant (MLD) regarding the discovery of Native American human remains. The MLD has 48 hours from the time of being granted access to the site by the landowner to inspect the discovery and provide recommendations to the landowner for the treatment of the human remains and any associated grave goods.

In the event that no descendant is identified, or the descendant fails to make a recommendation for disposition, or if the land owner rejects the recommendation of the descendant, the landowner may, with appropriate dignity, reinter the remains and burial items on the property in a location that will not be subject to further disturbance.

California Health and Safety Code Section 7050.5

California Health and Safety Code section 7050.5 requires that in the event human remains are discovered, the County Coroner is required to be contacted to determine the nature of the remains. In the event the remains are determined to be Native American in origin, the Coroner is required to contact the NAHC within 24 hours to relinquish jurisdiction.

Assembly Bill 52 and Related Public Resources Code Sections

AB 52 was approved by Governor Brown on September 25, 2014. The act amended PRC section 5097.94, and added PRC sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 applies specifically to projects for which an NOP or a notice of intent to adopt a negative declaration or mitigated negative declaration (MND) is filed.

The primary intent of AB 52 is to include California Native American Tribes early in the environmental review process and to establish a new category of resources related to Native Americans, known as Tribal cultural resources, that require consideration under CEQA. PRC section 21074(a)(1) and (2) defines Tribal cultural resources as “sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American [T]ribe” that are either included or determined to be eligible for inclusion in the California Register or included in a local register of historical resources, or a resource that is determined to be a Tribal cultural resource by a lead agency, in its discretion and supported by substantial evidence. On July 30, 2016, the California Natural Resources Agency adopted the final text for Tribal cultural resources update to CEQA Guidelines Appendix G, which was approved by the Office of Administrative Law on September 27, 2016.

PRC section 21080.3.1 requires that within 14 days of a lead agency determining that an application for a project is complete, or a decision by a public agency to undertake a project, the lead agency provide formal notification to the designated contact, or a Tribal representative, of California Native American Tribes that are traditionally and culturally affiliated with the geographic area of the project (as defined in PRC section 21073) and who have requested in

writing to be informed by the lead agency (PRC section 21080.3.1(b)). Tribes interested in consultation must respond in writing within 30 days from receipt of the lead agency's formal notification and the lead agency must begin consultation within 30 days of receiving the Tribe's request for consultation (PRC sections 21080.3.1(d) and 21080.3.1(e)).

PRC section 21080.3.2(a) identifies the following as potential consultation discussion topics: the type of environmental review necessary; the significance of Tribal cultural resources; the significance of the project's impacts on the Tribal cultural resources; project alternatives or appropriate measures for preservation; and mitigation measures. Consultation is considered concluded when either: (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a Tribal cultural resource; or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached (PRC section 21080.3.2(b)).

If a California Native American Tribe has requested consultation pursuant to PRC section 21080.3.1 and does not provide comments to the lead agency, or otherwise does not engage in the consultation process, or if the lead agency has complied with section 21080.3.1(d) and the California Native American Tribe has not requested consultation within 30 days, then the lead agency may certify an EIR or adopt an MND (PRC section 21082.3(d)(2) and (3)).

PRC section 21082.3(c)(1) states that any information, including, but not limited to, the location, description, and use of the Tribal cultural resources, that is submitted by a California Native American Tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public without the prior consent of the Tribe that provided the information. If the lead agency publishes any information submitted by a California Native American Tribe during the consultation or environmental review process, then that information shall be published in a confidential appendix to the environmental document unless the Tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.

Senate Bill 18

Senate Bill 18 (SB 18) (Statutes of 2004, Chapter 905), which went into effect January 1, 2005, requires local governments (city and county) to consult with Native American Tribes before making certain planning decisions and to provide notice to Tribes at certain key points in the planning process. The intent is to "provide California Native American [T]ribes an opportunity to participate in local land use decisions at an early planning stage, for the purpose of protecting, or mitigating impacts to, cultural places."⁵⁸

The purpose of involving Tribes at these early planning stages is to allow consideration of cultural places in the context of broad local land use policy, before individual site-specific, project-level, land use designations are made by a local government. The consultation

⁵⁸ Governor's Office of Planning and Research, 2005. State of California Tribal Consultation Guidelines. Sacramento, California.

requirements of SB 18 apply to general plan or specific plan processes proposed on or after March 1, 2005.

According to the *Tribal Consultation Guidelines: Supplement to General Plan Guidelines*,⁵⁹ the following are the contact and notification responsibilities of local governments:

- Prior to the adoption or any amendment of a general plan or specific plan, a local government must notify the appropriate Tribes (on the contact list maintained by the NAHC) of the opportunity to conduct consultations for the purpose of preserving, or mitigating impacts to, cultural places located on land within the local government's jurisdiction that is affected by the proposed plan adoption or amendment. Tribes have 90 days from the date on which they receive notification to request consultation, unless a shorter timeframe has been agreed to by the Tribe (Government Code section 65352.3).
- Prior to the adoption or substantial amendment of a general plan or specific plan, a local government must refer the proposed action to those Tribes that are on the NAHC contact list and have traditional lands located within the city or county's jurisdiction. The referral must allow a 45-day comment period (Government Code section 65352). Notice must be sent regardless of whether prior consultation has taken place. Such notice does not initiate a new consultation process.
- Local government must send a notice of a public hearing, at least 10 days prior to the hearing, to Tribes who have filed a written request for such notice (Government Code section 65092).

Local

The City of Inglewood's General Plan does not identify any goals or policies related specifically to cultural or Tribal resources.

3.4.4 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to cultural resources. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines section 15064.5;
2. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines section 15064.5;
3. Cause a substantial adverse change in the significance of a Tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:
 - Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); and

⁵⁹ Governor's Office of Planning and Research, 2005. State of California Tribal Consultation Guidelines. Sacramento, California.

- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe.

4. Disturb any human remains, including those interred outside of dedicated cemeteries; or

Methodology and Assumptions

Historic Architectural Resources

The analysis of impacts to historic architectural resources is based on the *Cultural Resources Assessment Report* (Appendix F) prepared by qualified personnel who meet or exceed the Secretary of the Interior’s Professional Qualification Standards in history and architectural history. Key steps in completing the assessment included a survey of historic-age building within the Project Site, archival research, and field documentation. Research into the Project Site’s development history included a review of historic permits for improvements to the property, historic photographs, aerial photographs, and local histories. The California State Historic Resources Inventory for Los Angeles County, records housed at the California Historic Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC), was consulted to identify any previous evaluations of potential historic resources on, or immediately adjacent to, the Project Site. The only National or California Register-listed architectural historical resource within 1 mile of the Project Site is The Forum. Sanborn Fire Insurance maps were not available for the area.

Under CEQA, the evaluation of impacts to historic resources consists of a two-part inquiry: (1) a determination of whether the Project Site contains or the immediate surroundings contain, any historic resources that may be impacted by the Project; and, if any such resources exist, (2) a determination of whether the Project would result in a “substantial adverse change” to the significance of any such resources.

Archaeological Resources

The analysis of impacts to archaeological resources is also based on the *Cultural Resources Assessment Report*, which included: (1) a cultural resource records search conducted at the SCCIC to review recorded archaeological resources within 0.5-mile radius of Project Site, as well as a review of cultural resource reports and historic topographic maps on file; (2) a review of the California Points of Historical Interest, the California Historical Landmarks, the California Register, the National Register, and the California State HRI listings; (3) a Sacred Lands File (SLF) search commissioned through the NAHC; (4) a review of available Sanborn Maps, historic aerial imagery; and other technical studies; and (5) a pedestrian survey of the Project Site.

The potential for the Project Site to contain buried archaeological resources is assessed based on the findings of the cultural resource records search (i.e., presence and proximity of known resources) and SLF search, land use history research, subsurface geological conditions, and the proposed excavation parameters (maximum depth of 35 feet below ground surface) for the Proposed Project.

Tribal Cultural Resources

The analysis of impacts to Tribal cultural resources is based on the consultation between the City and the responding Tribe, information provided by the Tribe, and the *Cultural Resources Assessment Report*. The potential for the Project Site to contain Tribal cultural resources was assessed based on information provided by Tribes and supplemented by the findings of the cultural resource records search (i.e., presence and proximity of known resources), the SLF search, land use history research, subsurface geological conditions, and the proposed excavation parameters for the Proposed Project. The NAHC was contacted on April 24, 2018, to request a search of the SLF of the Project Site (see Appendix F).

Human Remains

The analysis of impacts to human remains is based on the *Cultural Resources Assessment Report*. The potential for the Project Site to contain human remains was assessed based on the findings of the cultural resource records search (i.e., presence and proximity of known resources), the SLF search, land use history research, subsurface geological conditions, and the proposed excavation parameters for the Proposed Project.

Cultural Resources Archival Research

A records search for the Proposed Project was conducted on May 7, 2018, by ESA staff at the CHRIS-SCCIC housed at California State University, Fullerton. The records search included a review of all recorded archaeological resources and previous studies within the Project Site and a 0.5-mile radius of the Project Site, and historic architectural resources within or adjacent to the Project Site.

Previous Cultural Resources Investigations

The records search results indicate that four cultural resources studies have been conducted within a 0.5-mile radius of the Project Site. Of the four previous studies, two studies (LA-10567 and 11150) were performed in areas that are adjacent to the Project Site along West Century Boulevard. None of the study areas overlaps with the Project Site. LA-10567 is a linear survey report that covers several communities for a pipeline alignment, and LA-11150 is a memorandum from the Office of Historic Preservation regarding the section 106 process for the same project.

Previously Recorded Cultural Resources

The records search results indicate that no archaeological resources have been previously recorded within the Project Site or the 0.5-mile records search radius. The records search also indicated that no historical architectural resources have been previously recorded within or adjacent to the Project Site. The Forum is located approximately 1 mile north of the Project Site

and is listed on the National Register and the California Register; it is the only National Register or California Register-listed property within 1 mile of the Project Site. There are no California Landmarks within 1 mile of the Project Site.

Sacred Lands File Search

The NAHC maintains a confidential SLF which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on April 24, 2018, to request a search of the SLF. On April 25, 2018, the NAHC responded that there was no record of sacred lands in the SLF for the Project Site.⁶⁰

Geoarchaeological Review

A geoarchaeological review was performed to characterize the geology of the Project Site and assess the potential for the presence of subsurface archaeological resources in the Project Site. The review included study of the geological mapping of the Project Site and vicinity, historic topographic maps, historic aerial photographs, mapped soils, and a review of the geotechnical data for the site. The Project Site is located on the alluvial Torrance Plan and is situated approximately 0.18 miles southwest of the Potrero Fault Zone and 1.13 miles southeast of the Newport-Inglewood Fault Zone. Elevation within the Project Site ranges between 87 and 106 feet above mean sea level and slopes towards the south and west. Presently, the majority of the Project Site is previously disturbed, and previously contained residences but is currently vacant land with the exception of commercial properties including a motel, manufacturing, and warehouse land uses, utilities, and paved roads and parking. In addition, the Arena Site includes a parcel containing an existing City water supply well and associated infrastructure.

Geologically, the Project Site is situated within the West Coast Basin portion of the greater Los Angeles Basin, a broad trough formed by tectonic activity and stream erosion of nearby mountains, and filled with Quaternary-aged terrestrial and shallow marine sediments overlying Tertiary-aged marine sediments. Older geological mapping⁶¹ depicts shallow sediments underlying the Project Site as Pleistocene-aged Lakewood Formation sand, silt, silty sand, and silty clay with occasional gravel lenses. Jennings⁶² identifies sediments beneath the Project Site as river terrace deposits. Recent maps by Dibblee and Minch⁶³ and Saucedo et al.⁶⁴ are generally consistent with earlier maps in identifying Pleistocene-aged alluvium beneath the Project Site; however, these maps additionally identify a small area of Late Pleistocene to Holocene alluvial sediment in the vicinity of South Doty Avenue. A review of historic topographic maps (1923, 1924, and 1930) and aerial photos (1923 and 1928)⁶⁵ shows an intermittent stream flowing from

north to south across the Project Site suggesting a source of the sediment. As a result of the construction of the Hollywood Park racetrack in 1938, the stream is no longer evident on maps and aerial photographs.

Historic Maps and Aerial Photographs

The available historic maps and aerial photographs indicate that the vicinity of the Project Site was largely rural until the early 1920s. An aerial image of the area from 1923 shows a mixture of residential development and agricultural properties. In 1928, the area remained sparsely developed but the agricultural properties appear uncultivated or developed with residential buildings. Between 1928 and 1963, the area became nearly fully developed with single- and multi-family residences, while the properties in the Project Site along West Century Boulevard and South Prairie Avenue transitioned from residential to commercial use. Between 1952 and 1963 many of the single family residences and lower density multi-family residences east of South Prairie Avenue were replaced with apartment buildings, hotels and commercial buildings that took up most of any given parcel with zero or minimal lot line setbacks. By 1972, the majority of the parcels on and around the Project Site west of South Prairie Avenue remained smaller, single-family homes; however, the area east of South Prairie Avenue appears to be dominated by apartment buildings with some commercial and single family homes present. This level and type of development appears to have remained consistent according to the 1972 and 1980 aerials. By 2003, large portions of land were vacant on the north side of West 102nd Street in the project area on either side of South Prairie Avenue.

Building permit information obtained from the City of Inglewood's Building Safety Division provides a history of ownership and construction within the Project Site for the two parcels (3940 West Century Boulevard and 10212 South Prairie Avenue) containing historic age buildings. The history and status of these buildings are described in the *Cultural Resources Assessment Report* in Appendix F.

Pedestrian Survey

ESA archaeologists and historians conducted an intensive survey of the entire Project Site for historic, and archaeological resources. The surveys were aimed at identifying historic architectural resources and archaeological, resources within the Project Site. Areas with visible ground surface were subject to pedestrian survey using transect intervals spaced no more than 10 meters (approximately 30 feet) apart. Existing on-site buildings and structures, as well as the immediate surroundings, were photographed. Due to the fully urbanized nature of the area surrounding the Project Site the possibility of impacts to off-site architectural historical resources diminished greatly as distance from the Project Site increased. Additionally, South Prairie Avenue and West Century Boulevard are wide, four-lane roads that provide additional buffer between the Project Site and the areas to the west and north.

The Project Site is comprised of four discontinuous areas as described in Chapter 2, Project Description, of this EIR. All but six parcels (4032-001-039 and -049; 4032-007-035; and 4032-008-002, -006, and -035) that make up the Project Site are currently vacant or undeveloped.

The developed six parcels are all within the Arena Site. The northern portion of the Arena Site currently contains buildings within its northwestern and south-central portions, and vacant/undeveloped land in its eastern half. The undeveloped portions of the Project Site were subject to pedestrian survey and contain low-lying non-native grasses, which obscured ground surface resulting in ground surface visibility ranging from 30 to 70 percent. All undeveloped parcels on the Project Site contained modern building debris including plastic, glass, metal, ceramic, cement, and brick fragments. One historic-period isolate, a clear-glass beverage bottle (EAN-1), and one abalone shell fragment (WSN-1), were identified as a result of the survey.

Two historic-age architectural resources were identified on the Project Site as a result of the survey; the former Turf and Sky Motel (currently the Rodeway Inn & Suites motel), located at 3940 West Century Boulevard within the northwest portion of Arena Site, and a commercial building (currently Let's Have a Cart Party) located at 10212 South Prairie Avenue, within the southern portion of the Arena Site. Also, two historic-age architectural resources were identified within the boundaries of the Alternate Prairie Access Variant: 10204 South Prairie Avenue and 10226 South Prairie Avenue. Detailed descriptions and significance evaluations of these resources are provided in the *Cultural Resources Assessment Report* included as Appendix F of this Draft EIR.

Impacts and Mitigation Measures

Impact 3.4-1: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of a historical resource pursuant to section 15064.5. (Less than Significant with Mitigation)

Historic Architectural Resources

As discussed in the *Cultural Resources Assessment Report* (Appendix F), the Rodeway Inn & Suites (formerly the Turf and Sky Motel) located at 3940 West Century Boulevard, and other buildings at 10212 South Prairie Avenue are the only extant, historic-age buildings on the Project Site. Both of these buildings were constructed more than 45 years ago, meaning they meet the general age requirement to qualify as potential historical resources. As such, the buildings were evaluated for eligibility for listing under the National and California registers.

The Rodeway Inn & Suites at 3940 West Century Boulevard (4032-001-049) was evaluated against the following theme: Hotels and Motels. The Rodeway Inn & Suites is a two-story hotel designed in a contemporary and modest interpretation of the Spanish Colonial Revival style. The hotel was originally constructed in 1955 and has an "O" shaped footprint with a rectangular courtyard situated in the middle that includes a driveway providing access to the surface parking lot at the rear of the property. The hotel building is oriented toward the north with horizontal massing. It is clad in stucco and has a mansard roof with clay tiles. The hotel is set back from the road behind an asphalt parking lot. Planters are located on the east and west sides of the parking lot with mature palm trees and shrubbery. There is also a planter centered on the front property line and flanked by two driveways. There is a concrete wall present at the side (east and west) and rear (south) property lines.

The other existing, historic-age building on the Project Site is at 10212 South Prairie Avenue (4032-008-035), which is not associated with an established theme. 10212 South Prairie Avenue includes a commercial building that abuts the west property line and one smaller accessory building. The primary (west) façade of the main building faces South Prairie Avenue. It is rectangular in plan and does not represent a particular architectural style. It has a flat roof with a mansard parapet covered in Spanish-style roof tiles. The primary façade is symmetrical and features a pair of glazed, metal-frame doors flanked by two large plate glass windows. This façade is clad in stucco and large rocks while the secondary facades are clad only in stucco. One smaller accessory building, which is noted on one building permit application as a detached garage, is located along the east property line. This building is clad in stucco and has a hipped roof with shallow eaves and composite shingles.

The historic-age buildings were evaluated using the criteria for the National and California registers. The buildings at 3490 West Century Boulevard, 10212 South Prairie Avenue, 10204 South Prairie Avenue, and 10226 South Prairie Avenue are not considered eligible for listing in the National or California registers, because they were not found to be significant under any of the four eligibility criteria. As such, they do not meet the definition of historical resources as outlined in CEQA Guidelines section 15064.5(a)(1) or (2), and the Proposed Project would not have an impact on historical resources. Accordingly, no further analysis of impacts on Project Site historic architectural resources qualifying as historical resources is required pursuant to CEQA.

Archaeological Resources

As a result of the archival research and archaeological resources survey, two archaeological resources consisting of one historic-period isolate (EAN-1) and one shell isolate of undetermined age (WSN-1) were identified within the Project Site. Due to their isolate nature and lack of clear cultural context, EAN-1 and WSN-1 are not eligible for listing in the California Register and do not otherwise qualify as historical or unique archaeological resources pursuant to CEQA.

Based on previous geological and geotechnical work, the Project Site is likely to contain alluvial sedimentary deposits dating to the Late Pleistocene and Holocene. These deposits are expected to be most prevalent in the vicinity of South Doty Avenue between the northern portion of the Arena Site and East Transportation and Hotel Site, which formerly contained a channel drainage. Based on age and environment, these middle/late Holocene sediments are considered more sensitive for buried, intact cultural resources than areas to the east and west, which are underlain by older alluvium. The older alluvial unit has low sensitivity to contain buried cultural resources because these landforms have remained relatively stable through the Holocene; if cultural remains had been left behind they would have tended to remain at or near ground surface, and subject to decay or other destructive forces, including from the extensive disturbance at the Project Site.

The entirety of the Project Site has been disturbed, including: historic development, demolition of development, and removal of foundations and other components; portions of the Project Site that are currently vacant have been graded and/or plowed. The likely net effect of these actions, particularly in areas with little to no younger alluvium, would have been destruction or

disturbance of any cultural resources that may have existed on the site, further reducing the prehistoric archaeological sensitivity of these areas. As described below under Impact 3.4-3, however, the City has engaged in consultations under AB 52 with Tribal representatives from the Gabrieleño Band of Mission Indians Kizh Nation in the area. During consultation, Tribal representatives expressed a concern that the Project Site vicinity has not been studied or observed during ground-disturbing activities, and according to the Tribe, could have sensitivity for prehistoric archaeological resources. Mitigation Measure 3.4-1, set forth below, incorporates the recommendations of Tribal representatives in light of these concerns. For further information concerning the consultation process, and the recommendations of Tribal representatives, please see the analysis under Impact 3.4-3.

Although the likelihood of encountering prehistoric and/or historic-period archaeological deposits is low, there remains the possibility that Project-related ground disturbance, which could extend to depths of 35 feet below ground disturbance, could encounter archaeological deposits that qualify as historical resources or unique archaeological resources. If such resources were encountered, the Proposed Project would have a **potentially significant impact** on those resources, which would be mitigated to a less-than-significant level through implementation of Mitigation Measure 3.4-1, presented below, which includes provisions for archaeological and Native American monitoring as a result of discussions with the Tribe regarding sensitivity of the Project Site.

Off-Site Resources

Historic Architectural Resources

The Proposed Project was analyzed to determine if it would result in a substantial adverse change to the integrity of adjacent or nearby historical resources. Currently, there are no National or California register-listed historic resources located adjacent to the Project Site. The Forum, located approximately 1-mile north, is the nearest listed historic resource to the Project Site. The Forum underwent a rehabilitation, was listed on the National Register and the California Register, and reopened in 2014. “Following the rehabilitation, The Forum retains significant character-defining features ... It retains integrity of location, design, setting, materials, workmanship, feeling, and association.”⁶⁶ The Forum has been listed on the National and California registers under Criterion C/3, respectively, for its embodiment of the distinctive characteristics of a type, period, or method of construction and its representative work of a master. It was designed by Charles Luckman and Associates in the New Formalist architectural style. The Forum is a multi-purpose indoor arena built in 1966, which hosted its first event in 1967. The following character-defining features were identified in the National Register Nomination:

Exterior:

- Symmetrical façade
- Central location on an open site with high visibility from adjacent streets and properties
- Low profile landscaping

⁶⁶ National Register of Historic Places, 2014. National Register of Historic Places Registration Form, Forum, Los Angeles, CA. August 2014.

- Raised podium
- Concrete ramps and railings
- Sculptural columnar supports that form an arcade and covered passage at the exterior
- Smooth surfaces of the exterior concrete columns
- Original roof fascia profile
- Flat roof
- Suspension roof system
- Metal panel exterior walls set back from colonnade
- Four main entrances with multiple personnel doors
- Original ticket windows

Interior:

- The interior bowl spatial volume, including the elliptical seating rows, an elliptical cross aisle at the main concourse level, congruent elliptical wall at the lower event level, and the circular wall enclosure at the top
- Seating tier: risers and treads that form the lower and upper seating bowls
- Perforated metal wall cladding
- Vomitoria, truck tunnel, and other exit passages
- Two public concourses formed by an exterior circular wall and an interior elliptical seating cross aisle
- Passages from concourses to cross aisles
- Ceiling shape, texture, and light fixtures in the public concourses

The Forum is located outside of the Project Site approximately 1-mile north of West Century Boulevard along South Prairie Avenue. The Proposed Project would not involve the demolition, destruction, relocation, or alternation of the resource or its immediate surroundings. The character-defining features that are associated with setting include landscaping surrounding The Forum and views of The Forum from adjacent streets and properties. However, the surrounding views of The Forum from beyond properties and streets adjacent to The Forum (for example, from the Project Site) are not character-defining features of the resource and alterations to the surrounding setting in the area of the Project Site would not affect the resource's integrity. Therefore, the development of the HPSP Adjusted Baseline projects under Adjusted Baseline Environmental Setting conditions would not affect the baseline for analysis of the historic resource. These features would be preserved and would not be materially altered in a manner as a result of the Proposed Project. The Project Site is approximately 1 mile away and is not considered to be the resource's immediate surroundings. For these reasons, views to or from The Forum from the Project Site would not be relevant in assessing potential Project-related impacts to The Forum. The Forum is currently visible from the Project Site, and these views will be obscured as a result of the HPSP Adjusted Baseline projects. However, the setting is fully urbanized, the distance between The Forum and the Project Site (approximately 1 mile) is too

great to alter setting of The Forum, and the Proposed Project would not materially impair any of the character-defining features of The Forum. Altering the views to and from The Forum would not result in alterations to The Forum's integrity. The Forum would continue to retain all aspects of integrity and would remain eligible for listing in the National and California registers.

For the reasons described above, the Proposed Project effects on historical architectural resources would be **less than significant**.

Archaeological Resources

Archaeological resources are not evaluated for off-site impacts as they are typically underground or buried resources within the Project Site and would not be impacted indirectly by development of the Proposed Project.

For the reasons described above, this impact is considered **potentially significant**.

Mitigation Measure 3.4-1

***Retention of Qualified Archaeologist.** Prior to the start of ground-disturbing activities associated with the Project, including demolition, trenching, grading, and utility installation, the project applicant shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (US Department of the Interior, 2008) to carry out all mitigation related to cultural resources.*

- a) **Monitoring and Mitigation Plan.** Prepare, design, and implement a monitoring and mitigation program for the Project. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project Site, data recovery (including halting or diverting construction so that archaeological remains can be evaluated and recovered in a timely manner), artifact and feature treatment, procurement, and reporting. The Plan shall be prepared and approved prior to the issuance of the first grading permit.*
- b) **Cultural Resources Sensitivity Training.** The qualified archaeologist and Native American Monitor shall conduct construction worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Plan as outlined in (i), for all construction personnel conducting, supervising, or associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.*
- c) **Archaeological and Native American Monitoring.** The qualified archaeologist will oversee archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations*

such as grading, trenching, or any other excavation activity associated with the Project and as defined in the Monitoring and Mitigation Plan. If, after advanced notice, the Tribe declines, is unable, or does not respond to the notice, construction can proceed under supervision of the qualified archaeologist. The frequency of monitoring shall be based on the rate of excavation and grading activities, the materials being excavated, and the depth of excavation, and if found, the quantity and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased entirely, if determined adequate by the qualified archaeologist and the Native American monitor.

- d) In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the project applicant regarding recommendation for treatment and ultimate disposition of the resource(s).*
- e) If it is determined that the discovered archaeological resource constitutes a historical resource or a unique archaeological resource pursuant to CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement.*
- f) In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the project applicant, and appropriate Native American representatives (if the find is of Native American origin). The Cultural Resources Treatment Plan shall provide for the adequate recovery of the scientifically consequential information contained in the archaeological resource through laboratory processing and analysis of the artifacts. The Treatment Plan will further make recommendations for the ultimate curation of any archaeological materials, which shall be curated at a public, non-profit curation facility, university or museum with a research interest in the materials, if such an institution agrees to accept them. If resources are determined to be Native American in origin, they will first be offered to the Tribe for permanent curation, repatriation, or reburial, as directed by the Tribe. If no institution or Tribe accepts the archaeological material, then the material shall be donated to a local school or historical society in the area for educational purposes.*
- g) If the resource is identified as a Native American, the qualified archaeologist and project applicant shall consult with appropriate Native American representatives, as identified through the AB 52 consultation process in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered, to the extent feasible.*

- h) Prepare a final monitoring and mitigation report for submittal to the applicant, and the South Central Coastal Information Center (SCCIC), in order to document the results of the archaeological and Native American monitoring. If there are significant discoveries, artifact and feature analysis and final disposition shall be included with the final report, which will be submitted to the SCCIC and the applicant. The final monitoring report shall be submitted to the applicant within 90 days of completion of excavation and other ground disturbing activities that require monitoring.*

Level of Significance After Mitigation: Mitigation Measure 3.4-1 would avoid and/or substantially lessen the above impact by ensuring that any unanticipated archaeological resources that qualify as historical resources or unique archaeological resources pursuant to CEQA are appropriately identified, documented, evaluated, and treated promptly, so they are not inadvertently damaged or destroyed. Therefore, the recommended Mitigation Measure 3.4-1 for the retention of a qualified archaeologist, cultural resources sensitivity training, and inadvertent discovery protocols is proposed to address potential impacts. With implementation of Mitigation Measure 3.4-1, the impact to any unanticipated archaeological resources that qualify as historical resources or unique archaeological resources pursuant to CEQA would be **less than significant**.

Impact 3.4-2: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of an archaeological resource pursuant to section 15064.5. (Less than Significant with Mitigation)

Archaeological resources not qualifying as historical resources under CEQA are considered for their potential to qualify as unique archaeological resources. Review of previous investigations undertaken in the vicinity of the Project Site, as well as review of the prehistoric context for the area, provides an understanding of the potential for encountering prehistoric archaeological resources in the Project Site during construction. When completing analysis of subsurface archaeological sensitivity, important factors to consider include elevation, soil conditions, proximity to water, proximity to raw materials, and ethnographic and historic information. It is also necessary to evaluate the historic land use and past development and disturbances on the Project Site in determining the possibility for the preservation of subsurface prehistoric archaeological materials.

As discussed above under Impact 3.4-1, no archaeological resources have been previously recorded within or adjacent to the Project Site; two archaeological resources consisting of one historic-period isolate (EAN-1) and one shell isolate of undetermined age (WSN-1) were identified within the Project Site during survey. Due to their isolate nature and lack of clear cultural context, EAN-1 and WSN-1 are not eligible for listing in the California Register and do not otherwise qualify as historical or unique archaeological resources pursuant to CEQA.

The geoarchaeological review indicates that much of the Project Site is underlain by Pleistocene-aged alluvium which has low potential for intact archaeological deposits. An area of Late Pleistocene to Holocene alluvium is mapped along South Doty Avenue between the Arena Site

and the East Transportation and Hotel Site; the Late Pleistocene to Holocene alluvium has higher potential to contain buried archaeological deposits. Furthermore, the historic map and aerial photograph review indicates the Project Site was developed by the 1920s with residential subdivisions, which were largely replaced by commercial buildings sometime in the 1960s. As such, there may be historic-period archaeological deposits associated with the early residential development of the Project Site. Given the degree of disturbance within the Project Site, which has included the prior construction and demolition of residential and commercial buildings, prehistoric and/or historic-period archaeological deposits that may have underlain the Project Site could have been destroyed.

Although the likelihood of encountering prehistoric and/or historic-period archaeological deposits is low, there remains the possibility that Project-related ground disturbance, which could extend to depths of 35 feet below ground disturbance on the Arena Site, could encounter archaeological deposits that qualify as historical resources or unique archaeological resources, and would be considered a **potentially significant impact**.

Mitigation Measure 3.4-2

Implement Mitigation Measure 3.4-1. Implement Cultural Resources Monitoring and Mitigation Plan.

Level of Significance After Mitigation: Mitigation Measure 3.4-2 would avoid and/or substantially lessen the above impact by ensuring that any unanticipated archaeological resources that qualify as historical resources or unique archaeological resources pursuant to CEQA are appropriately identified, documented, evaluated, and treated promptly, so they are not inadvertently damaged or destroyed. Therefore, the recommended Mitigation Measure 3.4-2 for the retention of a qualified archaeologist, cultural resources sensitivity training, archaeological and Native American monitoring and inadvertent discovery protocols is proposed to address potential impacts. With implementation of Mitigation Measure 3.4-2, the impact to any unanticipated archaeological resources that qualify as historical resources or unique archaeological resources pursuant to CEQA would be **less than significant**.

Impact 3.4-3: Construction of the Proposed Project could have the potential to cause a substantial adverse change in the significance of a Tribal Cultural Resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and that is:

- i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k).**
- ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code section 5024.1. In applying the criteria set forth in section 5024.1, the lead agency shall consider the significance of the resource to a California Native American Tribe. (Less than Significant with Mitigation)**

Tribal Consultation

The City has engaged in consultations with Native American Tribes pursuant to AB 52. Letters and other materials reflecting the City's consultations with Native American Tribes and the NAHC are provided in Appendix F (detailed notes of conversations are confidential and on file with the City). The following discussion summarizes those consultations.

On February 12, 2018, the City submitted letters requesting consultation to five Native American individuals and organizations on the City's AB 52 Notification List. As a result of this outreach, the City received letters via email from the Gabrieleño Band of Mission Indians – Kizh Nation (Tribe) requesting formal consultation.

Through consultation the Tribe provided its knowledge of the Project Site and concerns about the Proposed Project. The site is located in the Tribe's ancestral territory, and they consider the area around the Project Site to have a high sensitivity for finding cultural resources and human remains related to trade routes and village activity. The Tribe also stated that the Project Site is archaeologically sensitive. The Tribe did not identify any known Tribal cultural resources (as defined in PRC section 21074) within the Project Site. The Tribe provided a map, consistent with **Figure 3.4-1**, showing the nearest known Native American village sites and trade routes. None of the village sites or trade routes is located on the Project Site. The nearest village site or trade route is labeled "Old Salt Road." This road is located approximately 2 miles to the west of the Project Site. The road curves to the north and east, and is located approximately 2 miles to the north of the Project Site.⁶⁷ The Tribe also submitted images of four pages from an untitled report. These pages consist of reproductions of four historic hand drawn maps that include: "*Rancho del paso de las carreta*" (located approximately 5 miles northwest of the Project Site), "*Rancho Sausal Redondo*" (located approximately 4 miles north of the Project Site), a portion of the Kirkman map identifying the location of "*Guacha*" (located approximately 6 miles northwest of

⁶⁷ George W. Kirkman, 1937. The Kirkman-Harriman Pictorial and Historical Map of Los Angeles County 1860 A.D.–1937 A.D., 1887, Map on File: Map Room of the History Department, Los Angeles Public Library. Los Angeles, CA.

 1937 Kirkman Map

the Project Site), and the Johnston 1952 map depicting the villages “*Sa’angna*” (located approximately 5.5 miles northwest of the Project Site).^{68,69,70,71}

The Tribe further referenced a 1920 topographic map and the presence of the ephemeral drainage to the north of the Project Site. Additionally, the Tribe provided their recommended mitigation measures, and requested that the City (1) require sensitivity training; (2) have a Native American monitor on site to monitor ground disturbance activity; (3) provide the Tribe with an opportunity to review the EIR’s description of Tribal history; and (4) provide the opportunity to review proposed mitigation measures addressing Tribal resources. The City discussed proposed mitigation with Tribe throughout the consultation process, and in June of 2019 the City and the

Tribe agreed upon the recommend mitigation for archaeological and Native American monitoring for ground disturbance as well as a provision that artifacts would be repatriated to the Tribe or reburied depending on the type of materials encountered. The City documented this mutual agreement in a close of consultation letter on July 15, 2019.

On May 16, 2019, the City met with Tribal representatives to discuss proposed mitigation measures addressing the potential presence of Tribal resources. The City stated that, as requested by the Tribe, recommended mitigation measures for archaeological and Tribal resources would include Native American monitoring during construction activities that involve ground disturbance. Tribal representatives stated that they were satisfied with this recommended mitigation measure. Tribal representatives also requested that the City add language to the recommended mitigation providing that that, if found, artifacts would be repatriated to the Tribe or reburied depending on the type of materials encountered. The Tribe further agreed that, once they concur with this request, consultations under AB 52 would be concluded. Recommended Mitigation Measure 3.4-1, as set forth above, has been revised to incorporate this request.

Analysis

The *Cultural Resources Assessment Report* includes a prehistoric and historical context of the Project Site and vicinity, and summarizes the Rancho period history of Inglewood. The report also includes a summary of the record search results, a land use analysis, and geoarchaeological analysis of the Project Site. This information was analyzed to assess the sensitivity for cultural resources during ground disturbance.

The records search results indicate that four cultural resources studies have been conducted within a 0.5-mile radius of the Project Site. Of the four previous studies, two are adjacent to the Project Site along West Century Boulevard. None of the previous studies overlaps with the Project Site. The previous studies include a linear survey report that covers several communities for a pipeline alignment, and a memorandum from the Office of Historic Preservation regarding

⁶⁸ California State Archives, n.d. Diseno for the Rancho Sausal Redondo.

⁶⁹ California State Archives, n.d. Location of Guacho on the 1839 diseno for the Rancho La Ballona.

⁷⁰ George W. Kirkman, 1937. The Kirkman-Harriman Pictorial and Historical Map of Los Angeles County 1860 A.D.–1937 A.D., 1887, Map on File: Map Room of the History Department, Los Angeles Public Library. Los Angeles, CA.

⁷¹ Johnston, Bernice Eastman, 1962. *California’s Gabrielino Indians*. Southwest Museum. Los Angeles, California.

the section 106 process for the same project. The NAHC responded to the SLF request in a letter stating that the SLF search did not reveal the presence of Native American cultural resources within or adjacent to the Project Site.

Historic maps, including the Kirkman Map and other maps provided or referenced by the Tribe, were reviewed as part of the background research for the Proposed Project to identify historic land uses and the location of Native American villages in the historic era. The Kirkman map is identified by the Tribe as a source providing the locations of Gabrielino village sites and trails, or old roads that followed aboriginal trails throughout Los Angeles County. To accurately determine the location of the Project Site on the Kirkman map, this map was georeferenced in GIS to Los Angeles County boundaries (see Figure 3.4-1). The georeferencing is based off of three control points throughout the County including: the southwest corner near Malibu, California; the northwest corner near Gorman, California; and northeast corner near Kramer Junction, California. Georeferencing the map reflected changes in the boundaries of Los Angeles County from the boundary that existed in 1937, at the time the Kirkman map was prepared. At this referenced scale, the Kirkman map does not show any roads, villages, trails, landforms, or locations overlapping with the Project Site. The map does show a dot which is noted as “(Inglewood) *Aguaje de la Centinela*” approximately 2 miles to the northwest of the Project Site. This location is generally consistent with the location of the Centinela Adobe, which was and still is located near the banks of the Centinela Creek. Over 2 miles to the south of the Project Site the City of “(Hawthorne)” is also indicated on the map. There are no trails or old roads depicted on the Kirkman map in the vicinity of the Project Site, the nearest route is over 2 miles to the west and is labeled “Old Salt Road”; this feature curves around to the north of the Project Site continuing east at a distance of over 2 miles to the north of the Project Site. These are the closest locations of Gabrielino village sites, old roads, or possible trails, to the Project Site as indicated on the Kirkman map.

During consultations, the Tribe stated that Centinela Springs represented a significant source of water for Tribes in the area and, as a result, Tribal resources might be located there. The Kirkman map does not show the location of such a resource; however, the Centinela Springs are commemorated with a plaque at their former location. The plaque is located in a park 2 miles to the north of the Project Site. The nearest Gabrielino villages that are depicted on the Kirkman map are located near the Baldwin Hills (approximately 3 miles north) and toward the Ballona Wetlands (approximately 4 miles northwest).

The four historic hand drawn maps provided by the Tribe include one entitled “*Rancho del paso de las carretas,*” which is a hand drawing showing the location of the village of *Guacho* on a map of the *Rancho La Ballona*. The *Ballona* land grant (or rancho) is approximately 4.87 miles to the northwest of the Project Site, just to the north of the *Sausan Redondo* land grant.

The second hand drawn map is of the *Rancho Sausal Redondo*. The *Rancho Sausal Redondo*’s boundaries end at West Century Boulevard to the north of the Project Site, and South Prairie Avenue to the west of the Project Site, and continue to extend northwest over 4 miles to just south

of Jefferson Boulevard. This map is also depicted in McCawley⁷² who describes the map as a “Map of *Rancho Sausal Redondo* showing the Mexican land grant of *Guaspita* located on the east bank of Ballona Creek.” *Guaspita* is depicted on the map a short distance from the coast on the hill overlooking Ballona Creek, which is located approximately 5 miles to the northwest of the Project Site. The third hand drawn map is a portion of the Kirkman⁷³ map which calls out the location of *Guacha*, which is again depicted near Playa del Rey near the banks of the Ballona Creek. The final hand drawn map is cited as “Johnston 1962” which depicts geographical features and known Gabrielino villages at the time of the Portola Expedition. The map depicts a village called *Sa’angna* just to the south of the Ballona Creek, northwest of the Project Site; the map does not depict any labeled villages in, or within the immediate vicinity of, the Project Site. McCawley indicates that *Sa’angna* was a Gabrielino village located near the banks of the Ballona, over 5 miles from the Project Site.

On March 21, 2018, the Tribe submitted another document entitled “Cultural Resources Mitigation Measures, regarding Tribal Cultural Resources and Human Remains and associated funerary objects within Kizh Gabrieleño Tribal Territory.” This document provides recommendations for project applicants to follow during project construction, which include the retention of a qualified Native American Monitor during construction related ground disturbance, unanticipated discovery of Tribal cultural resources mitigation, unanticipated discovery of human remains and associated funerary objects mitigation, as well as professional standards descriptions.

As described above, the materials submitted by the Tribe provided information regarding the Project Site and vicinity as discussed during the meetings between the City and the Tribe on March 21, 2018, and March 20, 2019. The maps provided are historic maps of Gabrielino village locations throughout Los Angeles County, as well as hand drawn maps of two ranchos which were established to the north and west of the Project Site. The historic documentation provided by the Tribe has been included as context in the *Cultural Resources Assessment Report* and considered for this analysis.

The determination that the Project Site itself has low sensitivity for archaeological resources is based on many factors described in this section. In addition, the maps provided by the Tribe do not indicate the presence of any known village sites within the Project Site or the immediate vicinity. The historic maps, the geoarchaeological analysis, and the land use history, were all used to determine the proximity of a sustainable source of water and other natural resources such as wetlands that may be indicators of prehistoric habitation. The materials studied did not indicate that such resources existed at, or in the immediate vicinity of, the Project Site. Although evidence was provided by the Tribe that indicates the location of villages and known archaeological sites, none of these resources is located within 2 miles of the Project Site (i.e., all are 2 to 5 miles away). The locations of these villages and archaeological sites are close to known trade routes

⁷² McCawley, William, 1996. *The First Angelinos: The Gabrielino Indians of Los Angeles*. Malki Museum Press, Banning, California pp. 62-63.

⁷³ George W. Kirkman, 1937. *The Kirkman-Harriman Pictorial and Historical Map of Los Angeles County 1860 A.D.–1937 A.D.*, 1887, Map on File: Map Room of the History Department, Los Angeles Public Library. Los Angeles, CA.

and old roads known to have been used by prehistoric and early historic era peoples to travel from the inland to the coast. There are no such trade routes, old roads, or known villages documented within 2 miles of the Project Site. In the course of the City's investigation, including information obtained through consultations with the Tribe, the City has not obtained evidence that sacred lands or Tribal cultural resources overlap with or occur within the Project Site. The City, having reviewed the information provided by the Tribe, concludes that the Project Site does not contain any previously known Tribal cultural resources, and that the Project Site has a low sensitivity for buried archaeological resources that, if encountered, could potentially be considered a Tribal cultural resource as defined in PRC section 21074, 5020.1(k), or 5024.1.

Based on all available information, including the information provided by the Tribe during consultations, the City does not have evidence of known Tribal cultural resources as defined in PRC section 21074(a)(1) that are listed or eligible for listing in the California Register, or in a local register of historical resources as defined in PRC section 5020.1(k), or that are determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to PRC section 5024.1, within the Project Site. The Tribe provided information to the City during the consultation process under AB 52. This information indicates that sites that are likely to contain sensitive resources due to their importance to the Tribe are located 2 miles or more from the Project Site.

As described above, no sensitive Tribal cultural resources have been found on or near the Project Site. The single shell identified during survey (WSN-1) is likely related to historic subsistence practices at the site; however, should similar resources be encountered during construction the qualified archaeologist would evaluate the find as described in Mitigation Measure 3.4-1. While there is no identified Tribal cultural resource on the Project Site, there is potential that subsurface archaeological resources may be encountered during ground disturbing activity. Given the sensitivity of the Project Site, previously unknown archaeological resources identified during ground disturbing activities could be determined by the Tribe to be a potential Tribal cultural resource. If not treated properly, ground disturbing activities therefore could cause a substantial adverse change in the significance of a known Tribal cultural resource, defined in PRC section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American Tribe, and would be considered a **potentially significant impact**.

Mitigation Measure 3.4-3

Implement Mitigation Measure 3.4-1. Implement Cultural Resources Monitoring and Mitigation Plan.

Level of Significance After Mitigation: As documented in the July 15, 2019, letter closing Tribal consultation, the City and the Tribe are in mutual agreement that the Proposed Project would not result in potentially significant impacts to Tribal cultural resources with implementation of Mitigation Measure 3.4-3. Mitigation Measure 3.4-3 would avoid and/or substantially lessen the above impact by ensuring that any unanticipated tribal cultural resources are appropriately identified, documented,

evaluated, and treated promptly, so they are not inadvertently damaged or destroyed. With implementation of Mitigation Measure 3.4-3, the impact to any unanticipated Tribal cultural resources would be **less than significant**.

Impact 3.4-4: Construction of the Proposed Project could have the potential to disturb human remains including those interred outside of dedicated cemeteries. (Less than Significant with Mitigation)

No human remains were identified during the pedestrian survey of the Project Site and no known human remains have been recorded within the Project Site or a 0.50-mile radius. The overall sensitivity of the Project Site with respect to archaeological resources, including human remains, is low. Project-associated grading and excavation would extend into previously undisturbed subsurface areas or other locations where there is some possibility to encounter buried human remains. As a result, although unlikely, construction may disturb human remains, including those interred outside of dedicated cemeteries, which would be a **potentially significant impact**.

Mitigation Measure 3.4-4

Inadvertent Discovery of Human Remains. In the event of the unanticipated discovery of human remains during excavation or other ground disturbance related to the Project, all work shall immediately cease within 100 feet of the discovery and the County Coroner shall be contacted in accordance with PRC section 5097.98 and Health and Safety Code section 7050.5. The project applicant shall also be notified. If the County Coroner determines that the remains are Native American, the California Native American Heritage Commission (NAHC) shall be notified in accordance with Health and Safety Code section 7050.5, subdivision (c), and PRC section 5097.98 (as amended by AB 2641). The NAHC shall designate a Most Likely Descendant (MLD) for the remains per PRC section 5097.98. Until the landowner has conferred with the MLD, the project applicant shall ensure that a 50-foot radius around where the discovery occurred is not disturbed by further activity, is adequately protected according to generally accepted cultural or archaeological standards or practices, and that further activities take into account the possibility of multiple burials.

Level of Significance After Mitigation: Mitigation Measure 3.4-4 requires notification of the County Coroner in the event of the unanticipated discovery of human remains and a proscribed protocol for their disposition in accordance with applicable regulations, notification of the NAHC, and subsequent Tribal coordination if remains are determined to be of Native American descent. If the NAHC is unable to identify a MLD, or the MLD identified fails to make a recommendation, or the landowner or his or her authorized representative rejects the recommendation of the descendants and the mediation provided for in PRC section 5097.94(k), if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance. Thus, the impact would be considered **less than significant**.

Cumulative Impacts

The cumulative setting for cultural, archaeological, and Tribal resources varies by resource type, as is described below. The Project Site, in the southwestern portion of the fully urbanized City of Inglewood, is surrounded by residential and commercial development to the west, south, and east. The HPSP area is located to the north. Part of the HPSP Adjusted Baseline projects that are currently under development will result in new commercial, office, residential, parking, open space, and NFL Stadium uses. Prior to the development of the Project Site and vicinity, historic topographic maps indicate a north-south trending ephemeral drainage originating north from the Baldwin Hills and extending to the East Transportation and Hotel Site. The area is within the ethnographic territory of the Gabrielino Tribe. Geologically, the Project Site is situated within the West Coast Basin portion of the greater Los Angeles Basin, a broad trough formed by tectonic activity and stream erosion of nearby mountains, and filled with Quaternary-aged terrestrial and shallow marine sediments overlying Tertiary-aged marine sediments.

In addition to the Proposed Project, there are 145 projects that have been taken into consideration when developing the cumulative context, although the context varies by resource type. The closest cumulative project (Cumulative Project No. 67) is the proposed development associated with the development of the HPSP area, located immediately to the north of the Arena Site. As noted above, the HPSP Adjusted Baseline projects are currently under construction, and are considered in the project-level analysis above.

Impact 3.4-5: Construction of the Proposed Project, in conjunction with construction of other cumulative projects, could have the potential to result in cumulatively considerable impacts to historical resources. (Less than Significant with Mitigation)

A cumulative impacts analysis for historic architectural resources evaluates whether impacts of a project and related projects, when taken as a whole, would have significant environmental impacts on historical resources. If these projects would result in a significant impact, then the Proposed Project contribution would need to be determined. The cumulative context for historic resources can be defined by a number of factors depending on the conditions and the presence or absence of known historic resources in the area. For the Proposed Project the cumulative context for historical resources considers impacts to significant historical resources in Inglewood. There are 33 cumulative projects in the City of Inglewood, with the HPSP project being the only one in the immediate vicinity of the Project Site. The majority of the 33 projects are residential developments, many of which are small scale, while the HPSP accounts for a large portion of the cumulative development. The HPSP EIR was certified in 2009 and concluded that the HPSP project would result in a less-than-significant impact to historic resources. Given the long history of Inglewood and large number of historic-age buildings and structures throughout the City it is possible that historical resources may be significantly impacted as a result of at least one of the 33 projects that constitute the cumulative context. Therefore, the cumulative impact on historic architectural resources would be potentially significant.

As discussed above, although the likelihood of encountering prehistoric and/or historic-period archaeological deposits is low, there remains the possibility that Project-related ground disturbance, which could extend to depths of 35 feet below ground disturbance, could encounter archaeological deposits that qualify as historical resources or unique archaeological resources. If such resources were encountered, the Proposed Project would have a potentially significant impact on those resources. Given the proximity of other cumulative projects and the sensitivity for encountering such resources, the Proposed Project could contribute to cumulative impacts. Based on the above considerations, the Proposed Project, in conjunction with cumulative development within the Project vicinity, implementation of the Proposed Project could result in cumulatively considerable impacts to historical resources. Therefore, the cumulative impact would be **potentially significant**.

Mitigation Measure 3.4-5

Implement Mitigation Measure 3.4-1. (Cultural Resources Monitoring and Mitigation Plan).

Level of Significance After Mitigation: Mitigation Measure 3.4-5 would ensure that archaeological monitoring would discover unanticipated archaeological resources that qualify as historical resources, during construction, that will be identified, evaluated and treated promptly before they can be damaged or destroyed during construction, and reducing significant project-level impacts on archaeological resources that are historical resources under CEQA. Therefore, with mitigation, the Proposed Project would not have a considerable contribution to a cumulative impact on archaeological resources and would be considered **less than significant**.

Impact 3.4-6: Construction of the Proposed Project, in conjunction with construction of other cumulative projects, could have the potential to contribute to cumulative impacts on archaeological resources. (Less than Significant with Mitigation)

The cumulative context for archaeological resources, which may also be historical resources under CEQA, is within 0.5 miles of the Project Site, which includes areas within the fully urbanized City of Inglewood and other urbanized areas. Within these areas, the context has been defined by the known archaeological resources or level of archaeological sensitivity in the area. The site and its vicinity were developed around the turn of the century, and there are no known historic archaeological sites within a 0.5 miles of the Project Site. However, unknown, subsurface, historic or archaeological resources, some of which may be historical resources under CEQA, could be preserved under the surface of vacant land or under the current development. As such, development in these areas could have a potentially significant cumulative impact to archaeological resources. While the Project Site is not known to contain archaeological resources, it is possible that the Project Site could contain previously undiscovered archaeological resources. The Proposed Project could have a cumulatively considerable contribution to the loss of archaeological resources, and the impact would be **potentially significant**.

Mitigation Measure 3.4-6

Implement Mitigation Measure 3.4-1. (Cultural Resources Monitoring and Mitigation Plan).

Level of Significance After Mitigation: Mitigation Measure 3.4-6 would ensure that archaeological monitoring would discover unanticipated archaeological resources, during construction, that will be identified, evaluated and treated promptly before they can be damaged or destroyed during construction, and reducing significant project-level impacts on archaeological resources that are historical resources under CEQA. Therefore, with mitigation, the Proposed Project would not have a considerable contribution to a cumulative impact on archaeological resources and would be considered **less than significant**.

Impact 3.4-7: Construction of the Proposed Project, in conjunction with construction of other cumulative development, could have the potential to contribute to cumulative impacts on the significance of a Tribal Cultural Resource, defined in Public Resources Code section 21074. (Less than Significant with Mitigation)

The cumulative context for Tribal cultural resources is within the Gabrielino Tribal territory which encompasses land within Los Angeles County north to Thousand Oaks, east to Pomona, west to the coast and south to Long Beach. Their territory also extends into Orange County as far south as Costa Mesa. The City is included within the Gabrielino Tribal territory and has been subject to historic development within the City since the rancho period, with more wide scale development occurring at the turn of the century. The Gabrielino Tribal territory has been subject to wide scale development and redevelopment projects over the past several decades and is currently experiencing a high level of redevelopment projects. Known Tribal village locations, trade routes, and known significant prehistoric archaeological sites that have a higher potential to represent a Tribal cultural resource are mapped and documented between 2 and 5 miles from the Project Site. As such, development in these areas could have a significant impact to a Tribal cultural resource. Cumulatively, the large amount of development within the Tribal territory, especially development within known village locations, trade routes, and known significant prehistoric archaeological sites could have significant and unavoidable impacts to Tribal cultural resources. All related projects would, like the Proposed Project, be required to comply with regulatory requirements governing Tribal cultural resources, including consultation with California Native American Tribes where required under AB 52. Should an impact be identified the related projects would be required to comply with PRC section 21084.3, which would require avoidance and preservation or mitigation as defined in PRC section 21084.3(b).

As described above, the Proposed Project could result in a significant impact on a previously unknown Tribal cultural resource. While there are no Tribal cultural resources identified within the Project Site, the City has consulted with Tribal representatives and recognizes the potential sensitivity. Based on the above considerations, the Proposed Project, in conjunction with cumulative development within the Project vicinity and in the City, could result in cumulatively

considerable impacts to Tribal cultural resources. Therefore, the cumulative impact would be **potentially significant**.

Mitigation Measure 3.4-7

Implement Mitigation Measure 3.4-1. (Cultural Resources Monitoring and Mitigation Plan).

Level of Significance After Mitigation: As documented in the July 15, 2019, letter closing Tribal consultation, the City and the Tribe are in mutual agreement that the Proposed Project would not result in potentially significant impacts to Tribal cultural resources with implementation of Mitigation Measure 3.4-7. Mitigation Measure 3.4-7 would avoid and/or substantially lessen the above impact by ensuring that any unanticipated Tribal cultural resources are appropriately identified, documented, evaluated, and treated promptly, so they are not inadvertently damaged or destroyed. Therefore, with mitigation, the Proposed Project would not have a considerable contribution to a cumulative impact to any unanticipated Tribal cultural resources and would be considered **less than significant**.

Impact 3.4-8: Construction of the Proposed Project, in conjunction with construction of other cumulative projects, could have the potential to contribute to cumulative impacts on human remains including those interred outside of dedicated cemeteries. (Less than Significant with Mitigation)

The cumulative context for the discovery of human remains is 0.5 miles. This area was developed since the rancho period with more wide scale development occurring historically around the turn of the century. Based on the SLF search and sensitivity analysis for cultural resources, there are no known burial grounds or unmarked cemeteries in, or within a 0.5-mile radius of the Project Site, and the overall sensitivity of the area, with respect to human remains, is low. The Project Site and surrounding 0.5-mile radius is more than 1.5 miles from the nearest known village sites or known prehistoric archaeological sites. There is a lack of year round water resources in the Project vicinity that makes the presence of prehistoric resources including human remains unlikely.

During the rancho period, the settlers resided near Centinela Creek, over 2 miles north of the Project Site. The likelihood of unmarked graves associated with the Rancho period is low as the preference would have been to bury family members at the Mission or in the Pueblo near the church. The site and vicinity were developed around the turn of the century, at which time (i.e., in 1905) the Inglewood Park Cemetery was established. The cemetery is still in operation and located 1.5 miles to the north of the Project Site, and outside of the cumulative context established for human remains. Because the cemetery was close by, available, and in use, the likelihood of unmarked historic-age graves in the 0.5-mile radius of the Project Site is low. However, due to the current development and disturbance in the cumulative context area, it is not currently possible to identify any sites or resources that may exist subsurface. Any disturbance of potential subsurface human remains as a result of cumulative development would be a potentially significant cumulative impact on human remains.

The Project Site is not known to contain any unmarked graves or human remains. However, the loss of any previously unknown human remains would be significant, and the Proposed Project would have a considerable contribution to a significant impact. Therefore, the cumulative impact to human remains is **potentially significant**.

Mitigation Measure 3.4-8

Implement Mitigation Measure 3.4-4. (Inadvertent Discovery of Human Remains).

Level of Significance After Mitigation: Implementation of Mitigation Measure 3.4-8 would ensure that all work immediately cease within 100 feet of the discovery, all relevant PRC and Health and Safety Codes that pertain to human remains discovery are followed, and the identified appropriate actions have taken place. Therefore, with mitigation, the Proposed Project would not have a considerable contribution to a cumulative impact on human remains and would be considered **less than significant**.

3.5 Energy Demand and Conservation

This section describes and evaluates potential effects on energy resources in the form of electricity, natural gas, and transportation fuels that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing energy infrastructure serving and energy consumption from the Project Site, as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, State, and local regulations related to energy demand and conservation; and (3) an analysis of the potential impacts related to energy demand associated with the implementation of the Proposed Project, as well as identification of potentially feasible measures that could mitigate significant impacts.

The information has been prepared in accordance with Public Resources Code (PRC) section 21100(b)(3), CEQA Guidelines section 15126.2(b), and CEQA Guidelines Appendix F. Section 15126.2 and Appendix F provide that an EIR should include an evaluation of potential impacts of a proposed project as a result of the demand for energy during construction and operational phases of the Proposed Project, and encourage measures to avoid or reduce the inefficient, wasteful, or unnecessary consumption of energy.

Comments received in response to the NOP for the EIR regarding energy demand and conservation can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to energy demand and conservation that were raised in comments on the NOP are analyzed within this section.

The analysis included in this section was developed based on project-specific construction and operational features described in Chapter 2, Project Description and Section 3.15, Utilities and Service Systems. The analysis also takes into account, and is consistent with, Section 3.7, Greenhouse Gas Emissions, and Section 3.14, Transportation and Circulation.

3.5.1 Environmental Setting

Regional Setting

Electricity

Electricity, as a consumptive utility, is a man-made resource. The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into energy. The delivery of electricity involves a number of system components for distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid.

Energy capacity, or electrical power, is generally measured in watts (W), while energy use is measured in watt-hours (Wh). For example, if a light bulb has a capacity rating of 100 W, the energy required to keep the bulb on for 1 hour would be 100 Wh. If ten 100 W bulbs were on for 1 hour, the energy required would be 1,000 Wh or 1 kilowatt-hour (kWh). On a utility scale, the capacity of a

generator is typically rated in megawatts (MW), which is 1 million watts, while energy usage is measured in megawatt-hours (MWh) or gigawatt-hours (GWh), which is one billion watt-hours.

Southern California Edison (SCE) provides electrical services to approximately 15 million people, 15 counties, 180 incorporated cities including the City of Inglewood and the Project Site, 5,000 large businesses, and 280,000 small businesses throughout its 50,000-square-mile service area, across central, coastal and southern California, an area bounded by Mono County to the North, Ventura County to the West, San Bernardino County to the East, and Orange County to the South.¹ SCE produces and purchases energy from a mix of conventional and renewable generating sources.

SCE generates power from a variety of energy sources, including large hydropower (greater than 30 MW), coal, gas, nuclear sources, and renewable resources, such as wind, solar, small hydropower (less than 30 MW), and geothermal sources. In 2017, the SCE power system experienced a peak demand of 23,508 MW.^{2,3} Approximately 32 percent of the SCE 2017 electricity purchases were from renewable sources, which is similar to the 29 percent statewide percentage of electricity purchases from renewable sources.⁴ The annual electricity sale to customers in 2018 was approximately 87,143,000 MWh.⁵ See **Table 3.5-1** for a summary of SCE 2018 electricity use.

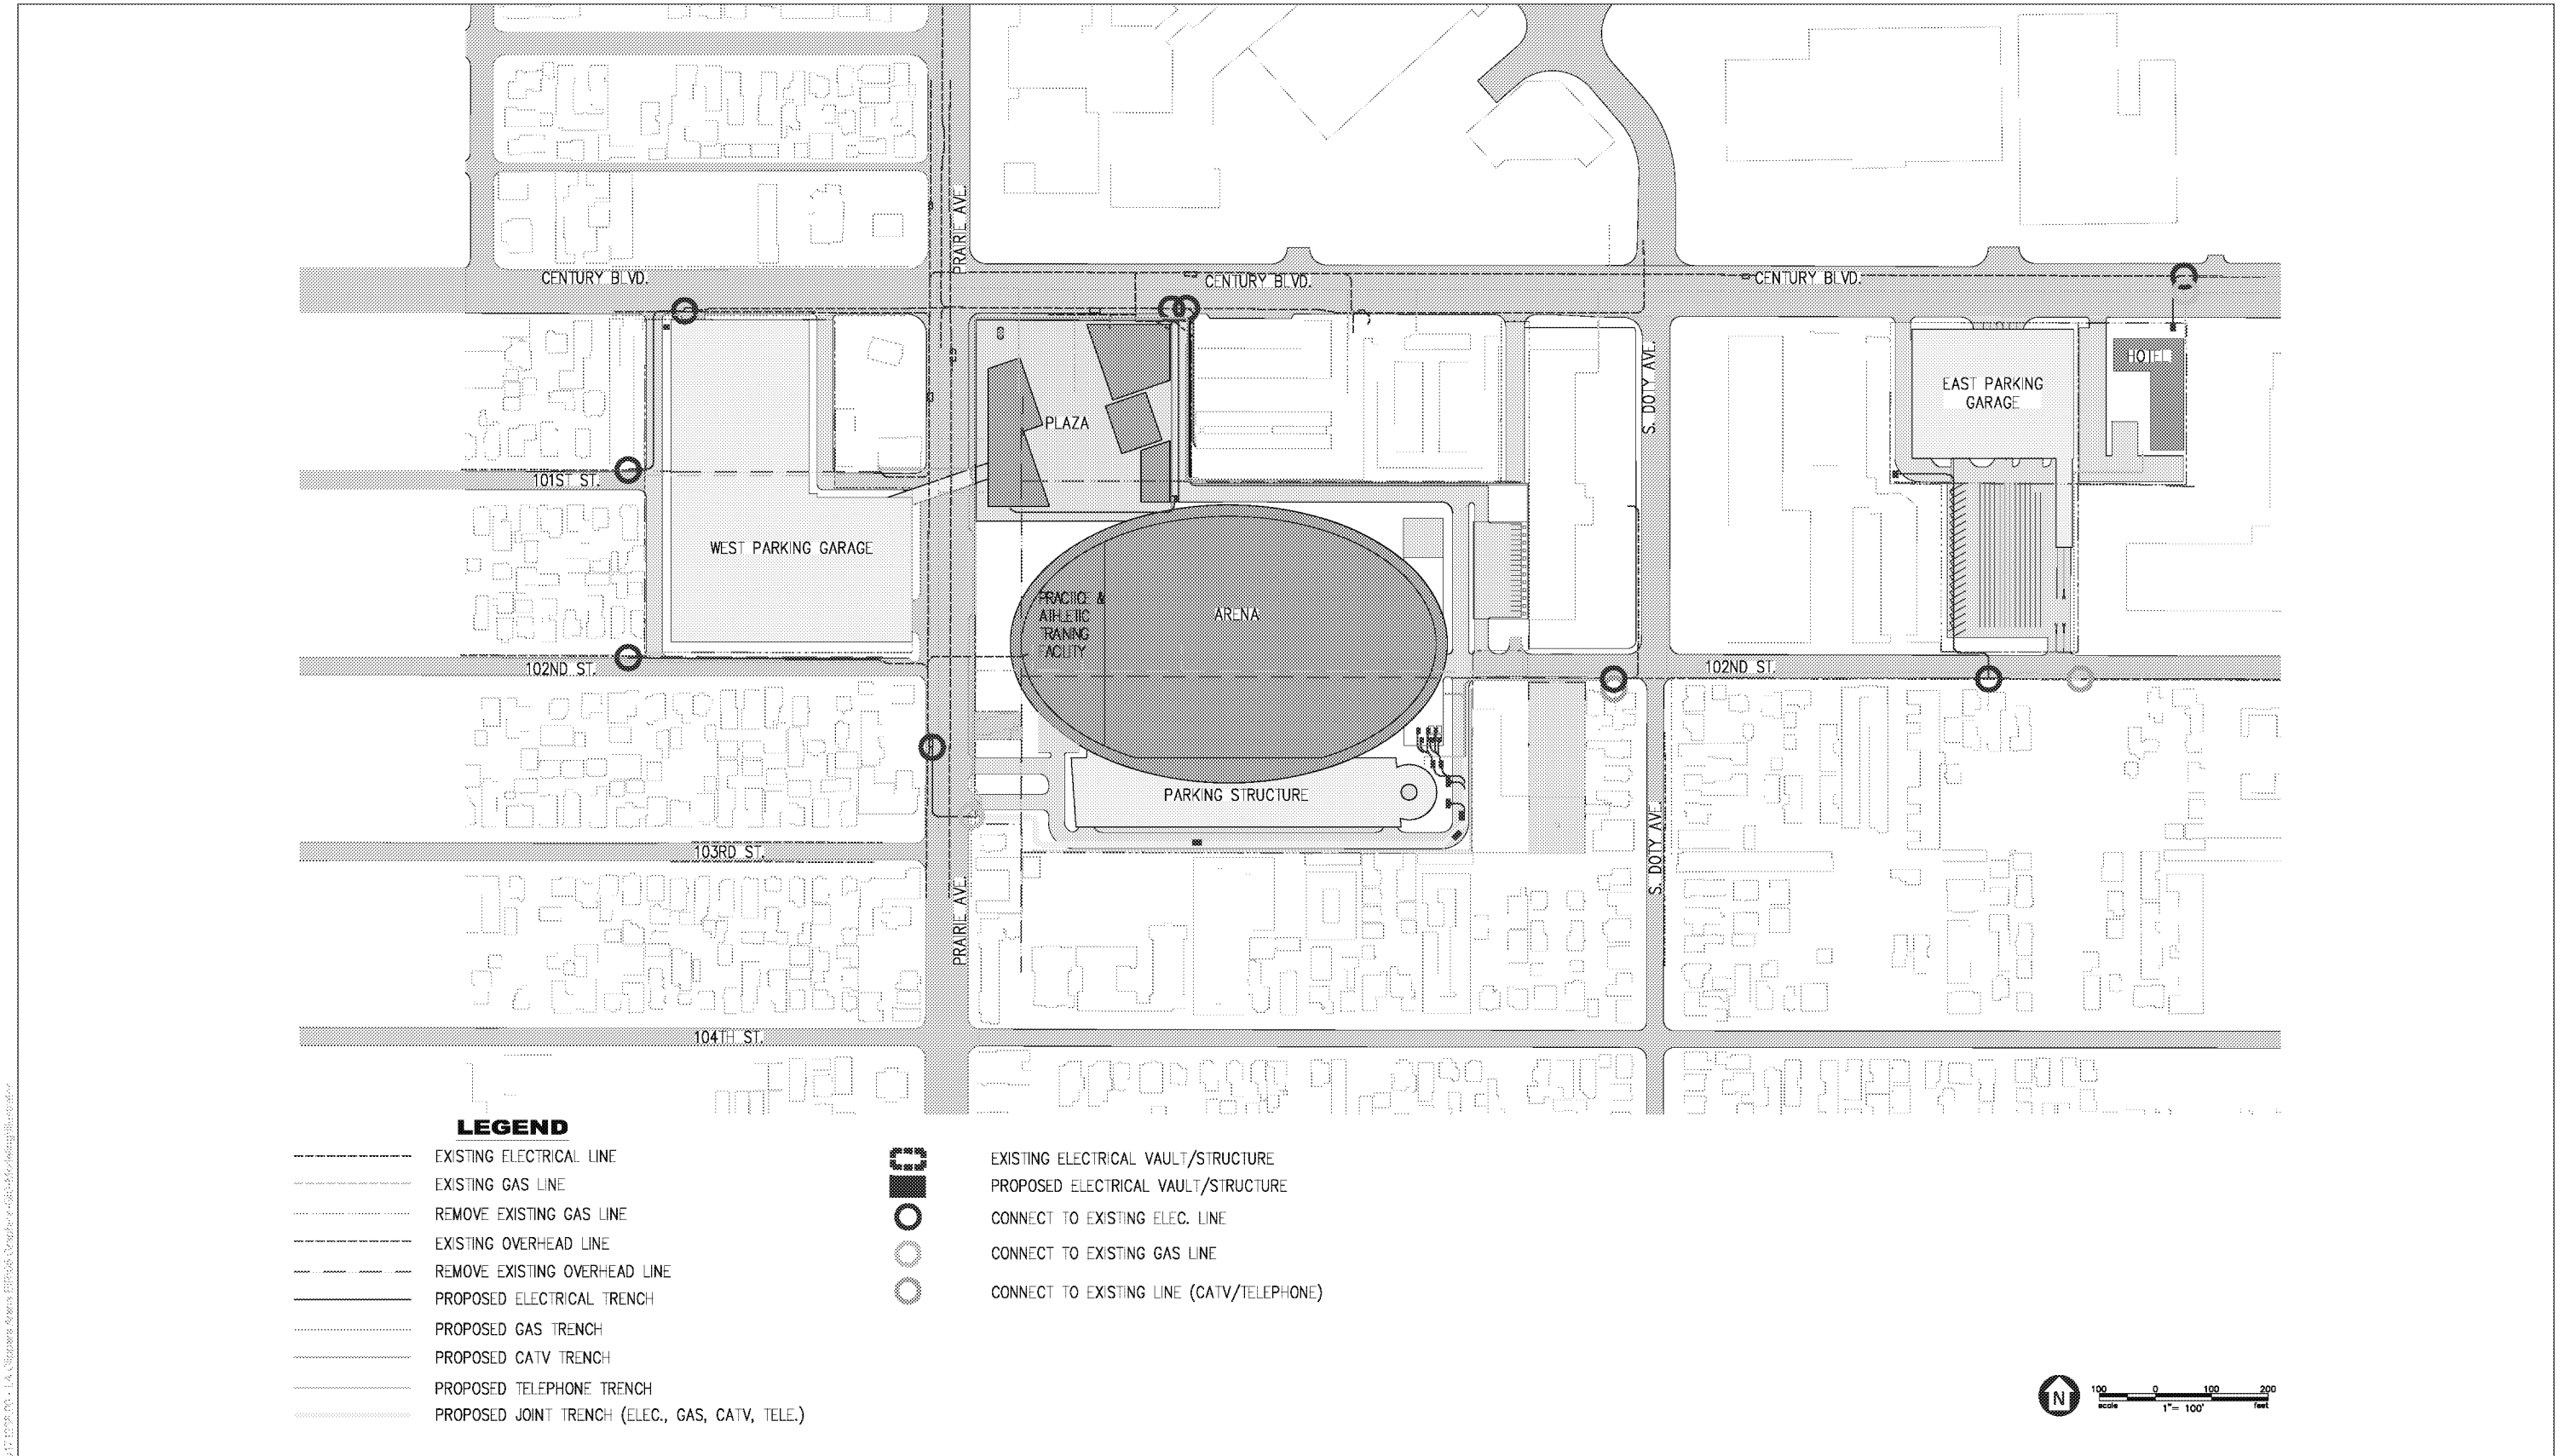

**TABLE 3.5-1
 EXISTING ANNUAL REGIONAL ENERGY USE**

Source	Amount
Electricity (SCE) ^a	87,143,000 MWh
Natural Gas (SoCalGas) ^b	988,785,000 MMBtu
Gasoline (Statewide) ^c	3,659,000,000 gallons
Diesel (Statewide) ^c	590,196,078 gallons

The closest SCE substation to the Project Site is located at 4128 West 103rd Street (Lennox Substation), and is the primary source of power to the existing uses on the Project Site. The substation provides two distribution service voltages: 16 kV and 4.8 kV. Overhead and underground electric power lines service the existing uses and run from west to east along West Century Boulevard and West 102nd Street, south to north along South Prairie Avenue, and along South Doty Avenue south of 102nd Street, as well as across portions of the Project Site, as illustrated in **Figure 3.5-1**.

Natural Gas

Natural gas is a combustible mixture of simple hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas consumed in California is obtained from naturally occurring reservoirs and delivered through high-pressure transmission pipelines. Natural gas provides almost one-third of the total energy requirements in California. Natural gas is measured in terms of both cubic feet (cf) or British thermal units (Btu).

The Project Site is served by the Southern California Gas Company (SoCalGas), which is the principal distributor of natural gas in Southern California, serving residential, commercial, and industrial markets. SoCalGas serves approximately 21.6 million customers in more than 500 communities encompassing approximately 20,000 square miles throughout central and southern California, from the City of Visalia to the US/Mexican border.⁶

SoCalGas, along with five other California utility providers, released the *2018 California Gas Report*, presenting a forecast of natural gas supplies and requirements for California through the year 2035. This report predicts gas demand for all sectors (residential, commercial, industrial, energy generation and wholesale exports) and presents best estimates, as well as scenarios for hot and cold years. Overall, SoCalGas predicts a decrease in natural gas demand in future years due to a decrease in per capita usage, energy efficiency policies, and the transition of the State to renewable energy displacing fossil fuels including natural gas.⁷

SoCalGas receives gas supplies from several sedimentary basins in the western United States (US) and Canada, including supply basins located in New Mexico (San Juan Basin), west Texas (Permian Basin), the Rocky Mountains, and western Canada as well as local California supplies.⁸ Sources of natural gas in the southwestern US will continue to supply most of the SoCalGas natural gas demand. The Rocky Mountain supply is available but is used as an alternative supplementary supply source, and Canadian sources provide only a small share of SoCalGas supplies due to the high cost of transport.⁹ Gas supply available to SoCalGas from California sources averaged 2,625 million cf per day or 2,717 million Btu (MMBtu) in 2017, the most recent year for which data are available.¹⁰ This equates to an annual average of 892,060 million cf per year or 992 million MMBtu per year. See Table 3.5-1 for a summary of the SoCalGas 2018 natural gas use.

Existing gas lines in the vicinity of the Project Site extend west to east along West Century Boulevard, West 101st Street, and West 102nd Street, and from south to north along South Prairie Avenue and South Doty Avenue, as well as across portions of the Project Site, as illustrated in Figure 3.5-1.

¹⁰ California Gas and Electric Utilities, 2018. 2018 California Gas Report, p. 102. 2018.

Transportation Energy

According to the California Energy Commission (CEC), transportation accounted for nearly 38.5 percent of total energy consumption in California during 2015.¹¹ In 2016, 15.5 billion gallons of gasoline and 3.8 billion gallons of diesel fuel were consumed in California.^{12,13} Petroleum-based fuels currently account for more than 90 percent of transportation fuel use in California.¹⁴

The State is now working on developing flexible strategies to reduce petroleum use. Over the last decade, California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and greenhouse gas emissions (GHGs) from the transportation sector, and reduce vehicle miles traveled (VMT). Accordingly, gasoline consumption in California has declined. The CEC predicts that the demand for gasoline will continue to decline over the next 10 years, and there will be an increase in the use of alternative fuels.¹⁵ According to fuel sales data from the CEC, fuel consumption in Los Angeles County was approximately 3.66 billion gallons of gasoline and 0.59 billion gallons of diesel fuel in 2017.^{16,17} See Table 3.5-1 for a summary of Statewide fossil fuel consumption in 2017.

Telecommunications

AT&T is the primary phone provider in the surrounding area and would provide telecommunication service to the Proposed Project. AT&T has existing overhead facilities on the SCE poles along West 102nd Street, as well as across portions of the Project Site, and existing underground facilities are located along South Prairie Avenue.¹⁸

Spectrum Business is the primary cable provider in the surrounding area and would provide high speed internet, voice and video services to the Proposed Project. Spectrum Business has existing overhead facilities on the SCE poles along West 101st Street west of South Prairie Avenue, along West 102nd Street east of South Prairie Avenue, and from south to north paralleling South Prairie Avenue to the east within the Project Site.¹⁹

¹¹ California Energy Commission, 2018. 2017 Integrated Energy Policy Report, p. 3. February 2018. Based on the transportation sector accounting for 38.5 percent of the State GHG emissions in 2015.

¹² California Energy Commission, 2018. 2017 California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, https://ww2.energy.ca.gov/almanac/transportation_data/gasoline/piira_retail_survey.html. Accessed March 27, 2019. Diesel is adjusted to account for retail (52%) and non-retail (48%) diesel sales.

¹³ CEC A15 Results for diesel sales do not include non-retail diesel sales, which are 49% of total diesel sales. For purposes of this analysis, the 49% of non-retail diesel sales were accounted and, therefore, reported Statewide diesel sales are higher than reported in the A15 results. See footnote in A15 results.

Project Site

The Project Site is comprised of approximately 28 acres of land. All but six of the parcels that make up the Project Site are currently vacant. The vacant parcels within the Project Site total approximately 23 acres, or more than 85 percent of the Project Site. The six developed parcels, approximately 2.9 acres all within the Arena Site, include a fast food restaurant (on a privately-owned parcel), a motel (on a privately-owned parcel), a warehouse and light manufacturing facility (on two privately-owned parcels), a commercial catering business (on a privately-owned parcel), and a groundwater well and related facilities (on a City-owned parcel) (see Chapter 2, Table 2-1, Project Site and Existing Development).

All of these uses, besides the currently unoccupied light manufacturing/warehouse facilities, actively consume electricity for lighting, electronics, appliances, and water conveyance. Natural gas is also used for cooking, hot water heating, and building heating/cooling at four of the five active land uses (the well and related facilities do not use natural gas), and transportation fuels are used for visitor, vendor, and worker trips to and from the existing active land uses. The remaining, and majority, of the Project Site is undeveloped and does not consume energy or natural gas.

The existing energy consumption for the active uses within the Project Site are summarized in **Table 3.5-2, Estimated Existing Energy Consumption**. Detailed energy calculations are provided in Appendix G of this Draft EIR.

Existing Uses Relocating to Project Site

In addition to the LA Clippers NBA games being relocated to the Project Site, the uses at the existing LA Clippers Team Offices, which are currently located at 1212 South Flower Street, Los Angeles, California, and the existing LA Clippers practice and athletic training center, which is located in the Playa Vista neighborhood of Los Angeles, at 6854 South Centinela Avenue in Los Angeles, California, would be relocated to the Project Site upon completion of construction. See “Existing – LA Clippers Facilities (off Site)” in Table 3.5-1, above.

3.5.2 Adjusted Baseline Environmental Setting

Section 3.5, Energy Demand and Conservation, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to energy demand and conservation, the changes associated with the Hollywood Park Specific Plan (HPSP) Adjusted Baseline projects include provision of energy infrastructure to serve the HPSP Adjusted Baseline project (electric vehicle (EV) charging stations, electricity lines, and transformers, natural gas lines, etc.). These infrastructure improvements will be constructed and in operation at the time the Proposed Project commences operations. For purposes of this analysis, the infrastructure improvements included in the Adjusted Baseline would not affect the threshold of significance or the impact analyses related to energy demand and conservation for the Proposed Project. No other changes to the existing environmental setting related to energy demand and conservation would occur under the Adjusted Baseline.

**TABLE 3.5-2
 ESTIMATED EXISTING ENERGY CONSUMPTION**

Emissions Sources	Electricity (MWh)	Natural Gas (MMBtu)	Gasoline (gallons)	Diesel (gallons)
Existing – on Site				
Commercial (Fast Food Restaurant)	48	296		
Commercial (Motel)	199	609		
Warehouse	282	637		
Light Manufacturing/Warehouse	29	30	67,226 ^a	7,791
Commercial (Catering)	19	12		
Natural Gas-Powered Vehicles	—	76		
Subtotal^b	577	1,660	67,226	7,791
Existing – LA Clippers Facilities (off Site)				
LA Clippers Team Office	307	247	77,969	9,036
LA Clippers Practice and Athletic Training Facility	537	845		
Natural Gas-Powered Vehicles	—	88	—	—
Subtotal	845	1,180	77,969	9,036
Total	1,421	2,840	145,195	16,827

NOTES:

Totals may not add up exactly due to rounding in the modeling calculations.

CO₂e emissions are calculated using the global warming potential values from the IPCC AR4.

^a Existing on-site fossil fuel consumption is calculated as a total for all on-site existing land uses.

^b Energy consumption from the proposed well would be less than under existing conditions.

CalEEMod® (v. 2016.3.2) annual outputs and default emission factors were used to calculate building energy for all land uses (electricity and natural gas) <http://www.caleemod.com/>;

EMFAC2017 emission factors were used to calculate fossil fuel and natural gas usage from all mobile sources. <https://www.arb.ca.gov/emfac/2017/>.

3.5.3 Regulatory Setting

Federal

Energy Policy Act of 1992

The Energy Policy Act (EPAcT) of 1992 was passed to reduce US dependence on foreign petroleum and improve air quality. EPAcT includes several provisions intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. EPAcT requires certain Federal, State, and local government and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. Financial incentives are also included in EPAcT. Federal tax deductions will be allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the EPAcT to consider a variety of incentive programs to help promote AFVs.

Energy Policy Act of 2005

The Energy Policy Act of 2005 includes provisions for renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a Federal purchase requirement for renewable energy.

Corporate Average Fuel Economy Standards

Established by the US Congress in 1975, the CAFE standards reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and United States Environmental Protection Agency (US EPA) jointly administer the Corporate Average Fuel Economy (CAFE) standards. The US Congress has specified that CAFE standards must be set at the “maximum feasible level” with consideration given to: (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) need for the nation to conserve energy.²⁰

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by US EPA and NHTSA. The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type.²¹ US EPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type.²²

US Department of Transportation, US Department of Energy, and US Environmental Protection Agency Influence on Transportation Energy

On the federal level, the US Department of Transportation, US Department of Energy, and US EPA are three agencies with substantial influence over energy policies related to transportation fuels consumption. Generally, federal agencies influence transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy-related research and development projects, and through funding for transportation infrastructure projects.

²⁰ For more information on the CAFE standards, refer to <https://www.nhtsa.gov/laws-regulations/corporate-average-fuel-economy>. Accessed March 27, 2019.

State

California Public Utilities Commission

The California Public Utilities Commission (CPUC) is a State agency created by a constitutional amendment to regulate privately owned utilities providing telecommunications, electric, natural gas, water, railroad, rail transit, and passenger transportation services, and in-State moving companies. The CPUC is responsible for assuring that California utility customers have safe, reliable utility services at reasonable rates, while protecting utility customers from fraud. The CPUC regulates the planning and approval for the physical construction of electric generation, transmission, or distribution facilities; and local distribution pipelines of natural gas.²³

California Energy Commission

The CEC is primary energy policy and planning agency in California. Created by the California Legislature in 1974, the CEC has five major responsibilities: (1) forecasting future energy needs and keeping historical energy data; (2) licensing thermal power plants 50 MW or larger; (3) promoting energy efficiency through appliance and building standards; (4) developing energy technologies and supporting renewable energy; and (5) planning for and directing State response to energy emergencies.

Senate Bill 1389

Senate Bill (SB) 1389 (PRC sections 25300–25323) requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the electricity, natural gas, and transportation fuel sectors in California, and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the State economy; and protect public health and safety (PRC section 25301(a)). The 2017 Integrated Energy Policy Report provides the results of the CEC assessments of a variety of energy issues facing California including energy efficiency, strategies related to data for improved decisions in the Existing Buildings Energy Efficiency Action Plan, building energy efficiency standards, the impact of drought on the California energy system, achieving 50 percent renewables by 2030, the California Energy Demand Forecast, the Natural Gas Outlook, the Transportation Energy Demand Forecast, Alternative and Renewable Fuel and Vehicle Technology Program benefits updates, an update on electricity infrastructure in Southern California, an update on trends in California sources of crude oil, an update on California nuclear plants, and other energy issues.

California Global Warming Solutions Act of 2006

In 2006, Governor Schwarzenegger signed Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006 (codified in the California Health and Safety Code (HSC), Division 25.5), which focused on reducing GHG emissions in California to 1990 levels by 2020. Under HSC Division 25.5, California Air Resources Board (CARB) has the primary

²³ California Public Utilities Commission, California Public Utilities Commission, <http://www.cpuc.ca.gov/>. Accessed April 25, 2019.

responsibility for reducing the GHG emissions in California; however, AB 32 also tasked the CEC and CPUC with providing information, analysis, and recommendations to CARB regarding strategies to reduce GHG emissions in the energy sector.

In 2016, Governor Brown signed SB 32 and its companion bill AB 197. SB 32 and AB 197 amend HSC Division 25.5 and establish a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and include provisions to ensure that the benefits of state climate policies reach into disadvantaged communities. Please see Section 3.7, Greenhouse Gas Emissions, of this Draft EIR, for additional details regarding these statutes.

SB 1078 (Sher) (Chapter 516, Statutes of 2002), SB 107 (Simitian) (Chapter 464, Statutes of 2006), SB 100 (De León) (Chapter 312, Statutes of 2018) and Executive Order S-14-08

The State of California adopted standards to increase the percentage of electricity that retail sellers, including investor-owned utilities and community choice aggregators, must provide from renewable resources.²⁴ The standards are referred to as the Renewables Portfolio Standards (RPS). The legislation requires utilities to increase the percentage of electricity obtained from renewable sources to 33 percent by 2020 and 50 percent by 2030.

On September 10, 2018, Governor Jerry Brown signed SB 100, which further increased the California RPS and requires retail sellers and local publicly owned electric utilities to procure eligible renewable electricity for 44 percent of retail sales by December 31, 2024; 52 percent by December 31, 2027; and 60 percent by December 31, 2030. SB 100 also provides that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by December 31, 2045.

CPUC and the CEC jointly implement the RPS program. The responsibilities of the CPUC include: (1) determining annual procurement targets and enforcing compliance; (2) reviewing and approving renewable energy procurement plan of each investor-owned utility; (3) reviewing contracts for RPS-eligible energy; and (4) establishing the standard terms and conditions used in contracts for eligible renewable energy.²⁵ Refer to Section 3.7, Greenhouse Gas Emissions, of this Draft EIR for additional details regarding this program.

California Building Standards Code (Title 24, Parts 6 and 11)

The California Building Energy Efficiency Standards for Residential and Nonresidential Buildings (California Code of Regulations [CCR], Title 24, Part 6) were adopted to ensure that building construction and system design and installation achieve energy efficiency and preserve outdoor and indoor environmental quality. The current California Building Energy Efficiency Standards (Title 24 standards) are the 2016 Title 24 standards, which became effective on January

²⁴ SB 1078 (Chapter 526, Statutes of 2002); SB 107 (Chapter 464, Statutes of 2006); Executive Order S-14-08.

²⁵ California Public Utilities Commission, RPS Program Overview, http://www.cpuc.ca.gov/RPS_Overview/. Accessed April 25, 2019.

1, 2017.²⁶ The 2016 Title 24 standards include efficiency improvements to the residential standards for attics, walls, water heating, and lighting; and efficiency improvements to the non-residential standards include alignment with the American Society of Heating and Air-Conditioning Engineers 90.1-2013 national standards.²⁷

The next update to the Title 24 energy efficiency standards (2019 standards) goes into effect on January 1, 2020.

The California Green Building Standards Code (CCR, Title 24, Part 11), commonly referred to as the CALGreen Code, became effective on January 1, 2017. The 2016 CALGreen Code includes mandatory measures for non-residential development related to site development, energy efficiency, water efficiency and conservation; material conservation and resource efficiency; and environmental quality.²⁸ Most mandatory measure changes, when compared to the previously applicable 2013 CALGreen Code, were related to the definitions and to the clarification or addition of referenced manuals, handbooks, and standards. For example, several definitions related to energy that were added or revised affect electric vehicle (EV) chargers and charging, and hot water recirculation systems. For new multi-family dwelling units, the residential mandatory measures were revised to provide additional EV charging requirements, including quantity, location, size, single EV space, multiple EV spaces, and identification. For non-residential mandatory measures, Table 5.106.5.3.3 of the CALGreen Code, identifying the number of required EV charging spaces has been revised in its entirety. Refer to Section 3.7, Greenhouse Gas Emissions, of this Draft EIR for additional details regarding these standards.

A discussion of the consistency of the Proposed Project with the requirements of the CALGreen Code and Title 24 is provided under Impact 3.5-2, below.

California AB 1493 (Pavley)

The transportation sector accounts for more than half of carbon dioxide (CO₂) emissions in California. AB 1493 (commonly referred to as Pavley regulations), enacted on July 22, 2002, requires CARB to set GHG emission standards for new passenger vehicles, light duty trucks, and other vehicles manufactured in and after 2009 whose primary use is non-commercial personal transportation. Phase I of the legislation established standards for model years 2009–2016 and Phase II established standards for model years 2017-2025.^{29,30} Refer to Section 3.7, Greenhouse Gas Emissions, of this Draft EIR for additional details regarding this regulation.

³⁰ United States Environmental Protection Agency, 2012. EPA and NHTSA Set Standards to Reduce Greenhouse Gases and Improve Fuel Economy for Model Years 2017-2025 Cars and Light Trucks. August 2012.

California AB 341

AB 341 was approved in October 2011 and requires that integrated waste management plans set a policy goal that not less than 75 percent of solid waste is diverted from landfill disposal by 2020. AB 341 also requires any business that generates more than 4 cubic yards of commercial solid waste per week to arrange for recycling services.

Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling

In 2004, CARB adopted an Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling to reduce public exposure to diesel particulate matter emissions (Title 13 CCR section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure prohibits diesel-fueled commercial vehicles from idling for more than 5 minutes at any given location. While the goal of this measure is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling.

Airborne Toxic Control Measure for Stationary Compression Ignition (CI) Engines

In 2004, CARB adopted an Airborne Toxic Control Measure to reduce public exposure to diesel particulate matter emissions and criteria pollutant emissions from stationary diesel-fueled compression ignition (CI) engines (Title 17 CCR section 93115). The measure applies to any person who owns or operates a stationary CI engine in California with a rated brake horsepower greater than 50, or anyone who either sells, offers for sale, leases, or purchases a stationary CI engine. This measure outlines fuel and fuel additive requirements; emission standards; recordkeeping, reporting and monitoring requirements; and compliance schedules for CI engines.

Low-Carbon Fuel Standard

The Low Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10-percent total reduction in 2020. Petroleum importers, refiners and wholesalers can either develop their own low carbon fuel products, or buy LCFS credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.

Regulation to Reduce Emissions of Diesel Particulate Matter, Nitrogen Oxides, and Other Criteria Air Pollutants, from In-Use Heavy-Duty Diesel-Fueled Vehicles

In addition to limiting exhaust from idling trucks, in 2008 CARB approved the Truck and Bus regulation to reduce NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California (13 CCR section 2025). The phased regulation aims to reduce emissions by requiring installation of diesel soot filters and encouraging the retirement, replacement, or retrofit of older engines with newer emission-controlled models. The phasing of this regulation has full implementation by 2023.

CARB also promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower (hp) such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The In-Use Off-Road Diesel-Fueled Fleets regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models (13 CCR section 2449). The compliance schedule requires full implementation by 2023 in all equipment for large and medium fleets and by 2028 for small fleets.

While the goals of these measures are primarily to reduce public health impacts from diesel emissions, compliance with the regulation has shown an increase in energy savings in the form of reduced fuel consumption from more fuel-efficient engines.³¹

CARB Advanced Clean Car Program

The Advanced Clean Cars emissions-control program was approved by CARB in 2012 and is closely associated with the Pavley regulations.³² The program requires a greater number of zero-emission vehicle models for years 2015 through 2025 to control smog, soot, and GHG emissions. This program includes the Low-Emissions Vehicle regulations to reduce criteria air pollutants and GHG emissions from light- and medium-duty vehicles; and the Zero-Emissions Vehicle regulations (ZEV) to require manufactures to produce an increasing number of pure ZEV vehicles (meaning battery and fuel cell electric vehicles) with the provision to produce plug-in hybrid electric vehicles between 2018 and 2025.

Sustainable Communities and Climate Protection Act of 2008 (SB 375)

Adopted by the State on September 30, 2008, the Sustainable Communities and Climate Protection Act of 2008, or SB 375, establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions. Under SB 375, the reduction target of each region must be incorporated within that relevant Regional Transportation Plan (RTP), which is used for long-term transportation planning in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities must then be consistent with the SCS. However, SB 375 expressly provides that the SCS does not regulate local land use decisions, and further provides that local land use plans and policies (e.g., general plan) are not required to be consistent with either the RTP or the SCS. Refer to Section 3.7, Greenhouse Gas Emissions, of this Draft EIR for additional details regarding these requirements.

California Environmental Quality Act

Under CEQA (PRC section 21100(b)(3)), EIRs are required to include a discussion of the potential significant energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. If the analysis of a proposed project shows that the project may result in significant environmental effects due to

³¹ Cummins, Inc., Cummins Tier-4-Final Field Test Showed 10% Lower Fuel Consumption, <https://cumminsengines.com/cummins-tier-4-final-field-test-program>. Written March 5, 2014. Accessed March 27, 2019.

³² California Air Resources Board, Clean Car Standards – Pavley, Assembly Bill 1493, <https://www.arb.ca.gov/cc/ccms/ccms.htm>, last reviewed January 11, 2017. Accessed March 27, 2019.

wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources, then the EIR must identify mitigation measures to address that energy use. This analysis should include the project energy use for all project phases and components, including transportation-related energy, during construction and operation. In addition to building code compliance, other relevant considerations may include, among others, the project size, location, orientation, equipment use and any renewable energy features that could be incorporated into the project (CEQA Guidelines section 15126.2(b)). CEQA Guidelines Appendix F provides a list of energy-related topics that should be analyzed in the EIR, and more specifically provides the following topics for consideration in the evaluation of energy impacts in an EIR, to the extent the topics are applicable or relevant to the Proposed Project:

- The Proposed Project energy requirements and its energy use efficiencies by amount and fuel type for each stage of the Proposed Project including construction, operation, maintenance, and/or removal. If appropriate, the energy intensiveness of materials may be discussed;
- The effects of the Proposed Project on local and regional energy supplies and on requirements for additional capacity;
- The effects of the Proposed Project on peak and base period demands for electricity and other forms of energy;
- The degree to which the Proposed Project complies with existing energy standards;
- The effects of the Proposed Project on energy resources; and
- The Proposed Project projected transportation energy use requirements and its overall use of efficient transportation alternatives.³³

The effect of the Proposed Project relevant to each of these issues is addressed in this section.

Regional

Southern California Association of Governments

As described in Section 3.10, Land Use and Planning, the 2016–2040 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, with a specific goal of achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 18 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Although the RTP/SCS is not technically an energy efficiency plan, consistency with the RTP/SCS has energy implications, including the reduction of VMT which reduces GHG emissions and has the co-benefit of reducing fossil fuel consumption from travel to and from the Project Site.

Consistency of the Proposed Project with the 2016–2040 RTP/SCS, including the per capita passenger vehicle emission goals, is discussed under Impact 3.5-2, below.

³³ CEQA Guidelines, Appendix F (II)(C).

Local

City of Inglewood General Plan

The City of Inglewood General Plan sets forth goals, objectives, and policies for the future development of the City and designates the location of desired future land uses within the City.

There are no goals and policies in the General Plan that directly address energy demand and conservation. However, the following goals from the Land Use Element of the City of Inglewood General Plan are relevant to transportation-related energy demand and conservation.³⁴

Circulation Goal: Promote and support adequate public transportation within the City and the region.

Circulation Goal: Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

See further discussion of transit and pedestrian circulation in Section 3.14, Transportation and Circulation.

City of Inglewood Climate Action Plan

The Inglewood Energy and Climate Action Plan (ECAP) presents community and municipal inventories, emissions forecasts, and recommended reduction targets for emissions to mitigate impacts on climate change.³⁵

The ECAP includes a business-as-usual (BAU) forecast that estimates future emissions in 2020 and 2035 from six sectors: Transportation, Residential Energy, Commercial/Municipal Energy, Industrial Energy, Solid Waste, and Water. The BAU forecast assumes a future under regulatory conditions as they existed in 2010, and it does not include the effects of updates to Title 24, the Renewables Portfolio Standard, and the Pavley Clean Car Standards on future GHG emissions. Under the BAU forecast, total GHG emissions in Inglewood are expected to increase approximately 14 percent from 2010 (594,273 MTCO_{2e}) to 2035 (678,283 MTCO_{2e}). On a per-service population (SP)³⁶ basis, the increase is shown to be 4.5 percent, from 4.22 MTCO_{2e}/SP in 2010 to 4.41 MTCO_{2e}/SP in 2035. The GHG emissions reductions realized by state and local measures would be a direct result of energy efficiency upgrades aimed at increasing building energy performance, promoting renewable energy, and increasing vehicle fuel economy.

The ECAP includes energy reductions from the following implementing strategies and actions:

Strategy 1 – Lead by Example with Municipal Government Actions

- Continue Building and Facility Energy Upgrades to reduce energy use
- Replace all City-owned street, park, and traffic lights with LED lights

³⁴ City of Inglewood, Department of Community Development and Housing, 1980. Land Use Element of the Inglewood General Plan. January 1980. Amended September 14, 2016.

³⁵ City of Inglewood, 2013. Inglewood Energy and Climate Action Plan. March 2013.

³⁶ Service population = residents plus employees working within the City limits.

- Accelerate city vehicle fleet replacement
- Continue commute trip reduction program
- Planning for electric vehicle infrastructure

Strategy 2: Increase Energy Efficiency

- Make commercial buildings more efficient
- Increase the energy efficiency of residential buildings
- Increase the energy efficiency of street and traffic lights.

Strategy 3: Support Renewable Energy Generation

- Remove barriers to renewable energy generation
- Make renewable energy generation more affordable
- Educate potential customers

Strategy 4: Improve Transportation Options and Manage Transportation Demand

- Make roadways more efficient
- Improve transit
- Improve bicycle facilities
- Make parking more efficient
- Reduce commute trips
- Encourage land use intensification and diversity

Strategy 5: Reduce Consumption and Waste

- Use less water
- Produce less water
- Promote local food production

The ECAP strategies and local actions support reducing energy consumption. A discussion of the consistency of the Proposed Project with the ECAP is provided under Impact 3.5-2, below.

3.5.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to energy. The following thresholds of significance are consistent with CEQA Guidelines section 15065 and CEQA Guidelines Appendix G. These thresholds are also based on PRC section 21100(b)(3),

CEQA Guidelines section 15126.2(b), and CEQA Guidelines Appendix F. A significant impact would occur if the Proposed Project would:

1. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation; or
2. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

In addition, Section XIX, Utilities and Service Systems, of CEQA Guidelines Appendix G addresses impacts on electric power, natural gas, and telecommunications facilities. In accordance with this, a significant impact would occur if the Proposed Project would:

3. Require or result in the relocation or construction of new or expanded electric power, natural gas, or telecommunications facilities, the construction or relocation of which would cause significant environmental effects.

Methodology and Assumptions

The discussion below presents the methodology used to analyze the potential energy usage of the Proposed Project, including electricity, natural gas, and transportation fuels during construction and operational phases. Specific assumptions and data sources needed to quantify energy consumption during both construction and operation are presented. The methods and scenarios used for the energy calculations (see Appendix G of this Draft EIR) are the same as those used for the GHG calculations, as discussed in the Methodology and Assumptions on pages 3.7-31 through 3.7-50 in Section 3.7, Greenhouse Gas Emissions, of this Draft EIR.

Baseline Conditions

Baseline annual energy consumption includes the operational energy use associated with, and vehicle trips to and from, LA Clippers games at the Staples Center, LA Clippers team business operations at the existing team offices, the existing practice and athletic training facilities, market-shifted non-NBA events, and the existing on-site structures that would be removed and replaced with construction of the Proposed Project. This energy use is currently occurring, and is therefore part of the existing environmental setting.

The Proposed Project would include relocation of the existing LA Clippers team offices, which are located in downtown Los Angeles, at 1212 South Flower Street, and the existing LA Clippers practice and athletic training facility, which is located in the Playa Vista neighborhood within Los Angeles, at 6854 South Centinela Avenue. Energy use at the existing team offices and practice and training facilities are currently occurring, and are therefore arguably part of the existing environmental setting. The use of energy at the existing team offices and practice and athletic training facility was included in the “baseline” energy use.

Although these uses would be relocated to the Project Site upon completion of construction, it is likely that these facilities would be backfilled with new tenants once they are vacated by the LA Clippers. This is particularly true of the current LA Clippers team offices in downtown Los Angeles, located in a multi-tenant office building where demand for commercial real estate is

relatively high. For the LA Clippers practice and athletic training facility, it would be speculative to assume the type of use that could occupy it in the future, given its unique use, design and space allocation, but for the purposes of this analysis it is assumed that a new tenant would backfill it with a similar energy use intensity. Thus, the existing energy from operations of both the team offices and the training center were considered part of the baseline conditions against which the Proposed Project energy use was measured.

Relocated LA Clippers Games and Market Shifted Events

Starting in the first NBA season following completion of the Proposed Project, all LA Clippers games currently hosted at the Staples Center would relocate to the new Arena. Although these games would not be replaced by home games for another professional sports team, it is reasonable to assume that the operator of the Staples Center would attempt to replace those LA Clippers games with other events. It is difficult to estimate the extent to which these vacant dates at Staples Center would backfill with other events. An expert consultant retained by the applicant has prepared an estimate of the extent to which Staples Center would backfill with events.³⁷ Based on an evaluation of the past several years of Staples Center schedules, the consultant estimated that seven events would be backfilled at the Staples Center.

In addition, a total of 178 non-NBA game events (e.g., concerts, family shows, non-NBA sports games, etc.) are expected to occur at the Project Arena. Some of these events will be events that would otherwise occur at other venues in the region absent construction of the Proposed Project and some of these events will be new to the region. The City retained an expert to estimate, out of this total, the number of market-shifted events. Of the 178 non-NBA events, 89 would be market-shifted to the Project Arena, and the balance would be new events.³⁸ For these 89 market-shifted events, a backfill event may or may not occur at the vacated venue. As is the case for relocated LA Clippers games, it is difficult to estimate the extent to which these market-shifted events will result in backfilled events at the venues from whence they came. For the market-shifted events, there may be no backfilled events at the vacated venues; backfill may occur for all such events; or the outcome could be something in between.

The estimate of energy use is dependent in part on the number of relocated, market-shifted, and backfilled events. The applicant has also engaged with CARB, as part of the AB 987 application process. At CARB's request, the applicant has prepared an analysis that presumes that all relocated LA Clippers games, and all non-NBA game market-shifted events, would be backfilled by other events at Staples Center or other venues.

In light of this uncertainty, this EIR presents two analyses. These analyses present a range of potential outcomes for these dates representing what could occur once the LA Clippers have vacated Staples Center and approximately 89 non-NBA events shift to the Project Arena. Under

³⁷ See Conventions, Sports and Leisure (CSL), 2019. *Staples Center Vacated Event Days Analysis*. May 14, 2019.

³⁸ Based on information included in Appendix R, a total of 80 percent of concerts and family shows, and 41 percent of other events would be market-shifted. For this analysis 41 percent of civic and community events are also assumed to be market-shifted, resulting in a total of 89 market-shifted events.

either scenario, the energy use from these backfilled events could be attributable to the Proposed Project. Because of the unavoidable uncertainty regarding the extent to which vacated venues will backfill with other events, the EIR describes and analyzes two potential scenarios: a Full Backfill Scenario and a Partial Backfill Scenario. Each is described and analyzed below.

Full Backfill Scenario

The Full Backfill Scenario accounts for the possibility that all relocated LA Clippers games and market-shifted non-NBA events at the Project Arena would be backfilled with other events at Staples Center and other existing venues in the Los Angeles region. Under this “Full Backfill” Scenario, all 47 LA Clippers games being relocated from Staples Center to the Project Arena would be backfilled with other events at Staples Center. In addition, all of the non-NBA game events being market shifted to the Project Arena would be backfilled with comparable events at the vacated venue. The energy use from these backfilled events are considered to be attributable to the Proposed Project under the Full Backfill Scenario.

Partial Backfill Scenario

The Partial Backfill Scenario assumes that seven of the vacated LA Clippers games would be backfilled by new events at Staples Center. Under the Partial Backfill Scenario, the energy use from these seven backfill events are considered to be attributable to the Proposed Project. This scenario assumes none of the vacated market-shifted non-NBA events would be backfilled with new events at the other existing venues.

Construction

Baseline annual energy use includes mobile sources and energy usage associated with the existing on-site structures that would be removed and replaced with construction of the Proposed Project. Existing buildings within the Project Site include a 16,806 square foot (sf) motel; an 1,118 sf fast food restaurant; a 28,809 sf light manufacturing/warehouse building; an 1,134 sf commercial building; and a 6,231 sf warehouse. See Chapter 2, Project Description, for a detailed discussion of the existing land uses that would be demolished as part of the Proposed Project.

Construction energy consumption would result from transportation fuels (e.g., diesel, gasoline, and compressed natural gas [CNG]) used for haul trucks, heavy-duty construction equipment, construction workers traveling to and from the Project Site, electricity consumed to power the construction trailers (lights, electronic equipment, and heating and cooling) and exterior uses such as lights, conveyance of water for dust control, and any electrically-driven construction equipment. Natural gas would be used for CNG powered off-road vehicles.

Construction activities could vary substantially from day to day, depending on the specific type of construction activity and the number of workers and vendors that would travel to the Project Site. This analysis considered these factors and provides the estimated maximum construction energy consumption for the purposes of evaluating the associated impacts on energy resources.

Construction fuel use was forecasted by assuming a conservative estimate of construction activities and applying mobile source emission factors. Construction of the Proposed Project would occur over approximately 40 months, from July 2021 through October 2024 (i.e., assuming all construction occurs at the earliest feasible date). If, for various site planning, financial, or other reasons, the onset of construction is delayed to a later date than assumed in the analysis, construction impacts would be similar to or less than those analyzed, because more energy-efficient and cleaner burning construction equipment and vehicle fleet mix would be expected in the future. This is due to the In-Use Off-Road Diesel-Fueled Fleets Regulation implemented by CARB that requires construction equipment fleet operators to phase-in less polluting heavy-duty equipment and trucks over time.³⁹

Electricity

Construction electricity use was estimated for a temporary construction office, for construction equipment that would use electricity as an alternative to diesel fuel, and for water usage from dust control activities. The CalEEMod® emissions model, described further in Section 3.7, Greenhouse Gas Emissions, was used to estimate project emissions of criteria air pollutants and GHGs, and was also used to estimate electricity, natural gas, and water use. The same model used for air quality and GHG analyses was also used for the purpose of estimating energy use.

The construction office was assumed to be two 2,500 sf trailers and was modeled using the CalEEMod® land use category for “General Office.” Electricity demand by construction equipment was estimated using default horsepower (hp) and load factors from CalEEMod® and hours of operation per day.⁴⁰ The total horsepower-hours (hp-h) were then converted to kilowatt-hours (kWh) using a standard conversion factor.⁴¹ Electricity use from water conveyance for dust control on site was conservatively estimated using a standard water usage factor per square foot for irrigated landscaping areas that would be generally equivalent to conveying water to a construction site.⁴² The calculated water usage was then converted to electricity used for conveyance using default CalEEMod® electricity intensity factors for the South Coast Air Basin.⁴³

The electricity demand under existing, baseline conditions was then subtracted from the construction electricity use to determine the net electricity use during construction of the Proposed Project.

⁴³ South Coast Air Quality Management District, 2017. CalEEMod® Users Guide Appendix D: Default Data Tables. October 2017.

Natural Gas

Natural gas would not be consumed in large quantity during construction of the Proposed Project because construction offices would not be heated with natural gas, and construction equipment and vehicles would be primarily powered by either diesel, gasoline, or electricity. However, the Proposed Project could use CNG powered forklifts during construction. Therefore, natural gas associated with construction activities was calculated by converting the hp and usage factor provided in CalEEMod®. The total hp-h of CNG-powered equipment was then multiplied by fuel usage estimates per hp-h to estimate the amount of CNG fuel used.⁴⁴

Transportation Fuels

Transportation fuels would be consumed for transportation of construction workers and materials to and from the Project Site, and operation of construction equipment on the Project Site throughout the construction phase.

Fuel consumption from on-site heavy-duty construction equipment was calculated based on the equipment mix estimated by the project applicant and usage factors provided in the CalEEMod® construction output files included in Appendix D of this Draft EIR. The total hp was then multiplied by fuel usage estimates per hp-h from the CARB off-road vehicle (OFFROAD) model.⁴⁵

Fuel consumption from construction on-road worker, vendor, and delivery/haul trucks was calculated using the trip rates and distances consistent with the air quality and GHG emissions modeling worksheets and CalEEMod® construction output files. Total VMT for these on-road vehicles were then calculated for each type of construction-related trip and divided by the corresponding county-specific miles per gallon factor using the CARB EMFAC2017 model. The model was used to calculate fuel consumed based on the total annual VMT for each vehicle type. A combination of CalEEMod® assumed trip lengths and client-provided specific trip lengths were used for worker commutes, vendor and concrete trucks, and haul truck trips. Consistent with CalEEMod®, construction worker trips were assumed to include a mix of light duty gasoline automobiles and light duty gasoline trucks. Construction vendor trucks were assumed to be a mix of medium-heavy duty and heavy duty diesel trucks and concrete and haul trucks were assumed to be heavy-duty diesel trucks. The fuel consumption of the baseline conditions was then subtracted from the construction fuel consumption to determine the net fuel consumption during construction of the Proposed Project. Please see Appendix G of this Draft EIR for detailed energy calculations.

The energy usage required for construction of the Proposed Project was estimated based on the number and type of construction equipment that would be used during construction by assuming a conservative estimate of construction activities (i.e., maximum daily equipment usage levels). Energy for construction worker commuting trips was estimated based on the predicted number of workers for the various phases of construction and the estimated VMT based on the conservative values in the CalEEMod® and EMFAC2017 models. The assessment also includes a discussion

⁴⁴ International Gas Union 2012. Natural Gas Conversion Guide. 2012.

⁴⁵ California Air Resources Board, 2017. Off-Road Diesel Emission Factor Update for NO_x and PM. 2017.

of the Proposed Project compliance with relevant energy-related regulatory requirements and incorporation of design features discussed in Section 3.7, Greenhouse Gas Emissions, that would minimize the amount of energy usage during construction. These measures are also discussed in Chapter 2, Project Description; and Section 3.2, Air Quality, of this Draft EIR.

The estimated fuel economy for heavy-duty construction equipment was based on fuel consumption factors from the CARB OFFROAD emissions model, which is a state-approved model for estimating emissions from off-road heavy-duty equipment. The estimated fuel economy for haul trucks, vendor trucks, concrete trucks, and worker commute vehicles was based on fuel consumption factors from the CARB EMFAC2017 emissions model, which is a state-approved model for estimating emissions from on-road vehicles and trucks.

Operation

Operational energy impacts were assessed based on the increase in energy demand compared to baseline conditions described above. The analysis assumes that an annual average of 5 pre-season, 41 regular season, and 3 postseason LA Clippers home NBA games would be hosted at the proposed Arena. The LA Clippers currently play 3 pre-season games per year, but up to 5 pre-season games are assumed for the purposes of this analysis (see Chapter 2.0, Project Description, Table 2-3, Anticipated Annual Event Characteristics). The annual average number of post-season games was based on the average number of post-season home games per NBA team per year.

The same assumptions are used here that were used in Section 3.7, Greenhouse Gas Emissions. Also, some events currently occurring at the Staples Center would be market-shifted to the IBEC. Therefore, operational energy associated with the baseline conditions (demolished existing uses, the off-site LA Clippers facilities, and relocated LA Clippers games and market-shifted non-NBA events) was subtracted from the total operations of the Project to calculate the net energy consumed by the Proposed Project. Within the CalEEMod® software, building electricity and natural gas usage rates were adjusted to account for prior Title 24 Building Energy Efficiency Standards for the existing uses.⁴⁶ As stated above, the net change in operational energy demand was based on the difference between the existing baseline condition energy demand and the energy demand of the Proposed Project at full buildout. The following discusses only the methodology for the new operations at the Project Site; the methodology for determining energy usage from the baseline conditions is described above.

Electricity

The Proposed Project estimated electricity demand was analyzed relative to the SCE existing and planned energy supplies in 2024 (i.e., the Proposed Project buildout year)⁴⁷ to determine whether the utility would be able to meet the Proposed Project energy demands. Annual consumption of electricity (including electricity usage associated with the supply and conveyance of water) from operation of the Proposed Project was calculated using demand factors provided in CalEEMod®

⁴⁶ California Air Resources Board, 2016. CalEEMod® Users Guide, Appendix E, Section 5. September 2016. Factors for the prior Title 24 standard are extrapolated based on the technical source documentation.

⁴⁷ California Energy Commission, 2018. California Energy Demand 2018-2030 Revised Forecast. January 2018.

and adjusted for the Proposed Project compliance with 2019 Title 24 building energy efficiency standards, which go into effect on January 1, 2020. Because lighting and air handling would be controlled by zone within the proposed Arena, it was estimated that large events (12,000 or more attendees) require full arena energy demand, medium events (between 5,000 and 10,000 attendees) require 80 percent of the full arena energy demand and small events (less than 5,000 attendees) required 25 percent of the full arena energy demand. It was assumed that the 16 plaza events require 0 percent of arena energy demand because the Arena would not be in use. Additionally, the Proposed Project energy demand was analyzed relative to SCE expected total capacity in 2024.

A total of 330 electric vehicle charging stations would be installed at the South, East, and West Parking Garages. Electricity estimates from the charging stations were calculated by multiplying the number of spaces, days of operation, charge hours per day, and charging station capacity resulting in the total annual electricity.

Electricity from water use associated with operation of the Proposed Project was calculated using CalEEMod® and the Water Supply Assessment prepared for the Proposed Project, and the electrical intensity factors for water supply and distribution. Water-related energy intensities in CalEEMod® are based on the CEC report *Refining Estimates of Water-Related Energy Use in California*.⁴⁸ For more detail on the Water Supply Assessment, see Section 3.15, Utilities and Service Systems. The Water Supply Assessment is included in Appendix M of this Draft EIR.

Natural Gas

The Proposed Project operational natural gas demand would be generated mainly by building heating/cooling, restaurant kitchen equipment, and other appliances. The Proposed Project estimated natural gas demand was analyzed relative to the SoCalGas existing and planned energy supplies in 2024 (i.e., the Proposed Project buildout year)⁴⁹ to determine whether the utility would be able to meet the Proposed Project energy demands. Furthermore, natural gas demand generated by the baseline conditions were calculated using demand factors provided in CalEEMod® and subtracted from the Proposed Project natural gas demand to obtain the net annual natural gas demand.

Transportation Fuels

Mobile source fuel consumption for the Proposed Project would include event-day trips related to LA Clippers games and other events at the Arena, commute trips by arena and sports team management employees, vendors and suppliers, concert/event attendees, and visitor trips associated with the accompanying development land uses.

⁴⁸ California Energy Commission, 2006. *Refining Estimates of Water-Related Energy Use in California*, PIER Final Project Report, CEC-500-2006-118. December 2006.

⁴⁹ California Gas and Electric Utilities, 2018. *2018 California Gas Report*, p. 101-103. 2018. While the estimated life of the Proposed Project would be 30 years, comparison to the analyzed first full operational year of 2024 provides a conservative analysis as supply projections for electricity and natural gas increase in future years.

Energy demand due to the transportation of spectators, employees, vendors and suppliers, and visitors to and from the Project Site was estimated based on the predicted number of trips to and from the Project Site and the estimated VMT for the Proposed Project; see Section 3.14, Transportation and Circulation, and Appendix K for additional transportation-related details.

Based on the Proposed Project annual operational VMT, gasoline and diesel consumption rates were calculated using the county-specific miles per gallon in EMFAC2017. The vehicle fleet mix for vehicles anticipated to visit the Project Site was calculated and deemed consistent with the CalEEMod® defaults based on the Project Site location within Los Angeles County. Supporting calculations are provided in Appendix G of this Draft EIR.

Energy Consumption from Backfilled Uses and Events

For the uses that will backfill the current off-site LA Clippers' off-site team offices and practice and athletic training facility, energy use estimates were based on the same methodology used to estimate existing energy use at those locations, where the mobile source fuel emission factor was also adjusted for the operational year (i.e., 2024).

For the backfilled events at Staples Center, energy use was calculated based on the same methodology used to estimate energy use from relocated LA Clippers games, using an event size of 10,500 attendees (conservatively considered as a large event), based on the 2019 market analysis by Conventions, Sports and Leisure (CSL) that averaged attendance at Staples Center third-party events over a 3-year period report.⁵⁰ As mentioned above, the analysis assumed 47 backfilled Staples Center events under the Full Backfill Scenario and 7 backfilled Staples Center events under the Partial Backfill Scenario. In addition, the mobile source fuel emission factors were adjusted for the operational year (i.e., 2024).

The analysis assumed 89 backfilled market-shifted non-NBA events under the Full Backfill Scenario and no backfilled market-shifted non-NBA events under the Partial Backfill Scenario. Under the Full Backfill Scenario, backfilled events at other regional venues vacated by market-shifted non-NBA events, energy use was calculated based on the same methodology used to estimate energy use from the market-shifted events.

LEED Gold Certification Requirements

The Proposed Project would be designed and constructed to meet the US Green Building Council Leadership in Energy and Environmental Design (LEED) Gold certification requirements. LEED provides a level of flexibility for projects to choose the exact credits and project features that reduce energy and water use, promote resource conservation through redevelopment and the sourcing of local construction materials, and create healthier indoor environments. The Proposed Project design is in the conceptual stage, so the exact LEED credits and project features that would be selected to achieve LEED Gold certification (i.e., 60-79 LEED points) are not yet

⁵⁰ Conventions, Sports and Leisure (CSL), 2019. *Staples Center Vacated Event Days Analysis*. May 14, 2019.

finalized. Section 3.7, Greenhouse Gas Emissions, provides details of the potential design features resulting from the expected LEED Gold certification of the Proposed Project.

A brief summary of the design features that could be applicable to energy are described below:

- *Location and Transportation.* The Proposed Project would be eligible for LEED credits in the location and transportation category in the following areas: (1) the Project Site has access to high quality transit, (2) the Proposed Project would include bicycle and electric vehicle charging facilities, and (3) the Proposed Project would minimize its parking footprint.
- *Access to Quality Transit.* The Proposed Project would be eligible to achieve the Access to Quality Transit credit because local transit service to the Project Site would be provided by the Los Angeles Metropolitan Transportation Authority (Metro) in the form of future below- and at-grade light rail on the Metro Crenshaw/LAX Line, which is currently under construction and expected to be complete in 2019. The Proposed Project would provide shuttle pick-up and drop-off service at the following two Metro rail stations: the existing Metro Green Line – Hawthorne/Lennox Station and the future Metro Crenshaw/LAX Line – Florence/La Brea Station. In addition, the Proposed Project would also be served by above-ground, route bus service; the Project Site is located within a quarter of a mile of 8 existing Metro bus stops along the following four Metro routes, 117, 211/215, and 212/312.
- *Green Vehicles.* The Proposed Project would also provide electric vehicle charging stations for 8 percent of parking spaces, which would exceed the requirements for the Proposed Project to be eligible for the Green Vehicles credit.
- *Sustainable Sites.* The Proposed Project would be eligible for LEED credits for rainwater management, open space, heat island reduction, and light pollution reduction. Credits for open space are based on the percentage of permeable surfaces.
- *Water Efficiency.* The Proposed Project would be eligible for LEED credits for the use of ultra-low-flow fixtures in restrooms such as low-flow faucets with aerators, dual-flush toilets, and waterless urinals. These features would reduce indoor water use by a minimum of 40 percent and would be required to meet Universal Plumbing Code standards. The Proposed Project would also be eligible for credits for using 100 percent recycled water at the West Parking Garage and Arena sites to service project landscaping designed for low water usage.
- *Energy and Atmosphere.* The Proposed Project would be eligible for LEED credits for optimized energy performance and renewable energy production. The Proposed Project would include a 700-kilowatt (kW) PV system, generating approximately 1,085,000 kWh of carbon-free energy annually. The Proposed Project would also implement the following energy efficiency measures: Title 24 compliance; use of 100 percent light emitting diode (LED) lighting indoors and outdoors throughout the site; and implementation of high efficiency HVAC systems. In addition, the Proposed Project design would include compliance with CALGreen Code Voluntary Tier 1, which is estimated to achieve a reduction in energy consumption greater than Title 24 2019 standards based on the preliminary design of the Proposed Project.
- *Materials and Resources.* The Proposed Project would be eligible for LEED credits for Construction and Demolition Waste Management and sourcing of raw materials. The Proposed Project would recycle at least 75 percent of demolition materials, which exceeds the City of Inglewood target of 50 percent demolition waste recycling and would be in accordance with state diversion targets that aim to divert a minimum of 75 percent of construction and demolition materials from landfill disposal.

- *Innovation.* The Proposed Project would be eligible for innovation credits. Innovative strategies include the following: implementation of the FanFirst/Occupant Comfort Survey,⁵¹ green education program, LEED Operations + Management (O+M) Starter Kit (Pest Management and Green Cleaning Program), and the purchase of 100 percent LED lamps.

Impacts and Mitigation Measures

Impact 3.5-1: Construction and operation of the Proposed Project could cause wasteful, inefficient, or unnecessary consumption of energy resources. (Less than Significant)

Construction

During construction of the Proposed Project, energy would be consumed in the form of electricity for powering the construction trailers (lights, electronic equipment, and heating and cooling) and exterior uses, such as lights, water conveyance for dust control, and other construction activities. Natural gas would be used for CNG-powered off-road vehicles. Project construction would also consume energy in the form of petroleum-based fuels associated with the use of off-road construction vehicles and equipment on the Project Site, construction workers travel to and from the Project Site, and delivery and haul truck trips (e.g., hauling of demolition material to off-site reuse and disposal facilities).

Table 3.5-3 provides a summary of the annual average electricity, natural gas, gasoline fuel, and diesel fuel estimated to be consumed during Project construction. Net construction energy use subtracts out all existing on-site use (see Table 3.5-2) from the construction energy use since the construction of the Proposed Project would require the demolition of all on-site existing uses. All off-site existing uses and market shifted events would be operational during construction and therefore are left out of the net energy calculation. Each of these is discussed and analyzed in greater detail in the sections below.

⁵¹ FanFirst Connected Comfort utilizes real time crowdsourced feedback during an event to adjust temperature in the arena bowl to increase fan comfort and reduce over cooling/wasted energy.

**TABLE 3.5-3
 NET ENERGY USE DURING PROJECT CONSTRUCTION**

Energy Type	Annual Average Quantity During Construction ^{a,b}
Electricity	
Existing on Site	(577 MWh)
Total Construction Electricity	1,248 MWh
<i>Off-Road Equipment</i>	1,026 MWh
<i>Construction Office</i>	65 MWh
<i>Electricity from Water (Dust Control)</i>	157 MWh
Total Net Electricity	671 MWh
Natural Gas	
Existing on Site	(1,660 MMBtu)
Off-road Equipment	254 MMBtu
Total Net Natural Gas	(1,405 MMBtu)
Gasoline	
Existing on Site	(67,226 gallons)
On-Road Construction Equipment	464,062 gallons
Off-Road Construction Equipment	0 gallons
Total Net Gasoline	396,836 gallons
Diesel	
Existing on Site	(7,791 gallons)
On-Road Construction Equipment	162,673 gallons
Off-Road Construction Equipment	139,291 gallons
Total Net Diesel	294,173 gallons
NOTES:	
kWh = kilowatt-hours; N/A = not applicable	
Detailed calculations are provided in Appendix G of this Draft EIR.	
^a Totals may not add up due to rounding of decimals.	
^b Negative values are denoted using parentheses.

Electricity

During construction of the Proposed Project, electricity would be consumed to power lighting, heating, and cooling in the construction trailers, outdoor lighting of the site, electric equipment, and supply and convey water for dust control. Electricity would be supplied to the Project Site by SCE and would be obtained from the existing electrical lines that connect to the Project Site.

As shown in Table 3.5-3, annual average construction electricity usage would be approximately 1,248 MWh. The existing electricity usage at the Project Site is approximately 577 MWh annually; therefore, the average annual net construction electricity consumption would be increased by approximately 671 MWh per year. Although there is a temporary increase in electricity consumption at the site during construction, the electrical consumption would be

within the supply and infrastructure capabilities of SCE (87,143 GWh net energy for 2018).⁵² The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed, and would cease upon completion of construction. Electricity use from construction would be short-term, limited to working hours, used for necessary construction-related activities, and represent a small fraction of the Proposed Project net annual operational electricity. Furthermore, the electricity used for off-road light construction equipment would have the effect of reducing construction-related air pollutant and GHG emissions from more traditional construction-related energy in the form of diesel fuel. Therefore, impacts from construction electrical demand would be **less than significant** and would not result in the wasteful, inefficient, and unnecessary consumption of energy.

Natural Gas

As stated above, construction activities, including the construction of new buildings and facilities, would consume natural gas in the form of CNG for powering a portion of the off-road equipment. CNG needed for this equipment would be brought to the site or the equipment taken to a CNG fueling station. Therefore, natural gas would not be directly supplied by SoCal Gas to support Project construction activities. Existing annual natural gas usage at the site equals 1,660 MMBtu. Annual natural gas demand for construction activities would be approximately 254 MMBtu. Therefore, the average annual net natural gas consumption would be decreased by approximately 1,405 MMBtu per year during construction. Therefore, impacts from construction natural gas demand would be **less than significant** and would not result in the wasteful, inefficient, and unnecessary consumption of energy.

Transportation Energy

Table 3.5-3 reports the amount of petroleum-based transportation energy that could potentially be consumed during Proposed Project construction based on the conservative set of assumptions provided in Appendix G of this Draft EIR. As shown, the current annual demand on the Project Site is approximately 67,226 gallons of gasoline and 8,017 of diesel fuel. During Project construction, on- and off-road vehicles would consume an estimated annual average of approximately 464,062 gallons of gasoline and 301,964 gallons of diesel. Proposed Project construction activities would last for approximately 40 months; therefore, the annual average net fuel consumption would be approximately 396,836 gallons of gasoline and 294,173 gallons of diesel per year of construction. For informational purposes only, and not for the purpose of determining significance, the fuel usage during Project construction would represent approximately 0.01 percent of the 2017 annual on-road gasoline-related energy consumption and 0.05 percent of the 2017 annual diesel fuel-related energy consumption in Los Angeles County,⁵³ as shown in Appendix G of this Draft EIR.

⁵² Southern California Edison, 2018. 2018 Annual Report, p. 2. 2018.

⁵³ California Energy Commission, 2018. 2017 California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, https://www.energy.ca.gov/almanac/transportation_data/gasoline/2010-2017_A15_Results.xlsx. Accessed December 26, 2018.

Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, crude oil production would be sufficient to meet over 50 years of worldwide consumption.⁵⁴ The Proposed Project would comply with CAFE fuel economy standards, which would result in more efficient use of transportation fuels (lower consumption). Project-related vehicle trips would also comply with Pavley and Low Carbon Fuel Standards which are designed to reduce vehicle GHG emissions, but would also result in fuel savings in addition to compliance with CAFE standards.

Construction of the Proposed Project would utilize fuel-efficient equipment consistent with state and federal regulations, such as fuel efficiency regulations in accordance with the CARB Pavley Phase II standards, the anti-idling regulation in accordance with section 2485 in CCR Title 13, and fuel requirements for stationary equipment in accordance with section 93115 (concerning Airborne Toxic Control Measures) in CCR Title 17, and would comply with State measures to reduce the inefficient, wasteful, and unnecessary consumption of energy, such as petroleum-based transportation fuels. While these regulations are intended to reduce construction emissions, compliance with the anti-idling and emissions regulations discussed above would also result in fuel savings from the use of more fuel-efficient engines.

In addition, the Proposed Project would divert mixed construction and demolition debris to City-certified construction and demolition waste processors using City-certified waste haulers, consistent with State targets of 75 percent waste diversion by 2020 and consistent with achieving the USGBC LEED Gold Certification level as discussed in design features (Green Building Features) in Section 3.7, Greenhouse Gas Emissions. Diversion of mixed construction and demolition debris would reduce truck trips to landfills, which are typically located some distance away from City centers, and increase the amount of waste recovered (e.g., recycled, reused, etc.) at material recovery facilities, thereby further reducing transportation fuel consumption.⁵⁵

Based on the analysis above, construction would utilize energy only for necessary on-site activities, construction worker travel to and from the Project Site, and to transport construction materials and demolition debris to and from the Project Site. As discussed above, idling restrictions and the use of cleaner, energy-efficient equipment would result in less fuel combustion and energy consumption and thus minimize the Proposed Project construction-related energy use. Therefore, construction of the Proposed Project would not result in the wasteful, inefficient, and unnecessary consumption of energy, and the impact would be **less than significant**.

⁵⁴ BP Global, Oil reserves, <https://www.bp.com/en/global/corporate/energy-economics/statistical-review-of-world-energy/oil.html>. Accessed December 26, 2018.

⁵⁵ Energy savings result from the avoidance of needing to mine and process virgin materials and then transport those materials to the project. As shown on MS52 California Aggregates Map (https://www.conservation.ca.gov/cgs/Documents/MS_052_California_Aggregates_Report_201807.pdf) Aggregate production areas in the Los Angeles areas include Irwindale and areas further away in Upland and Temescal Canyon areas in Orange County. Irwindale is a lesser producer of virgin aggregate as most of the mines have been depleted to their permitted limits. According to LA County (https://dpw.lacounty.gov/epd/CD/cd_attachments/Recycling_Facilities.pdf) there are recycling facilities much closer that supply recycled aggregate and other construction materials to the region.

Operations

During operation of the Proposed Project, energy would be consumed for multiple purposes, including, but not limited to, HVAC, lighting, EV charging, emergency generators, aerial lifts, and forklifts for building operations. Energy would also be consumed during Proposed Project operations related to water usage, solid waste disposal, and vehicle trips.

On- and off-site existing uses shown in Table 3.5-2 are netted out of the Proposed Project operational energy use. Market shifted events presented in Tables 3.5-4a and 3.5-4b are also netted from the Proposed Project operational energy use. It is assumed that an estimated seven events would be backfilled at the Staples Center, and that the existing LA Clippers team office and LA Clippers practice and athletic training facility would be backfilled with new tenants once they are vacated by the LA Clippers.⁵⁶ Future energy consumption at the existing LA Clippers practice and athletic training facility is conservatively assumed to remain unchanged because no specific tenants or changes in use have been identified.

For reasons described above and in greater detail in Section 3.7, Greenhouse Gas Emissions, a Full Backfill Scenario and Partial Backfill Scenario were analyzed. Energy consumption for both of the scenarios have been calculated based on estimated event number and sizes and are presented in Table 3.5-4a (Full Backfill) and Table 3.5-4b (Partial Backfill), respectively. Energy consumption for the backfilled events and the backfilled existing team office use are included as part of the Proposed Project operational energy consumption.

**TABLE 3.5-4B
 ANNUAL ENERGY USE DURING PROJECT OPERATION – PARTIAL BACKFILL SCENARIO**

Source	Electricity (MWh/yr)	Natural Gas (MMBtu/yr) ^{a,b}	Gasoline (gal)	Diesel (gal)
Net Total (Project + Backfill - Existing and Relocated/Shifted Events)	13,194	16,413	1,011,301	66,983
SCE (2018)/SoCalGas (2018)/LA County Fuel Consumption (2017)	87,143,000	988,785,000	3,659,000,000	590,196,078
Project Contribution to LA County Consumption	0.015%	0.002%	0.028%	0.011%

NOTES:

All mobile fuel consumption calculated using fleet mixes, vehicle types, fuel efficiencies, and fuel types from EMFAC2017.

^a EMFAC2017 includes natural gas vehicles which are incorporated into natural gas totals in this table.

^b Natural Gas consumption includes consumption of natural gas through vehicles that would access the Project Site.

SOURCES: ESA, 2019; CalEEMod®, 2019; EMFAC, 2017; Southern California Edison, 2018 Annual Report, p.2. <https://www.edison.com/content/dam/eix/documents/investors/corporate-governance/eix-sce-2018-annual-report.pdf>; California Gas and Electric Utilities, 2018 California Gas Report, p. 102. https://www.socalgas.com/regulatory/documents/cgr/2018_California_Gas_Report.pdf; California Energy Commission, California Annual Retail Fuel Outlet Report Results (2017). https://www.energy.ca.gov/almanac/transportation_data/gasoline/2010-2017_A15_Results.xlsx.

As shown in Table 3.5-4a, the Proposed Project’s annual net new energy demand for the Full Backfill Scenario would be approximately 16,934 MWh of electricity, 22,767 MMBtu of natural gas, 1,583,770 gallons of gasoline, and 91,347 gallons of diesel.

As shown in Table 3.5-4b, the Proposed Project’s annual net new energy demand for the Partial Backfill Scenario would be approximately 13,194 MWh of electricity, 16,413 MMBtu of natural gas, 1,011,301 gallons of gasoline, and 66,983 gallons of diesel fuel.

Electricity

Assuming compliance with 2019 Title 24 standards and applicable 2019 CALGreen requirements, at buildout the Full Backfill Scenario would result in a projected net increase in the annual demand for electricity totaling approximately 16,934 MWh and the Partial Backfill Scenario would result in approximately 13,194 MWh, as shown in Tables 3.5-4a and 3.5-4b. In addition to compliance with CALGreen, the Proposed Project would also incorporate design features (Green Building Features) as described in Section 3.7, Greenhouse Gas Emissions, of this Draft EIR. The design features would achieve USGBC LEED Gold Certification level, as well as reduce indoor water use by 40 percent and outdoor water use by 50 percent.

By 2020 SCE is required to procure at least 33 percent of its energy portfolio from renewable sources. The current sources for SCE include wind, solar, and geothermal sources. These sources accounted for 32 percent of the SCE overall energy mix in 2017, the most recent year for which

data are available, and represent the available off-site renewable sources of energy that would meet the Proposed Project energy demand.⁵⁷

Based on data collected by SCE in its 2018 Annual Report, SCE total system sales for 2017-2018 fiscal year (the latest data available) was 87,143,000 MWh of electricity.⁵⁸ As such, the Project-related net increase in annual electricity consumption of 16,934 MWh for the Full Backfill Scenario and 13,194 MWh for the Partial Backfill Scenario would represent approximately 0.019 percent or 0.015 percent of SCE supplied electricity, respectively. Furthermore, SCE projected energy demand for 2024 (the Proposed Project opening year) is estimated at 106,000,000 MWh.⁵⁹ The Full Backfill Scenario future energy use would represent about 0.016 percent and the Partial Backfill Scenario future energy use would represent about 0.012 percent of total SCE sales, and both scenarios would be within the SCE projected electricity supplies. As previously described, the Proposed Project incorporates a variety of energy and water conservation measures and features to reduce energy usage and minimize energy demand as evidenced by the reduced contribution of the Proposed Project to overall sales between 2018 and 2024. Therefore, with the incorporation of these measures and features, operation of the Proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of electricity and the impact would be **less than significant**.

Natural Gas

With compliance with 2019 Title 24 standards and applicable 2016 CALGreen requirements, at buildout, the Proposed Project would generate an estimated net increase in the on-site annual demand for natural gas totaling approximately 22,767 MMBtu for the Full Backfill Scenario and 16,413 MMBtu for the Partial Backfill Scenario, as shown in Tables 3.5-4a and 3.5-4b. As discussed above, in addition to complying with applicable regulatory requirements regarding energy conservation (e.g., California Building Energy Efficiency Standards and CALGreen), the Proposed Project would incorporate design features to further reduce energy use. The Proposed Project incorporates design features (Green Building Features) as described in Section 3.7, Greenhouse Gas Emissions, which includes achievement of the USGBC LEED Gold Certification level.

In the 2018 California Gas Report, SoCalGas accounts for anticipated regional demand based on various factors including growth in employment by economic sector, growth in housing and population, and increasingly demanding State goals for reducing GHG emissions. SoCalGas accounts for an increase in employment and housing from 2018 to 2035. The Proposed Project would add jobs within the SoCalGas region and would be consistent with the growth projections set forth in the 2018 California Gas Report.⁶⁰

⁵⁷ California Energy Commission, 2018. Utility Annual Power Content Labels for 2017, Southern California Edison. July 2018.

⁵⁸ Southern California Edison, 2018. 2018 Annual Report, p. 2.

⁵⁹ California Energy Commission. 2018. California Energy Demand 2018-2030 Revised Forecast. January 2018.

⁶⁰ California Gas and Electric Utilities, 2018. 2018 California Gas Report, p. 63.

Furthermore, the 2018 California Gas Report, estimates that natural gas supplies within the SoCalGas planning area will be approximately 923,282,100 MMBtu in 2024 (the year the Proposed Project would become operational).⁶¹ As stated above, the Proposed Project annual net increase in demand for natural gas is estimated to be approximately 22,767 MMBtu for the Full Backfill Scenario and 16,413 MMBtu for the Partial Backfill Scenario. Under both scenarios, the Proposed Project would account for approximately 0.002 percent of the 2024 forecasted annual consumption in the SoCalGas planning area and would fall within the SoCalGas projected consumption for the area and would be consistent with the SoCalGas anticipated regional demand from population or economic growth.⁶² Therefore, with the incorporation of the project design features described above, operation of the Proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of natural gas, and the impact would be **less than significant**.

Transportation Energy

During operation, Proposed Project-related vehicle use would result in the consumption of petroleum-based fuels related to vehicular travel to and from the Project Site. The Project Site would be located near shopping areas with a grocery store, restaurants, and retail/commercial land uses, and the Project Site itself would be connected to multiple transit options through the use of shuttles in and around events, providing alternatives to the use of passenger vehicles. A majority of the vehicle fleet that would be used by the Proposed Project employees and visitors would consist of light-duty automobiles and light-duty trucks, which are subject to fuel efficiency standards. Annual trips for the Proposed Project were estimated using trip rates provided in the Section 3.14, Transportation and Circulation, and Appendix K of this Draft EIR.

As reported in Table 3.5-4a and Table 3.5-4b, the Proposed Project estimated annual net increase in petroleum-based fuel usage would be approximately 1,583,770 gallons of gasoline and 91,347 gallons of diesel for the Full Backfill Scenario and 1,011,301 gallons of gasoline and 66,983 gallons of diesel under the Partial Backfill Scenario. Based on the California Energy Commission *California Annual Retail Fuel Outlet Report*, residents and employees in Los Angeles County consumed 3,659,000,000 gallons of gasoline and approximately 590,200,000 gallons of diesel fuel in 2017.⁶³ The Proposed Project would account for 0.043 percent of County-wide gasoline consumption and 0.015 percent of County-wide diesel consumption under the Full Backfill Scenario and account for 0.028 percent of County-wide gasoline consumption and 0.011 percent of County-wide diesel consumption under the Partial Backfill Scenario, based on the available County fuel sales data for the year 2017.

⁶¹ California Gas and Electric Utilities, 2018. 2018 California Gas Report, p. 103.

⁶² Note while actual operations would only occur for part of 2024, the energy analysis assumes a full year of operations to present a conservative estimate as energy efficiencies will increase in subsequent years therefore reducing energy consumption from the same activities.

⁶³ California Energy Commission, California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, https://ww2.energy.ca.gov/almanac/transportation_data/gasoline/piira_retail_survey.html. Accessed December 26, 2018.

Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, crude oil production would be sufficient to meet over 50 years of worldwide consumption.⁶⁴ Fuels used for vehicle trips resulting from the Proposed Project would be required to comply with CAFE fuel economy standards, which would result in more efficient use of transportation fuels (lower consumption). Vehicles used for Project-related vehicle trips would also comply as applicable with Pavley and Low Carbon Fuel Standards which are designed to reduce vehicle GHG emissions, but would also result in fuel savings, in addition to compliance with CAFE standards.

The Proposed Project would support statewide efforts to improve transportation energy efficiency and reduce transportation energy consumption with respect to private automobiles for the reasons provided below. As discussed in detail in Section 3.10, Land Use and Planning, the Proposed Project design and characteristics would be consistent with and would not conflict with the goals of the SCAG 2016 RTP/SCS. As discussed below under Impact 3.5-2, the mixed use design of the Proposed Project would increase the density of an infill site served by a variety of transit options. The Project Site is adjacent to two bus lines (the 117 and 212/312 lines, which stop at the intersection of West Century Boulevard and South Prairie Avenue) and within one half mile of a third bus route (the combined 740/40 Metro bus). The Proposed Project also would provide shuttle service from the Metro Green Line Hawthorne/Lennox Station and the Metro Crenshaw/LAX Line Downtown Inglewood Station to the Project Site during LA Clippers basketball games and other large events.

The close proximity of the Proposed Project to retail, restaurant, entertainment, commercial, and job destinations supports achievement of reductions in VMT. Additionally, the Project design would provide for the installation of electric vehicle charging stations for a minimum of 8 percent of the parking spaces pursuant to the CALGreen Code, reducing the amount of fossil fuel consumed during vehicular travel to and from the Proposed Project.

For the reasons described above, the Proposed Project would reduce operational transportation fuel demand consistent with and not in conflict with State, regional, and City goals. Therefore, operation of the Proposed Project would not result in the wasteful, inefficient, and unnecessary consumption of energy and the impact would be **less than significant** under either scenario.

Mitigation Measure

None required.

⁶⁴ BP Global, Oil reserves, <https://www.bp.com/en/global/corporate/energy-economics/statistical-review-of-world-energy/oil.html>. Accessed December 26, 2018.

Impact 3.5-2: Construction and operation of the Proposed Project could conflict with or obstruct a State or local plan for renewable energy or energy efficiency. (Less than Significant)

CALGreen Code and Title 24

The Proposed Project would be designed in a manner that is consistent with relevant energy conservation plans designed to encourage development that results in the efficient use of energy resources. The Proposed Project would comply with CALGreen and Title 24 requirements to reduce energy consumption by implementing energy efficient building designs, reducing indoor and outdoor water demand, providing EV charging spaces, and installing energy-efficient appliances and equipment.

The Proposed Project would be designed to obtain a LEED Gold level of certification. The Proposed Project would be designed to optimize building energy performance with a minimum of a 5 percent reduction from the CCR, Title 24, Part 11 baseline requirement (this corresponds to a minimum of 18 percent energy efficiency beyond the American Society of Heating, Refrigerating and Air-Conditioning Engineers Standard 90.1).

Final design of the Proposed Project has not yet been finalized and is still being refined; therefore, specific green building strategies to obtain LEED certification for each proposed building have not been fully identified. However, LEED Certification of the Proposed Project necessarily could not occur prior to the completion of construction. The strategies and measures identified in the IBEC Project AB 987 Application demonstrate that the IBEC Project would meet LEED Gold Certification requirements, as appropriate at this stage in the design and approval process. The LEED scorecards (included as Attachment B to the IBEC Project AB 987 Application) would be key components of the Proposed Project Basis of Design documentation required for compliance with the Title 24 commissioning requirements and the LEED collaborative design requirements. Compliance with LEED requirements would be demonstrated in a two-step process - with a first submittal being made at the completion of design, and a second submittal upon completion of construction. The credit strategies identified on the LEED scorecard would be monitored and approved through each design submittal. LEED Gold certification achieved through this process would be anticipated prior to completion of the first NBA season at the proposed Arena (expected to be June 30, 2025).

The Proposed Project would implement LEED efficiency strategies and incorporate water conservation, energy conservation, and other features consistent with the CALGreen, Title 24, and City sustainability goals. As a result, the Proposed Project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Thus, the impact would be **less than significant**.

SCAG 2016–2040 RTP/SCS

As discussed in Section 3.7, Greenhouse Gas Emissions; Section 3.10, Land Use and Planning; and Section 3.14, Transportation and Circulation, the Proposed Project would be consistent with the 2016-2040 RTP/SCS. The SCAG 2016-2040 RTP/SCS is designed to support development of

compact communities in existing urban areas, with more mixed-use and infill development, and reuse of developed land that is also accessible to transit and/or served by high quality transit. The 2016-2040 RTP/SCS describes how the region can attain the GHG emission-reduction targets set by CARB by reducing VMT to achieve an 8 percent reduction in passenger vehicle emissions by 2020, 18 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level on a per capita basis. Section 3.7, Greenhouse Gas Emissions, details the features incorporated into the Proposed Project to reduce vehicle trips, resulting in less gasoline and diesel fuel use.

Overall, the Proposed Project would be consistent with the goals and policies of the SCAG 2016 RTP/SCS because it is an infill site accessible to transit, and by supporting reductions in VMT to and from the Project Site. Although the 2016-2040 RTP/SCS is not technically an energy efficiency plan, consistency with the RTP/SCS has energy implications, including the reduction of VMT from the plan which reduces GHG emissions and reduces fossil fuel consumption from travel to and from the Project Site. For these reasons, the impact would be **less than significant**

City of Inglewood ECAP

ECAP implementation is expected to reduce emissions by 18.8 percent below 2005 levels by 2020, enabling the City to meet its 2005 target. However, the City would, need to reduce emissions by an additional 111,702 MT CO₂e per year by 2035 to meet its 2035 target. The ECAP identifies a number of strategies aimed at reducing emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste. Based on the concept designs, the Proposed Project would be consistent with the City of Inglewood ECAP. However, because the final design of the Proposed Project is not yet available and the specific LEED credits and project features are not finalized. Assuming the final design does incorporate the planned LEED efficiency strategies, the impact would be **less than significant**. See Section 3.7, Greenhouse Gas Emissions, for a detailed explanation of each strategy and the consistency of the Proposed Project with the energy efficiency goal of the ECAP.

Summary

The Proposed Project would incorporate physical design features such that it would be consistent with applicable plans, policies and regulations adopted for the purpose of promoting renewable energy and overall energy efficiency. Thus impacts would be **less than significant**.

Mitigation Measures

None required.

Impact 3.5-3: Construction and operation of the Proposed Project could result in the relocation or construction of new or expanded electric power, natural gas or telecommunication facilities, the construction or relocation of which could cause significant environmental effects. (Less than Significant)

Construction

Electricity

During construction of the Proposed Project, electricity would be consumed to power lighting, heating, and cooling in the construction trailers; outdoor lighting of the site; electric equipment; and supply and convey water for dust control. Electricity would be supplied to the Project Site by SCE and would be obtained from the existing electrical lines that connect to the Project Site. As previously discussed, although there would be a temporary increase in electricity consumption at the Project Site during construction (a net increase of approximately 671 MWh per year), the electrical consumption would be within the supply and infrastructure capabilities of SCE (87,143 GWh net energy for 2018).⁶⁵ Electricity use from construction would be short-term, limited to working hours, used for necessary construction-related activities, and represent a small fraction of the Proposed Project's net annual operational electricity. While existing off-site infrastructure would not have to be expanded and new infrastructure would not be required to provide electrical service during construction activities, it may be necessary to construct temporary overhead and/or underground facilities to provide sources or change the direction of "feed" to accommodate improvement requirements for the removal of existing facilities. These facilities would be considered temporary in nature and would be removed upon installation of permanent electrical facilities. Therefore, Proposed Project construction would not result in an increase in demand for electricity that exceeds available supply or distribution infrastructure capabilities that could result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects, and impacts would be **less than significant**.

With regard to existing electrical distribution lines, the Proposed Project would be required to coordinate electrical infrastructure removals or relocations with SCE, who would provide electric power to the Project Site,⁶⁶ and comply with site-specific requirements set forth by SCE. This coordination would ensure that service disruptions and potential service impacts associated with grading, construction, and development within SCE easements would be minimized. As previously discussed, existing electric power lines are located across portions of the Project Site. These existing electric power lines would need to be rerouted around the Project Site as the parameters of the building footprint would prohibit the undergrounding within the boundaries of the Project Site, as shown in Figure 3.5-1. These relocations would occur prior to the removal of the existing on-site facilities. In addition, the Proposed Project would be required to construct structures, including switches, capacitor banks, transformers and metering equipment, for the anticipated operational electric power demand generated by the Proposed Project. The proposed

⁶⁵ Southern California Edison, 2018. 2018 Annual Report, p. 2. 2018.

⁶⁶ SCE Will Serve Letter provided in Appendix G, of this Draft EIR.

locations for these facilities is in the southeast corner of the Arena Site.⁶⁷ Analysis of other construction-related impacts associated with providing electricity to the Project Site during construction, including the removal and relocation of facilities, are described in sections 3.1 through 3.15 of this Draft EIR, as applicable. As such, construction of the Proposed Project is not anticipated to adversely affect the electrical infrastructure serving the surrounding uses or utility system capacity and would not result in the construction of new electric power facilities or expansion of existing facilities, which could cause significant environmental effects, and impacts would be **less than significant**.

Natural Gas

As stated above, construction activities, including the construction of new buildings and facilities, would consume natural gas in the form of CNG for powering a portion of the off-road construction equipment. CNG needed for this construction equipment would be brought to the Project Site or the equipment taken to a CNG fueling station. Natural gas would not be directly supplied by SoCalGas to support Proposed Project construction activities. Therefore, construction of the Proposed Project would not result in an increase in demand for natural gas that exceeds available supply or distribution infrastructure capabilities that could result in the construction of new energy facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

Project construction would involve installation of new natural gas connections to serve the Project Site. The natural gas lines in the surrounding area were installed decades ago for residential uses and are typically 2 inches in size and not large enough to handle the necessary volume for the Proposed Project's natural gas demand. To accommodate the Proposed Project's natural gas demand during operation of the Proposed Project, the natural gas distribution main in West 102nd Street would need to be sized up to 4 inches and would tie into an 8-inch natural gas main on the west side of South Prairie Avenue. The Proposed Project would also require abandonment of several existing natural gas lines as well as new connections and extensions to existing natural gas lines, shown in Figure 3.5-1.⁶⁸ Construction impacts associated with the installation of natural gas connections are expected to be limited to grading/trenching activities in order to replace, relocate, and extend existing natural gas pipes below grade. In addition, prior to ground disturbance, Project contractors would be required to notify and coordinate with SoCalGas, who would provide natural gas service to the Project Site,⁶⁹ to identify the locations and depth of all existing gas lines and avoid disruption of natural gas service to other properties. Analysis of other construction-related impacts associated with providing electricity to the Project Site during construction, including the removal and relocation of facilities, are described in sections 3.1 through 3.15 of this Draft EIR, as applicable. Therefore, construction of the Proposed Project would not result in an increase in demand for natural gas that would affect the available supply or distribution infrastructure capabilities and would not result in the construction of new

⁶⁷ BJ Palmer and Associates, Inc., 2018. Dry Utilities Study, page 4. July 2018.

⁶⁸ BJ Palmer and Associates, Inc., 2018. Dry Utilities Study, page 11. July 2018.

⁶⁹ SoCalGas Will Serve Letter provided in Appendix G of this Draft EIR.

natural gas facilities or expansion of existing facilities, which could cause significant environmental effects, and impacts would be **less than significant**.

Telecommunications

Construction activities, including the construction of new buildings and hardscape, typically do not have the need for the construction of telecommunication facilities. As a majority of the Project Site is currently undeveloped, installation of new underground telecommunication lines (for telephone, internet, and other services) to serve the Proposed Project and related uses would be required on the Project Site. Existing AT&T and Spectrum Business facilities that are located along West 102nd Street as well as those that traverse the Project Site would need to be relocated in order to prepare the Project Site for development. In addition, AT&T has fiber capability to service the Project Site from existing infrastructure on West 104th Street;⁷⁰ the existing infrastructure would need to be extended to the Project Site. Furthermore, Spectrum Business would provide service to the Project Site⁷¹ from the southwest corner of the Arena Site. Construction impacts associated with the installation of new telecommunication infrastructure would primarily involve trenching in order to place the lines below ground surface. When considering impacts resulting from the installation of any required telecommunications infrastructure, all impacts are of a relatively short duration and would cease to occur when installation is complete. Installation of new telecommunications infrastructure would be limited to on-site telecommunications distribution and minor off-site work associated with connections to the public system. No upgrades to off-site telecommunications facilities are anticipated. Any work that may affect services to the existing telecommunications lines would be coordinated with service providers (i.e., AT&T and Spectrum Business). Analysis of other construction-related impacts associated with providing electricity to the Project Site during construction, including the removal and relocation of facilities, are described in sections 3.1 through 3.15 of this Draft EIR, as applicable. As such, construction of the Proposed Project is not anticipated to adversely affect telecommunications infrastructure and would not result in the relocation or construction of new telecommunication facilities or expansion of existing facilities, which could cause significant environmental effects, and impacts would be **less than significant**.

Operations

Electricity

At buildout, the Proposed Project would result in a projected net increase in the annual demand for electricity totaling approximately 16,934 MWh for the Full Backfill Scenario and 13,194 MWh for the Partial Backfill Scenario, as shown in Table 3.5-4a and Table 3.5-4b, and would represent approximately 0.019 percent and 0.015 percent of SCE-supplied electricity, respectively. The electrical demand for the Proposed Project would be within SCE's projected electricity supplies. As previously discussed, the closest SCE substation to the Project Site is located at 4128 West 103rd Street (Lennox Substation), which is the primary source of power to the few existing uses on the Project Site. The substation provides two distribution service

⁷⁰ AT&T Will Serve Letter provided in Appendix G of this Draft EIR.

⁷¹ Spectrum Business (also known as Charter Communications) Will Serve Letter provided in Appendix G of this Draft EIR.

voltages: 16 kV and 4.8 kV. SCE does not anticipate the need for a new substation as the current capacity of the 16 kV system would be adequate to service the anticipated electricity demand of the Proposed Project. During operation of the Proposed Project, it is expected that SCE's existing infrastructure, planned electricity capacity, and electricity supplies would be sufficient to support the Proposed Project's electricity demand. Therefore, the Proposed Project would not create the need for additional off-site electrical infrastructure (i.e., substation), which could cause significant environmental effects, and impacts would be **less than significant**.

Natural Gas

At buildout, the Proposed Project would generate an estimated net increase in the on-site annual demand for natural gas totaling approximately 22,767 MMBtu for the Full Backfill Scenario and 16,413 MMBtu for the Partial Backfill Scenario, as shown above in Table 3.5-4a and Table 3.5-4b. Under both scenarios, the Proposed Project would account for approximately 0.002 percent of the 2024 forecasted annual consumption in the SoCalGas planning area and would fall within the SoCalGas projected consumption for the area, and would be consistent with the SoCalGas anticipated regional demand from population or economic growth.⁷² SoCalGas expects overall natural gas demand to decline through 2035 accounting for population and economic growth as well as efficiency improvements and the State's transition away from fossil fuel-generated electricity to increased renewable energy. The 2018 California Gas Report states, "SoCalGas projects total gas demand to decline at an annual rate of 0.5 percent per year from 2018 to 2035. The decline in throughput demand is due to modest growth in the natural gas vehicle market and across-the board declines in other market segments."⁷³ Based on the Proposed Project's small fraction of total natural gas capacity for the region, ongoing SoCalGas long-range planning efforts to provide natural gas for this service region, and sufficient existing infrastructure, it is expected that SoCalGas' existing and planned natural gas supplies would be sufficient to support the Proposed Project's demand for natural gas. Therefore, the Proposed Project would not create the need for additional off-site natural gas infrastructure, which could cause significant environmental effects, and impacts would be **less than significant**.

Telecommunications

As previously discussed, underground telecommunication lines (for telephone, internet, and other services) to serve the Proposed Project would be installed on the Project Site during construction activities. As telecommunication providers already deliver their services to a large number of homes and commercial businesses in the vicinity of the Project Site, it is anticipated that existing telecommunications facilities would be sufficient to support the Proposed Project's needs for telecommunication services. As such, no upgrades to off-site telecommunications facilities are anticipated. Therefore, the Proposed Project would not create the need for additional

⁷² Note while actual operations would only occur for part of 2024, the energy analysis assumes a full year of operations to present a conservative estimate as energy efficiencies will increase in subsequent years therefore reducing energy consumption from the same activities.

⁷³ California Gas and Electric Utilities, 2018. 2018 California Gas Report, 2018, p. 4. 2018.

off-site telecommunications infrastructure, which could cause significant environmental effects, and impacts would be **less than significant**.

Mitigation Measures

None required.

Cumulative Impacts

Impact 3.5-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could cause wasteful, inefficient, or unnecessary consumption of energy resources during construction or operation of the Proposed Project. (Less than Significant)

Electricity

The geographic context for the cumulative analysis of electricity is the SCE service area. Growth within this service area is anticipated to increase the demand for electricity and the need for infrastructure, such as new or expanded facilities.

Future development, including the Proposed Project, would result in the increased use of electricity resources. However, SCE has determined that the use of such resources would be minor compared to existing supply and infrastructure within the SCE service area and would be consistent with growth expectations.⁷⁴ Furthermore, like the Proposed Project, other cumulative developments would be required to incorporate energy conservation features in order to comply with applicable mandatory regulations including CALGreen Code, State energy standards under Title 24, and incorporate mitigation measures, as necessary. Therefore, the cumulative electricity impact would be **less than significant**.

Natural Gas

The geographic context for the cumulative analysis of natural gas is the SoCalGas service area. Growth within this service area is anticipated to increase the demand for natural gas and the need for infrastructure, such as new or expanded facilities.

Cumulative development projects, including the Proposed Project, in the SoCalGas service area would result in the use of natural gas resources, however the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for the SoCalGas service area. Further, like the Proposed Project, other future development projects would be required to incorporate energy conservation features in order to comply with applicable mandatory regulations including CALGreen and State energy standards in Title 24, and incorporate mitigation measures, as necessary. Therefore, the cumulative natural gas impact would be **less than significant**.

⁷⁴ California Energy Commission, 2018. California Energy Demand 2018-2030 Revised Forecast. January 2018.

Transportation Energy

The geographic context for the cumulative analysis of transportation energy is the SCAG region. Growth within this region is anticipated to increase the demand for transportation and the need for infrastructure, such as new or expanded facilities.

Buildout of the Proposed Project and cumulative projects in the SCAG region would be expected to increase overall VMT; however, the effect on transportation fuel demand would be reduced by future improvements to vehicle fuel economy pursuant to Federal and State regulations. By 2025, vehicles are required to achieve 54.5 mpg (based on USEPA measurements), which is a 54 percent increase from the 35.5 mpg standard in the 2012–2016 standards. Siting land use development projects at infill sites is consistent with the overall goals of the State to reduce VMT pursuant to SB 375. Cumulative development projects would need to demonstrate consistency with these goals and incorporate any mitigation measures required under CEQA, which would also ensure cumulative development projects contribute to transportation energy efficiency and the impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.5-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could conflict with or obstruct a State or local plan for renewable energy or energy efficiency. (Less than Significant)

The geographic scope of analysis for cumulative impacts related to compliance with State or local plans for renewable energy or energy efficiency includes those past, present, and reasonably foreseeable cumulative projects located within the in the City of Inglewood and the surrounding area, as identified in Table 3.0-2, Cumulative Projects List (see Section 3.0, Introduction to the Analysis).

Pursuant to State law, all present and reasonably foreseeable cumulative projects would be required to comply with CALGreen and Title 24 energy efficiency requirements, which would reduce energy consumption by implementing energy efficient building designs and installing energy-efficient appliances and equipment, among other measures and would support and promote the use of renewable energy and energy efficiency. Assuming the compliance of the Proposed Project and other cumulative projects with State energy efficiency requirements, the cumulative impact would be **less than significant**.

All of the cumulative development projects included in Table 3.0-1 are in the SCAG region and are infill projects which would be constructed within existing urbanized areas and, therefore, demonstrate characteristics that would be consistent with the guidance provided in the SCAG 2016 RTP/SCS. As infill developments, these projects would support development of compact

communities in existing urban areas, with more mixed-use and infill development, and reuse of developed land that is also accessible to transit and/or served by transit. Development of infill areas supports the reduction of VMT by locating jobs and housing in closer proximity to each other, thereby reducing energy consumption and GHG emissions. VMT reductions also result in reducing fossil fuel consumption from travel to and from project sites within the cumulative context. Since the Proposed Project and other cumulative projects would support the RTP/SCS goals for infill of existing urbanized areas, the cumulative impact would be considered **less than significant**.

A total of 33 of the 145 cumulative projects in the Cumulative Projects List presented in Table 3.0-2 are located within the City of Inglewood (Cumulative Projects numbers 42 through 74). Each of those 33 cumulative projects in the City of Inglewood would be expected to comply with the energy efficiency goal established in the ECAP. The ECAP identifies a number of strategies aimed at reducing emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste. Assuming the compliance of the cumulative projects with the energy efficiency goals of the ECAP, impacts would be **less than significant**.

For the reasons described above, cumulative development including the Proposed Project would not conflict with or obstruct implementation of a State or local plan for renewable energy or energy efficiency, and the cumulative impact would be **less than significant**. Assuming the final design does incorporate the planned LEED efficiency strategies, complies with Title 24 requirements, and complies with the City of Inglewood ECAP, the project would not have a considerable contribution to this significant impact and, thus, the cumulative impact is **less than significant**.

Mitigation Measures

None required.

Impact 3.5-6: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would result in the relocation or construction of new or expanded electric power, natural gas or telecommunication facilities, the construction or relocation of which could cause significant environmental effects. (Less than Significant)

Electricity

The geographic context for the cumulative analysis of electricity is the SCE service area, which includes as 50,000-square-mile service area, across central, coastal and southern California and is bounded by Mono County to the north, Ventura County to the west, San Bernardino County to the east, and Orange County to the south.⁷⁵ Growth within this service area is anticipated to increase the demand for electricity and potentially the need for infrastructure, such as new or expanded facilities.

⁷⁵ Southern California Edison, About Us >Who We Are, <https://www.sce.com/about-us/who-we-are>. Accessed April 25, 2019.

Electricity infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SCE are ongoing. Generally, aside from ongoing maintenance, SCE has currently, and will continue to install additional system upgrades to support other large projects in its service area.⁷⁶ It is expected that SCE would continue to expand delivery capacity as necessary to meet demand increases within its service area. Development projects within the SCE service area would also be anticipated to incorporate site-specific infrastructure improvements, as necessary. Each cumulative project would be reviewed by SCE to identify necessary power facilities and service connections to meet individual project needs. In addition, as with the Proposed Project, related projects would need to analyze potential environmental effects of infrastructure extensions, adhere to any applicable ground-disturbing design features, and implement necessary mitigation measures, which would also serve to reduce potential impacts from any infrastructure removal or relocation activities. Project applicants would be required to provide for the needs of their individual projects, thereby contributing to the electrical infrastructure in the surrounding area. As such, the electricity demands of customers in the SCE service area would continue to be met, and the cumulative impact would be **less than significant**.

Natural Gas

The geographic context for the cumulative analysis of natural gas is the SoCalGas service area, which includes approximately 20,000 square miles throughout central and southern California, from the City of Visalia to the US/Mexico border. Growth within this service area is anticipated to increase the demand for natural gas and potentially the need for infrastructure, such as new or expanded facilities.

Natural gas infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SoCalGas occur as needed. It is expected that SoCalGas would continue to expand delivery capacity as necessary to meet demand increases within its service area. At this time, SoCalGas does not have plans for the construction of any new medium or high-pressure mains in the surrounding area.⁷⁷ Development projects within its service area, including the Proposed Project and other cumulative projects also served by the existing SoCalGas infrastructure, would also be anticipated to incorporate site-specific infrastructure improvements, as appropriate. In addition, as with the Proposed Project, cumulative projects would need to analyze potential environmental effects of infrastructure extensions, adhere to any applicable ground-disturbing design features, and implement necessary mitigation measures, which would also serve to reduce potential impacts from any off-site infrastructure improvement activities. As such, the natural gas demands of customers in the SoCalGas service area would continue to be met, and the cumulative impact would be **less than significant**.

Telecommunications

The geographic context for the cumulative analysis of telecommunication facilities is the service areas for the telecommunication service providers (i.e., AT&T and Spectrum Business). Growth

⁷⁶ BJ Palmer and Associates, Inc., 2018. Dry Utilities Study, page 9. July 2018.

⁷⁷ BJ Palmer and Associates, Inc., 2018. Dry Utilities Study, page 11. July 2018.

within this service area is anticipated to increase the demand for telecommunication services (such as telephone, internet, and other services) and potentially the need for infrastructure, such as new or expanded facilities.

Expansion of telecommunication infrastructure, including telephone and internet services, is typically at the discretion of the service providers and would occur as needed. It is expected that the telecommunication service providers would expand off-site telecommunications systems if necessary to meet demand increases within their service area. Cumulative projects may require the relocation or installation of new underground telecommunication lines to serve individual projects. As with the Proposed Project, relocation and installation of new telecommunications infrastructure for the related projects are anticipated to be limited to on-site telecommunications distribution and minor off-site work associated with connections to the public system. Installation would be short term in duration and would cease to occur when installation is complete. In addition, as with the Proposed Project, cumulative projects would need to analyze potential environmental effects of infrastructure extensions, adhere to any applicable ground-disturbing design features, and implement necessary mitigation measures, which would also serve to reduce potential impacts from any installation activities. As such, the telecommunications demands of customers in the telecommunications service areas would continue to be met, and the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

3.6 Geology and Soils

This section describes and evaluates potential impacts related to geology and soils conditions and hazards, including paleontological resources. The section contains: (1) a description of the existing regional and local conditions of the Project Site and the surrounding areas as it pertains to geology and soils as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, State, and local regulations related to geology and soils; and (3) an analysis of the potential impacts related to geology and soils associated with the implementation of the Proposed Project, as well as identification of potentially feasible mitigation measures that could mitigate the significant impacts.

Comments received in response to the NOP for the EIR regarding geology and soils can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to geology and soils that were raised in comments on the NOP are analyzed in this section.

The analysis included in this section was developed based on Project-specific construction and operational features; the *Paleontological Resources Assessment Report* prepared by ESA and dated July 2019 (Appendix I); and the site-specific existing conditions, including geotechnical hazards, identified in the *Preliminary Geotechnical Report* prepared by AECOM and dated September 14, 2018 (Appendix H).¹

3.6.1 Environmental Setting

Regional Setting

The Project Site is located in the northern Peninsular Ranges geomorphic province close to the boundary with the Transverse Ranges geomorphic province. The Transverse Ranges geomorphic province is characterized by east-west trending mountain ranges that include the Santa Monica Mountains. The southern boundary of the Transverse Ranges province is marked by the Malibu Coast, Santa Monica, Hollywood, Raymond, Sierra Madre, and Cucamonga faults.

The Peninsular Range province is characterized by northwest/southeast trending alignments of mountains and hills and intervening basins, reflecting the influence of northwest trending major faults and folds controlling the general geologic structural fabric of the region. This province extends northwesterly from Baja California into the Los Angeles Basin and westerly into the offshore area, including Santa Catalina, Santa Barbara, San Clemente and San Nicolas islands. It is bounded by the Colorado Desert along the San Jacinto Fault Zone on the east. The Los Angeles Basin is the northernmost part of the Peninsular Ranges province. The Project Site is located within the Los Angeles Basin, which is a broad sediment-filled trough that forms an alluvial plain of low relief. The basin was created by tectonic subsidence and subsequent deposition of sediments derived from ancestral streams from erosion along the flanks of the local mountains since the Pliocene time (approximately 2.6 million to 11,700 years ago). Within this portion of

¹ AECOM, *Preliminary Geotechnical Report*, September 14, 2018.

the basin, thick accumulations of non-marine to shallow marine deposits overlie older marine sediments.²

Project Vicinity and Project Site

The Project Site is located within the southwest block of the Los Angeles Basin and is part of the Torrance Plain, which is a southward-dipping gently sloping alluvial plain developed by continued uplift and subsequent filling of sediments derived from headward erosion along the flanks of the Santa Monica Mountains and local uplands.³ The southwestern block of the Los Angeles Basin is interrupted by a series of a left-stepping pattern of dome-shaped hills. These hills (Baldwin Hills, Dominguez Hills, and Signal Hills) were formed due to folding and deformation produced by the Newport-Inglewood Fault Zone and extend southeasterly from the Santa Monica Mountains on the north to the San Joaquin Hills in the Newport Beach area to the south.

Overall, the Project Site is in a relatively level area that is blanketed by artificial fill overlying native alluvial and older alluvial deposits. Due to the varied history of different developments throughout the Project Site, some of the fill could have been placed with or without control following demolition of older structures that occupied most of the parcels. There are no known records of fill placement available, but the borings drilled at the Project Site during the geotechnical investigation encountered artificial fill to depths ranging from 5 to 10 feet below ground surface (bgs).⁴

According to the *Preliminary Geotechnical Report*, native materials underlying the fill consist of alluvial sediments described as fine to medium-grained silty sand and sand with trace fine gravels interbedded with discontinuous flood plain fine-grained sediments consisting of clayey silt, lean clay, and sandy clay.⁵ Based on the geotechnical report borings, the younger alluvium may extend to depths ranging from 30 to 40 feet bgs.⁶ Older alluvium that consists of dense to very dense silty sands and stiff to hard sandy clays was noted as present from approximately 30 to 40 feet bgs to the maximum depth explored of 100 feet bgs; however, geological mapping indicates that older alluvium is present at the surface (below fill soils).

Groundwater was encountered during the geotechnical investigation at depths that were generally below 75 feet bgs. According to Seismic Hazard Zone Report 027, the historically highest groundwater level in the area has been inferred to be more than 50 feet bgs.⁷

Fault Rupture

Background

Fault rupture is defined as the displacement that occurs along the surface of a fault during an earthquake. Based on criteria established by the California Geological Survey (CGS), faults are

² AECOM, *Preliminary Geotechnical Report*, September 14, 2018.

³ AECOM, *Preliminary Geotechnical Report*, September 14, 2018.

⁴ AECOM, *Preliminary Geotechnical Report*, September 14, 2018.

⁵ AECOM, *Preliminary Geotechnical Report*, September 14, 2018.

⁶ Note that the description of the younger alluvium does not agree with the geologic mapping for the area which shows the site as being underlain by Older alluvium. See also discussion in the Paleontology methodology.

⁷ AECOM, *Preliminary Geotechnical Report*, September 14, 2018, p. 10.

classified as either active, potentially active, or inactive.⁸ Faults are considered active when they have shown evidence of movement within the past 11,000 years (i.e., Holocene epoch). Potentially active faults are those that have shown evidence of movement between 1.6 million and 11,000 years ago (Quaternary age). Faults showing no evidence of surface displacement within the last 1.6 million years are considered inactive.

Blind thrust faults are defined as faults that are deeper and do not exhibit surface expression or displacement but that nonetheless can become a potential significant source of seismic activity. Since they are essentially buried, their existence is usually not known until they produce an earthquake. Several blind thrust faults underlie the Los Angeles Basin at depth, including the Puente Hills Blind Thrust, Compton Thrust, and Upper Elysian Park (**Figure 3.6-1**). However, blind thrust faults are not exposed at the ground surface and do not present a potential for surface fault rupture.

The Alquist-Priolo Earthquake Fault Zoning Act (formerly known as the Alquist-Priolo Special Studies Zones Act) established state policy to identify active faults and determine a boundary zone on either side of a known fault trace, called the Alquist-Priolo Earthquake Fault Zone. The delineated width of an Alquist-Priolo Earthquake Fault Zone is based on the location precision, complexity, or regional significance of the fault and can be between 200 and 500 feet in width on either side of the fault trace. If a site lies within a designated Alquist-Priolo Earthquake Fault Zone, a geologic fault rupture investigation must be performed to demonstrate that a proposed building site is not threatened by surface displacement from the fault, before development permits may be issued.

Project Site

Based on the available geologic data, no active or potentially active faults with the potential to cause surface fault rupture are known to be located directly beneath the Project Site, which includes the Arena Site, the West Parking Garage Site, the East Transportation and Hotel Site, and the Well Relocation Site. The closest and most significant active fault to the Project Site with surface rupture potential (e.g., non-blind thrust faults) is the Newport-Inglewood Fault Zone, located approximately 1.13 miles to the northwest.⁹ The Project Site is not located within or near a designated Alquist-Priolo Earthquake Fault Zone.

⁸ The California Geological Survey was formerly called the California Division of Mines and Geology (CDMG).
⁹ AECOM, *Preliminary Geotechnical Report*, September 14, 2018, Figure 5, p. 147. Note that while the Potrero Fault is located 0.18 miles northeast of the Project Site, for purposes of this analysis, it is not considered a significant active fault.

SOURCE: AECOM, 2018

Inglewood Basketball and Entertainment Center

Figure 3.6-1
Regional Fault Locations

Ground Shaking

The Project Site is located within a very seismically active Southern California region, within 50 miles of many active or potentially active faults that are capable of producing very strong ground shaking (Figure 3.6-1). The Newport-Inglewood Fault is the closest and most significant active fault to the Project Site. As mentioned above, the Newport-Inglewood Fault Zone is approximately 1.13 miles to the northwest. The Newport-Inglewood Fault is considered to connect with fault zones south of Newport Beach (the “offshore zone of deformation” and the Rose Canyon Fault) forming a system of faults that extend from Santa Monica to Baja California. The Newport-Inglewood Fault was the source for the 1933 magnitude 6.4 (M6.4) Long Beach earthquake. It caused major damage and the loss of 115 lives in Long Beach and surrounding communities of Los Angeles. Other significant historic earthquakes that have occurred relatively near (30 miles or less) the Project Site include:

- The 1971 San Fernando Earthquake (M6.5) on the San Fernando Fault,
- The 1987 Whittier Earthquake (M5.9), and
- The 1994 Northridge Earthquake (M6.7).

The effects of seismic shaking are dependent on the distance between the Project Site, the causative fault, and the on-site geology. Based on the latest forecasting by the US Geological Survey, the Southern California region has a 93 percent likelihood of experiencing a magnitude 6.7 or greater earthquake over the following 30 years.¹⁰ The secondary effects of seismic shaking potentially include subsidence, liquefaction, settlement (including landslides), and lateral spreading.

Subsidence

Subsidence is characterized as a sinking of ground surface relative to surrounding areas and can occur when underlying soils fail to support new loadings, such as structures or placement of additional fill materials. Subsidence in areas of thick alluvial deposits can also be associated with regional fluid (groundwater and/or petroleum) withdrawal, peat oxidation, or hydrocompaction. Subsidence can result in the development of ground cracks and damage to subsurface vaults, pipelines, and other improvements.

Subsidence can occur from immediate settlement, consolidation, shrinkage of expansive soil (see also discussion below), and/or liquefaction (discussed below). Immediate settlement occurs when a load from a structure or placement of new fill material is applied, causing distortion in the underlying materials. This settlement occurs quickly and is typically complete after placement of the final load. Consolidation settlement occurs in saturated clay from the volume change caused by squeezing out water from the pore spaces. Consolidation occurs over a period of time and is followed by secondary compression, which is a continued change in void ratio under the continued application of the load. Soils tend to settle at different rates and by varying amounts

¹⁰ United States Geological Survey, 2015. UCERF3: A New Earthquake Forecast for California’s Complex Fault System, USGS Fact Sheet 2015-3009, March 2015. Note that the relatively recent Ridgecrest earthquake, located over 150 miles northeast from the Project Site, had a magnitude of 7.1.

depending on the load weight or changes in properties over an area, which is referred to as differential settlement. According to the geotechnical report, the presence of undocumented fill materials makes the Project Site susceptible to settlement unless site preparations, such as removal of artificial fill and replacement, with engineered fill is conducted.

According to the California Division of Gas and Geothermal Resources (DOGGR), the Project Site is not located within the limits of any existing or former oil fields.¹¹ The Project Site does not contain existing oil production wells, and no plugged or abandoned oil exploration wells are known to be located at the Project Site. The closest known oil production well is located approximately 1,200 feet northeast of the Arena Site and is categorized as “idle.” Therefore, while there is some history of oil extraction in the area, as indicated by a cluster of wells located over a half mile to the northeast, no oil extraction occurs or is known to have historically occurred at the Project Site. There is one operational groundwater well in the southwest part of the Arena Site, proposed to be relocated as part of the Proposed Project, though it is not extensively used and use would not change with the Proposed Project.

According to the *Preliminary Geotechnical Report*, the Project Site is not located within an area of known subsidence associated with fluid (e.g., groundwater or petroleum) withdrawal, and no major extraction of water or petroleum is planned in the future in the vicinity of the Project Site.¹²

Liquefaction

Liquefaction is a form of earthquake-induced ground failure that occurs when relatively shallow, loose, granular, water-saturated soils behave similarly to a liquid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions exist: (1) shallow (50 feet bgs or less) groundwater; (2) low-density non-cohesive (granular) soils; and (3) high-intensity ground motion. Liquefaction is typified by a buildup of pore-water pressure in the affected soil layer to a point where a total loss of inherent shear strength occurs, thus causing the soil to behave as a liquid. Saturated, loose to medium-dense, near-surface non-cohesive soils and cohesive soils exhibit the highest liquefaction potential. Liquefaction usually results in horizontal and vertical movement of soils from lateral spreading (i.e., lateral displacement of gently sloping ground) of liquefied materials and post-earthquake settlement of liquefied materials. The effects of liquefaction on level ground include potential seismic settlement, sand boils, ground oscillation, and bearing capacity failures below structures.

According to the *Preliminary Geotechnical Report*, the Project Site is not located within an area identified as having a potential for liquefaction. As mentioned above, the historic-high groundwater levels in the area would be more than 50 feet bgs, and groundwater was not encountered in the borings carried out during the site-specific investigation which went to a depth of 75 feet bgs.¹³ Therefore, according to the *Preliminary Geotechnical Report* prepared for the

¹¹ California Division of Gas and Geothermal Resources (DOGGR), Well Finder, <https://maps.conservation.ca.gov/doggr/wellfinder/#openModal/-118.32073/33.94064/15>. Accessed January 28, 2019.

¹² AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 12.

¹³ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 10.

Project Site, the potential for liquefaction and associated ground deformation at the Project Site is considered low.

Seismically Induced Settlement

Settlement of the ground surface can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the relatively rapid compaction and settling of subsurface materials (particularly loose, uncompacted, and variable sandy sediments above the water table) due to the rearrangement of soil particles during prolonged ground shaking.

Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different amounts). Areas underlain by artificial fill can be susceptible to this type of settlement. Given the geologic setting of the Project Site and the surrounding area, and the artificial fill identified beneath the Project Site, all areas of the Project Site could potentially be subjected to earthquake-induced settlement.

Site Soils

Compressible/Collapsible Soils

Compressible and collapsible soils are considered to have a greater potential in soils with high porosities and low densities, such as with windblown silt deposits (i.e., loess deposits), which are more commonly found in arid climates. Loess deposits are characterized by relatively low density and cohesion, appreciable strength and stiffness in the dry state, but susceptible to significant deformations as a result of wetting.

Typical collapsible soils are lightly colored, low in plasticity and relatively low densities. Based on the geotechnical borings completed at the Project Site, the underlying natural soils are generally firm and dense and, thus, would not be considered susceptible to collapse. The fill materials above the natural soils were characterized as not uniformly well compacted, but the potential for collapse was considered to be very low.¹⁴

Expansive Soils

Expansive soils include clay minerals characterized by their ability to undergo significant volume change (shrink or swell) due to variation in moisture content. Sandy soils are generally not expansive, while clayey soils generally are expansive. Changes in soil moisture content can result from rainfall, irrigation, pipeline leakage, perched groundwater, drought, or other factors. Volumetric change of expansive soil may cause excessive cracking and heaving of structures with shallow foundations, concrete slabs-on-grade, or pavements supported on these materials.

According to the *Preliminary Geotechnical Report*, the materials encountered in the exploratory borings conducted at the Project Site include: (1) artificial fill to a depth of 12.5 feet bgs, consisting primarily of silty sand and sand with silt and gravel; (2) alluvial deposits from 12.5 feet to 30 feet bgs, consisting of sand, gravel, and cobbles; and (3) alluvial deposits from 30 feet bgs to the

¹⁴ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

maximum boring depths of up to 130 feet bgs, consisting of silty sand, sand, silty clay, and sandy clay.¹⁵ Typically, sandy soils have a low expansion potential while clayey soils can have a high expansion potential. The predominance of granular content in the soils on site including gravels, sands, and cobbles indicate a generally low potential for expansive soils at the Project Site.

Corrosive Soils

Soil corrosion is a geologic hazard that affects buried metals and concrete materials that are in direct contact with soil or bedrock. Depending on the chemical constituents of the soil or bedrock, electrochemical corrosion processes can degrade the structural integrity of the buried metal or concrete. Soil corrosion is a complex phenomenon, with a multitude of variables involved. Pitting corrosion and stress-corrosion cracking (SCC) are a result of soil corrosion, which can eventually lead to substantive damage.

The results of corrosivity tests conducted as part of the *Preliminary Geotechnical Report* for the Project Site indicated that the on-site soils, at present moisture content, are mildly corrosive to ferrous metals, aggressive to copper, and the potential for sulfate attack on Portland cement concrete is considered negligible.¹⁶

Soil Erosion

Erosion is the wearing-away of soil and rock by processes such as mechanical or chemical weathering, mass wasting, and the action of waves, wind, and underground water. Excessive soil erosion can eventually lead to damage of building foundations and roadways. In general, areas that are most susceptible to erosion are those that would be exposed during the construction phase when earthwork activities disturb soils and require stockpiling. Typically, the soil erosion potential is reduced once the soil is graded and covered with concrete, structures, asphalt, or landscaping. However, changes in drainage patterns can also cause areas to be susceptible to the effects of erosion.

Landslides

Landslides, slope failures, and mudflows of earth materials generally occur where slopes are steep and/or the earth materials are too weak to support themselves. Earthquake-induced landslides may also occur due to seismic ground shaking. According to the *Preliminary Geotechnical Report*, the relatively flat-lying topography at the Project Site precludes both stability problems and the potential for seismically induced landslides. Also, according to the Seismic Hazard Zones Map for the Inglewood Quadrangle, the Project Site is not located within areas designated by the State Geologist as susceptible to landslide movement or local topographic, geological, geotechnical and subsurface conditions that indicate a potential for landslides.¹⁷ Furthermore, there are no known landslides near the Project Site, nor is the Project Site in the path of any known or potential landslides. Lastly, the Project Site is not located within an area identified as having a potential for seismic slope instability according to the California

¹⁵ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. pp. 9 and 10.

¹⁶ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 33.

¹⁷ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

Division of Mines and Geology. Therefore, the potential for landslides, slope failures, and mudflows at the Project Site is considered low.

Oil Fields and Methane

As indicated previously, the Project Site is not located within the immediate vicinity of an active or abandoned oil well. The closest known oil production well is located approximately 1,200 feet northeast of the Project Site and is categorized as “idle.”

Methane (CH₄) is a naturally occurring colorless gas associated with the decomposition of organic materials. In high-enough concentrations, methane can be considered an explosion hazard. According to the Los Angeles County Department of Public Works Solid Waste Information Management System, the Project Site or its elements are not within 300 feet of an oil or gas well or 1,000 feet of a methane producing site.¹⁸ As such, the potential for explosive methane gases impacting the Project Site is low.

Paleontological Setting

The Project Site is located in the Los Angeles Basin, a structural depression approximately 50 miles long and 20 miles wide in the northernmost Peninsular Ranges Geomorphic Province.¹⁹ The Los Angeles Basin developed as a result of tectonic forces and the San Andreas Fault Zone, with subsidence occurring 18 million to 3 million years ago (Ma).²⁰ While sediments dating back to the Cretaceous (66 Ma) are preserved in the basin, continuous sedimentation began in the middle Miocene (around 13 Ma).²¹ Since that time, sediments have been eroded into the basin from the surrounding highlands, resulting in thousands of feet of accumulation.²² Most of these sediments are marine, as they eroded from surrounding marine formations, until sea level dropped in the Pleistocene Era and deposition of the alluvial sediments that compose the uppermost units in the Los Angeles Basin began.

The Los Angeles Basin is subdivided into four structural blocks, with the Project Site occurring in the Southwestern Block, where alluvial sediments can be 5,000 to 14,000 feet below sea level.²³ The Southwest Block is roughly rectangular, extending from Santa Monica in the northwest to Long Beach to the southeast.²⁴

3.6.2 Adjusted Baseline Environmental Setting

Section 3.6, Geology and Soils, assumes the Adjusted Baseline as described in Section 3.0, Introduction to the Analysis. Construction of the HPSP Adjusted Baseline projects will be subject to City of Inglewood plan check and building inspection functions which ensures that projects in the City are constructed in accordance with current building code requirements.²⁵ Construction of these structures is not likely to have any effect on the geotechnical hazards present at the Project Site as geotechnical conditions tend to be site specific, particularly in areas with low topographic relief, as is the case for the Project Site. In addition, pursuant to the General Construction Permit overseen and enforced by the Los Angeles Regional Water Quality Control Board, construction of the NFL Stadium and associated improvements is required to implement best management practices (BMPs) to minimize the potential for erosion and, thus, will not have any material effect on the potential for erosion at the Project Site. There is no evidence that HPSP Adjusted Baseline projects would affect the baseline for analysis of paleontological resources. No paleontological resources have been discovered and documented during construction of the HPSP Adjusted Baseline projects that would provide additional information on the presence or sensitivity of these resources in the area.

3.6.3 Regulatory Setting

Federal

There are no federal regulations, plans, or policies applicable to geology and soils relevant to the Proposed Project.

State

Alquist-Priolo Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act (Public Resources Code section 2621) was enacted by the State of California in 1972 to address the hazard of surface faulting to structures for human occupancy. The Alquist-Priolo Earthquake Fault Zoning Act was a direct result of the 1971 San Fernando Earthquake, which was associated with extensive surface fault ruptures that damaged homes, commercial buildings, and other structures. The primary purpose of the Alquist-Priolo Earthquake Fault Zoning Act is to prevent the construction of buildings intended for human occupancy on the surface traces of active faults. The Alquist-Priolo Earthquake Fault Zoning Act is also intended to provide the citizens with increased safety and to minimize the loss of life during and immediately following earthquakes by facilitating seismic retrofitting to strengthen buildings against ground shaking.

The Alquist-Priolo Earthquake Fault Zoning Act requires the State Geologist to establish regulatory “earthquake fault zones” around the surface traces of active faults and to issue appropriate maps to assist cities and counties in planning, zoning, and building regulation functions. Maps are distributed to all affected cities and counties to assist them in regulating new construction and

²⁵ The California Building Code is updated on a triennial basis. The current code in effect is the 2016 CBC and the 2019 CBC is anticipated to become effective on January 1, 2020.

renovations. These maps are required to sufficiently define potential surface rupture or fault creep. The State Geologist is charged with continually reviewing new geologic and seismic data, revising existing zones, and delineating additional earthquake fault zones when warranted by new information. Local agencies must enforce the Alquist-Priolo Earthquake Fault Zoning Act in the development permit process, where applicable, and may be more restrictive than State law requirements. Projects within an earthquake fault zone can be permitted, but only after cities and counties have required a geologic investigation, prepared by licensed geologists, to demonstrate that buildings will not be constructed across active faults. If an active fault is found, a structure for human occupancy cannot be placed over the trace of the fault and must be “set back.” Although setback distances may vary, a minimum 50-foot setback is generally required.

The Alquist-Priolo Earthquake Fault Zoning Act and its regulations are presented in CGS Special Publication (SP) 42, *Fault-Rupture Hazard Zones in California* (2007). The Proposed Project is not located within an Alquist-Priolo Fault Rupture Hazard Zone and, therefore, would not be subject to the requirements of the Alquist-Priolo Earthquake Fault Zoning Act.

Seismic Hazards Mapping Act

In order to address the effects of strong ground shaking, liquefaction, landslides, and other ground failures due to seismic events, the State of California passed the Seismic Hazards Mapping Act of 1990 (Public Resources Code sections 2690–2699). Under the Seismic Hazards Mapping Act, the State Geologist is required to delineate “seismic hazard zones.” Cities and counties must regulate certain development projects within these zones until the geologic and soil conditions of their project sites have been investigated and appropriate mitigation measures, if any, have been incorporated into development plans. The State Mining and Geology Board provides additional regulations and policies to assist municipalities in preparing the Safety Element of their General Plan and encourage land use management policies and regulations to reduce and mitigate those hazards to protect public health and safety. Under Public Resources Code section 2697, cities and counties must require, prior to the approval of a project located in a seismic hazard zone, submission of a *Preliminary Geotechnical Report* defining and delineating any seismic hazard. Each city or county must submit one copy of each *Preliminary Geotechnical Report*, including mitigation measures, to the State Geologist within 30 days of its approval. Under Public Resources Code section 2698, cities and counties may establish policies and criteria which are stricter than those established by the Mining and Geology Board.

State publications supporting the requirements of the Seismic Hazards Mapping Act include the CGS SP 117A, *Guidelines for Evaluating and Mitigating Seismic Hazards in California*,²⁶ discussed above, and SP 118, *Recommended Criteria for Delineating Seismic Hazard Zones in California* (2004).²⁷ SP 117A provides guidelines to assist in the evaluation and mitigation of

²⁶ Special Publication 117A, *Guidelines for Evaluating and Mitigating Seismic Hazards in California*, prepared by California Geologic Survey, 2008, <http://www.conservation.ca.gov/cgs/shzp/webdocs/Documents/sp117.pdf>.

²⁷ Special Publication 118, *Recommended Criteria for Delineating Seismic Hazard Zones in California*, dated May 1992, Revised April 2004, http://www.conservation.ca.gov/cgs/shzp/webdocs/Documents/sp118_revised.pdf.

earthquake-related hazards for projects within designated zones requiring investigations and to promote uniform and effective Statewide implementation of the evaluation and mitigation elements of the Seismic Hazards Mapping Act.²⁸ SP 118 provides recommendations to assist the CGS in carrying out the requirements of the Seismic Hazards Mapping Act to produce the Probabilistic Seismic Hazard Maps for the State. The Project Site is not located within a Seismic Hazard Zone for liquefaction or landslides.

California Building Code

The 2016 California Building Code (CBC), Title 24 of the California Code of Regulations, is a compilation of building standards, including seismic safety standards, for new buildings. California Building Code standards are based on building standards that have been adopted by State agencies without change from a national model code; building standards based on a national model code that have been changed to address particular California conditions; and building standards authorized by the California legislature but not covered by the national model code. The CBC applies to all occupancies in California, except where stricter standards have been adopted by local agencies. Specific CBC building and seismic safety regulations have been incorporated by reference into the current Inglewood Municipal Code, with local amendments.

The California Building Code is published on a triennial basis, and supplements and errata can be issued throughout the cycle. The 2016 edition of the California Building Code became effective on January 1, 2017, and incorporates by adoption the 2015 edition of the International Building Code of the International Code Council, with California amendments. The 2016 California Building Code incorporates the latest seismic design standards for structural loads and materials as well as provisions from the National Earthquake Hazards Reduction Program to mitigate losses from an earthquake and provide for the latest in earthquake safety. The 2019 California Building Code is anticipated to become effective on January 1, 2020. The current California Building Code has been adopted by the City with local amendments.

California Environmental Quality Act

The CEQA Guidelines (California Code of Regulations Title 14, Chapter 3, section 15000 et seq.), are prescribed by the Secretary of Resources to be followed by state and local agencies in California in their implementation of the CEQA. CEQA Guidelines Appendix G includes an Environmental Checklist Form with questions that may be used by public agencies in their assessment of impacts on the environment. The question within Appendix G that relates to paleontological resources states: “Will the proposed project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?”

Public Resources Code Sections 5097.5 and 30244

Other state requirements for paleontological resource management are included in PRC sections 5097.5 and 30244. Section 5097.5 prohibits the removal of any paleontological site or

²⁸ Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California, prepared by California Geologic Survey, 2008, <http://www.conservation.ca.gov/cgs/shzp/webdocs/Documents/sp117.pdf>.

feature from public lands without permission of the jurisdictional agency. It defines the removal of paleontological sites or features as a misdemeanor, and requires reasonable mitigation of adverse impacts to paleontological resources from developments on public (state, county, city, district) lands. Section 30244 requires that, where development would adversely impact archaeological or paleontological resources as identified by the State Historic Preservation Officer, reasonable mitigation measures shall be required.

Local

City of Inglewood General Plan

The following goal from the City of Inglewood General Plan is relevant to geology and soils issues:

Safety Element

Goal 1: Provide measures to reduce seismic impacts.

This policy is implemented through adherence to the seismic safety requirements of the California Building Code, established in City of Inglewood Municipal Code Chapter 11, Article 2, and enforced through plan check and building inspection services administered by the City of Inglewood and imposed on the Proposed Project. The Proposed Project would be consistent with this policy through adherence to the California Building Code, the City of Inglewood Municipal Code, and all plan check and building inspection services administered by the City of Inglewood.

3.6.4 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to geology and soils. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42;
 - ii. Strong seismic ground shaking;
 - iii. Seismic-related ground failure, including liquefaction; or
 - iv. Landslides.
2. Result in substantial soil erosion or the loss of topsoil;
3. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;

4. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property;
5. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water; or
6. Directly or indirectly destroy a unique paleontological resource or site or unique geological feature.

Paleontological Resources Significance Criteria

Fossils are considered to be of significant scientific interest if one or more of the following criteria apply:

1. The fossils provide information on the evolutionary relationships and developmental trends among organisms, living or extinct;
2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life; or
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.²⁹

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Significant fossils can include remains of large to very small aquatic and terrestrial vertebrates or remains of plants and animals previously not represented in certain portions of the stratigraphy. Assemblages of fossils that might aid stratigraphic correlation, particularly those offering data for the interpretation of tectonic events, geomorphologic evolution, and paleoclimatology are also critically important.^{30,31}

Methodology and Assumptions

The potential for significant impacts related to geology and soils through construction and operation of the Proposed Project were determined based on a thorough review of the existing conditions informed by the *Preliminary Geotechnical Report* prepared for the Project Site,³² and data from the US Geological Survey, CGS, and Southern California Earthquake Data Center.

Paleontological Resources

The analysis of paleontological resources is based on the *Paleontological Resources Assessment Report* (Appendix I), which includes a review of the Natural History Museum of Los Angeles County (LACM) paleontological records search results and other documentation regarding disturbances to the Project Site and its subsurface geological conditions. The objective of the record search through the LACM was to determine the geological formations underlying the Project Site, whether any paleontological localities have previously been identified within the Project Site or in the same or similar formations near the Project Site, and the potential for excavations associated with the Proposed Project to encounter paleontological resources. These methods are consistent with the Society for Vertebrate Paleontology (SVP) guidelines for assessing the importance of paleontological resources in areas of potential environmental effect.

There are no plans, policies, or regulations with which the Proposed Project is required to comply with regard to treatment of paleontological resources. However, it is accepted professional practice to recognize standard guidelines promulgated by the SVP that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines. Most state regulatory agencies with paleontological resource-specific Laws, Ordinances, Regulations, and Standards accept and use the professional standards set forth by the SVP.

As defined by the SVP,³³ significant nonrenewable paleontological resources are:

Fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.

As defined by the SVP,³⁴ significant fossiliferous deposits are:

A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces, and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material

³⁴ Society of Vertebrate Paleontology, 1995. Assessment and mitigation of adverse impacts to nonrenewable paleontological resources: standard guidelines. Society of Vertebrate Paleontology News Bulletin 163:22-27.

and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years B.P. [before present].

Based on the significance definitions of the SVP,³⁵ all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new information on the taxon it represents, its paleoenvironment, and/or its distribution. Furthermore, all geologic units in which vertebrate fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils or if defined as significant by project paleontologists, specialists, or local government agencies.

The loss of any identifiable fossil that could yield information important to prehistory, or that embodies the distinctive characteristics of a type of organism, environment, period of time, or geographic region, would be a significant environmental impact. A geologic unit known to contain significant fossils is considered to be “sensitive” to adverse impacts if there is a high probability that earth-moving or ground-disturbing activities in that rock unit will either directly or indirectly disturb or destroy fossil remains. Direct impacts to paleontological resources primarily concern the potential destruction of nonrenewable paleontological resources and the loss of information associated with these resources. This includes the unauthorized collection of fossil remains. If potentially fossiliferous bedrock or surficial sediments are disturbed, the disturbance could result in the destruction of paleontological resources and subsequent loss of information (significant impact). Paleontological sites indicate that the containing sedimentary rock unit or formation is fossiliferous. The limits of the entire rock formation, both areal and stratigraphic, therefore define the scope of the paleontological potential in each case.³⁶

Fossils are contained within surficial sediments or bedrock, and are therefore not observable or detectable unless exposed by erosion or human activity. In general, for project sites that are underlain by paleontologically sensitive geologic units, the greater the amount of ground disturbance, the higher the potential for significant impacts to paleontological resources. For project sites that are directly underlain by geologic units with no paleontological sensitivity, there is no potential for impacts on paleontological resources unless sensitive geologic units which underlie the non-sensitive unit are also affected. In summary, paleontologists cannot know either the quality or quantity of fossils prior to natural erosion or human-caused exposure. As a result, even in the absence of surface fossils, it is necessary to assess the sensitivity of rock units based on their known potential to produce significant fossils elsewhere within the same geologic unit (both within and outside of the study area), a similar geologic unit, or based on whether the unit in question was deposited in a type of environment that is known to be favorable for fossil preservation. Monitoring by experienced paleontologists greatly increases the probability that

³⁵ Society of Vertebrate Paleontology, 1995. Assessment and mitigation of adverse impacts to nonrenewable paleontological resources: standard guidelines. Society of Vertebrate Paleontology News Bulletin 163:22-27.

³⁶ Society of Vertebrate Paleontology, 1995. Assessment and mitigation of adverse impacts to nonrenewable paleontological resources: standard guidelines. Society of Vertebrate Paleontology News Bulletin 163:22-27.

fossils will be discovered during ground-disturbing activities and that, if these remains are significant, successful mitigation and salvage efforts may be undertaken in order to prevent adverse impacts to these resources.

Paleontological Sensitivity

Paleontological sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey. In its “Standard Guidelines for the Assessment and Mitigation of Adverse Impacts to Non-renewable Paleontologic Resources,” the SVP³⁷ defines four categories of paleontological sensitivity (potential) for rock units: high, low, undetermined, and no potential:

- **High Potential.** Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rock units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations and some volcanoclastic formations (e.g., ashes or tephra), and some low-grade metamorphic rocks which contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils (e.g., middle Holocene and older, fine-grained fluvial sandstones, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstones, fine-grained marine sandstones, etc.).
- **Low Potential.** Reports in the paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Such rock units will be poorly represented by fossil specimens in institutional collections, or based on general scientific consensus only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule, e.g., basalt flows or Recent colluvium. Rock units with low potential typically will not require impact mitigation measures to protect fossils.
- **Undetermined Potential.** Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study is necessary to determine if these rock units have high or low potential to contain significant paleontological resources. A field survey by a qualified professional paleontologist to specifically determine the paleontological resource potential of these rock units is required before a paleontological resource impact mitigation program can be developed. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy.
- **No Potential.** Some rock units have no potential to contain significant paleontological resources, for instance high-grade metamorphic rocks (such as gneisses and schists) and plutonic igneous rocks (such as granites and diorites). Rock units with no potential require no protection nor impact mitigation measures relative to paleontological resources.

³⁷ Society of Vertebrate Paleontology. 2010. Standard procedures for the assessment and mitigation of adverse impacts to paleontological resources. Available: http://vertpaleo.org/Membership/Member-Ethics/SVP_Impact_Mitigation_Guidelines.aspx Accessed January 3, 2017.

For geologic units with high potential, full-time monitoring is generally recommended during any Project-related ground disturbance. For geologic units with low potential, protection or salvage efforts will not generally be required. For geologic units with undetermined potential, field surveys by a qualified vertebrate paleontologist should be conducted to specifically determine the paleontological potential of the rock units present within the study area.

Geologic Map and Paleontological Literature Review

Geologic mapping by Dibblee and Minch³⁸ indicates that the Project Site is underlain with Pleistocene-age older alluvium (mapped as Qoa). However, as noted above, the *Preliminary Geotechnical Report* determined that the older alluvium was encountered at the Project Site at depths of 30 to 40 feet bgs and overlain by younger alluvium (mapped as Qa and dated within Holocene age – up to 11,700 years).³⁹ The *Preliminary Geotechnical Report* does not reconcile the discrepancy between the Dibblee and Minch mapping which was referenced in the report and their identification of the native materials. Thus, for the purposes of providing a conservative analysis, the paleontological analysis assumes that the native materials encountered across the Project Site consisted of the older alluvium. These sediments consist of pebble-gravel, sand, and silt-clay deposited from erosion of the surrounding highlands that has since been dissected by recent erosion.⁴⁰ Older alluvium is poorly constrained in age, but is generally considered to have been deposited during the Pleistocene, 11,700 to 2.58 Ma.⁴¹

These sediments are old enough to preserve fossil resources (i.e., over 5,000 years, as per the SVP,⁴² and have a rich fossil history in Los Angeles^{43,44} and throughout southern

California.^{45,46,47,48,49,50} The most common fossils include the bones of mammoth, bison, horse, lion, cheetah, wolf, camel, antelope, peccary, mastodon, capybara, and giant ground sloth, as well as small animals such as rodents and lizards.⁵¹ In addition to illuminating the striking differences between Southern California in the Pleistocene and today, this abundant fossil record has been vital in studies of extinction,^{52,53} ecology,⁵⁴ and climate change.⁵⁵

LACM Records Search

On April 24, 2018, ESA requested a database search from the LACM for records of fossil localities in and around the Project Site. The purpose of the museum records search was to: (1) determine whether any previously recorded fossil localities occur in the Project Site, (2) assess the potential for disturbance of these localities during construction, and (3) evaluate the paleontological sensitivity within the Project Site and vicinity. The records search returned no known localities within the Project Site, however a number of vertebrate fossils are known from similar sedimentary deposits in Los Angeles.⁵⁶ These are summarized here.

The closest locality known to the LACM from older alluvial sediments is approximately 2.0 miles west of the Project Site on Bellanca Avenue south of 98th Street, where a fossil mammoth was recovered from 40 feet bgs.⁵⁷ North of that locality, 2.2 miles northwest of the Project Site near the intersection of Bellanca Avenue and Manchester Avenue, specimens of mammoth (*Mammuthus*), rodent (Rodentia), and a speckled sanddab (*Citharichthys stigmaeus*), were

collected from 14 feet below the surface.⁵⁸ Near the intersection of Airport Boulevard and Manchester Avenue, fossil specimens of horse (*Equus*), mammoth (*Mammuthus*), bison (*Bison*), and rabbit (*Lepus*) were collected from 13 to 16 feet bgs.⁵⁹ Further west, during construction of Tom Bradley International Terminal 3.75 miles from the Project Site, a fossil elephant (*Proboscidea*) was collected from 25 feet bgs.⁶⁰

Issues Determined to be Less Than Significant

Upon review of the Proposed Project, the City of Inglewood has determined that due to the physical characteristics of the Project Site and the design of the Proposed Project, several environmental issues or resources addressed in the CEQA geology and soils significance criteria would not be affected by the Proposed Project and need not be further considered in the Draft EIR.⁶¹ The discussions below provide statements of reasons for the City's determination that these issues do not warrant further consideration in the EIR.

In December 2015, the California Supreme Court found that “agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project’s future users or residents.” In *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369, 392, the Supreme Court explained that except under a limited number of circumstances specifically identified in CEQA, an agency is only required to analyze the potential impact of such hazards on future residents if the project would worsen those existing environmental hazards or conditions. CEQA analysis is, therefore, concerned with a project’s impact on the environment, rather than the environment’s impact on a project, including its users or residents. Thus, with respect to geologic and seismic hazards, the City is not required to consider the effects of bringing people or structures into an area where such hazards exist, because the project itself would not worsen or otherwise affect the geologic conditions that create those risks. Nonetheless, in order to provide a complete picture of the Proposed Project, these impacts are discussed below.

⁵⁸ McLeod, S. 2018. Re: Paleontological resources for the proposed Clippers Arena Project, Project # 171236.00, in the City of Inglewood, Los Angeles County, project area. Letter response to Vanessa Ortiz. May 8, 2018.

⁵⁹ McLeod, S. 2018. Re: Paleontological resources for the proposed Clippers Arena Project, Project # 171236.00, in the City of Inglewood, Los Angeles County, project area. Letter response to Vanessa Ortiz. May 8, 2018.

⁶⁰ McLeod, S. 2018. Re: Paleontological resources for the proposed Clippers Arena Project, Project # 171236.00, in the City of Inglewood, Los Angeles County, project area. Letter response to Vanessa Ortiz. May 8, 2018.

⁶¹ Public Resources Code section 21003(e) states that “[t]o provide more meaningful public disclosure, reduce the time and cost required to prepare an environmental impact report, and focus on potentially significant effects on the environment of a proposed project, lead agencies shall, in accordance with Section 21100, focus the discussion in the environmental impact report on those potential effects on the environment of a proposed project which the lead agency has determined are or may be significant. Lead agencies may limit discussion on other effects to a brief explanation as to why those effects are not potentially significant.”

The Proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault. (No Impact)

No known active, sufficiently active, or well-defined faults have been recognized as crossing or being immediately adjacent to the Project Site.^{62,63} CGS does not delineate any part of the Project Site as being within an Alquist-Priolo Earthquake Fault Zone. The Alquist-Priolo Earthquake Fault Zone closest to the Project Site is the Newport-Inglewood Fault, located approximately 1.13 miles to the northwest.⁶⁴ Since there are no active faults on or adjacent to the Project Site, the Proposed Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving the rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the California State Geologist for the area. Further, there is no evidence that development of the Proposed Project would increase the frequency or effects of seismic activity in the area. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic groundshaking. (No Impact)

Strong Seismic Ground Shaking

The Project Site is located in a seismically active region with numerous active faults. The Newport-Inglewood Fault is the active fault closest to the Project Site, which is approximately 1.13 miles to the northwest.⁶⁵ Given the proximity of known faults, there is potential for high-intensity groundshaking associated with the earthquakes in this region. The intensity of such an event would depend on the causative fault and the distance to the epicenter, the strength and duration of shaking, and the nature of the geologic materials on which the Proposed Project would be constructed. The geologic material on which the Proposed Project would be constructed would be removed, compacted, or replaced as necessary pursuant to further subsurface investigations of areas where near-surface structures are planned.⁶⁶ All fill and backfill materials would be observed and tested by the geotechnical engineer prior to their use in order to evaluate their suitability. The properties of fill and backfill material that would be investigated may include grain size, shear strength, compressibility, expansion, compaction, and corrosivity characteristics.⁶⁷

⁶² A sufficiently active fault is “one that has evidence of Holocene surface displacement along one or more of its segments or branches.”

⁶³ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 16.

⁶⁴ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 16.

⁶⁵ AECOM, 2018. *Preliminary Geotechnical Report*, Project Condor, August 23, 2018. p. 16.

⁶⁶ AECOM, 2018. *Preliminary Geotechnical Report for Murphy’s Bowl LLC*. p. 22.

⁶⁷ AECOM, 2018. *Preliminary Geotechnical Report for Murphy’s Bowl LLC*. p. 24.

The structural elements of the Proposed Project would be required to undergo appropriate design-level geotechnical evaluations prior to final design and construction in accordance with CBC Chapter 18. Implementing the regulatory requirements of the most recent CBC (currently 2016, but the 2019 CBC will likely go into effect on January 1, 2020), County and City ordinances, the CGS Guidelines for Evaluating and Mitigating Seismic Hazards in California, and ensuring all buildings and structures are constructed in compliance with the law is the responsibility of the project engineers and building officials as also detailed in CBC Chapter 18. The proposed pedestrian footbridge would utilize cast-in-drilled-hole piles (CIDH) or spread footings. Construction of the pedestrian footbridge would undergo the same geotechnical investigations to ensure that the soil or fill is suitable to support the pedestrian footbridge; any unsuitable material would be excavated and compacted until suitable.⁶⁸ Compliance with the CBC and local ordinances would minimize the potential for damage from strong seismic ground shaking. The Proposed Project would not directly or indirectly expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking. Further, there is no evidence that development of the Proposed Project would increase the frequency or effects of seismic activity in the area. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. (No Impact)

Liquefaction occurs when saturated, granular soils within 50 feet of ground surface lose their inherent shear strength due to excess pore water pressure build-up, such as that generated during repeated cyclic loading from an earthquake. Factors that contribute to liquefaction include low relative density and loose consistency of soils, shallow groundwater tables, and long duration and high acceleration of seismic ground shaking. The Project Site is not within a liquefaction zone area as mapped by the CGS or as shown in the Earthquake Zones of Required Investigation Map, Inglewood Quadrangle, and the *Preliminary Geotechnical Report* indicated the potential for liquefaction was remote.⁶⁹ The historic high groundwater level beneath the Project Site is reported as more than 50 feet bgs, and the Project Site is characterized by the presence of dense to very dense and very stiff to hard soils.⁷⁰ The Proposed Project would not directly or indirectly expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction. Further, there is no evidence that development of the Proposed Project would increase the frequency or effects of seismic activity in the area. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

⁶⁸ AECOM, 2018. Preliminary Geotechnical Report for Murphy's Bowl LLC. p. 22.

⁶⁹ California Geological Survey, 1999. Earthquake Zones of Required Investigation Inglewood Quadrangle, released March 25, 1999. AECOM, 2018. Preliminary Geotechnical Investigation, September 14, 2018. p. 17.

⁷⁰ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

The Proposed Project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. (No Impact)

The Project Site and its surrounding area are relatively flat, with gentle slopes from east to west and north to south, depending on the parcel. The Project Site is not within areas designated by the State Geologist where previous landslide movement has occurred.⁷¹ The Project Site is also not mapped within areas designated as having the potential for seismically induced landslides.⁷² Local topographic, geological, geotechnical, and subsurface conditions indicate that the potential for permanent ground displacement, such as a landslide, is minimal.⁷³ The Proposed Project would not directly or indirectly expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides. Further, there is no evidence that development of the Proposed Project would increase the potential occurrence of landslides. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse. (No Impact)

Collapsible soils undergo settlement upon wetting, even without the application of additional load. Water weakens the bonds between soil particles and reduces the bearing capacity of the soil. Collapsible soils are typically lightly colored, have low plasticity, and relatively low densities. The Project Site fill soils are expected to be predominantly clayey, which are not soil properties that typically lead to collapsible soils.

Subsidence is the gradual settling or sinking of the ground, most often caused by the removal of water, oil, natural gas, or mineral resources from the ground. There is no historic evidence of subsidence in the City of Inglewood, and no major extraction of petroleum is planned in the vicinity of the Project Site in the future. While an existing groundwater well would be relocated as part of the Proposed Project, it would pump groundwater at the same rates as in the existing condition. As such, there would be no effect on unstable geologic units, including subsidence or liquefaction. The historic high groundwater level beneath the Project Site is reported as more than 50 feet bgs. Excavations of up to 35 feet bgs may be required during construction of the Proposed Project. Given the depth of excavation and the depth of groundwater, it is expected that no temporary dewatering would be required during construction of the Proposed Project; therefore, the risk of subsidence during construction and operation is minimal.

Lateral spread displacement can occur during strong earthquakes, especially when conditions such as free-face, sloping ground surfaces and liquefiable layers are present. The Project Site does

⁷¹ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

⁷² AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 18.

⁷³ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

not have unsupported free-face, sloping ground surfaces, and has a very low susceptibility of liquefaction. The risk of lateral spreading is minimal.

The Proposed Project would not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Proposed Project, and would not result in on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse. Further, there is no evidence that development of the Proposed Project would increase the potential for landslides, lateral spreading, subsidence, liquefaction, or collapse. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property. (No Impact)

Expansive soils are fine-grained soils that can undergo a significant increase in volume with an increase in water content and a significant decrease in volume with a decrease in water content. Changes in the water content of an expansive soil can result in severe distress to structures constructed upon the soil. The Project Site includes areas that are underlain by clayey soils that could exhibit expansion potential when not properly addressed during site preparation during construction.⁷⁴ The structural elements of the Proposed Project would be required to undergo appropriate design-level geotechnical evaluations prior to final design and construction, which would include all necessary measures, such as removal of expansive soils, if present, that would be replaced with engineered fill to ensure that expansive soil hazards are minimized. In addition, the Proposed Project would increase the amount of impervious surface on the Project Site, thereby reducing the amount of stormwater that directly percolates into the soil and reduces the potential for soil expansion. Implementing the regulatory requirements of the CBC, County, and City ordinances, the CGS *Guidelines for Evaluating and Mitigating Seismic Hazards in California*, and ensuring all buildings and structures are constructed in compliance with the law is the responsibility of the project engineers and building officials. Therefore, with implementation of the recommendations from the final design-level geotechnical report in accordance with building code requirements, would eliminate the potential for substantial direct or indirect risks to life or property from expansive soils. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

The Proposed Project would not have soils incapable of adequately supporting the use of septic tanks or alternative waste disposal systems where sewers are not available for the disposal of waste water. (No Impact)

The Proposed Project would not include the use or construction of any septic tank or alternative wastewater disposal systems. All proposed sewer impacts would involve connections to existing service systems, as discussed further in Section 3.15, Utilities and Service Systems. Thus, there

⁷⁴ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

Impacts and Mitigation Measures

Impact 3.6-1: Construction and operation of the Proposed Project could have the potential to result in the substantial erosion or the loss of topsoil. (Less than Significant with Mitigation)

Erosion of exposed soils can occur as a result of the forces of wind or water, and could be worsened through ground disturbing activities that take place during construction of the Proposed Project. Substantial earth work and excavation would occur during construction of the Proposed Project. Additionally, the Project Site would change from largely soil surfaces to developed hardscape areas.

Projects that disturb more than one acre of land during construction, such as the Proposed Project, are required to file a Notice of Intent with the State Water Resources Control Board (SWRCB) to be covered under the National Pollution Discharge Elimination System (NPDES) Construction General Permit for discharges of stormwater associated with construction activity (also discussed further in Section 3.9, Hydrology and Water Quality). In addition, City of Inglewood Municipal Code Chapter 10, Article 16, section 10-208(H.1) (Low Impact Development Requirements for New Development and Redevelopment) establishes that the City is required to evaluate the consistency of the Proposed Project with the NPDES regional municipal separate storm sewer system (MS4) Permit (discussed further in Section 3.9, Hydrology and Water Quality) and erosion and grading requirements of the City Building Official or Authorized Enforcement Officer. The City has the discretion to impose conditions upon the issuance of the building permit, in addition to any required by the State Construction General Permit for the Proposed Project, in order to minimize the flow of pollutants into the City's municipal stormwater system.

In addition, in compliance with Municipal Code section 10-208, the project applicant would be required to prepare and submit to the City a Low Impact Development (LID) Report (a draft of which can be found in Appendix Q to this EIR), which would implement LID standards and practices for stormwater pollution mitigation consistent with the County's LID Standards Manual. The LID Report serves to demonstrate the compliance of the Proposed Project with the MS4 Permit.

As part of the Construction General Permit, prior to construction of the Proposed Project, the project applicant would be required to prepare a SWPPP, which would describe BMPs that would be implemented to reduce runoff and subsequent erosion. The SWRCB also issues the NPDES MS4 Permit. The MS4 permit imposes a number of basic programs, called Minimum Control Measures, on all permittees in order to maintain a level of acceptable runoff conditions through the implementation of practices, devices, or designs generally referred to as BMPs, that mitigate stormwater quality problems, including erosion, during construction and operational phases of a project. The SWPPP would include erosion and sediment control BMPs to minimize the potential for erosion and sedimentation to occur during construction. BMPs would include, but would not

be limited to, filtering runoff during construction, avoiding heavy grading and earthwork operations during the rainy season, and incorporating landscaping as early as possible. In addition, prior to receiving grading and building permits from the City, the project applicant would be required to prepare a final design-level geotechnical report, which requires recommendations for surface and subsurface drainage, slope stabilization, erodible soils, and compliance with City drainage requirements. During construction of the Proposed Project, all activities would also be required to adhere to the applicable BMPs that would be prescribed in order to prevent erosion and runoff during construction.

Following construction of the Proposed Project, it is estimated that approximately 90 percent of the Project Site would be covered by impervious surfaces (an increase from approximately 15 percent under existing conditions). During operation of the Proposed Project, most of the Project Site would be covered with impervious surfaces such as asphalt or concrete that include required drainage control measures consistent with NPDES MS4 requirements (see Section 3.9, Hydrology and Water Quality) such that the Proposed Project would not result in substantial erosion or loss of topsoils. Further, through compliance with the County's LID⁷⁵ Standards Manual, the Proposed Project would utilize a combination of County standard bio-filtration planters and bio-filtration systems to treat the stormwater. Runoff would be directed from drainage areas to on-site biofiltration plants and bio-swales. The bio-filtration systems would be designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to mimic pre-developed conditions. Given the developed nature of the Proposed Project, the Project Site would not be readily susceptible to erosion.⁷⁶ However, because a final LID Report and SWPPP have not yet been approved by the City or Los Angeles RWQCB and the City, construction impacts would be **potentially significant**. Erosion is also discussed in Section 3.9, Hydrology and Water Quality, under Impact 3.9-3.

Mitigation Measure 3.6-1

Implement Mitigation Measure 3.9-1(a) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB).

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.6-1, the Proposed Project would comply with the MS4 permit regulations, NPDES General Construction Permit, Inglewood Municipal Code regulation, the County's LID Standards manual, and the USGBC's LEED Program. In addition, an LID Plan and SWPPP will be prepared to the satisfaction of the City and Los Angeles RWQCB. Therefore, the Proposed Project would not result in substantial erosion or the loss of topsoil. Thus, this impact would be considered **less than significant**.

⁷⁵ Low Impact Development features are systems and practices that use or mimic natural processes to all stormwater runoff to infiltrate, evapotranspire or reuse stormwater in order to protect water quality and retain runoff on site.

⁷⁶ AECOM, 2018. *Preliminary Geotechnical Report*, September 14, 2018. p. 11.

Impact 3.6-2: Construction of the Proposed Project could have the potential to directly or indirectly destroy a unique paleontological resource or site or unique geologic feature. (Less than Significant with Mitigation)

A direct effect on a unique paleontological resource would result in the direct damage or destruction of such a resource. Indirect impacts are not specifically caused by a development project, but may be a reasonably foreseeable result of such a project. Typical indirect impacts to paleontological resources include the destruction or loss of surface fossils from increased erosion or the non-scientific or unauthorized surface collection or subsurface excavation of a fossil or paleontological site. Following the guidelines of the SVP,^{77,78} a review of the scientific literature and geologic mapping, as well as and the records search from Natural History Museum, were used to assign paleontological sensitivities to the geologic units present in the subsurface of the Project Site that would be subject to ground-disturbing activities. As noted above in Section 3.6.1, the *Preliminary Geotechnical Report* determined that the site is underlain by approximately 5 to 10 feet of artificial fill materials before alluvial soils are encountered. As a result of this study, the subsurface sediments of the Project Site identified as Older Quaternary Alluvium, present at depths ranging from 30 to 40 feet bgs, are assigned high paleontological sensitivity, as they have a proven record throughout Los Angeles of containing scientifically significant fossils. Although no known resources were identified within the Project Site from the Natural History Museum search, this does not preclude the possibility that previously unknown buried paleontological resources within the Project Site could be impacted during construction. The potential to encounter paleontological resources during construction was determined by reviewing the results of the records search, the depth of native versus fill soils, land use history, past disturbances, and the proposed excavation parameters for the Proposed Project.

A wide variety of Ice Age fossils are known from the Older Alluvium sediments across the Los Angeles Basin, as reviewed above in Section 3.6.1, including multiple specimens belonging to ten taxa known from within 2 to 4 miles of the Project Site.⁷⁹ Excavation during construction within the Arena Site, the West Parking Garage Site, and the East Transportation and Hotel Site, is planned at depths of up to 35 feet bgs, which could impact Older Quaternary Alluvium determined to have a high sensitivity for fossils. As a result, construction of the Proposed Project would have the potential to directly or indirectly destroy a previously unknown unique paleontological resource not identified in the analysis conducted for the Proposed Project. This would be considered a **potentially significant impact**.

⁷⁹ McLeod, S., 2018. Re: Paleontological resources for the proposed Clippers Arena Project, Project # 171236.00, in the City of Inglewood, Los Angeles County, project area. Letter response to Vanessa Ortiz. May 8, 2018.

Mitigation Measure 3.6-2

A qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards (SVP, 2010) shall be retained by the project applicant and approved by the City prior to the approval of grading permits. The qualified paleontologist shall:

- a) Prepare, design, and implement a monitoring and mitigation program for the Project consistent with Society of Vertebrate Paleontology Guidelines. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project Site, data recovery (including halting or diverting construction so that fossil remains can be salvaged in a timely manner), fossil treatment, procurement, and reporting. The Plan monitoring and mitigation program shall be prepared and approved by the City prior to the issuance of the first grading permit. If the qualified paleontologist determines that the Project-related grading and excavation activity will not affect Older Quaternary Alluvium, then no further mitigation is required.*
- b) Conduct construction worker paleontological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Plan as outlined in (a). In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. The training session shall provide instruction on the recognition of the types of paleontological resources that could be encountered within the Project Site and the procedures to be followed if they are found. Documentation shall be retained by the qualified paleontologist demonstrating that the appropriate construction personnel attended the training.*
- c) Direct the performance of paleontological resources monitoring by a qualified paleontological monitor (meeting the standards of the SVP, 2010). Paleontological resources monitoring shall be conducted pursuant to the monitoring and mitigation program developed under (a), above. Monitoring activities may be altered or ceased if determined adequate by the qualified paleontologist. Monitors shall have the authority to, and shall temporarily halt or divert work away from exposed fossils or potential fossils, and establish a 50-foot radius temporarily halting work around the find. Monitors shall prepare daily logs detailing the types of ground disturbing activities and soils observed, and any discoveries.*
- d) If fossils are encountered, determine their significance, and, if significant, supervise their collection for curation. Any fossils collected during Project-related excavations, and determined to be significant by the qualified paleontologist, shall be prepared to the point of identification and curated into an accredited repository with retrievable storage.*
- e) Prepare a final monitoring and mitigation report for submittal to the City in order to document the results of the paleontological monitoring. If there are significant discoveries, fossil locality information and final disposition shall be included with the final report which will be submitted to the appropriate repository and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that could affect Older Quaternary Alluvium.*

Level of Significance After Mitigation: Implementation of Mitigation Measure 3.6-2 would ensure that paleontological resources would be identified before they are damaged or destroyed, and are properly evaluated and treated. Thus, the impact would be considered **less than significant**.

Cumulative Impacts

The geographic scope considered for the cumulative analysis for the issue of erosion and loss of topsoil is the Torrance Plain, which is the alluvial plain located within the southwest block of the Los Angeles Basin. The Torrance Plain was developed by uplift and deposition of sediments derived from the erosion of the uplands including the Santa Monica Mountains.⁸⁰ The geographic scope for paleontology resources is the Southwestern Block of the Los Angeles Basin, which is one of four structural blocks in the Basin that contains the Project Site. According to geologic mapping, the Southwestern Block includes the Pleistocene-age (2.58 million to 11,700 years ago) Older Alluvium, which has a rich fossil history in the Los Angeles Basin.

Impact 3.6-3: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could have the potential to result in substantial erosion or loss of topsoil. (Less than Significant with Mitigation)

Development activities associated with the cumulative projects found in Table 3.0-2, many of which are located within the Torrance Plain, include past, present, and reasonably foreseeable projects that have construction components, such as earthwork activities. These ground disturbing activities could expose soils in a manner that lead to increased erosion if not managed properly. Such erosion could cause unstable ground surfaces and result in eventual damage to roads, foundations and other improvements. Cumulative effects of increased erosion on receiving water quality is addressed in Section 3.9, Hydrology and Water Quality, Impact 3.9-7.

Construction activities at the Project Site, as well as other current and future cumulative projects greater than 1 acre in size, which would apply to the vast majority of the cumulative projects, are required to comply with the NPDES Construction General Permit, which contains erosion control requirements that would minimize the potential for soil erosion. The NPDES program requires the preparation and implementation of stormwater pollution prevention programs (SWPPPs) for construction activities that include BMPs that ensure erosion control measures are included during construction. All cumulative projects, including the Proposed Project, would be required to comply with these regulations, as would other nearby reasonably foreseeable development and other construction projects. In addition, once construction is completed, the cumulative projects, such as the apartment developments, commercial developments, hotels, and office complexes, and various other developments identified in Table 3.0-2, would generally include the cover of site soils with either landscaping or impervious surfaces, which limits the potential for erosion.

⁸⁰ AECOM, 2018. Preliminary Geotechnical Investigation, September 14, 2018, p. 10.

As shown in Figure 3.0-1, the cumulative projects that are located throughout the Torrance Plain are primarily within urban areas and within highly developed areas where previous development has disturbed surface soils to the point where native topsoil has largely been reworked or covered by artificial fill similar to the Project Site. As noted above, the *Preliminary Geotechnical Report* determined that the Project Site is underlain by approximately 5 to 10 feet of artificial fill materials. Therefore, considering that the Project Site is underlain by artificial fill at the surface, there would be no potential for the Proposed Project to contribute to a cumulative impact related to loss of topsoil. However, if not constructed or designed appropriately, the Proposed Project, in conjunction with cumulative projects within the larger region, could result in substantial erosion. Therefore, the cumulative impact would be **potentially significant**.

Mitigation Measure 3.6-3

Implement Mitigation Measure 3.9-1(a) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB).

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.6-3, the Proposed Project would comply with the MS4 permit regulations, NPDES General Construction Permit, Inglewood Municipal Code regulation, the County's LID Standards manual, and the USGBC's LEED Program. In addition, an LID Report and SWPPP will be prepared to the satisfaction of the City and Los Angeles RWQCB. Therefore, the Proposed Project would not have a considerable contribution to a cumulative impact related to erosion or loss of topsoil and would be considered **less than significant**.

Impact 3.6-4: Construction of the Proposed Project, in conjunction with other cumulative development, could have the potential to contribute to cumulative impacts on paleontological resources. (Less than Significant with Mitigation)

Projects within the vicinity of the Proposed Project and within the Southwestern Block of the Los Angeles Basin could also be within Quaternary-age terrestrial and shallow marine sediments overlying Tertiary-age marine sediments, which have been found to contain significant fossil resources. The majority of the current and future development contained with Table 3.0-2 includes subsurface disturbances for the construction of foundations and utilities, which increases the likelihood that paleontological resources could be uncovered, and it is therefore possible that cumulative development would result in the demolition or destruction of significant paleontological resources. This potential loss of resources is considered a significant cumulative impact. The Proposed Project could contribute to this impact if paleontological resources are located beneath the Project Site and damaged or destroyed during the excavation process. In that event, the Proposed Project contribution to the significant cumulative impact would be cumulatively considerable and impacts would be **potentially significant**.

Mitigation Measure 3.6-4

Implement Mitigation Measure 3.6-2. (Paleontological Monitoring and Mitigation Plan).

Level of Significance After Mitigation: Mitigation Measure 3.6-4 would lessen the Proposed Project contribution to the loss of paleontological resources by requiring that work stop if such resources are discovered until the resource can be evaluated, collected, properly treated, and curated with accredited repository with retrievable storage. With implementation of this mitigation measure, the Proposed Project contribution to the cumulative loss of paleontological resources would be less than cumulatively considerable, and, therefore, this cumulative impact would be **less than significant**.

3.7 Greenhouse Gas Emissions

This section addresses the potential impacts of greenhouse gas (GHG) emissions from the proposed Inglewood Basketball and Entertainment Center (IBEC, or Proposed Project). The section contains: (1) a description of the local setting of the Project Site and surrounding areas to establish baseline conditions; (2) a summary of the relationship between GHG emissions and global climate change; (3) an overview of applicable plans, policies, and regulations related to GHG emissions; (4) an assessment of current GHG emissions at the City, State, national, and global levels; (5) a quantitative analysis of future GHG emissions associated with construction and operation of the Proposed Project; and (6) an analysis of the consistency of the Proposed Project with applicable regulations, plans, and policies to reduce GHGs as set forth by the State of California, South Coast Air Quality Management District (SCAQMD), Southern California Association of Governments (SCAG) and the City of Inglewood (City).

Comments received in response to the NOP for the EIR regarding GHG emissions can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to GHG emissions that were raised in comments on the NOP are analyzed within this section.

The analysis included in this section was developed based on Project-specific construction and operational features described in Chapter 2, Project Description.

3.7.1 Environmental Setting

GHG Fundamentals

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation and storms. Historical records indicate that global climate changes have occurred in the past due to natural phenomena; however, current data increasingly indicate that the current global conditions differ from past climate changes in rate and magnitude. Global climate change attributable to anthropogenic (human) GHG emissions is currently one of the most important and widely debated scientific, economic and political issues in the United States and the world. The extent to which increased concentrations of GHGs have caused or will cause climate change and the appropriate actions to limit and/or respond to climate change are the subject of significant and rapidly evolving regulatory efforts at the federal and state levels of government.

GHGs are compounds in the Earth's atmosphere that play a critical role in determining temperature near the Earth's surface. More specifically, these gases allow high-frequency shortwave solar radiation to enter the Earth's atmosphere, but retain some of the low frequency infrared energy that otherwise is radiated back from the Earth towards space, resulting in a warming of the atmosphere.

Not all GHGs possess the same capacity to induce atmospheric warming; as a result, the warming contribution of a GHG is commonly quantified in the common unit of carbon dioxide equivalent

(CO₂e) over a 100-year period, by applying the appropriate global warming potential (GWP) value.¹ By using the applicable GWP for each GHG, Project-related emissions can be tabulated in the common unit of metric tons per year CO₂e. GWP ratios are provided by the Intergovernmental Panel on Climate Change (IPCC). Historically, GHG emission inventories were calculated using the GWPs from the IPCC's Second Assessment Report (SAR), published in 1996. The IPCC has since updated the GWP values based on the latest science in its Fourth Assessment Report (AR4)² and Fifth Assessment Report (AR5),³ published in 2007 and 2014, respectively. California Air Resources Board (CARB) uses the AR4 GWPs in the statewide GHG emissions inventory,⁴ in the current Climate Change Scoping Plan,⁵ and in the current version of the California Emissions Estimator Model (CalEEMod®)⁶ that is used to calculate CO₂e values for construction as well as operations for existing and Proposed Project build-out conditions. Compounds that are regulated as GHGs are discussed below.

Carbon Dioxide (CO₂): CO₂ is the most abundant anthropogenic GHG in the atmosphere and is primarily generated from fossil fuel combustion from stationary and mobile sources. CO₂ is the reference gas (GWP of 1) for determining the GWPs of other GHGs. CO₂ accounted for approximately 83 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Methane (CH₄): CH₄ is emitted from biogenic sources (i.e., resulting from the activity of living organisms), incomplete combustion in forest fires, anaerobic decomposition of organic matter in landfills, manure management, and leaks in natural gas pipelines. The GWP of CH₄ is 25 in the IPCC AR4. CH₄ accounted for approximately 9 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Nitrous Oxide (N₂O): N₂O produced by human-related sources including agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuel, adipic acid production, and nitric acid production. The GWP of N₂O is 298 in the IPCC AR4. N₂O emissions accounted for approximately 3 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Hydrofluorocarbons (HFCs): HFCs are fluorinated compounds consisting of hydrogen, carbon, and fluorine. They are typically used as refrigerants in both stationary refrigeration and mobile air

- ¹ GWPs and associated CO₂e values were developed by the IPCC, and published in its Second Assessment Report (SAR) in 1996. Historically, GHG emission inventories have been calculated using the GWPs from the IPCC's SAR. The IPCC updated the GWP values based on the latest science in its AR4. The CARB reports GHG emission inventories for California using the GWP values from the IPCC AR4.

conditioning systems. The GWPs of HFCs range from 124 for HFC-152a to 14,800 for HFC-23 in the IPCC AR4. HFCs and PFCs (see below) combined accounted for approximately 5 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Perfluorocarbons (PFCs): PFCs are fluorinated compounds consisting of carbon and fluorine. They are primarily created as a byproduct of aluminum production and semiconductor manufacturing. The GWPs of PFCs range from 7,390 to 17,700 in the IPCC AR4.

Sulfur Hexafluoride (SF₆): SF₆ is a fluorinated compound consisting of sulfur and fluoride. It is a colorless, odorless, nontoxic, nonflammable gas. It is most commonly used as an electrical insulator in high voltage equipment that transmits and distributes electricity. SF₆ has a GWP of 22,800 in the IPCC AR4. SF₆ emissions accounted for less than 1 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Effects of Global Climate Change

The scientific community's understanding of the fundamental processes responsible for global climate change has improved over the past decade, and its predictive capabilities are advancing. However, there remain scientific uncertainties in, for example, predictions of local effects of climate change, occurrence, frequency, and magnitude of extreme weather events, effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. Due to the complexity of and inability to accurately model Earth's climate system, the uncertainty surrounding climate change may never be completely eliminated. Nonetheless, the IPCC's AR5 states that it is extremely likely that the dominant cause of the observed warming since the mid-20th century is the anthropogenic increase in GHG concentrations.⁷ A report from the National Academy of Sciences concluded that 97 to 98 percent of the climate researchers most actively publishing in the field support the tenets of the IPCC in that climate change is very likely caused by human (i.e., anthropogenic) activity.⁸

The Fourth California Climate Change Assessment (Fourth Assessment), published in 2018, found that the potential impacts in California due to global climate change include: loss in snow pack; sea-level rise; more extreme heat days per year; more high ozone days; more extreme forest fires; more severe droughts punctuated by extreme precipitation events; increased erosion of California's coastlines and sea water intrusion into the Sacramento and San Joaquin Deltas and associated levee systems; and increased pest infestation.⁹ The Fourth Assessment's findings are consistent with climate change studies published by the California Natural Resources Agency

(CNRA) since 2009, starting with the *California Climate Adaptation Strategy*¹⁰ as a response to the Governor's Executive Order S-13-2008. In 2014, the CNRA rebranded the first update of the 2009 adaptation strategy as the *Safeguarding California Plan*.¹¹ The 2018 update to *Safeguarding California Plan* identifies hundreds of ongoing actions and next steps state agencies are taking to safeguard Californians from climate impacts within a framework of 81 policy principles and recommendations.¹²

In 2016, the CNRA released *Safeguarding California: Implementation Action Plans* in accordance with Executive Order B-30-15, identifying a lead agency to lead adaptation efforts in each sector. In accordance with the 2009 *California Climate Adaptation Strategy*, the California Energy Commission (CEC) was directed to develop a website on climate change scenarios and impacts that would be beneficial for local decision makers. The website, known as Cal-Adapt, became operational in 2011.¹³ The information provided on the Cal-Adapt website represents a projection of potential future climate scenarios comprised of local average values for temperature, sea-level rise, snowpack and other data representative of a variety of models and scenarios, including potential social and economic factors.

Below is a summary of some of the potential effects that could be experienced in California as a result of global warming and climate change.

Temperature Increase

The primary effect of adding GHGs to the atmosphere has been a rise in the average global temperature. The impact of human activities on global temperature is readily apparent in the observational record. Since 1895, the contiguous US has observed an average temperature increase of 1.5°F per century. The last 5-year period (2014–2018) is the warmest on record for the contiguous US,¹⁴ while the 20 warmest years have occurred over the past 22-year period.¹⁵

The Fourth Assessment indicates that average temperatures in California could rise 5.6°F to 8.8°F by the end of the century, depending on the global trajectory of GHG emissions.¹⁶ According to the Cal-Adapt website, the portion of the state in which the Project Site is located could result in an average increase in temperature of approximately 4.2° to 6.9°F by 2070–2090, compared to the baseline period of 1961–1990.

¹⁶ Governor's Office of Planning and Research, 2018. *California's Fourth Climate Change Assessment: Statewide Summary Report*. August 2018.

With climate change, extreme heat conditions and heat waves are predicted to impact larger areas, last longer, and have higher temperatures. Heat waves, defined as three or more days with temperatures above 90°F, are projected to occur more frequently by the end of the century. Extreme heat days and heat waves can negatively impact human health. Heat-related illness includes a spectrum of illnesses ranging from heat cramps to severe heat exhaustion and life-threatening heat stroke.¹⁷

Wildfires

The hotter and dryer conditions expected with climate change will make forests more susceptible to extreme wildfires. One study found that, if GHG emissions continue to rise, the frequency of extreme wildfires burning over approximately 25,000 acres would increase by nearly 50 percent, and the average area burned statewide each year would increase by 77 percent, by the year 2100. In the areas that have the highest fire risk, wildfire insurance is estimated to see costs rise by 18 percent by 2055 and the fraction of property insured would decrease.¹⁸

Air Quality

Higher temperatures, conducive to air pollution formation, could worsen air quality in California and make it more difficult for the state to achieve air quality standards. Climate change may increase the concentration of ground-level ozone in particular, which can cause breathing problems, aggravate lung diseases such as asthma, emphysema, chronic bronchitis, and cause chronic obstructive pulmonary disease (COPD) but the magnitude of the effect, and therefore, its indirect effects, are uncertain. Emissions from wildfires can lead to excessive levels of particulate matter, ozone, and volatile organic compounds.¹⁹ Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state.²⁰

Precipitation and Water Supply

There is a high degree of uncertainty with respect to the overall impact of global climate change on future water supplies in California. Studies indicate considerable variability in predicting precise impacts of climate change on California hydrology and water resources. Increasing uncertainty in the timing and intensity of precipitation will challenge the operational flexibility of California's water management systems. Warmer, wetter winters would increase the amount of runoff available for groundwater recharge; however, this additional runoff would occur at a time

when some basins are either being recharged at their maximum capacity or are already full. Conversely, reductions in spring runoff and higher evapotranspiration because of higher temperatures could reduce the amount of water available for recharge.²¹

Hydrology and Sea-Level Rise

As discussed above, climate changes could potentially affect: the amount of snowfall, rainfall and snow pack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide and high runoff events); sea-level rise and coastal flooding; coastal erosion; and the potential for salt water intrusion. Sea-level rise can be a product of global warming through two main processes: expansion of seawater as the oceans warm, and melting of ice over land. A rise in sea levels could result in coastal flooding and erosion and could jeopardize California's water supply. Sea level could rise as much as 2 feet along most of the US coastline. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events.²²

Agriculture

California has a massive agricultural industry that represents 11.3 percent of total US agricultural revenue. Higher CO₂ levels can stimulate plant production and increase plant water-use efficiency. However, a changing climate presents significant risks to agriculture due to “potential changes to water quality and availability; changing precipitation patterns; extreme weather events including drought, severe storms, and floods; heat stress; decreased chill hours; shifts in pollinator lifecycles; increased risks from weeds, pest and disease; and disruptions to the transportation and energy infrastructure supporting agricultural production.”²³

Ecosystems and Wildlife

Increases in global temperatures and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increased concentrations of GHGs are likely to accelerate the rate of climate change. Scientists expect that the average global surface temperature could rise by 2–11.5°F (1.1–6.4°C) by 2100, with significant regional variation.²⁴ Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. With climate change, ecosystems and wildlife will be challenged by the spread of invasive species, barriers to species migration or movement in response to changing climatic

conditions, direct impacts to species health, and mismatches in timing between seasonal life-cycle events such as species migration and food availability.²⁵

Existing Conditions

Global Emissions

Global estimates are based on country inventories developed as part of programs of the United Nations Framework Convention on Climate Change (UNFCCC). Worldwide man-made emissions of GHGs were approximately 49 billion metric tons CO₂e in 2010, including ongoing emissions from industrial and agricultural sources and emissions from land use changes (e.g., deforestation). Emissions of CO₂, primarily from fossil fuel use and industrial processes, account for 76 percent of total GHG (CO₂e) emissions. Methane emissions account for 16 percent and N₂O emissions for 6.2 percent. Worldwide emissions of GHGs in 1970 were 27 billion metric tons of CO₂e per year.²⁶

US Emissions

In 2017, the United States emitted about 6,457 million metric tons (MMT) of CO₂e, with 76.1 percent of those emissions coming from fossil fuel combustion. Of the major sectors nationwide, transportation accounts for the highest amount of GHG emissions (approximately 29 percent), followed by electricity (28 percent), industry (22 percent), agriculture (9 percent), commercial buildings (6 percent), and residential buildings (5 percent). Between 1990 and 2017, total US GHG emissions rose by 1.3 percent, but emissions have generally decreased since peaking in 2005. Since 1990, US emissions have increased at an average annual rate of 0.4 percent.²⁷

California Greenhouse Gas Emissions Inventory

CARB compiles GHG inventories for the state. Based on the 2016 GHG inventory data (i.e., the latest year for which data are available from CARB) prepared by CARB in 2018, California emitted 429.4 MMTCO₂e including emissions resulting from imported electrical power.²⁸ Between 1990 and 2016, the population of California grew by approximately 9.4 million (from 29.8 to 39.2 million).²⁹ This represents an increase of approximately 31 percent from 1990 population levels. In addition, the California economy, measured as gross state product, grew from \$773 billion in 1990 to \$2.26 trillion in 2016 representing an increase of approximately

292 percent (almost three times the 1990 gross state product) in today’s dollars.³⁰ Despite the population and economic growth, CARB’s 2016 statewide inventory indicated that California’s net GHG emissions in 2016 were just below 1990 levels, which is the 2020 GHG reduction target codified in California Health and Safety Code (HSC), Division 25.5, also known as The Global Warming Solutions Act of 2006 (AB 32). **Table 3.7-1** identifies and quantifies statewide anthropogenic GHG emissions and sinks (e.g., carbon sequestration due to forest growth) in 1990 and 2016. As shown in the table, the transportation sector is the largest contributor to statewide GHG emissions at approximately 39 percent in 2016.

**TABLE 3.7-1
 STATE OF CALIFORNIA GREENHOUSE GAS EMISSIONS**

Category	Total 1990 Emissions Using IPCC SAR (MMTCO ₂ e)	Percent of Total 1990 Emissions	Total 2016 Emissions Using IPCC AR4 (MMTCO ₂ e)	Percent of Total 2016 Emissions
Transportation	150.7	35%	169.4	39%
Electric Power	110.6	26%	68.6	16%
Commercial Fuel Use	14.4	3%	15.2	4%
Residential	29.7	7%	24.2	6%
Industrial	103.0	24%	89.6	21%
Recycling and Waste ^a	–	–	8.8	2%
High GWP/Non-Specified ^b	1.3	<1%	19.8	5%
Agriculture/Forestry	23.6	6%	33.8	8%
Forestry Sinks	-6.7	-2%	— ^c	—
Net Total (IPCC SAR)	426.6	100%^e	—	—
Net Total (IPCC AR4)^d	431	100%^e	429.4	100%^e

NOTES:

- ^a Included in other categories for the 1990 emissions inventory.
- ^b High GWP gases are not specifically called out in the 1990 emissions inventory.
- ^c Revised methodology under development (not reported for 2012).
- ^d CARB revised the state’s 1990 level GHG emissions using GWPs from the IPCC AR4.
- ^e Total of individual percentages may not add up to 100% due to rounding

City of Inglewood Greenhouse Gas Emissions Inventory

The South Bay Cities Council of Governments (SBCCOG) received funding from Southern California Edison’s 2013-2014 Local Government Partnership Strategic Plan Pilots program to assist local governments within the South Bay sub-region perform inventories of local GHG

³⁰ California Department of Finance, 2018. Gross State Product. Available: http://www.dof.ca.gov/Forecasting/Economics/Indicators/Gross_State_Product/. Accessed February 8, 2019. Amounts are based on current dollars as of the date of the report (May 2018).

emissions and develop GHG reduction programs and policies. As a member of the SBCCOG, the City collaborated with the SBCCOG to develop inventories of community-wide GHG emissions for the years 2005 and 2007.³¹ Additionally, the City developed a community-wide inventory for 2010 as reported in the 2013 Inglewood Energy and Climate Action Plan.³² **Table 3.7-2, *City of Inglewood GHG Emissions by Sector: 2005 to 2010***, is a summary of the City’s emissions from each sector for the years 2005, 2007 and 2010 and the percent change from 2005 to 2010. As shown in Table 3.7-2, the City’s community and municipal GHG emissions decreased approximately 2.7 percent from 2005 to 2010, falling from 610,910 MTCO_{2e} in 2005 to 594,273 MTCO_{2e} in 2010.

**TABLE 3.7-2
 CITY OF INGLEWOOD GHG EMISSIONS BY SECTOR: 2005 TO 2010 (MTCO_{2e})**

Sector	2005	2007	2010	2010 % of total	Percent Change (2005–2010)
Transportation	320,254	311,853	322,042	54.2%	+0.6%
Residential Energy	124,872	123,062	122,429	20.6%	-2.0%
Commercial/Municipal Energy	97,176	99,458	95,261	16.0%	-2.0%
Industrial Energy	34,940	31,272	26,100	4.4%	-25.3%
Solid Waste	19,855	16,841	16,448	2.8%	-17.2%
Water	13,813	13,272	11,993	2.0%	-13.2%
Total	610,910	595,758	594,273	100%	-2.7%

SOURCE: City of Inglewood, *Inglewood Energy and Climate Action Plan* (2013).

The City’s Community-wide emissions were categorized in six sectors: Transportation, Residential Energy, Commercial/Municipal Energy, Industrial Energy, Solid Waste, and Water.

- **Transportation** includes emissions from vehicles traveling (wholly or partially) within the City, and emissions from operating off-road vehicles and equipment (e.g., lawn and garden equipment, construction equipment, industrial equipment, and light commercial equipment).
- **Residential Energy** includes emissions from electricity and natural gas consumption in residential buildings.
- **Commercial/Municipal Energy** includes emissions from electricity and the on-site combustion of natural gas and fuel use in nonresidential buildings and city facilities (including outdoor lighting).
- **Industrial Energy** includes emissions from electricity and the on-site combustion of natural gas and fuel use in industrial buildings and facilities.
- **Solid Waste** includes emissions from solid waste that is generated in the community and sent to landfills.

³¹ South Bay Cities Council of Governments, 2011. *City of Inglewood Community Greenhouse Gas Emissions Inventory Report*. Available: http://www.southbaycities.org/sites/default/files/documents/inventories/Inglewood_Community_Inventory.pdf. Accessed March 10, 2019.

³² City of Inglewood, 2013, *Inglewood Energy and Climate Action Plan*. Available: <https://www.cityofinglewood.org/225/Sustainability>. Accessed Feb 15, 2019. March 2013.

- **Water** includes emissions from the electricity used to source, treat, and deliver imported water in the community that is not accounted for in the community utility data.

As shown in Table 3.7-2, the transportation sector was the largest contributor to the most recent inventory (2010) at over 54 percent of the total. Residential Energy consumption is the second-largest contributor to emissions at 20.6 percent of the total, followed by Commercial/Municipal Energy (16 percent), Industrial Energy (4.4 percent), Solid Waste (2.8 percent), and Water (2 percent).

Existing Project Site

The entire Project Site is comprised of approximately 28 acres of land. All but six of the parcels that make up the Project Site are currently vacant. The vacant parcels within the Project Site total approximately 23 acres, or more than 85 percent of the Project Site. The six developed parcels include a fast food restaurant (on a privately owned parcel), a motel (on a privately owned parcel), a warehouse and light manufacturing facility (on two privately owned parcels), a commercial catering business (on a privately owned parcel), and a groundwater well and related facilities (on a City-owned parcel) that would be relocated on site during Proposed Project operations.

GHG emissions are currently associated with vehicle trips to and from the existing land uses at the Project Site (on-road mobile sources), on-site combustion of natural gas for heating and cooking, on-site combustion emissions from landscaping equipment (area source), off-site combustion of fossil fuels for electricity, and off-site emissions from solid waste decomposition, water conveyance, and wastewater treatment. The existing GHG emissions at the Project Site are estimated to be approximately 1,119 MTCO_{2e} per year, as shown in Table 3.7-6, below, generated primarily from transportation sources.

Existing Uses Relocating to Project Site

The existing off-site LA Clippers Team Offices, which are currently located at 1212 South Flower Street, Los Angeles, California, and the existing off-site LA Clippers practice and athletic training facility, which is located in the Playa Vista neighborhood within Los Angeles, at 6854 South Centinela Avenue, would be relocated to the Project Site upon completion of construction. The existing GHG emissions from off-site uses are estimated to be 1,333 MTCO_{2e} per year, as shown in Table 3.7-6, generated primarily from transportation sources.

3.7.2 Adjusted Baseline Environmental Setting

Section 3.7, Greenhouse Gas Emissions, assumes the Adjusted Baseline as described in Section 3.0, Introduction to the Analysis. Analysis of GHG emissions is cumulative in nature because global climate change effects are caused by cumulative global emissions. Although the Hollywood Park Specific Plan project will be constructed and in operation prior to opening of the Proposed Project, its potential impact on global emissions would not affect the threshold of significance or the impact analysis regarding GHG emissions from the Proposed Project. For this reason, the Adjusted Baseline is not relevant to the GHG impact analysis for the Proposed

Project. No other changes to the existing environmental setting related to GHG emissions would occur under the Adjusted Baseline.

3.7.3 Regulatory Setting

This section provides a summary of pertinent federal, State, and local GHG laws, executive orders, regulations, and policies.

Federal

US Environmental Protection Agency “Endangerment” and “Cause or Contribute” Findings

In *Massachusetts v. Environmental Protection Agency*, 549 U.S. 497 (2007), twelve states and cities, including California, together with several environmental organizations, sued to require the US EPA to regulate GHGs as pollutants under the Federal Clean Air Act (CAA). The US Supreme Court ruled that GHGs fit within the CAA’s definition of a pollutant and the US Environmental Protection Agency (EPA) had the authority to regulate GHGs.

On December 7, 2009, the US EPA Administrator signed two distinct findings regarding GHGs under CAA section 202(a):

- **Endangerment Finding:** The current and projected concentrations of the six key GHGs—CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆—in the atmosphere threaten the public health and welfare of current and future generations.
- **Cause or Contribute Finding:** The combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

These findings did not, by themselves, impose any requirements on industry or other entities. However, these actions were a prerequisite for implementing GHG emissions standards for motor vehicles.

Mandatory Greenhouse Gas Reporting Rule

On September 22, 2009, the US EPA released its final Greenhouse Gas Reporting Rule (Reporting Rule). The Reporting Rule was a response to the fiscal year (FY) 2008 Consolidated Appropriations Act (H.R. 2764; Public Law 110-161), that required the US EPA to develop “... mandatory reporting of GHGs above appropriate thresholds in all sectors of the economy ...” The Reporting Rule applied to most entities that emit 25,000 MTCO₂e or more per year at their facility from stationary sources. Starting in 2010, facility owners were required to submit an annual GHG emissions report with detailed calculations of facility GHG emissions. The Reporting Rule also mandated recordkeeping and administrative requirements in order for the US EPA to verify annual GHG emissions reports.

Vehicle Emissions Standards

In 1975, Congress enacted the Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the US. Pursuant to the act, the US EPA and National Highway Traffic Safety Administration (NHTSA) are responsible for establishing additional vehicle standards. In August 2012, standards were adopted for model year 2017 through 2025 for passenger cars and light-duty trucks. Under the standards, by 2025 vehicles are required to achieve 54.5 miles per gallon (mpg) (if GHG reductions are achieved exclusively through fuel economy improvements) and 163 grams of CO₂ per mile. According to the US EPA, a model year 2025 vehicle would emit one-half of the GHG emissions as compared to emissions from a model year 2010 vehicle.³³ California harmonized its vehicle efficiency standards through 2025 with the federal standards (see Advanced Clean Cars Program below).

In January 2017, the US EPA issued its Mid-Term Evaluation of the GHG emissions standards, finding that it would be practical and feasible for automakers to meet the model year 2022-2025 standards through a number of existing technologies. In August 2018, the US EPA revised its 2017 determination, and issued a proposed rule that maintains the 2020 Corporate Average Fuel Economy (CAFE) and CO₂ standards for model years 2021 through 2026.³⁴ The estimated CAFE and CO₂ standards for model year 2020 are 43.7 mpg and 204 grams of CO₂ per mile for passenger cars and 31.3 mpg and 284 grams of CO₂ per mile for light trucks, projecting an overall industry average of 37 mpg, as compared to 46.7 mpg under the standards issued in 2012. On February 7, 2019, the state of California, joined by 16 other states and the District of Columbia, filed a petition challenging the US EPA's proposed rule to revise the vehicle emissions standards, arguing that the US EPA had reached erroneous conclusions about the feasibility of meeting the existing standards.³⁵ As of December 2019, the US EPA's proposed rule remains subject to multiple lawsuits that have been filed in federal court regarding the US EPA's GHG emissions standards. Because the outcome of pending litigation is speculative, this analysis assumes that the US EPA's existing CAFE standards will remain unchanged, and applies those standards as opposed to relying on speculative future standards.

State

California has promulgated a series of executive orders, laws, and regulations aimed at reducing both the level of GHGs in the atmosphere and emissions of GHGs from commercial and private activities within the state. The major components of California's climate protection initiative are reviewed below.

Executive Orders Establishing California Greenhouse Gas Reduction Targets

Through executive order, California governors have established long-term GHG reduction goals for the state.

Executive Order S-3-05

On June 1, 2005, Governor Schwarzenegger announced Executive Order S-3-05,³⁶ which established the following GHG emission reduction targets:

- By 2010, California shall reduce GHG emissions to 2000 levels;
- By 2020, California shall reduce GHG emissions to 1990 levels; and
- By 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

Executive Order B-30-15

On April 29, 2015, Governor Brown issued Executive Order B-30-15,³⁷ in which, the Governor:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030;
- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets; and
- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

California Health and Safety Code, Division 25.5 – California Global Warming Solutions Act of 2006 (AB 32)

Following the issuance of Executive Order S-3-05, in 2006, the California State Legislature adopted the California Global Warming Solutions Act of 2006 (passed as Assembly Bill [AB] 32 and codified in the California Health and Safety Code [HSC], Division 25.5), which focuses on reducing GHG emissions in California to 1990 levels by 2020. HSC Division 25.5 defines GHGs as CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆ and represents the first enforceable statewide program to limit emissions of these GHGs from all major industries with penalties for noncompliance. The law further requires that reduction measures be technologically feasible and cost effective.

Under HSC Division 25.5, CARB has the primary responsibility for reducing GHG emissions. CARB is required to adopt rules and regulations directing state actions that would achieve GHG emissions reductions equivalent to 1990 statewide levels by 2020.

³⁶ California Office of the Governor, 2005. Executive Order S-3-05. Available: https://www.climatechange.ca.gov/state/executive_orders.html. Accessed March 4, 2019.

³⁷ California Office of the Governor, 2005. Executive Order B-30-15. Available: https://www.climatechange.ca.gov/state/executive_orders.html. Accessed March 4, 2019.

CARB 2008 and 2014 Scoping Plans

A specific requirement of AB 32 was the preparation of a Climate Change Scoping Plan for achieving the maximum technologically feasible and cost-effective GHG emission reduction by 2020. CARB developed and approved the initial Scoping Plan in 2008, outlining the regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs that would be needed to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives.³⁸

The First Update to the Scoping Plan was approved by CARB in May 2014 and built upon the initial Scoping Plan with new strategies and recommendations. In 2014, CARB revised the target using the GWP values from the IPCC AR4 and determined that the 1990 GHG emissions inventory and 2020 GHG emissions limit is 431 MMTCO_{2e}. CARB also updated the state's 2020 NAT emissions estimate to account for the effect of the 2007–2009 economic recession, new estimates for future fuel and energy demand, and the reductions required by regulation that were adopted for motor vehicles and renewable energy.³⁹

SB 32/AB 197

In 2016, Senate Bill (SB) 32 and its companion bill AB 197, augmented AB 32 and amended HSC Division 25.5, establishing a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and including provisions to ensure the benefits of state climate policies reach into disadvantaged communities.

2017 Climate Change Scoping Plan Update

In response to SB 32 and the 2030 GHG reduction target, CARB approved the 2017 Climate Change Scoping Plan Update (2017 Scoping Plan Update) in December 2017.⁴⁰ The 2017 Scoping Plan Update outlines the proposed framework of action for achieving the 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels.⁴¹ The 2017 Scoping Plan Update identifies key sectors of the state's implementation strategy, which includes improvements in low-carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 MMTCO_{2e}, and that further commitments will need to be made to achieve an additional reduction of 50 MMTCO_{2e} beyond current policies and programs. The cornerstone of the 2017 Scoping Plan Update is an expansion of the Cap-and-Trade Program (discussed further below) to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2030 limit set forth by E.O. B-30-15.

³⁸ California Air Resources Board, 2008. *Climate Change Scoping Plan*. Available: <https://www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm>. Accessed March 4, 2019. December 2008.

³⁹ California Air Resources Board, 2014. *First Update to the Climate Change Scoping Plan*. Available: <https://www.arb.ca.gov/cc/scopingplan/document/updatedscopingplan2013.htm>. Accessed March 4, 2019. May 2014.

⁴⁰ California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan*. Available: <https://www.arb.ca.gov/cc/scopingplan/scopingplan.htm>. Accessed March 4, 2019. November 2017.

⁴¹ California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan*. Available: <https://www.arb.ca.gov/cc/scopingplan/scopingplan.htm>. Accessed March 4, 2019. November 2017.

The 2017 Scoping Plan Update's strategy for meeting the state's 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030, including the following, described elsewhere in this section:

- Extending the low-carbon fuel standard (LCFS) beyond 2020 and increasing the carbon intensity reduction requirement to 18 percent by 2030;
- SB 350, which increases the Renewables Portfolio Standard (RPS) to 50 percent by 2030 and requires the CEC to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by 2030. These targets may be achieved through energy efficiency savings and demand reductions from a variety of programs, including but not limited to appliance and building energy efficiency standards and a comprehensive program to achieve greater energy efficiency standards in existing buildings;
- The 2016 Mobile Source Strategy is estimated to reduce emissions from mobile sources including an 80 percent reduction in smog-forming emissions and a 45 percent reduction in diesel particulate matter from 2016 levels in the South Coast Air Basin, a 45 percent reduction in statewide GHG emissions (from both on-road and off-road mobile sources) and a 50 percent reduction in statewide consumption of petroleum-based fuels;
- The Sustainable Freight Action Plan to improve freight efficiency and transition to zero emission freight handling technologies (described in more detail below);
- SB 1383, which requires a 50 percent reduction in anthropogenic black carbon and a 40 percent reduction in hydrofluorocarbon and methane emissions below 2013 levels by 2030; and
- AB 398, which extends the state Cap-and-Trade Program through 2030.

In the 2017 Scoping Plan Update, CARB recommends statewide targets of no more than six MT CO₂e per capita by 2030 and no more than two metric tons CO₂e per capita by 2050. CARB acknowledges that because the statewide per capita targets are based on the statewide GHG emissions inventory that includes all emissions sectors in the state (including large industrial sources covered under the state's cap and trade program), they are not applicable for use at the local level. Rather, it is appropriate for local jurisdictions to derive evidence-based local per-capita goals based on local emissions sectors and growth projections.

To demonstrate how a local jurisdiction can achieve their long-term GHG goals at the community plan level, CARB recommends developing a geographically specific GHG reduction plan (i.e., climate action plan) consistent with the requirements of CEQA Guidelines section 15183.5(b). A so-called "CEQA-qualified" GHG reduction plan, once adopted, can provide local governments with a streamlining tool for project-level environmental review of GHG emissions, provided there are adequate performance metrics for determining project consistency with the plan. Absent conformity with such a plan, CARB recommends "that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development."⁴²

⁴² California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan*. Available: www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed March 9, 2019. November 2017. pp. 100–101.

Cap-and-Trade Program

Initially authorized by the California Global Warming Solutions Act of 2006 (AB 32), and extended through the year 2030 with the passage of AB 398 (2017), the California Cap-and-Trade Program is a core strategy that the state is using to meet its GHG reduction targets for 2020 and 2030, and ultimately achieve an 80 percent reduction from 1990 levels by 2050. CARB designed and adopted the California Cap-and-Trade Program to reduce GHG emissions from “covered entities”⁴³ (e.g., electricity generation, petroleum refining, cement production, and large industrial facilities that emit more than 25,000 metric tons CO₂e per year), setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve reductions.⁴⁴ Under the Cap-and-Trade Program, an overall limit is established for GHG emissions from capped sectors. The statewide cap for GHG emissions from the capped sectors commenced in 2013. The cap declines over time. Facilities subject to the cap can trade permits to emit GHGs.⁴⁵

If California’s direct regulatory measures reduce GHG emissions more than expected, then the Cap-and-Trade Program will be responsible for relatively fewer emissions reductions. If California’s direct regulatory measures reduce GHG emissions less than expected, then the Cap-and-Trade Program will require relatively more emission reductions. In other words, the Cap-and-Trade Program can be adaptively managed by the state to ensure achievement of California’s 2020 and 2030 GHG emissions reduction mandates, depending on whether other regulatory measures are more or less effective than anticipated.

California Environmental Quality Act and Senate Bill 97

Senate Bill (SB) 97, signed in August 2007, acknowledged that climate change is an environmental issue requiring analysis under CEQA. This bill directed the Governor’s Office of Planning and Research (OPR) to prepare, develop, and transmit to the CNRA guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, no later than July 1, 2009. SB 97 required the CNRA to certify or adopt those guidelines by January 1, 2010. On December 30, 2009, the Natural Resources Agency adopted amendments to the CEQA Guidelines, as required by SB 97. The CEQA Guidelines amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The amendments became effective March 18, 2010.

CEQA Guidelines

The current CEQA Guidelines section 15064.4 specifically addresses the significance of GHG emissions, directing that a lead agency shall make a “good-faith effort” to “describe, calculate or estimate” GHG emissions in CEQA environmental documents.⁴⁶ Section 15064.4 further states that

⁴³ “Covered Entity” means an entity within California that has one or more of the processes or operations and has a compliance obligation as specified in subarticle 7 of the Cap-and-Trade Regulation; and that has emitted, produced, imported, manufactured, or delivered in 2008 or any subsequent year more than the applicable threshold level specified in section 95812 (a) of the regulation.

⁴⁴ 17 CCR §§ 95800 to 96023.

⁴⁵ See generally 17 CCR §§ 95811, 95812.

⁴⁶ California Natural Resources Agency, 2018. CEQA Guidelines Amendments, Sections 15064.4, 15183.5, 15364.5. Available: http://resources.ca.gov/ceqa/docs/2018_CEQA_FINAL_TEXT_122818.pdf. Accessed March 18, 2019.

the analysis of GHG impacts should include consideration of (1) the extent to which the project may increase or reduce GHG emissions, (2) whether the project GHG emissions would exceed a threshold of significance that the lead agency determines applies to the project, and (3) the extent to which the project would comply with “regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.”

The CEQA Guidelines focus on the effects of GHG emissions as cumulative impacts, and direct that they should be analyzed in the context of CEQA’s requirements for cumulative impact analysis.⁴⁷ CEQA Guidelines section 15064.4 states that “the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project’s emissions to the effects of climate change. A project’s incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. The agency’s analysis should consider a timeframe that is appropriate for the project. The agency’s analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes.” The CEQA Guidelines also establish that a project’s incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program (including plans or regulations for the reduction of GHG emissions) that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (CEQA Guidelines section 15064(h)(3)).

The CEQA Guidelines do not require or recommend a specific analytical methodology or provide quantitative criteria for determining the significance of GHG emissions, nor do they set a numerical threshold of significance for GHG emissions. Guideline 15064.7(c) clarifies that in adopting or using thresholds of significance, a lead agency may appropriately consider thresholds developed by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

When GHG emissions are found to be significant, CEQA Guidelines section 15126.4(c) includes the following direction on measures to mitigate GHG emissions:

Consistent with section 15126.4(a), lead agencies shall consider feasible means, supported by substantial evidence and subject to monitoring or reporting, of mitigating the significant effects of greenhouse gas emissions. Measures to mitigate the significant effects of greenhouse gas emissions may include, among others:

- (1) Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency’s decision;
- (2) Reductions in emissions resulting from a project through implementation of project features, project design, or other measures;
- (3) Off-site measures, including offsets that are not otherwise required, to mitigate a project’s emissions;

⁴⁷ California Natural Resources Agency, 2009. Final Statement of Reasons for Regulatory Action, December 2009, pp. 20-26. Available: http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf. Accessed March 15, 2019.

- (4) Measures that sequester greenhouse gases; and
- (5) In the case of the adoption of a plan, such as a general plan, long range development plan, or plans for the reduction of greenhouse gas emissions, mitigation may include the identification of specific measures that may be implemented on a project-by-project basis. Mitigation may also include the incorporation of specific measures or policies found in an adopted ordinance or regulation that reduces the cumulative effect of emissions.

In late 2018, the CNRA finalized amendments to the CEQA Guidelines, including changes to CEQA Guidelines section 15064.4, which addresses the analysis of GHG emissions. The amendments were approved by the Office of Administrative Law and filed with the Secretary of State. The amendments became effective on December 28, 2018. The revision of CEQA Guidelines section 15064.4 clarified several points, including the following:

- Lead agencies must analyze the GHG emissions of proposed projects.
- The focus of the lead agency's analysis should be on the project's effect on climate change, rather than simply focusing on the quantity of emissions and how that quantity of emissions compares to statewide or global emissions.
- The impacts analysis of GHG emissions is global in nature and thus should be considered in a broader context. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions.
- Lead agencies should consider a timeframe for the analysis that is appropriate for the project.
- A lead agency's analysis must reasonably reflect evolving scientific knowledge and state regulatory schemes.
- Lead agencies may rely on plans prepared pursuant to section 15183.5 (Plans for the Reduction of Greenhouse Gases) in evaluating a project's greenhouse gas emissions.
- In determining the significance of a project's impacts, the lead agency may consider a project's consistency with the state's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is consistent with those plans, goals, or strategies.
- The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

Transportation Sector

AB 1493

In 2002, Governor Davis signed AB 1493 (Pavley), which required CARB to set GHG emission standards for passenger vehicles, light duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009.

To meet the requirements of AB 1493, CARB approved amendments to the California Code of Regulations (CCR) in 2004, requiring automobile manufacturers to meet fleet-average GHG

emissions limits for all passenger cars, light-duty trucks within various weight criteria, and medium-duty passenger vehicle weight classes (i.e., any medium-duty vehicle with a gross vehicle weight [GVW] rating of less than 10,000 pounds and that is designed primarily for the transportation of persons), beginning with model year 2009. For passenger cars and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 pounds or less, the GHG emission limits for model year 2016 are approximately 37 percent lower than the limits for the first year of the regulations, model year 2009. For light-duty trucks with an LVW of 3,751 pounds to a GVW of 8,500 pounds, as well as for medium-duty passenger vehicles, GHG emissions will be reduced approximately 24 percent between 2009 and 2016.

Because the Pavley standards (named for the bill's author, state Senator Fran Pavley) would impose stricter standards than those under the CAA, California applied to the US EPA for a waiver under the CAA. In 2008, the US EPA denied the application. In 2009, however, the US EPA granted the waiver. The waiver has been extended consistently since 2009; however, in 2018 the US EPA and NHTSA indicated their intent to revoke California's waiver, and prohibit future state emissions standards enacted under the CAA. As of April 2019, the waiver was still in place and the status of the federal government's revocation of the waiver was uncertain.

As discussed previously, the federal government adopted standards for model year 2012 through 2016 light-duty vehicles. In addition, the US EPA and US Department of Transportation (DOT) have adopted GHG emission standards for model year 2017 through 2025 vehicles. These standards are slightly different from the state's standards (described below in the Advanced Clean Cars Program), but the state of California has agreed not to contest them, in part due to the fact that while the national standard would achieve slightly less reductions in California, the national standard would achieve greater reductions nationally and is stringent enough to meet state GHG emission reduction goals.

Advanced Clean Cars Program

In 2012, CARB approved the Pavley II (LEV III) Advanced Clean Cars Program, an emissions-control scheme for model years 2015 through 2025 that allows manufacturers to comply with the 2017 through 2025 national standards while meeting state law. The program includes components to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. The zero-emissions vehicle (ZEV) program will act as the focused technology of the Advanced Clean Cars Program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles (PHEV) in the 2018 to 2025 model years.⁴⁸

Executive Order B-16-12 – 2025 Goal for Zero Emission Vehicles

In March 2012, Governor Brown issued Executive Order B-16-12 establishing a goal of 1.5 million ZEVs on California roads by 2025. In addition to the ZEV goal, EO B-16-12 stipulated that by 2015 all major cities in California will have adequate infrastructure and be

⁴⁸ California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan*. Available: www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed March 10, 2019. November 2017.

‘zero-emission vehicle ready’; that by 2020 the state will have established adequate infrastructure to support 1 million ZEVs; that by 2050, virtually all personal transportation in the state will be based on ZEVs; and that GHG emissions from the transportation sector will be reduced by 80 percent below 1990 levels.

Mobile Source Strategy

In May 2016, CARB released the updated Mobile Source Strategy that demonstrates how the state can simultaneously meet air quality standards, achieve GHG emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next 15 years. The strategy promotes a transition to zero-emission and low-emission vehicles, cleaner transit systems and reduction of vehicle miles traveled (VMT). The Mobile Source Strategy calls for 1.5 million ZEVs (including plug-in hybrid electric, battery-electric, and hydrogen fuel cell vehicles) by 2025 and 4.2 million ZEVs by 2030. The strategy also calls for more-stringent GHG requirements for light-duty vehicles beyond 2025 as well as GHG reductions from medium-duty and heavy-duty vehicles and increased deployment of zero-emission trucks primarily for class 3–7 “last mile” delivery trucks in California. Statewide, the Mobile Source Strategy would result in a 45 percent reduction in GHG emissions from mobile sources and a 50 percent reduction in the consumption of petroleum-based fuels.⁴⁹

Executive Order B-48-18 – 2030 Goal for Zero Emission Vehicles

On January 26, 2018, Governor Brown issued Executive Order B-48-18 establishing a goal of 5 million ZEVs on California roads by 2030, in recognition of the critical need to reduce emissions from the transportation sector in order to meet the GHG emissions target of SB 32.

Low Carbon Fuel Standard

In January 2007, Governor Schwarzenegger enacted Executive Order S-01-07, which mandates that the state: (1) establish a statewide goal to reduce the carbon intensity of California’s transportation fuels by at least 10 percent by 2020; and (2) adopt a Low Carbon Fuel Standard (LCFS) for transportation fuels in California. The overall goal of the LCFS is to lower the carbon intensity of California transportation fuel. The 2017 Scoping Plan Update calls for the LCFS to reduce fuel carbon intensity by at least 18 percent by 2030. In September 2018, CARB extended the LCFS program to 2030, making significant changes to the design and implementation of the Program including a doubling of the carbon intensity reduction to 20 percent by 2030.

Land Use Transportation Planning

On September 30, 2008, Governor Schwarzenegger signed SB 375 (Chapter 728, Statutes of 2008), which establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions. Under SB 375, CARB is required, in consultation with the

⁴⁹ California Air Resources Board, 2016. *Mobile Source Strategy*. Available: <https://www.arb.ca.gov/planning/sip/2016sip/2016mobsrc.htm>. Accessed March 10, 2019. May 2016.

state’s Metropolitan Planning Organizations (MPOs), to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035.⁵⁰

Under SB 375, the regional reduction target must be incorporated within the applicable MPO’s Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities need to be consistent with the SCS, and consistency with the SCS can provide certain CEQA streamlining for proposed projects; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plan) are not required to be consistent with either the RTP or SCS.

In 2011, CARB adopted GHG emissions reduction targets for SCAG, the MPO for the region in which the City is located. In March 2018, the CARB updated the SB 375 targets to require an 8 percent reduction by 2020 and a 19 percent reduction by 2035 in per capita passenger vehicle GHG emissions.^{51,52} As these reduction targets were updated after SCAG adopted the 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS), it is expected that a future iteration of the RTP/SCS will be updated to reflect these targets. The proposed reduction targets explicitly exclude emission reductions expected from the AB 1493 and the LCFS regulations.⁵³

Energy Sector

Appendix F of the CEQA Guidelines states that, in order to ensure that energy implications are considered in project decisions, the potential energy implications of a project shall be considered in an EIR, to the extent relevant and applicable to the project. Appendix F further states that a project’s energy consumption and proposed conservation measures may be addressed, as relevant and applicable, in Chapter 2, Project Description, and in technical sections found in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, as well as through mitigation measures and alternatives. In accordance with Appendix F, the energy effects of the Proposed Project are addressed in Section 3.5, Energy Demand and Conservation, of this EIR.

Title 24 Building Energy Efficiency Standards

CCR Title 24 establishes California’s Building Energy Efficiency Standards; Part 11 is referred to as the California Green Building Standards (CALGreen) Code. The purpose of the CALGreen Code is to “improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices in the following categories:

⁵⁰ California Air Resources Board, Sustainable Communities. Available: <https://www.arb.ca.gov/cc/sb375/sb375-rd.htm>. Accessed April 25, 2019.

⁵¹ California Air Resources Board, 2017. *California’s 2017 Climate Change Scoping Plan*. Available: www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed March 10, 2019. November 2017.

⁵² California Air Resources Board, 2018. *SB 375 Regional Greenhouse Gas Emissions Reduction Targets*. Available: <https://www.arb.ca.gov/cc/sb375/finaltargets2018.pdf>. Accessed March 11, 2019.

⁵³ California Government Code section 65080(b)(2)(A)(iii).

(1) planning and design; (2) energy efficiency; (3) water efficiency and conservation; (4) material conservation and resource efficiency; and (5) environmental air quality.”⁵⁴ Since 2011, the CALGreen Code is mandatory for all new residential and non-residential buildings constructed in the state. Such mandatory measures include energy efficiency, water conservation, material conservation, planning and design and overall environmental quality. The CALGreen Code was most recently updated in 2016 to include new mandatory measures for residential and nonresidential uses; the new measures took effect on January 1, 2017.⁵⁵

The CEC first adopted Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) in 1978 in response to a legislative mandate to reduce energy consumption in the state. Although not originally intended to reduce GHG emissions, increased energy efficiency and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. The standards are updated periodically (typically every three years) to allow for the consideration and inclusion of new energy efficiency technologies and methods.

The current Title 24, Part 6 standards (2016 standards) were made effective on January 1, 2017. The next update to the Title 24 energy efficiency standards (2019 standards) go into effect on January 1, 2020.

Renewables Portfolio Standard

In 2002, the passage of SB 1078 established the Renewables Portfolio Standard (RPS), which requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from eligible renewable sources by 2017. SB 107, adopted in 2006, changed the target date to 2010.

In November 2008, Executive Order S-14-08 expanded the state’s RPS goal to 33 percent renewable power by 2020. In September 2009, Executive Order S-21-09 directed CARB (under its AB 32 authority) to enact regulations to help the state meet the 2020 goal of 33 percent renewable energy. The 33 percent by 2020 RPS goal was codified in April 2011 with the passage of Senate Bill X1-2. This new RPS applied to all electricity retailers in the state, including publicly owned utilities (POUs), investor-owned utilities, electricity service providers, and community choice aggregators.

Senate Bill 350

The Clean Energy and Pollution Reduction Act of 2015, SB 350 (Chapter 547, Statutes of 2015), was approved by Governor Brown on October 7, 2015. SB 350 increased the RPS by requiring an increase in the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources from 33 percent to 50 percent by December 31, 2030. The Act also

⁵⁴ California Building Standards Commission, 2010. *California 2010 Green Building Standards Code (CALGreen)*. Available: http://www.hcd.ca.gov/building-standards/docs/2010_CA_Green_Bldg.pdf. Accessed March 11, 2019.

⁵⁵ California Building Standards Commission, 2016. *2016 California Green Building Standards Code (Part 11 of Title 24)*. Available: <https://www.dgs.ca.gov/BSC/Resources/Page-Content/Building-Standards-Commission-Resources-List-Folder/CALGreen>. Accessed April 25, 2019.

requires the State Energy Resources Conservation and Development Commission to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in existing electricity and natural gas final end uses of retail customers by January 1, 2030.

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100, establishing that 100 percent of all electricity in California must be obtained from renewable and zero-carbon energy resources by December 31, 2045. SB 100 also creates new standards for the RPS, increasing required energy from renewable sources for both investor-owned utilities and publicly owned utilities from 50 percent to 60 percent by December 31, 2030. Incrementally, these energy providers must also have a renewable energy supply of 44 percent by December 31, 2024, and 52 percent by December 31, 2027. The updated RPS goals are considered achievable, since many California energy providers are already meeting or exceeding the RPS goals established by SB 350.

SB 1383 (Short-lived Climate Pollutants)

Senate Bill 1383, passed in 2016, requires statewide reductions in short-lived climate pollutants (SLCPs) across various industry sectors. The SLCPs covered under AB 1383 include methane, fluorinated gases, and black carbon—all GHGs with a much higher warming impact than carbon dioxide and with the potential to have detrimental effects on human health. SB 1383 requires the CARB to adopt a strategy to reduce methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030. The methane emission reduction goals include a 75 percent reduction in the level of statewide disposal of organic waste from 2014 levels by 2025.

AB 987

AB 987 was signed by Governor Jerry Brown on September 30, 2018. The bill added section 21168.6.8 to the California Public Resources Code (PRC). AB 987 does not change the substantive content of this EIR, or the public review requirements for the EIR. AB 987 does, however, establish specific timelines for judicial review in the event that the adequacy of this EIR is challenged, so long as certain requirements are met. The discussion of AB 987 below is focused on the provisions of PRC 21168.6.8 that address GHG emissions; a full description of AB 987 is provided in Chapter 1, Introduction.

AB 987 is described in this chapter under Regulatory Setting because the statute potentially applies to the Proposed Project and addresses issues related to GHG emissions. However, AB 987 is not a regulatory statute, per se, in that the Proposed Project is not required to comply with the provisions of PRC section 21168.6.8. Instead, AB 987 established provisions by which the project applicant for the Proposed Project may voluntarily decide to attempt to qualify under the provisions of the statute. If certified as qualified by the Governor's Office, then specific timelines for judicial review identified in AB 987 would apply to any action brought to challenge the certification of this EIR or the approval of the Proposed Project. In the event that the Proposed Project does not qualify under the provisions of AB 987, then the Proposed Project could still be

reviewed and approved by the City, but judicial review would occur under the standard provisions of CEQA.

The provisions of PRC section 21168.6.8 are similar to the provisions of the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900; PRC sections 21178 through 21189.3), as subsequently amended, which established expedited judicial review of certified Environmental Leadership Development Projects. In order to qualify for expedited judicial review under AB 987, the Proposed Project would have to achieve certain vehicle trip reduction goals, and, most relevantly for this section, would have to achieve a “no net new” GHG emissions standard.⁵⁶ Further, as a condition of approval of the Proposed Project, the lead agency must require the project applicant, in consultation with SCAQMD, to implement measures that will achieve certain reductions in criteria air pollutant and toxic air contaminant emissions, over and above any reductions required by other laws or regulations in communities surrounding the Project Site.

Regional

SCAQMD

The Project Site is located in the South Coast Air Basin (Air Basin), which consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside Counties, in addition to the San Geronio Pass area in Riverside County. SCAQMD is responsible for air quality planning in the Air Basin and developing rules and regulations to bring the area into attainment with the ambient air quality standards. This is accomplished through air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and supporting and implementing measures to reduce emissions from motor vehicles.

SCAQMD adopted a “Policy on Global Warming and Stratospheric Ozone Depletion” on April 6, 1990. The policy commits SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:

- Phase out the use and corresponding emissions of chlorofluorocarbons, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;
- Phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons by the year 2000;
- Develop recycling regulations for hydrochlorofluorocarbons (e.g., SCAQMD Rules 1411 and 1415);
- Develop an emissions inventory and control strategy for methyl bromide; and
- Support the adoption of a California GHG emission reduction goal.

⁵⁶ Office of the Governor, 2018. Assembly Bill 987 Signing Message. September 30.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds.⁵⁷ Within its October 2008 document, SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 MTCO₂e per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where SCAQMD is the lead agency. However, SCAQMD did not adopt a GHG significance threshold for land use development projects (e.g., mixed-use/commercial projects) and formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds. This Working Group has been inactive since 2011 and SCAQMD has not formally adopted any GHG significance threshold guidance for land use development projects.

SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

As described in Section 3.10, Land Use and Planning, the 2016–2040 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, with a specific goal of achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 18 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Consistency of the Proposed Project with the 2016–2040 RTP/SCS, including Goals 6 and 7, is discussed under Impact 3.7-2, below, as well as in Section 3.10, Land Use and Planning, Impact 3.10-2.

Local

City of Inglewood General Plan

The City of Inglewood General Plan sets forth goals, objectives, and policies for the future development of the City and designates the location of desired future land uses within the City.

The following goals from the Land Use Element⁵⁸ of the City of Inglewood General Plan are relevant to GHG emissions.

Circulation Goal: Promote and support adequate public transportation within the City and the region.

Circulation Goal: Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

The use of public transportation reduces the GHG emissions that would otherwise occur through the use of private vehicles. Safe and adequate pedestrian networks promote walking and the use of assisted mobility devices (e.g., wheelchairs) instead of driving. The Proposed Project would include provisions that would promote the use of public transportation as a means of travel to and from the proposed Arena, including a transportation hub at the East Transportation and Hotel

Site, shuttle stops on South Prairie Avenue, and a shuttle system for large events that would connect the Proposed Project to nearby Metro stations. In addition, improvements to the sidewalks fronting the Project Site and a pedestrian bridge crossing South Prairie Avenue would promote a safe pedestrian circulation system that would meet ADA requirements. For these reasons, the Proposed Project would not be inconsistent with the General Plan Land Use Element circulation goals listed above. Ultimately, it is within the authority of the City Council to determine whether the Proposed Project is consistent with the City of Inglewood General Plan.

The Proposed Project's consistency with the City of Inglewood General Plan is discussed under Impact 3.7-2.

City of Inglewood Energy and Climate Action Plan

The Inglewood Energy and Climate Action Plan (ECAP) presents the City's community and municipal inventories, emissions forecasts, and recommended reduction targets for emissions to mitigate the City's impacts on climate change.⁵⁹ The ECAP includes a business-as-usual (BAU) forecast that estimates future emissions in 2020 and 2035 from six sectors: Transportation, Residential Energy, Commercial/Municipal Energy, Industrial Energy, Solid Waste, and Water. The BAU forecast assumes GHG emissions that would occur in the future under regulatory conditions as they existed in 2010; the BAU forecast does not include the effects of updates to Title 24, the Renewables Portfolio Standard, and the Pavley Clean Car Standards on future GHG emissions. Under the ECAP's BAU forecast, Inglewood's total GHG emissions are expected to increase approximately 14 percent from 2010 (594,273 MTCO_{2e}) to 2035 (678,283 MTCO_{2e}). On a per-service population (SP)⁶⁰ basis, the increase is shown to be just 4.5 percent, from 4.22 MTCO_{2e}/SP in 2010 to 4.41 MTCO_{2e}/SP in 2035.

The City's GHG inventories and forecasts are summarized in **Table 3.7-3**.

⁵⁹ City of Inglewood, 2013, *Inglewood Energy and Climate Action Plan*. Available: <https://www.cityofinglewood.org/225/Sustainability>. Accessed Feb 15, 2019. March 2013.

Meet target/goal?				Yes	No

SOURCE: City of Inglewood, 2013. *Inglewood Energy and Climate Action Plan*.

The ECAP establishes an emissions reduction target of 15 percent below 2005 levels by 2020 and an emissions reduction goal of 32.5 percent below 2005 levels by 2035. As shown in Table 3.7-3, state-level actions, such as the Pavley Clean Cars legislation, the Low Carbon Fuel Standard, the Renewables Portfolio Standard, and Title 24 upgrades are expected to reduce community emissions by 121,139 MTCO₂e per year by 2020, and 160,002 MTCO₂e by year 2035. Local measures in the CAP are expected to reduce community emissions an additional 9,803 MTCO₂e per year by 2020, and 10,994 MTCO₂e per year by year 2035. The ECAP quantifies GHG reductions from the following five implementing strategies and actions:

Strategy 1 – Lead by Example with Municipal Government Actions

- Continue Building and Facility Energy Upgrades to reduce energy use
- Replace all City-owned street, park, and traffic lights with light-emitting diode (LED) lights
- Accelerate city vehicle fleet replacement
- Continue commute trip reduction program
- Planning for electric vehicle infrastructure

Strategy 2: Increase Energy Efficiency

- Make commercial buildings more efficient
- Increase the energy efficiency of residential buildings

- Increase the energy efficiency of street and traffic lights.

Strategy 3: Support Renewable Energy Generation

- Remove barriers to renewable energy generation
- Make renewable energy generation more affordable
- Educate potential customers

Strategy 4: Improve Transportation Options and Manage Transportation Demand

- Make roadways more efficient
- Improve transit
- Improve bicycle facilities
- Make parking more efficient
- Reduce commute trips
- Encourage land use intensification and diversity

Strategy 5: Reduce Consumption and Waste

- Use less water
- Produce less waste
- Promote local food production

The Proposed Project's consistency with the ECAP is discussed under Impact 3.7-2.

3.7.4 Analysis, Impacts and Mitigation

Approach to Analysis

GHG emissions and global climate change represent cumulative impacts from human activities and development projects locally, regionally, statewide, nationally, and worldwide. GHG emissions from all of these sources cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and its associated environmental impacts.

The following analysis of the Proposed Project's impact on climate change focuses on the Proposed Project's contribution to cumulatively significant GHG emissions. Given that the analysis of GHG emissions is only relevant in a cumulative context, this section does not include an individual project-specific impact assessment.

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts related to GHG emissions. As described above, in 2009 the CNRA adopted amendments to the CEQA Guidelines addressing the analysis and mitigation of GHG emissions. As a result of the amendments, Appendix G of the CEQA Guidelines was amended to provide screening questions to assist lead agencies when assessing a project's potential impacts with regard to GHG emissions, and additional amendments were made in 2018. The following thresholds of significance are consistent with CEQA Guidelines section 15064.4 and CEQA Guidelines Appendix G.

A significant impact would occur if the Proposed Project would:

1. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
2. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

CEQA Guidelines section 15064.4 gives lead agencies the discretion to determine whether to assess the significance of GHG emissions quantitatively or qualitatively. Section 15064.4 recommends considering certain factors, among others, when determining the significance of a project's GHG emissions, including the extent to which the Proposed Project may increase or reduce GHG emissions as compared to the existing environment; whether the Proposed Project exceeds an applicable significance threshold; and extent to which the Proposed Project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs. None of the amendments establishes a threshold of significance; rather, so long as any threshold selected is supported by substantial evidence (see section 15064.7(c)), lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including by looking to thresholds developed by other public agencies, such as air districts, or suggested by experts, such as the California Air Pollution Control Officers Association (CAPCOA).

The CNRA's *Final Statement of Reasons for Regulatory Action* from December 2009 similarly provides that project-level quantification of emissions should be conducted where it would assist in determining the significance of emissions, even where no numeric threshold applies. In such cases, CNRA's guidance provides that qualitative thresholds can be utilized to determine the ultimate significance of project-level impacts based on a project's consistency with plans, which can include applicable regional transportation plans. Even when using a qualitative threshold, quantification can inform "the qualitative factors" and indicate "whether emissions reductions are possible, and, if so, from which sources."⁶¹

Neither CARB, SCAQMD, nor the City has adopted quantitative significance thresholds for assessing project-level impacts related to GHG emissions. CEQA Guidelines section 15183.5 states that a lead agency may determine that a project's incremental contribution to a cumulative

⁶¹ California Natural Resources Agency, 2009. *Final Statement of Reasons for Regulatory Action*, December 2009, pp. 20–26. Available: http://resources.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf. Accessed March 15, 2019.

effect is not cumulatively considerable if the project complies with the requirements in a previously adopted mitigation program, or plan for the reduction of GHG emissions that includes the following elements:

- Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
- Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;
- Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;
- Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
- Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels; and
- Be adopted in a public process following environmental review.

The City's ECAP, adopted in 2013, provides a set of strategies and supporting actions for achieving the City's 2020 GHG reduction targets, but it does not demonstrate how the City plans to reduce GHG emissions consistent with the State's post-2020 targets as represented by SB 32 and EO S-3-05.

CARB's 2017 Scoping Plan Update advises that absent conformity with a qualified GHG reduction plan, projects should incorporate all feasible GHG reduction measures and that achieving "no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development."⁶² Accordingly, for the purposes of this EIR, the City used a quantitative threshold for the Proposed Project of no net additional GHG emissions, including emissions from employee transportation.

The "no net new" emissions threshold means that if the Proposed Project would not emit any additional GHG emissions beyond the baseline over its estimated 30-year life, the impact would be less than significant. Further, the "no net new" emissions threshold for the Proposed Project is consistent with the project applicant's commitment to abide by the requirements of AB 987, which stipulates that the Proposed Project would not result in any net additional emissions of GHGs compared to the baseline, including GHG emissions from employee transportation. This threshold serves as a *project-specific* GHG threshold and does not set precedent for future City projects.⁶³

⁶² California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan*. pp. 100-101. Available: www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf. Accessed March 10, 2019. November 2017.

⁶³ Project-specific thresholds are not required to be formally adopted because the requirement for formal adoption of thresholds under 14 CCR §15064.7(b) applies only to thresholds of general application.

Consistent with CEQA Guidelines Appendix G, the City is also assessing whether the Proposed Project would be inconsistent with applicable plans, policies, regulations or requirements adopted to implement a statewide, regional or local plan for the reduction of GHG emissions.

Determining Net New Emissions of Greenhouse Gases

The net new GHG emissions associated with the Proposed Project is defined as the difference in emissions between baseline conditions and the Proposed Project buildout. Baseline operational emissions are the annual operational GHG emissions produced by existing emissions sources and activities against which the Proposed Project's GHG emissions will be compared. The Proposed Project's operational emissions would occur starting in 2024 and for analytical purposes are assumed to continue through the 30-year life of the Proposed Project to 2054.

For the purpose of this analysis, the Proposed Project's annual operational emissions include total construction emissions amortized over the 30-year life of the Proposed Project, consistent with regulatory guidance from SCAQMD and with the typical average lifespan of past NBA arenas.⁶⁴ SCAQMD recognizes that construction-related GHG emissions from projects "occur over a relatively short-term period of time" and that "they contribute a relatively small portion of the overall lifetime project GHG emissions." SCAQMD recommends that construction project GHG emissions be "amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies."⁶⁵

Project Consistency with Existing Plans, Policies and Regulations

A significant impact would occur if the Proposed Project would conflict with applicable regulations, plans and policies that were adopted to reduce GHG emissions that contribute to global climate change. For the Proposed Project, as a land use development project, this analysis considers the Proposed Project's consistency with the following applicable plans, policies and regulations to reduce GHG emissions:

- The 2017 Climate Change Scoping Plan Update, CARB's plan for achieving a 40 percent reduction on GHG emissions from 1990 levels by 2030, statewide, as mandated by SB 32;
- SCAG's 2016-2040 RTP/SCS, the regional plan for achieving sustainable land use patterns that reduce passenger vehicle GHG emissions, as mandated by SB 375;
- Executive Order S-3-05, which established a goal of reducing the state's GHG emissions to 80 percent below the 1990 level by the year 2050;
- CARB's Mobile Source Strategy and Executive Order B-48-18, which are designed to achieve GHG reductions from the state's largest contributing sector (transportation), consistent with the goals of SB 32 and the 2017 Scoping Plan Update; and
- The City's ECAP.

Accessed March 11, 2019. October 2008, pp. 3-8.

Methodology and Assumptions

As described in Chapter 2, Project Description (see Table 2-3), the Proposed Project includes an annual average of 5 pre-season, 41 regular season, and 3 post-season LA Clippers home games that would be hosted at the Project Arena, for an average of 49 games per year. The Project Arena would also host concerts, family shows, conventions and corporate or civic events, and non-LA Clippers sporting events, which would take place throughout the year and have maximum attendance ranging from 2,000 attendees to full Arena capacity of 18,500. It is estimated that the new Arena could host approximately 178 non-LA Clippers events annually, with an additional 16 smaller outdoor events in the plaza.

The baseline for determining the Proposed Project's net new annual emissions includes GHGs from:

- a. mobile sources and energy usage associated with the existing on-site structures that would be removed and replaced with construction of the Proposed Project;
- b. the existing LA Clippers team offices and practice and athletic training facility uses that would be relocated to the Project Site, and;
- c. LA Clippers games that would be relocated from the Staples Center,
- d. non-NBA events that would be market-shifted to the proposed Arena, as described below.

Existing Operations

Baseline annual emissions include GHGs from mobile sources and energy usage associated with the existing on-site structures that would be removed and replaced with construction of the Proposed Project. Existing buildings within the Project Site include a 16,806-square-foot (sf) motel, an 1,118 sf fast food restaurant, a 28,809 sf light manufacturing/warehouse building, an 1,134 sf commercial building, and a 6,231 sf warehouse and a groundwater well and related facilities that would be relocated on site. GHG emissions from the demolition and construction of the existing groundwater well and related facilities on site were calculated and included as Project emissions; however, the operational GHG emissions of the relocated groundwater well and related facilities "net out" since their operations would not change once relocated.

The Proposed Project would also include relocation of the existing off-site LA Clippers team offices, which are currently located approximately 11 miles northeast of the Project Site at 1212 South Flower Street in downtown Los Angeles, and the existing off-site LA Clippers practice and athletic training facility, which is located approximately 6 miles northwest of the Project Site at 6854 South Centinela Avenue in the Playa Vista neighborhood within Los Angeles. GHG emissions associated with the use of the existing team offices and the practice and athletic training facility (including travel to and from) are currently occurring, and are therefore part of the existing environmental setting.

GHG emissions associated with the use of the existing team offices and the practice and athletic training facility would be relocated to the Project site and are thus included in "baseline" GHG

emissions. However, it is likely that the facilities would be backfilled with new tenants once they are vacated by the LA Clippers. This is particularly true of the current LA Clippers team offices in downtown Los Angeles, located in a multi-tenant office building where demand for commercial real estate is relatively high. For the LA Clippers' practice and athletic training facility, it would be speculative to assume the type of use that could reoccupy it in the future given its unique design and space allocation, but for the purposes of this analysis it was assumed that a new tenant would backfill it with the same emissions profile. To account for the backfilling of these existing facilities, the future emissions of new tenants were added to the Project's operational emissions.

Relocated LA Clippers Games and Market Shifted Events

Starting in the first NBA season following completion of the Proposed Project, all LA Clippers games currently hosted at the Staples Center would relocate to the new Arena. Although these games would not be replaced by home games for another professional sports team, it is reasonable to assume that the operator of the Staples Center would attempt to replace those LA Clippers games with other events. It is difficult to estimate the extent to which these vacant dates at Staples Center will backfill with other events. An expert consultant retained by the applicant has prepared an estimate of the extent to which Staples Center would backfill with events.⁶⁶ Based on an evaluation of the past several years of Staples Center schedules, the consultant estimated that seven events would be backfilled at the Staples Center.

In addition, a total of 178 non-NBA game events (e.g., concerts, family shows, non-NBA sports games, etc.) are expected to occur at the Project Arena. Some of these events will be events that would otherwise occur at other venues in the region absent construction of the Proposed Project and some of these events will be new to the region. The City retained an expert to estimate, out of this total, the number of market-shifted events. Of the 178 non-NBA events, 89 would be market-shifted to the Project Arena, and the balance would be new events.⁶⁷ For these 89 market-shifted events, a backfill event may or may not occur at the vacated venue. As is the case for relocated LA Clippers games, it is difficult to estimate the extent to which these market-shifted events will result in backfilled events at the venues from whence they came. For the market-shifted events, there may be no backfilled events at the vacated venues; backfill may occur for all such events; or the outcome could be something in between.

The estimate of GHG emissions is dependent in part on the number of relocated, market-shifted, and backfilled events. The applicant has also engaged with CARB, as part of the AB 987 application process. At CARB's request, the applicant has prepared an analysis that presumes that

⁶⁶ See Conventions, Sports and Leisure (CSL), 2019. *Staples Center Vacated Event Days Analysis*. May 14, 2019. The majority of LA Clippers games at the Staples Center occur on weekday evenings from Monday through Thursday or on days that are double-booked with a home game for one of the other professional sports teams that play at Staples Center.

⁶⁷ Based on information included in Appendix R, a total of 80 percent of concerts and family shows, and 41 percent of other events would be market-shifted. For this analysis 41 percent of civic and community events are also assumed to be market-shifted, resulting in a total of 89 market-shifted events.

all relocated LA Clippers games, and all non-NBA game market-shifted events, would be backfilled by other events at Staples Center or other venues.

In light of this uncertainty, this EIR presents two analyses. These analyses present a range of potential outcomes for these dates representing what could occur once the LA Clippers have vacated Staples Center and approximately 89 non-NBA events shift to the Project Arena. Under either scenario, the emissions from these backfilled events could be attributable to the Proposed Project. Because of the unavoidable uncertainty regarding the extent to which vacated venues will backfill with other events, the EIR describes and analyzes two potential scenarios: a Full Backfill Scenario and a Partial Backfill Scenario. Each is described and analyzed below.

Full Backfill Scenario

The Full Backfill Scenario accounts for the possibility that all relocated LA Clippers games and market-shifted non-NBA events at the Project Arena would be backfilled with other events at Staples Center and other existing venues in the Los Angeles region. Under this Full Backfill Scenario, all 47 LA Clippers games being relocated from Staples Center to the Project Arena would be backfilled with other events at Staples Center. In addition, all of the non-NBA game events being market shifted to the Project Arena would be backfilled with comparable events at the vacated venue. The emissions from these backfilled events are considered to be attributable to the Proposed Project under the Full Backfill Scenario.

Partial Backfill Scenario

The Partial Backfill Scenario assumes that seven of the vacated LA Clippers games would be backfilled by new events at Staples Center. Under the Partial Backfill Scenario, the emissions from these seven backfill events are considered to be attributable to the Proposed Project. This scenario assumes none of the vacated market-shifted non-NBA events would be backfilled with new events at the other existing venues.

Summary of Event Characteristics under Backfill Scenarios

Table 3.7-4 provides a summary of annual events anticipated at the Project Arena, including the number of events that would be relocated or market-shifted from existing venues within the region, and the number of events that would be backfilled under the Full Backfill and Partial Backfill Scenarios discussed above. Under both scenarios, 47 LA Clippers games currently being played at Staples Center are relocated to the Project Arena,⁶⁸ and 89 non-NBA events are market-shifted from existing venues in the region. Under the Full Backfill Scenario, backfill would occur at Staples Center for all 47 of the vacated LA Clippers games, and at the existing venues that would have vacated event times for all 89 of the non-NBA game market-shifted events. Under the Partial Backfill Scenario, backfill would occur at Staples Center for seven of the vacated LA Clippers games, and for none of the 89 market-shifted events.

⁶⁸ It is anticipated that the proposed Arena would host up to five pre-season LA Clippers games per year, which is two more than is typically hosted by the Staples Center. The annual average number of post-season games at the Arena was based on the average number of post-season home games per NBA team per year.

**TABLE 3.7-4
 INGLEWOOD BASKETBALL & ENTERTAINMENT CENTER ANTICIPATED ANNUAL EVENT CHARACTERISTICS**

Event Type	Anticipated Annual Frequency	Maximum Attendance	Event-Day Employees ^a	Relocated or Market-Shifted ^b	Backfilled: Full Backfill Scenario	Backfilled: Partial Backfill Scenario
LA Clippers Home Basketball Games	Up to 5 Pre-season Games	18,000	1,320 ^c	3	3	0
	41 Regular Season Games	18,000	1,320 ^c	41	41	7
	3 Post-season Games ^d	18,000	1,320 ^c	3	3	0
Concerts^e	Up to 5 per year (large)	18,500	1,120 ^f	4	4	0
	Up to 8 per year (medium)	14,500	795 ^f	6	6	0
	Up to 10 per year (small)	9,500	530 ^f	8	8	0
Family Shows^g	Up to 20	8,500	530 ^f	16	16	0
Other Events^h	Up to 35	7,500	480 ^f	14	14	0
Corporate/Community Eventsⁱ	Up to 100	2,000	25 ^f	41	41	0
Plaza Events^j	Up to 16	4,000	25	0	0	0
Total	Up to 243	na	na	136	136	7

NOTES:

- ^a Estimates do not include full-time arena management and operations employees, LA Clippers basketball operations employees including players and coaches, LA Clippers employees that work in the management offices or related facilities during the day, or visiting event performers and their support staff at the arena.
- ^b Number of relocated LA Clippers Games and market shift events as provided in Appendix R.
- ^c Provided by Venue Solutions Group based on a blended analysis of the Amway Center, American Airlines Arena, Madison Square Garden, and Staples Center operations; includes 1,200 non-LA Clippers employees and 120 LA Clippers employees to provide game-day operations support.
- ^d The current NBA playoff format, implemented in the 2002–03 season, involves four rounds of best-of-seven series and allows for a potential maximum of 16 home games in one season. Based on an analysis of the past playoff appearances of all current NBA teams, the anticipated average annual number of home playoff games is 3 games.
- ^e Annual number and size of concerts may vary according to market conditions and availability of the arena; these estimates represent the anticipated annual average occurrences of each concert type.
- ^f Provided by Venue Solutions Group based on a blended analysis of the Amway Center, American Airlines Arena, Madison Square Garden, and Staples Center operations.
- ^g Examples of family shows include Disney Live, Harlem Globetrotters and Marvel Universe Live.
- ^h Examples of other sporting events include college basketball, boxing, lacrosse, arena football, or non-recurring events such as professional wrestling shows. Events could be professional, collegiate or amateur competitions. Other events could include speaking events or civic events such as local graduation ceremonies.
- ⁱ Examples of corporate or community events include small conventions, conferences, cultural events, civic events and private events. Events could be hosted on the arena floor or in club, locker room and concourse space throughout the arena, or in the plaza.
- ^j Examples of plaza events include outdoor exhibitions or festivals for arts, food, technology, or similar activities, fan appreciation days, holiday celebrations, and similar outdoor events.

For purposes of this analysis, the HPSP Adjusted Baseline projects would not affect GHG emissions associated with the Proposed Project and, as such, were not relevant to the impacts and thresholds related to GHG emissions associated with the Proposed Project.

GHG Calculation Methodology

The evaluation of potential impacts to GHG emissions that may result from the construction and long-term operations of the Proposed Project is consistent with CEQA Guidelines section

15064.4(a) and recent related guidance from OPR.⁶⁹ This analysis considered GHG emissions resulting from Project-related incremental (net) increases in the use of on road vehicles, electricity, and natural gas compared to existing conditions. This included construction activities associated with the Proposed Project such as demolition, site preparation, excavation/grading, building construction, paving, hauling, and construction worker trips. This analysis also considered indirect GHG emissions from water conveyance, wastewater generation, and solid waste handling. Because potential impacts resulting from GHG emissions would be long-term rather than acute, GHG emissions were calculated on an annual basis. In accordance with SCAQMD guidance, GHG emissions from construction have been amortized (i.e., averaged annually) over the lifetime of the Project. SCAQMD defines the lifetime of a project as 30 years.⁷⁰ As stated above, a 30-year lifetime is consistent with the average lifespan of past NBA arenas. Therefore, the Project's total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate comparable to operational emissions.

GHG quantification methods rely on guidance from State and regional agencies with scientific expertise in quantifying GHG emissions, including CARB and SCAQMD. GHG emissions were estimated using CalEEMod Version 2016.3.2, which is a California based land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria air pollutant and GHG emissions from land use projects of various types and in various air basins. CalEEMod was developed in collaboration with the air districts of California and is recommended by SCAQMD for evaluating GHG emissions for projects under CEQA.⁷¹ Regional data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) were provided by the various California air districts to account for local requirements and conditions. According to the California Air Pollution Control Officers Association, the model is an established, accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.⁷²

CalEEMod uses CARB's approved on-road and off-road equipment emission models including the Emission FACTor model (EMFAC) and ARB In-Use Off-Road Equipment model (OFFROAD2011), and studies commissioned by California agencies such as the California Energy Commission and CalRecycle. OFFROAD is an emission factor model used to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment). The off-road diesel emission factors used in CalEEMod are based on the CARB

⁶⁹ The GHG operational analysis is consistent with the OPR's *CEQA and Climate Change Advisory Discussion Draft*. As stated therein, "when possible, lead agencies should quantify the project's construction and operational greenhouse gas emissions, using available data and tools, to determine the amount, types, and sources of greenhouse gas emissions resulting from the project." Governor's Office of Planning and Research, *CEQA and Climate Change Advisory Discussion Draft*, December 2018, p. 8. Accessed March 2019.

OFFROAD2011 program. EMFAC is an emission factor model used to calculate emissions rates from on-road vehicles (e.g., passenger vehicles). The emission factors used in CalEEMod are based on the CARB EMFAC2014 program. CARB has released an updated EMFAC2017 version that includes various updates, notably the incorporation of USEPA and CARB regulations and standards (e.g., Advanced Clean Cars and the Truck and Bus Rule), and was recently approved by USEPA for use in California.⁷³ To more accurately assess the mobile GHG emissions, EMFAC2017 emission factors were used in the analysis.

Emissions from Existing Operations

Existing operations at the Project Site and at the LA Clippers' current off-site team offices and practice and athletic training facility generate GHG emissions from energy (electricity and natural gas), on-road motor vehicles (mobile), solid waste, water and wastewater, and area sources, as described further below.

Energy

The existing operations consume energy (electricity and natural gas) for multiple purposes including, but not limited to, building heating and cooling, lighting, and electronics. The existing buildings on the Project Site and the off-site team offices and the practice and athletic training facility were built before 2005. Thus, building energy consumption for these facilities was based on CalEEMod historical (pre-2005) electricity and natural gas usage rates per CalEEMod instructions.⁷⁴ For pre-2005 buildings, CalEEMod bases its energy usage estimates on the CEC's California Commercial End-Use Survey (CEUS), which lists energy demand by building type based on data from 2002.⁷⁵

For on-site existing land uses, electricity is supplied by Southern California Edison (SCE) and natural gas is supplied by Southern California Gas Company. CalEEMod provided default CO₂e intensity factors for natural gas and for SCE-supplied electricity. The CalEEMod default CO₂e intensity factor for SCE-provided electricity, 705 pounds CO₂e/MWh (0.320 MTCO₂e/MWh), is based on the SCE portfolio in 2012.⁷⁶ However, as described in Section 3.7.3, California's Renewables Portfolio Standard, mandates that publicly owned electric utilities procure an increasing percentage of their total sales from renewable power sources, with a 2020 goal of 33 percent qualifying renewables. SCE's average power mix in 2017 included 32 percent qualified

⁷⁶ Southern California Edison, 2012. 2012 Corporate Responsibility and Sustainability Report. Available: https://www1.sce.com/wps/wcm/connect/68145014-2eba-40c2-8587-6482ce056977/CRR_08202013.pdf?MOD=AJPERES&ContentCache=NONE. Accessed April 5, 2019.

as renewable under the RPS.⁷⁷ SCE's progress in meeting its 2020 RPS obligation is reflected in its decreasing average CO₂e intensity factor since 2012. For 2016 and 2017, SCE reports average CO₂e intensity factors for its total electricity mix as 0.259 and 0.232 MTCO₂e/MWh, respectively.⁷⁸ Thus, the analysis of on-site existing operations emissions used SCE's 2017 CO₂e intensity factor for electricity rather than the CalEEMod default, because that was the most recent SCE emission factor available.

For the off-site team offices and practice and athletic training facility, electricity is supplied by Los Angeles Department of Water and Power (LADWP) and natural gas is supplied by Southern California Gas Company. For quantifying energy emissions from the off-site team offices and practice and athletic training facility, a 2017 intensity factor for LADWP-supplied electricity (0.334 MTCO₂e/MWh) was provided through direct correspondence with LADWP.⁷⁹

For estimating electricity emissions for the Proposed Project through the expected life of the project, CO₂e intensity factors were projected for each operational year through 2054, based on RPS compliance, as shown in **Table 3.7-5**. Annual operational emissions account for the anticipated change over time in CO₂e intensity factors for electricity (due to the RPS) and mobile sources (due to state regulations for vehicle efficiency). Consistent with estimates of operational emissions over the life of the Project, estimates of electricity emissions associated with the existing on-site and off-site uses were adjusted through the year 2054, as shown in Table 3.7-9, below, using projected CO₂e intensity factors for each operational year, based on RPS compliance (see Table 3.7-5).

For quantifying emissions from natural gas usage, CalEEMod calculated operational GHGs emissions using CalEEMod's default CO₂e intensity factor for natural gas combustion.

NOTES:

^a See Appendix G for derivation of electricity emission factors for RPS milestone years; emission factors for other years are derived using linear interpolation.

^b Based on EMFAC 2017; Aggregate emission factors are provided to illustrate the expected decreasing emissions intensity of vehicles over time. See Appendix G for derivation of mobile source emission factors used in the analysis, which accounted for emission factors specific to vehicle classes and vehicle speeds.

SOURCE: ESA, 2019.

Mobile Sources

Mobile source GHG emissions associated with existing operations were calculated using EMFAC2017 emission factors and the estimated VMT for existing uses as presented in Section 3.14, Transportation and Circulation. Emissions modeling was conducted using the vehicle fleet mix for the South Coast Air Basin as provided in the EMFAC models, and South Coast Air Basin-specific vehicle fleet emission factors for 2018 in units of grams or metric tons per mile.

Consistent with estimates of operational emissions over the life of the Project, estimates of mobile emissions associated with the existing on-site and off-site uses were adjusted through the year 2054, as shown in Table 3.7-9, using EMFAC 2017's projected mobile CO₂e intensity factors for each operational year (see Table 3.7-5).

Solid Waste

Existing operations generate solid waste from day-to-day activities, which generally consists of product packaging, grass clippings, bottles, food scraps, newspapers, plastic, and other items routinely disposed of in trash bins. A portion of the waste is diverted to waste recycling and reclamation facilities. Waste that is not diverted is typically sent to local landfills for disposal, where it results in GHG emissions of CO₂ and CH₄ from the decomposition of the waste that occurs over the span of many years.

Emissions of GHGs associated with solid waste disposal from existing on-site operations were calculated using the CalEEMod model, using waste generation values by land use as provided in Section 3.15, Utilities and Service Systems, and the CalEEMod GHG emission factors for solid waste decomposition. Solid waste generation rates for existing off-site team offices and practice and athletic training facility were also estimated based on generation rates by land use as provided in Section 3.15, and the CalEEMod GHG emission factors for solid waste decomposition. A waste diversion rate of 50 percent was used, consistent with State regulations.

The CalEEMod model allows the input of several variables to quantify solid waste emissions. The GHG emission factors, particularly for CH₄, depend on characteristics of the landfill, such as the presence of a landfill gas capture system and subsequent flaring or energy recovery. In CalEEMod the default values for landfill gas capture (e.g., no capture, no flaring, no energy recovery) are statewide averages and were used in this assessment to provide a conservative analysis.

Water and Wastewater

GHG emissions from water and wastewater are a result of the required energy for supply, distribution, and treatment. Wastewater generation also results in emissions of GHGs from wastewater treatment systems (e.g., septic, aerobic, or lagoons) as well as from solids that are digested either through an anaerobic digester or with co-generation from combustion of digester gas.

GHG emissions from water use associated with existing operations at the Project Site were calculated using CalEEMod and the Water Supply Assessment prepared for the Proposed Project (see Appendix M), the electrical intensity factors for water supply and distribution, and the GHG emission factors for the electricity utility provider. Water usage rates for existing off-site team

offices and practice and athletic training facility were also estimated based on usage rates by land use as described in the Water Supply Assessment prepared for the Proposed Project (see Appendix M). GHG emissions from water use were calculated using CalEEMod's electrical intensity factors for water supply and distribution and the appropriate GHG emission factor for the electricity utility provider.⁸⁰ For more detail on Water Supply impacts of the Proposed Project, see Section 3.15, Utilities and Service Systems, and Appendix M.

Area Sources

Area source emissions associated with existing operations include landscaping equipment. The emissions for landscaping equipment were estimated using CalEEMod, based on the size of the existing land uses, the GHG emission factors for fuel combustion, and the GWP values for the GHGs emitted. CalEEMod uses landscaping equipment GHG emission factors from the CARB OFFROAD model and CARB's *Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment (6/13/2003)*.⁸¹ In the South Coast Air Basin CalEEMod estimates that landscaping equipment operates for 250 days per year.

Stationary Sources

As a conservative approach, it was assumed that the existing operations do not include emergency generators as a source of GHG emissions. Thus, the GHG emissions from generators in the Proposed Project were treated as net new GHG emissions.

Project Construction Emissions

Construction of the Proposed Project would result in GHG emissions of CO₂ and smaller amounts of CH₄ and N₂O from construction equipment and mobile sources such as haul trucks and worker vehicles. Construction emissions were calculated for each year of construction activity using CalEEMod and applying emission factors from EMFAC2017 to calculate mobile source emissions. Construction emissions were forecasted based on an expectation that construction of the Proposed Project would occur in several overlapping phases over approximately 40 months, from July 2021 through October 2024. This is a conservative approach that assumes all construction occurs at the earliest feasible date.

The CalEEMod software provides options for specifying equipment, horsepower ratings, load factors, and operational hours per day. Project-specific information about equipment types and the current anticipated construction schedule, including construction equipment lists for each phase of construction activity, was provided by the project applicant. Equipment operational hours were increased for the majority of the heavy-duty off-road equipment from CalEEMod default values, which are typically 8 hours or less, but ranged from 4 hours to 21 hours per day to

⁸⁰ Water-related energy intensities in CalEEMod are based on the California Energy Commission report, *Refining Estimates of Water-Related Energy Use in California*, PIER Final Project Report, CEC-500-2006-118, 2006. Available: <https://ww2.energy.ca.gov/2006publications/CEC-500-2006-118/CEC-500-2006-118.PDF>. Accessed April 5, 2019.

⁸¹ California Air Resources Board, OFFROAD Modeling Change Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment, June 13, 2003. Available: https://ww3.arb.ca.gov/msei/2001_residential_lawn_and_garden_changes_in_eqpt_pop_and_act.pdf. Accessed April 5, 2019.

conservatively estimate the Proposed Project's maximum emissions. These values were applied to the same construction equipment and phasing assumptions used in the criteria air pollutant analysis (see Section 3.2, Air Quality, of this EIR) to generate GHG emissions values for each construction year.

The indirect emissions from electricity used by two 2,500 sf temporary construction trailers/offices were estimated using CalEEMod default energy consumption factors and an estimated SCE CO_{2e} intensity factor for year 2021 (start of construction).

The electricity needed to convey water for dust control was estimated based on each site's acreage, estimated days of water use, US Department of Energy irrigation rates and CalEEMod default electricity intensity factors for water supply, treatment, and distribution.⁸²⁻⁸³ Water conveyance for dust control was assumed to occur prior to building construction at each site. GHG emissions associated with dust control were estimated based on the total electricity use multiplied by the SCE emissions intensity factor for year 2021 (start of construction).

As explained above in "Approach to Analysis," GHG emissions from construction were amortized over the 30-year lifetime of the Proposed Project.

Project Operational Emissions

Operational emissions associated with the Proposed Project would include emissions from energy use (electricity and natural gas), on-road motor vehicles (mobile), electric off-road motor vehicles (e.g., forklifts and aerial lifts), solid waste, water and wastewater, area sources (landscaping), and on-site stationary sources (emergency generators and a cooling tower). Detailed methodology for each emission source is presented below.

The operational life of the Proposed Project was assumed to be 30 years, consistent with the average lifespan of past NBA arenas and SCAQMD guidance.⁸⁴ Accordingly, operational emissions were estimated from the anticipated start of operations at the Proposed Project during the 3rd quarter of 2024 through 2054, using the CalEEMod software and on-road vehicle emissions factors from the EMFAC2017 model. CalEEMod was used to estimate GHG emissions from electricity, natural gas, solid waste, water and wastewater, and landscaping equipment. Emissions estimates for on-road mobile sources were based on VMT data provided in Appendix K.

⁸² Estimated construction water use assumed to be generally equivalent to landscape irrigation, based on a factor of 20.94 gallons per year per square foot of landscaped area within the Los Angeles area (Mediterranean climate), which assumes high water demand landscaping materials and an irrigation system efficiency of 85%. Factor is therefore $(20.94 \text{ GAL/SF/year}) \times (43,560 \text{ SF/acre}) / (365 \text{ days/year}) / (0.85) = 2,940 \text{ gallons/acre/day}$, rounded up to 3,000 gallons/acre/day. U.S. Department of Energy, Energy Efficiency & Renewable Energy, Federal Energy Management Program. "Guidelines for Estimating Unmetered Landscaping Water Use." July 2010. p. 12, Table 4 – Annual Irrigation Factor – Landscaped Areas with High Water Requirements.

Accessed March 11, 2019. October 2008, pp. 3–8.

Energy

The Proposed Project would consume energy (electricity and natural gas) for multiple purposes including, but not limited to, building heating and cooling, lighting, and electronics. For all land uses, building electricity and natural gas usage rates were based on CalEEMod defaults for building types (e.g., arena, office, hotel, retail/restaurant and parking), adjusted to account for the Proposed Project's expected compliance with 2019 Title 24 building energy efficiency standards. The Proposed Project's electricity would be supplied by SCE and natural gas is supplied by Southern California Gas Company.

As shown in Table 3.7-4, annual non-NBA market-shifted events at the new Arena would include 10 large events, 38 medium events, and 41 small events. Because lighting and air handling would be controlled by zone within the proposed Arena, it was estimated that large events (12,000 or more attendees) require full arena energy demand, medium events (between 5,000 and 10,000 attendees) require 80 percent of the full arena energy demand and small events (less than 5,000 attendees) required 25 percent of the full arena energy demand. It was assumed that the 16 plaza events require 0 percent of arena energy demand because the Arena would not be in use.

For electricity usage, CalEEMod calculated GHG emissions based on the estimated electricity usage, the GHG emission factors for the electricity utility provider (SCE), and the GWP values for the GHGs emitted. CalEEMod provides default CO₂e intensity factors for natural gas and for SCE-supplied electricity. However, as described in Section 3.7.3, SB 100 increased California's Renewables Portfolio Standard and requires retail sellers and local publicly owned electric utilities to procure eligible renewable electricity for 60 percent of retail sales by December 31, 2030, and that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by December 31, 2045. SB 100 also mandated interim RPS milestones of 44 percent of retail sales by December 31, 2024, and 52 percent by December 31, 2027. To achieve the RPS mandate, utilities such as SCE are expected to steadily increase their renewable resources for energy production. This assumption is appropriate because utilities have steadily increased the percentage of energy obtained from renewable resources in response to existing mandates. Therefore, all electricity consumption from SCE sources would decrease in GHG intensity (i.e., emissions generated per kilowatt-hour) as the RPS milestones are met.

For estimating electricity emissions for the Proposed Project through the expected life of the project, CO₂e intensity factors were projected for each operational year through 2054, based on RPS compliance, as shown in Table 3.7-5.

In addition to electricity used for regular building operations, the electricity used by media vans parked at the proposed Arena was also calculated. Media vans would use a direct line hookup to draw electricity for use to power parked vehicles. The analysis assumed a maximum of 18 media vans (equal to the total number of media van parking spaces) operating four hours per day for each basketball game taking place at the proposed Arena (49 games total per year). Electricity generation was calculated by assuming media vans would require the equivalent of a 50

horsepower generator to operate, converting the horsepower to kilowatts, and then multiplying by the hours per day and days per year to estimate the total kilowatt-hours per year.

The GHG emissions associated with the Proposed Project's operational off-road equipment were calculated using default equipment data for horsepower and load factor. The operational equipment would include aerial lifts and forklifts operating twice a week for five hours per day for deliveries at the Arena Site loading zone. All operational equipment would be electric-powered and associated emissions were calculated by converting the total horsepower-hours to kilowatt-hours and calculating annual emissions using SCE energy intensity factors from 2024 through 2054.

Electric vehicle charging stations would generate emissions related to electricity generation. A total of 330 electric vehicle charging stations would be installed at the South, East, and West Parking Garages. Emissions estimates from the charging stations were calculated by multiplying the number of spaces, days of operation, charge hours per day, and charging station capacity resulting in the total annual electricity. The GHG emissions were then calculated using the total annual electricity and SCE energy intensity factors from 2024 through 2054.

For natural gas usage, CalEEMod was used to calculate operational GHGs emissions using the estimated natural gas demand of the various land uses, the GHG emission factors for natural gas combustion, and the GWP values for the GHGs emitted. Natural gas demand was based on data from the CEUS, which lists energy demand by building type.⁸⁵ However, since the data from the CEUS is from 2002, correction factors were applied to account for compliance with the updated 2019 Title 24 Building Standards Code. CalEEMod's default statewide emission factor for natural gas combustion was used in the analysis.

Mobile Sources

As described in Section 3.14, Transportation and Circulation, the Proposed Project operations would include vehicle trips related to LA Clippers games and other events at the Arena, commute trips by employees of the Arena and all trips associated with the ancillary development land uses (including retail, restaurant, office, training facilities, and sports medicine clinic employee trips and delivery truck trips).

Mobile source emissions were calculated using VMT data, which takes into account mode (vehicle trip types including private attendee vehicles, transportation network company (TNC) vehicles, employee vehicles, shuttles, and miscellaneous vehicles), ridership (occupancy per vehicle), and trip lengths, as provided in Appendix K.

As discussed in Section 3.2, Air Quality, vehicles traveling at lower speeds have higher emission rates. For the Proposed Project arena land use and associated events-related VMT, trips lengths were separated into three trip length segments with different vehicle speeds to account for travel on residential and business district roadways, freeways and the local study area (for additional details

⁸⁵ California Energy Commission, California Commercial End-Use Survey, <http://capabilities.itron.com/CeusWeb/ChartsSF/Default2.aspx>. Accessed April 25, 2019.

regarding trip length segments and speed derivations see Section 3.2 and Appendix D). For the Proposed Project ancillary uses-related VMT, as provided in Appendix K, vehicles emissions were modeled using the average speed for all vehicle travel in the SCAQMD region as determined through EMFAC2017 (for additional information on trip length and speed derivation to select mobile emissions factors, refer to Section 3.2's Regional Operational Emissions Methodology).

Mobile source emissions are the product of the estimated VMT and the emission factors representative of the vehicle fleet as shown in Appendix K. Emission factors for CO₂, CH₄, and N₂O were obtained from EMFAC2017 for SCAQMD.⁸⁶ For vehicle trips associated with the arena land use, the on-road vehicle trips associated with spectators, event-day staff, and employees would be primarily passenger vehicles, so the default SCAQMD fleet mix was adjusted for a passenger fleet mix of light-duty autos, motorcycles, light duty trucks, and medium-duty vehicles to estimate passenger fleet-average emission factors. For on-road trips associated with TNC vehicles, the default SCAQMD fleet mix was adjusted for a TNC vehicle fleet mix of light-duty autos, light duty trucks, and medium-duty vehicles to estimate TNC fleet-average emission factors. For on-road vehicle trips associated with shuttles used to transport attendees and employees, the default SCAQMD fleet mix was adjusted for a shuttle fleet mix of light-heavy duty trucks to estimate shuttle fleet-average emission factors. For on-road vehicle trips associated with miscellaneous vehicles, the default SCAQMD fleet mix was adjusted for a miscellaneous vehicle fleet mix of medium-heavy duty and heavy-heavy duty trucks to estimate miscellaneous vehicle fleet-average emission factors. For ancillary land uses, including the hotel and restaurant/retail land uses, the default SCAQMD fleet mix was used to estimate fleet-average emission factors.

Delivery truck emissions generated by traveling to and from the Project Site, as well as on-site idling, were based on the proposed loading dock capacity at the proposed Arena and emission factors from EMFAC2017. As a conservative assumption, the maximum number of delivery trucks was assumed to be six at one time based on the proposed Arena's loading dock capacity and with half of the delivery trucks using diesel powered Transport Refrigeration Units (TRUs). TRU emission factors were provided from CARB.⁸⁷⁻⁸⁸ Delivery trucks emissions were based on twenty-two truck deliveries per day with half containing TRUs.

Emission factors for mobile source emissions are assumed to decrease in future years due to fleet turnover and regulations such as Advanced Clean Cars Program. Therefore, emission factors were derived from EMFAC2017 for each year after 2024 (first operational year) through 2050. To illustrate this change over time, the annual aggregate emission factor for all vehicle classes through 2054 is shown in Table 3.7-5. EMFAC2017 does not provide emission factors beyond

⁸⁶ CalEEMod incorporates on-road vehicle emission factors from the prior release of the model, EMFAC2014. ESA incorporated updated EMFAC2017 emission factors as it is the best available data.

⁸⁷ California Air Resources Board, 2011. Staff Report: 2011 Amendments for the Airborne Toxic Control Measure for In-USE Diesel Fueled TRUs and TRU Generator Sets, and Facilities where TRUs Operate, August 2011. CARB does not provide emission factors beyond 2050 for TRUs; thus, emissions associated with TRUs were conservatively assumed to remain constant from 2050 through 2054.

⁸⁸ California Air Resources Board, 2012, Final Regulation Order, Airborne Toxic Control Measure for In-Use Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets, and Facilities where TRUs Operate, October 2012.

2050; thus, emissions associated with mobile sources were conservatively assumed to remain constant through 2050 and 2054.

Solid Waste

The Proposed Project would generate solid waste from day-to-day operational activities, which generally consists of product packaging, grass clippings, bottles, food scraps, newspapers, plastic, and other items routinely disposed of in trash bins. A portion of the waste is diverted to waste recycling and reclamation facilities. Waste that is not diverted is typically sent to local landfills for disposal, where it results in GHG emissions of CO₂ and CH₄ from the decomposition of the waste that occurs over the span of many years.

Solid waste generated by the Proposed Project was estimated using waste generation values by land use as provided in Section 3.15, Utilities and Service Systems. Emissions of GHGs associated with solid waste disposal under the Proposed Project were calculated using the CalEEMod software, using the waste generation data, the waste diversion rate, the GHG emission factors for solid waste decomposition, and the GWP values for the GHGs emitted.

CalEEMod allows the input of several variables to quantify solid waste emissions. The GHG emission factors, particularly for CH₄, depend on characteristics of the landfill, such as the presence of a landfill gas capture system and subsequent flaring or energy recovery. CalEEMod's default values for landfill gas capture (e.g., no capture, flaring, energy recovery), based on statewide averages, were used in the assessment. A waste diversion rate of 50 percent was used, consistent with State regulations.

Water and Wastewater

GHG emissions from water use and wastewater associated with the Proposed Project operations were calculated using CalEEMod and the Water Supply Assessment prepared for the Proposed Project, the electrical intensity factors for water supply and distribution, and the GHG emission factors for the electricity utility provider. For more detail on the Water Supply Assessment, see Section 3.15, Utilities and Service Systems, and Appendix M.

Area Sources

The GHG emissions associated with the Proposed Project's area sources were calculated using the CalEEMod model. The emissions for landscaping equipment were based on the Proposed Project's land uses, the GHG emission factors for fuel combustion, and the GWP values for the GHGs emitted. CalEEMod uses landscaping equipment GHG emission factors from CARB's OFFROAD model and CARB's *Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment (6/13/2003)* where commercial landscape equipment emission factors are multiplied by the project's non-residential building square footage and residential landscape equipment emission factors are multiplied by the project's residential square footage.⁸⁹

⁸⁹ California Air Resources Board, 2003. OFFROAD Modeling Change Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment, June 13, 2003. Available: https://ww3.arb.ca.gov/msei/2001_residential_lawn_and_garden_changes_in_eqpt_pop_and_act.pdf. Accessed April 5, 2019.

Stationary Sources

Stationary sources would include two on-site emergency generators and two emergency fire pumps. Emissions associated with periodic maintenance and testing of the emergency generators were estimated separately from the CalEEMod model. The emergency generator emissions were calculated based on compliance with the applicable federal emissions standards and compliance with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. Rule 1470 applies to stationary compression ignition engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Stationary sources would also include an on-site cooling tower to assist in dissipating heat from commercial processes, such as heating, ventilation and air conditioning (HVAC) systems, of the Proposed Project. The cooling tower would utilize a flow rate of 4,800,000 gallons per year (refer to the Water Supply Assessment prepared for the Proposed Project and Appendix M). The cooling tower would require energy to supply, distribute, and treat the water. The emissions associated with this energy use were estimated based on the default energy demand factors in the CalEEMod software.

Emissions from Relocated LA Clippers Games and Market-Shift Events

Mobile Sources

Mobile source GHG emissions associated with relocated LA Clippers games and market-shifted events from the region were calculated using EMFAC2017 emission factors and the VMT data presented in Appendix K, using the same mix of vehicles that were used for the air quality analysis in Section 3.2, Air Quality.⁹⁰

As with operational emissions, emission factors for mobile source emissions associated with relocated LA Clippers games and market-shifted events were assumed to decrease in future years due to fleet turnover and regulations such as Advanced Clean Cars Program. Therefore, emission estimates for future years were based on factors derived from EMFAC2017 for each year after 2024 (first operational year) through 2050. EMFAC2017 does not provide emission factors beyond 2050; thus, emissions associated with mobile sources were assumed to remain constant through 2050 and 2054.

Energy

For relocated LA Clippers games and market-shifted events (see Table 3.7-4), electricity and natural gas use were based on CalEEMod defaults for land use type and facility square footage, which are based on the 2016 Title 24 energy efficiency standards. The 2016 standards are assumed to be

⁹⁰ For backfilled events at Staples Center, the third length segment was assumed to be the average distance each vehicle would travel from the two nearest freeways to the nearest parking structure associated with the Staples Center. Accordingly, the third length segment at Staples Center is 0.3 miles, rather than the 1.3 miles used for the third length segment at the Proposed Project site.

appropriate for the Staples Center operations for the 47 relocated LA Clippers games because of the \$20 Million energy upgrade project that was completed for the arena in 2016. To match assumptions in Appendix K, the Staples Center also served as a proxy for a regional event venue, which serves as the arena use modeled for the non-NBA shifted events. As shown in Table 3.7-4, non-NBA shifted events include 10 large events, 38 medium-size events, and 41 small events. It was assumed that the relocated LA Clippers games and other large (12,000 or more attendees) market-shifted events, would require full arena energy demand; medium events (between 5,000 and 10,000 attendees) would require 80 percent of the arena energy demand; and small events (less than 5,000 attendees) would require 25 percent arena energy demand.

CalEEMod calculated GHG emissions based on the estimated electricity usage, the GHG emission factors for the electricity utility provider (LADWP), and the GWP values for the GHGs emitted. As with existing off-site emissions, estimates for future electricity emissions were based on the forecasted emission factor for LADWP-supplied electricity.

Solid Waste

Solid waste generated by the relocated LA Clippers games from the Staples Center and the market-shifted events shifted at the regional event venue was estimated using waste generation factors from the analysis done for the Sacramento Entertainment and Sports Center EIR, 2014 (see Section 3.15, Utilities and Service Systems, for more information). A diversion rate of 50 percent was assumed for the relocated LA Clippers games and market-shifted events, consistent with state regulations. Emissions were calculated using CalEEMod default factors for solid waste decomposition, and the GWP values for the GHGs emitted. Similar to energy use, it was assumed that large events (12,000 or more attendees) would generate 100 percent of the solid waste generated by a full arena; medium events (between 5,000 and 10,000 attendees) would generate 80 percent of the waste generated by a full arena; small events (less than 5,000 attendees) would generate 25 percent of the solid waste generated by a full arena.

Water and Wastewater

Water usage rates for relocated LA Clippers games and market-shifted events were estimated based on event employee and visitor water usage rates from the Water Supply Assessment prepared for the Proposed Project (see Appendix M). GHG emissions from water use were calculated using CalEEMod's electrical intensity factors for water supply and distribution, and the GHG emission factors for the electricity utility provider. For more detail on the Water Supply Assessment, see Section 3.15, Utilities and Service Systems and Appendix M.

Area Sources

The GHG emissions associated with area sources for relocated LA Clippers games and market-shifted events were calculated using CalEEMod defaults for the arena land use type and facility square footage.

Stationary Sources

It is assumed that emissions from emergency generators are not associated with the relocated Clippers games and market-shifted events because they are accounted for in the Proposed Project's emissions and would occur regardless of how many events are relocated or market-shifted to the proposed Arena.

Emissions from Backfilled Uses and Events

For the uses that will backfill the current off-site LA Clippers' off-site team offices and practice and athletic training facility, emissions estimates were based on the same methodology used to estimate existing emissions at those locations, where the electricity emission factor was also adjusted for the operational year (i.e., 2024 through 2054).

For the backfilled events at Staples Center, emissions were calculated based on the same methodology used to estimate emissions from relocated LA Clippers games, using an event size of 10,500 attendees (conservatively considered as a large event), based on the 2019 market analysis by Conventions, Sports and Leisure (CSL) that averaged attendance at Staples Center third-party events over a 3-year period report.⁹¹ As shown in Table 3.7-4, the analysis assumed 47 backfilled Staples Center events under the Full Backfill Scenario and 7 backfilled Staples Center events under the Partial Backfill Scenario. In addition, the mobile source and electricity emission factors were adjusted for the operational year (i.e., 2024 through 2054).

As shown in Table 3.7-4, the analysis assumed 89 backfilled market-shifted events under the Full Backfill Scenario and no backfilled non-NBA market-shifted events under the Partial Backfill Scenario. Under the Full Backfill Scenario, for backfilled events at other regional venues vacated by market-shifted events, emissions were calculated based on the same methodology used to estimate emissions from the existing market-shifted events.

LEED Gold Certification Requirements

The Proposed Project would be designed and constructed to meet the US Green Building Council's Leadership in Energy and Environmental Design (LEED) Gold certification requirements under the Building Design + Construction (BD+C) category. LEED provides a level of flexibility for projects to choose the exact credits and project features that reduce energy and water use, promote resource conservation through redevelopment and the sourcing of local construction materials, and create healthier indoor environments. LEED certification for the Arena Structure would be sought under LEED BD+C New Construction and Major Renovation, and certification for the other buildings surrounding the proposed plaza would be sought under LEED BD+C Core + Shell. The hotel would be LEED Gold certified under LEED BD+C Hospitality. Measures would be incorporated into the final design of each component to achieve sufficient points for LEED Gold certification. Based on prior experience with sports facilities and other major venues, the design team for the Proposed Project has identified a menu of project features that are within control of the project applicant and that could be feasibly implemented to

⁹¹ Conventions, Sports and Leisure (CSL), 2019. *Staples Center Vacated Event Days Analysis*. May 14, 2019.

achieve the necessary points to achieve a LEED Gold certification, consistent with the requirements of AB 987. Based on the project applicant's AB 987 application, the Proposed Project's design features related to LEED certification could include the following:⁹²

Location and Transportation. The Proposed Project would be eligible for credits in the location and transportation category in the following areas: (1) the Project Site would have access to high quality transit, (2) the Proposed Project would include bicycle and electric vehicle charging facilities, and (3) the Proposed Project would minimize its parking footprint.

The Proposed Project would be eligible to achieve the Access to Quality Transit credit because local transit service to the Project Site would be provided by the Los Angeles Metropolitan Transportation Authority (Metro) in the form of future below- and at-grade light rail on the Metro Crenshaw/LAX Line, which is currently under construction and expected to be complete in 2019. The Proposed Project would provide shuttle pick-up and drop-off service at the following two Metro rail stations: the existing Metro Green Line – Hawthorne/Lennox Station and the future Metro Crenshaw/LAX Line – Downtown Inglewood Station. In addition, the Project Site is adjacent to two LA Metro bus routes (lines 117 and 212/312 stop at the intersection of West Century Boulevard and South Prairie Avenue) and is also within 0.5 miles of a third Metro bus route (the combined 740/40 line stops at the intersection of West Century Boulevard and La Brea/Hawthorne Boulevard).

The Proposed Project would also provide electric vehicle charging stations for 8 percent of parking spaces, which would exceed the requirements for the Proposed Project to be eligible for the Green Vehicles credit.

Sustainable Sites. The Proposed Project would be eligible for credits for rainwater management, open space, heat island reduction, and light pollution reduction. Credits for open space are based on the percentage of permeable surfaces, including roof-top gardens.

Water Efficiency. The Proposed Project would be eligible for credits for the use of ultra-low flow fixtures in restrooms such as low flow faucets with aerators, dual flush toilets, and waterless urinals. These features would reduce indoor water use by a minimum of 40 percent and would be required to meet Universal Plumbing Code standards. The Proposed Project would also be eligible for credits for using 100 percent recycled water to service project landscaping designed for low water usage.

Energy and Atmosphere. The Proposed Project would be eligible for credits for optimized energy performance and renewable energy production. The Proposed Project would include a 700-kilowatt (kW) photovoltaic (PV) system, generating approximately 1,085,000 kilowatt-hours (kW-hrs) of carbon-free energy annually. The Proposed Project would also implement the following energy efficiency measures: Title 24 compliance; use of 100 percent LED lighting

⁹² Murphy's Bowl LLC, 2018. *AB 987 Application for the Inglewood Basketball and Event Center, Attachment G: Greenhouse Gas Analysis*. November 2018.

indoors and outdoors throughout the site; and implementation of high efficiency HVAC systems. In addition, the Proposed Project's design would include compliance with CALGreen Code Voluntary Tier 1, which is estimated to achieve a reduction in energy consumption greater than Title 24 2019 standards based on the preliminary design of the Proposed Project.

Materials and Resources. The Proposed Project would be eligible for credits for Construction and Demolition Waste Management and sourcing of raw materials. To achieve this credit, the Proposed Project would recycle at least 75 percent of demolition materials, which would exceed the City's target of 50 percent demolition waste recycling and is in accordance with State diversion targets that aim to divert a minimum of 75 percent of construction and demolition materials from landfill disposal.

Indoor Environmental Quality. The Proposed Project would be eligible for credits for enhanced indoor and outdoor air quality, and would meet American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) 62.1:2010 indoor air quality requirements and ASHRAE 55 thermal comfort requirements.

Innovation. The Proposed Project would be eligible for innovation credits. Innovative strategies include the following: implementation of the FanFirst/Occupant Comfort Survey,⁹³ green education program, LEED Operations + Management (O+M) Starter Kit (Pest Management and Green Cleaning Program), and the purchasing of 100 percent LED lamps.

Impacts and Mitigation Measures

Impact 3.7-1: Construction and operation of the Proposed Project could generate "net new" GHG emissions, either directly or indirectly, that could have a significant impact on the environment. (Less Than Significant with Mitigation)

As noted above the Proposed Project's baseline emissions are the annual operational GHG emissions produced by existing conditions and activities against which the Proposed Project's GHG emissions are compared, which include existing on-site structures that would be removed and replaced with construction of the Proposed Project, the existing LA Clippers team offices and practice and athletic training facility uses, as well as the operational emissions associated with relocated LA Clippers games and non-NBA events that would be market-shifted from existing venues in the region.

Existing Emissions

Table 3.7-6 presents total annual GHG emissions by source representing the existing conditions (2018).

⁹³ FanFirst Connected Comfort utilizes real time crowdsourced feedback during an event to adjust temperature in the arena bowl to increase fan comfort and reduce over cooling/wasted energy.

**TABLE 3.7-6
 EXISTING CONDITIONS (2018) – TOTAL ANNUAL GHG EMISSIONS BY SOURCE AND CATEGORY (MTCO₂E)**

Category	Existing On-Site ^a	Existing Off-Site ^b	Total Existing

Operational Emissions

Operational emissions associated with the Proposed Project would include emissions from energy use (electricity and natural gas), on-road motor vehicles (mobile), off-road motor vehicles, solid waste, water and wastewater, area sources (landscaping), and on-site stationary sources (emergency generators). Emissions reductions would result from the IBEC Transportation Demand Management (TDM) Plan and the physical design features incorporated in the Project that stem from LEED Gold certification and Title 24 compliance. As discussed above under Methodology, the operational emissions associated with the Proposed Project were calculated using methods consistent with the CalEEMod model.

Section 3.14, Transportation and Circulation, presents estimates that the Proposed Project would result in approximately 48,899,432 net new total annual VMT under the Full Backfill Scenario and approximately 31,781,542 net new total annual VMT for the Partial Backfill Scenario after accounting for use of alternative modes of transportation, internal trip capture, and transportation demand management features of the Proposed Project.

Table 3.7-8 presents total annual GHG emissions by source for the first full year of operations (2025). Pursuant to SCAQMD guidance, construction emissions were amortized over a period of 30 years and then added to annual operational emissions. As indicated in Table 3.7-8, the Proposed Project’s first full year of operational GHG emissions at full buildout, including amortized construction emissions, would be approximately 23,729 MTCO₂e per year.

**TABLE 3.7-8
 ANNUAL OPERATIONAL GHG EMISSIONS AT FIRST FULL YEAR OF OPERATIONS (2025)**

Category	CO ₂ e Emissions (MT/year)
Mobile	18,233

Net New Emissions

Full Backfill Scenario

Table 3.7-9a presents annual net new annual GHG emissions by source over the 30-year lifetime of the Proposed Project (2024 through 2054) under the Full Backfill Scenario. The baseline for determining net new emissions includes existing emissions (as summarized in Table 3.7-6), as well as events that would be relocated or market-shifted to the Project Arena. As summarized in Table 3.7-4, under the Full Backfill Scenario all of the 47 LA Clippers games that currently occur at Staples Center and all of the 89 annual non-NBA market-shifted events that currently occur at other existing venues in the region would be backfilled. Thus, the GHG emissions from the backfilled Staples Center events and backfilled market shifted events are considered attributable to the Proposed Project under the Full Backfill Scenario. As indicated in Table 3.7-9a, the Proposed Project’s net new GHG emissions for the first full year of operation in 2025 would be approximately 20,991 MTCO_{2e} under the Full Backfill Scenario. By the year 2054, annual net new emissions would be reduced to approximately 14,354 MTCO_{2e}, due to anticipated improvements in vehicle fuel efficiency and lower GHG intensity of the electricity supply.

NOTES:

- ^a Includes construction emissions amortized over 30 years. For details, see Appendix G. Annual operational emissions account for the anticipated change over time in CO_{2e} intensity factors for electricity (due to the RPS) and mobile sources (due to state regulations for vehicle efficiency).
- ^b Existing emissions from Table 3.7-6. Includes emissions from existing on-site structures that would be removed and replaced with construction of the Proposed Project, as well as the existing off-site uses such as the LA Clippers' team business operations, and the existing LA Clippers' practice and athletic training facility. Annual existing emissions account for the anticipated change over time in CO_{2e} intensity factors for electricity (due to the RPS) and mobile sources (due to state regulations for vehicle efficiency).
- ^c Includes operational emissions from the relocated LA Clippers games at the Staples Center, See Appendix G.
- ^d Includes 89 non-NBA market shifted events transferred to the Proposed Project from elsewhere in the region.
- ^e Includes the backfilled LA Clippers' team business offices and the backfilled LA Clippers' practice and athletic training facility.
- ^f Includes the backfilling of Staples Center vacated LA Clippers game dates with 47 non-NBA events.
- ^g Includes 89 non-NBA market shifted events backfilled elsewhere in the region.
- ^h Net new emissions subtracts existing emissions, relocated LA Clippers game and market-shifted event emissions from operational emissions, and adds emissions from back-filled events.
- ⁱ Represents emissions from 6 months of operation.

SOURCE: ESA, 2019.

Partial Backfill Scenario

Table 3.7-9b presents annual net new annual GHG emissions by source over the 30-year lifetime of the Proposed Project (2024 through 2054) under the Partial Backfill Scenario. The baseline for determining net new emissions includes existing emissions (as summarized in Table 3.7-6), as well as events that would be relocated or market-shifted to the Project Arena. As summarized in Table 3.7-4, under the Partial Backfill Scenario, 7 of the 47 annual LA Clippers games at Staples Center would be backfilled, and none of the 89 non-NBA market-shifted events would be backfilled. The GHG emissions from the 7 backfilled Staples Center events are considered to be attributable to the Proposed Project. As indicated in Table 3.7-9b, the Proposed Project's net new GHG emissions for the first full year of operation in 2025 would be approximately 15,090 MTCO₂e under the Partial Backfill Scenario. By the year 2054, annual net new emissions would be reduced to approximately 10,331 MTCO₂e, due to anticipated improvements in vehicle fuel efficiency and lower GHG intensity of the electricity supply.

Based on the analyses presented above, over the 30-year operational life of the Proposed Project, a net increase of 496,745 MTCO₂e of GHG would occur under the Full Backfill Scenario, and a net increase of 357,635 MTCO₂e of GHG would occur under the Partial Backfill Scenario. Between now and the year 2054, there is considerable uncertainty about changes in the regulatory or technological environment that could affect the actual total GHG emissions of the Proposed Project. Nevertheless, based on the analysis presented above, this impact is considered **significant**.

The following mitigation measures have been designed to achieve no net increase in GHG emissions and thereby reduce the impact to a less-than-significant level. AB 987 imposes additional requirements that will be addressed through project conditions of approval.

Mitigation Measure 3.7-1(a)

- 1) **Project GHG Emissions.** *Estimate the Project's net new GHG emissions over the 30-year operational life of the Project. The estimate shall be based on final design, project-specific traffic generation, actual energy use estimates, equipment to be used on site, and other emission factors appropriate for the Project, using the best available emissions factors for electricity, transportation engines, and other GHG emission sources commonly used at the time the GHG Reduction Plan is completed, reflecting existing vehicle emission standards and building energy standards. Net operational (incremental) emissions shall be derived by adding the annual operational emissions and backfill emissions and then subtracting from that total existing emissions and emissions from relocated LA Clippers games and market shifted non-NBA events, as illustrated in Table 3.7-9a and Table 3.7-9b. The estimate shall include the Project's construction GHG emissions, which shall be amortized over the 30-year operational life of the Project, shown in Table 3.7-7 to be 603 metric tons of carbon dioxide equivalent (MTCO_{2e})/year.*

- 2) **GHG Mitigation.** *Include reduction measures that are sufficient to reduce or offset incremental emissions over the net neutral threshold, are verifiable, and are feasible to implement over project life. At a minimum, the GHG Reduction Plan shall include:*
 - (i) *implementation of all measures set forth under Section A. below; and*
 - (ii) *emissions reductions associated with implementation of Project Design Features 3.2-1 and 3.2-2 and Mitigation Measures 3.2-2(b) and 3.14-2(b) regarding the reduction of NO_x and PM_{2.5} emissions, to the extent these features and measures have co-benefits in the form of quantifiable GHG emissions reductions. The project applicant shall be required to implement a combination of measures identified in Section B below, or co-benefits of NO_x and PM_{2.5} emissions reduction measures required under AB 987, to achieve any remaining GHG emission reductions beyond those identified in (i) and (ii) above necessary to meet the no net new GHG emissions threshold over the 30-year operational life of the Project.*

A. Required GHG Reduction Measures.

- a. *Minimize energy demand, including electricity and natural gas demand, through implementation of LEED Gold certification design features.*

- b. *Implement a transportation demand management (TDM) program that includes the following, subject to further refinement and revision through coordination between the City and the project applicant at the time of project approval:*
 - i. *TDM 1 – Encourage Alternative Modes of Transportation (Rail, Public Bus, and Vanpool).*

The IBEC Project shall encourage alternative modes of transportation use by providing monetary incentives and bus stop improvements near the Project Site such as, but not limited to:

- *Integrated event and transit ticketing to enable seamless connections and provide event-day travel updates.*

- *Discounted event tickets with the purchase of a transit pass or providing proof of a registered TAP card (the regional fare payment method).*
- *Giveaways for transit users (goods for attendees, free tickets for employees, etc.).*
- *Rewards/gamification opportunities for fans to compete for prizes or points based on their transportation choices.*
- *Bus stop facilities improvements: the IBEC Project shall provide on-site and/or off-site improvements such as lighting, new benches and overhead canopies, added bench capacity if needed, and real-time arrival information for an improved user experience for bus stops that are relocated as a result of the IBEC Project.*
- *Transit and/or Multi-Modal Subsidy: the IBEC Project shall provide pre-tax commuter benefits for employees.*
- *Vanpool Subsidy: This shall provide pre-tax commuter benefits for employees.*
- *Marketing and outreach campaign to event attendees and employees for transit usage.*

ii. *TDM 2 – Event-day Dedicated Shuttle Services*

The following shall be provided to ensure sufficient connectivity to existing and planned Metro Rail Stations:

- *The IBEC Project shall provide dedicated shuttle service from the Green Line at Hawthorne Station, Crenshaw/LAX Line at AMC/96th Street Station, and Crenshaw/LAX Line at La Brea/Florence (Downtown Inglewood) Stations for Arena events. This shuttle service shall be a dedicated event-day shuttle service from the venue for employees and attendees.*
- *The IBEC Project shall provide no less than 27 shuttles with a capacity of no less than 45 persons per shuttle to accommodate employees and attendees traveling to and from the Project Site. Due to the arrival and departure of employees prior to and after the attendees, respectively, the same shuttles shall be utilized for the employees. Shuttle service shall begin no less than two hours before the event and extend to at least 30 minutes after the start of the event. After the event, shuttle service shall begin no less than 30 minutes before the end of the event and shall continue for at least one hour after the end of the event.*
- *The IBEC Project shall implement Mitigation Measure 3.14-2(b), requiring the IBEC operator to provide enough shuttles to ensure that there is successful and convenient connectivity with short wait times to these light rail stations. To this end, the IBEC operator will monitor the number of people using shuttles to travel between the*

above light rail stations and the IBEC. If the monitoring shows that peak wait times before or after major events exceeds 15 minutes, then the IBEC operator must add enough additional shuttle runs to reduce wait times to meet this target. The aim is to require increased shuttle runs as necessary to make sure that demand is accommodated within a reasonable amount of time and to encourage use of transit.

- *The IBEC Project shall provide a convenient and safe location on site for shuttle pick-up and drop-off on the east side of South Prairie Avenue, approximately 250 feet south of West Century Boulevard. The drop-off location shall be adjacent to the Arena so that shuttle users would not need to cross South Prairie Avenue to arrive at the Arena. The IBEC Project shall implement Mitigation Measure 3.14-3(f), which requires constructing a dedicated northbound right-turn lane that would extend from the bus pull-out on the east side of South Prairie Avenue to West Century Boulevard.*

iii. TDM 3 – Encourage Carpools and Zero-Emission Vehicles

The IBEC Project shall provide incentives to encourage carpooling and zero-emission vehicles as a means for sharing access to and from the Project Site. The incentives shall include:

- *Incentives for carpools or zero-emission vehicles, including preferential parking with the number of parking spots in excess of applicable requirements, reduced parking costs, discounted rides (or other, similar benefits) to incentivize sharing/pooling for attendees using transportation network company (TNC) rides to or from an event, or other discounts/benefits.*
- *Variable parking price based on car occupancy, structured to encourage carpooling.*
- *8 percent of parking spaces with electrical vehicle charging stations in excess of the minimum requirement of 6 percent (i.e., a minimum of three hundred and thirty (330) electric vehicle charging stations (EVCS) shall be installed within the three proposed on-site parking garages serving the Project for use by employees, visitors, event attendees, and the public).*

iv. TDM 4 – Encourage Active Transportation

The IBEC Project shall include features that would enhance the access for bicyclists and pedestrians, including the following:

- *Bicycle parking in excess of applicable code requirements as follows: 60 employee bike parking spaces and 23 attendee bike parking spaces.*
- *Showers and lockers for employees.*

- *A bike valet service if needed to accommodate bike parking space needs.*
- *A bicycle repair station where bicycle maintenance tools and supplies are readily available on a permanent basis and offered in good condition.*
- *Coordination of bike pools and walk pools.*
- *Sidewalks or other designated pathways following safe routes from the pedestrian circulation to the bicycle parking facilities and throughout the development.*

v. *TDM 5 – Employee Vanpool Program*

The IBEC Project shall provide an employee vanpool program to accommodate up to 66 employees utilizing the vanpool service. Each vanpool shall have a capacity of at least 15 persons per vehicle. The vanpool program shall be in conjunction with a vanpool subsidy providing pre-tax commuter benefits for employees as indicated in TDM 1.

vi. *TDM 6 – Park-n-Ride Program*

The IBEC Project shall provide a regional park-n-ride program that utilizes charter coach buses with a capacity of no less than 45 persons per bus. Parking lot locations shall correspond to zip code ticket purchase data, and the site circulation shall be designed to account for the charter coaches.

vii. *TDM 7 – Information Services*

The IBEC Project shall provide services to inform the public about activities at the IBEC, including the following:

- *Strategic Multi-modal Signage/Wayfinding.*
- *Real-time travel information; Changeable Message Sign (CMS) and social media.*
- *Welcome packets for new employees and ongoing marketing*
- *Commercials/Advertisement – Television, Website, Social Media, Radio, etc.*
- *Information kiosk or bulletin board providing information about public transportation options.*

viii. *TDM 8 – Reduce On-Site Parking Demand*

The IBEC Project shall include features that reduce on-site parking demand. These features shall include:

- *Provide coach bus/minibus/microtransit staging and parking areas: the IBEC Project is designed to accommodate 20 minibus/microtransit/paratransit parking spaces and 23 charter coach bus spaces. The capacity for minibus/microtransit/paratransit shall be no less than 10 persons per vehicle.*
- *Allocate sufficient TNC staging spaces: the IBEC Project shall be designed to accommodate approximately 160 spaces for TNC staging.*

ix. *TDM 9 – Event Day Local Microtransit Service*

The IBEC Project shall provide a local minibus/microtransit⁹⁴ service for all event days with a service range of approximately six (6) miles surrounding the Project Site. Each minibus shall have a capacity of no less than 10 persons per vehicle and shall provide service to employees and event attendees.

x. *Monitoring*

The TDM Program shall include an ongoing program to monitor each of the TDM Program elements listed above. The monitoring program shall collect data on the implementation of each specific TDM strategy and shall assess the extent to which the TDM Program is meeting demand for alternative forms of transportation and reducing vehicle trips and reliance on private automobiles. The information obtained through this monitoring program shall be provided to the City Traffic Engineer on an annual basis.

- c. *A monitoring report shall be prepared not less than once each year. The report shall evaluate the extent to which the TDM Program encourages employees to reduce single-occupancy vehicle trips and to use other modes of transportation besides automobile to travel to basketball games and other events hosted at the Project. The monitoring report shall be provided to the City Traffic Engineer (ongoing) and the State of California Office of Planning and Research (through 2030).*
- d. *The TDM Program shall be a dynamic document that is expected to be revised and refined as monitoring is performed, experience is gained, additional information is obtained regarding the Project transportation characteristics, and advances in technology or infrastructure become available. Any changes to the TDM Program shall be subject to review and approval by the City Traffic Engineer. In reviewing any proposed changes to the TDM Program, the City Traffic Engineer shall ensure that the TDM Program, as revised, is equally or more effective in addressing the issues set forth above.*

⁹⁴ A minibus is a physically smaller bus and/or shuttle (i.e., with capacity for 20 or fewer people). Microtransit refers to short-distance (i.e., approximately 6 miles or less) shuttle service.

- e. *Install “smart parking” systems in the on-site parking garages serving the Project to reduce vehicle circulation and idle time within the structures by more efficiently directing vehicles to available parking spaces.*

B. Potential Additional GHG Reduction Measures

The GHG Reduction Plan shall identify and quantify any additional GHG reduction measures proposed by the project applicant to reduce incremental emissions to below the net zero threshold. These additional measures may include one or more of the following:

a. Potential on-site measures:

- i. *Installation of additional photovoltaic systems as carports on the East Parking Garage.*
- ii. *Purchase of energy for on-site consumption through the Southern California Edison (SCE) Green Rate, which facilitates SCE’s purchase of renewable energy to meet the needs of Green rate participants from solar renewable developers within the SCE service territory or similar opportunities for renewable electricity that may arise in the future.*
- iii. *If available after approval by applicable regulatory agencies, on-site use of renewable natural gas.⁹⁵*
- iv. *Implementation of a waste diversion program with a goal of reducing landfill waste to zero.*

b. Potential off-site measures:

- i. *Carbon offset credits. The project applicant may purchase carbon offset credits that meet the requirements of this paragraph. Carbon offset credits must be verified by an approved registry. An approved registry is an entity approved by CARB to act as an “offset project registry” to help administer parts of the Compliance Offset Program under CARB’s Cap and Trade Regulation. Carbon offset credits shall be permanent, additional, quantifiable, and enforceable.*
- ii. *Transit and City Fleet Vehicles Replacement. The project applicant may enter into an agreement to cover replacement costs of existing City municipal fleet and transit vehicles with Zero Emissions Vehicles (ZEVs) and install related Electric Vehicle Charging Stations (EVCS).*
- iii. *Local EV Charging Stations. The project applicant may enter into agreements to install EVCS locations in the City for use by the public.*

⁹⁵ Renewable natural gas is a biogas which has been upgraded to a quality similar to fossil natural gas and having a methane concentration of 90% or greater. A biogas is a gaseous form of methane obtained from biomass. By upgrading the quality to that of natural gas, it becomes possible to distribute the gas to customers via the existing gas grid within existing appliances.

- iv. *The project applicant may develop or enter into partnership with other organizations to develop a tree planting program in the City.*
- v. *EV Home Charger Program. The project applicant may implement a program to cover 100 percent of the costs of purchasing and installing EV chargers for residential use in local communities near the Project Site.*

The GHG Reduction Plan may include different, substitute GHG reduction measures that are equally effective or superior to those proposed above, as new technology and/or other feasible measures become available during construction or the operational life of the Project. The GHG Reduction Plan shall identify such different, substitute GHG reduction measures, and shall provide enough information to assess the feasibility of these measures. The Project Applicant may rely on such measures only if they are reviewed by the City Chief Building Official, are quantified, are found to be feasible, and are found to be at least as effective as those measures listed above. The Plan shall identify and quantify any other GHG reduction measures needed to reduce the Project incremental GHG emissions to no net new GHG emissions, or better.

Mitigation Measure 3.7-1(b)

***Annual GHG Verification Report.** The project operator shall prepare an Annual GHG Verification Report, which shall be submitted to the City, with a copy provided to CARB, in the first quarter of each year following the commencement of project operations. The Annual GHG Verification Report shall estimate the Project's emissions for the previous year based on operational data and methods, and using appropriate emissions factors for that year, as set forth in the GHG Reduction Plan, and determine whether additional offset credits, or other measures, are needed for the Project to result in net zero GHG emissions. It shall include a process for verifying the actual number and attendance of net new, market-shifted, and backfill events.*

If an Annual GHG Verification Report determines that the Project's emissions for the previous year were lower than necessary to achieve net zero GHG emissions, credit for any emissions reductions achieved below net zero shall be applied to the next year in the following Annual GHG Verification Report. The Annual GHG Verification Report shall be verified by a qualified, independent expert entity retained at the project applicant's expense. GHG offset credits to achieve net zero GHG emissions for the previous year, if necessary, shall have been purchased by the end of each reporting year.

Following completion and verification of the Annual GHG Verification Report, the GHG Reduction Plan shall be refined as may be needed in order to maintain emissions below net zero over the next reporting year. Any such revisions shall be prepared by the qualified expert retained by the project applicant and shall be subject to review and approval by the City.

In reviewing the GHG Reduction Plan, any revisions to that plan, or other reports related to implementation of the Plan, the City may retain a qualified expert to assist with this review. The selection of such an expert shall be at the City's discretion. Any expenses incurred by the City in retaining this expert shall be borne by the project applicant.

The provisions of this Mitigation Measure 3.7-1(b) may be consolidated with the reporting obligations pursuant to AB 987, as memorialized in the conditions of approval to the Project, into a single GHG reduction monitoring and verification report.

Impact 3.7-2: Construction and operation of the Proposed Project could be inconsistent with applicable plans, policies and regulations adopted for the purpose of reducing the emissions of GHGs. (Less Than Significant)

CARB 2017 Scoping Plan Update

As directed by Executive Order B-30-15, CARB's 2017 Scoping Plan Update describes how the State plans to achieve the 2030 GHG emission reduction goal for California of 40 percent below 1990 levels by 2030, as mandated by SB 32. The 2017 Scoping Plan Update strategy for meeting the 2030 GHG target incorporates the full range of legislative actions and State-developed plans that have relevance to the year 2030, including the LCFS, SB 350, the 2016 Mobile Source Strategy, the Sustainable Freight Action Plan, SB 1383, and the Cap-and-Trade Program (AB 398).

The Proposed Project would be consistent with key state plans and regulatory requirements referenced in the 2017 Scoping Plan Update designed to reduce statewide emissions. According to the 2017 Scoping Plan Update, reductions needed to achieve the 2030 target are expected to be achieved by increasing the RPS to 50 percent of the State's electricity by 2030, greatly increasing the fuel economy of vehicles and the number of zero-emission or hybrid vehicles, reducing the rate of growth in VMT, supporting high-speed rail and other alternative transportation options, and increasing the use of high-efficiency appliances, water heaters, and HVAC systems. The Proposed Project would not impede implementation of these potential reduction strategies identified by CARB, and it would benefit from statewide and utility-provider efforts towards increasing the portion of electricity provided from renewable resources.⁹⁶ The Proposed Project would also benefit from statewide efforts towards increasing the fuel economy standards of vehicles and reducing the carbon content of fuels. The Proposed Project would utilize energy-efficient appliances and equipment, as required by Title 24, and it would provide EV charging stations to support the future use of electric and hybrid-electric vehicles by employees and visitors.

For these reasons described above, the Proposed Project post-2020 emissions trajectory would decline over time, consistent with the 2017 Scoping Plan Update.

⁹⁶ As discussed previously, with the passage of SB 100, California's RPS has been increased over what is prescribed by the 2017 Scoping Plan Update, requiring retail sellers and local publicly owned electric utilities to procure eligible renewable electricity for 44 percent of retail sales by the end of 2024, 52 percent by the end of 2027, and 60 percent by the end of 2030; and requires that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by the end of 2045.

SCAG 2016 RTP/SCS

As discussed in Section 3.2, Air Quality, the 2016 RTP/SCS is designed to support development of compact communities in existing urban areas, with more mixed-use and infill development, and reuse of developed land that is also served by high quality transit. The 2016 RTP/SCS describes how the region can attain the GHG emission-reduction targets set by CARB by reducing VMT to achieve an 8 percent reduction in passenger vehicle GHG emissions by 2020, 18 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level on a per-capita basis.

The 2016 RTP/SCS includes strategies for transportation and land use that are designed to reduce VMT and the GHG emissions associated with on-road vehicle travel. This includes but is not limited to strategies that increase the density and mix of land uses; focus growth around transit; provide transit improvements; expand active transportation networks; expand regional charging infrastructure for electric vehicles, and expand TDM programs.

As discussed in Section 3.10, Land Use and Planning, the 2016 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in infill areas well served by transit. The TDM strategies in the 2016 RTP/SCS are focused on reducing peak period and SOV travel by encouraging behavior shifts to carpooling or vanpooling or reducing peak period travel. SCAG encourages employers to offer telecommuting or alternative work week schedules to help reduce peak period travel.

In June 2016, CARB accepted SCAG's quantification of GHG emission reductions from the 2016 RTP/SCS and the determination that the 2016 RTP/SCS would, if implemented, achieve the 2020 and 2035 GHG emission reduction targets established by CARB.⁹⁷

Goal 6 of the 2016 RTP/SCS aims to improve air quality and encourage active transportation. The Proposed Project would be consistent with Goal 6 through the implementation of a comprehensive TDM Program provides transportation services, monetary incentives and project design features that encourage and support the use by employees, event attendees and customers of alternative modes of transportation and the reduction of vehicle trips, including by increasing average vehicle occupancy. The program is designed to be consistent with the requirements and achieve the reduction in vehicle trips set forth in AB 987 and would be required under Mitigation Measure 3.14-2(b). The Proposed Project TDM Program would include the following components: encourage alternative modes of transportation (rail, public bus, and vanpool); provide event-day dedicated shuttle services; encourage carpools and zero-emission vehicles; encourage active transportation; implement an employee vanpool program and a park-n-ride program; provide alternative transportation information services; reduce on-site parking demand; and provide event-day local microtransit service.

⁹⁷ California Air Resources Board, 2016. *Southern California Association of Governments' (SCAG) 2016 Sustainable Communities Strategy (SCS) ARB Acceptance of GHG Quantification Determination*. June 2016.

The TDM program (including TDM Program elements included in the Proposed Project) would be designed to achieve and maintain a 15 percent reduction in the number of vehicle trips, on an annual basis, by attendees, employees, visitors, and customers as compared to trips generated by Project operations absent the TDM program. Pursuant to AB 987, the measures included in the Proposed Project TDM program must be implemented so that a 7.5 percent reduction in vehicle trips is achieved and maintained by the end of the first NBA season during which an NBA team has played at the Arena, anticipated to occur by June 2025. A 15 percent reduction in vehicle trips must be achieved no later than January 1, 2030. This requirement directly supports SCAG's 2035 target of reducing per-capita VMT 18 percent reduction by 2035. The reduction in trips achieved under the Proposed Project TDM program would reduce GHG emissions from Project-related transportation.

In addition, as described above and in Section 3.14, Transportation and Circulation, the TDM Program would encourage active transportation and alternative modes of travel. For example, the Proposed Project would include 23 spectators and 60 employee on-site bicycle parking spaces, which would exceed the bicycle parking requirements established in Municipal Code Chapter 12, Article 19, section 12-42.1. To promote pedestrian travel, the Proposed Project would include improvements to the sidewalks fronting the Project Site and a pedestrian bridge crossing South Prairie Avenue to promote a safe pedestrian circulation system and would provide high-capacity pedestrian pathways. In addition, the Proposed Project would include provisions that would promote the use of public transportation as a means of travel to and from the Arena, including a transportation hub at the East Transportation and Hotel Site, shuttle stops on South Prairie Avenue, and a shuttle system for large events that would connect the Proposed Project to nearby Metro stations. This would further support Goal 6 of the RTP/SCS.

Goal 7 of the 2016 RTP/SCS aims to actively encourage and create incentives for energy efficiency. The Proposed Project would utilize energy efficiency appliances and equipment, as required by Title 24, and it would provide EV charging stations to support the future use of electric and hybrid-electric vehicles by employees and visitors traveling to and from the Project Site. In addition, the Proposed Project would be designed and constructed to meet LEED Gold certification requirements, which would require the incorporation of energy efficiency measures. The Proposed Project would comply with Title 24 energy efficiency requirements, use of 100 percent LED lighting indoors and outdoors throughout the site, and install high efficiency HVAC systems. In addition, the Proposed Project's design would include compliance with CALGreen Code Voluntary Tier 1, which, based on the preliminary design of the Proposed Project, is estimated to achieve a reduction in energy consumption greater than Title 24 2019 standards. These actions would be consistent with Goal 7 of the 2016 RTP/SCS.

For the reasons described above, the Proposed Project would be consistent with the 2016 RTP/SCS, and would not be inconsistent with its policies that were adopted for the purposes of avoiding or mitigating environmental effects.

Executive Order S-3-05

Executive Order No. S-3-05 established a long-term goal of reducing California's GHG emissions to 80 percent below the 1990 level by the year 2050. The Proposed Project GHG emissions would decline from its first operational year in 2024 through at least 2050 due to continued regulatory and technological advancements. The extent to which GHG emissions from mobile sources indirectly attributed to the Proposed Project would change in the future depends on the quantity (e.g., number of vehicles, average daily mileage) and quality (i.e., carbon content) of fuel that would be available and required to meet both regulatory standards, and resident and worker needs.

Renewable power requirements, the LCFS, and vehicle emissions standards discussed above will all decrease GHG emissions per unit of energy delivered or per VMT. Due to the uncertainty of technological advancements that could be anticipated over the next 30 years and the unknown parameters of the regulatory framework in 2050, further quantitative analysis of the Proposed Project impacts relative to the 2050 target would be speculative. CEQA Guidelines section 15145 directs that “[i]f, after thorough investigation, a Lead Agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact.”

Even though the State has not provided a clear regulatory and technological roadmap to achieve the 2050 goal, it has demonstrated the potential pace at which emission reductions can be achieved through new regulations, technology deployments, and market developments. In developing the 2017 Scoping Plan Update, CARB, CEC, CPUC, and the California Independent System Operator (CAISO) commissioned a study to evaluate the feasibility and cost of meeting the 2030 target along the way to reaching the State goal of reducing GHG emissions to 80 percent below 1990 levels by 2050. With input from the agencies, the California State Agencies' PATHWAYS Project explores scenarios for meeting the State long-term GHG emissions targets, encompassing the entirety of California economy with detailed representations of the buildings, industry, transportation, and electricity sectors.⁹⁸ While acknowledging the inherent uncertainty associated with its modeling assumptions, the PATHWAYS study emphasizes the need for significant action and continued policy development by the State to support low-carbon technologies and markets for energy efficiency, building electrification, renewable electricity, zero emission vehicles, and renewable liquid fuels. The study underscores the need for a periodic review of State policies and programs for reducing GHG emissions, as was anticipated by AB 32 in its directive to update the Scoping Plan at least every 5 years.

A 2018 update to the PATHWAYS study advanced the understanding of what is required for technology deployment and other GHG mitigation strategies if California is to meet its long-term climate goals. The 2018 study concludes that to achieve high levels of consumer adoption of zero-carbon technologies, particularly of electric vehicles and energy efficiency and electric heat

⁹⁸ Energy + Environmental Economics (E3), 2015. *Summary of the California State Agencies' PATHWAYS Project: Long-term Greenhouse Gas Reduction Scenarios*. Available: https://www.ethree.com/public_proceedings/summary-california-state-agencies-pathways-project-long-term-greenhouse-gas-reduction-scenarios/. Accessed March 19, 2019 and April 4, 2015.

in buildings, market transformation is needed to reduce the capital cost and to increase the range of options available. This market transformation can be facilitated by (1) higher carbon prices (which can be created by the Cap and Trade and LCFS programs); (2) codes and standards, regulations and direct incentives, to reduce the upfront cost to the customer; and (3) business and policy innovations to make zero-carbon technology options the cheaper, preferred solutions compared to fossil fueled alternatives.⁹⁹

Statewide efforts are underway to facilitate the achievement of the EO S-3-05 goals. It is reasonable to expect the Proposed Project GHG emissions to decline over time, as the regulatory initiatives identified by CARB in the 2017 Scoping Plan Update are implemented, and other technological innovations occur. Given the reasonably anticipated decline in Proposed Project emissions, the Proposed Project would not conflict with or frustrate the ability of the State to achieve the 2050 horizon-year goal of EO S-3-05.

Mobile Source Strategy and Executive Order B-48-18

State goals for ZEVs are expressed in the Advanced Clean Cars Initiative (ACC) and the ZEV mandate established by Governor's Executive Order B-16-1, which sets a target of reaching 1.5 million ZEVs (meaning battery electric vehicles and fuel cell electric vehicles) and plug-in hybrid electric vehicles on California's roadways by 2025.

According to EMFAC2017, which incorporates the State ZEV mandate, there will be approximately 31,700,000 passenger cars and light trucks on the road in California by 2030, at which time 1.5 million ZEVs would constitute approximately 4.7 percent of all vehicles.¹⁰⁰ The more aggressive Mobile Source Strategy, included in the 2017 Scoping Plan Update as a component of the overall strategy for achieving the 2030 GHG target, calls for 4.2 million ZEVs on the road by 2030, equivalent to about 13.2 percent of passenger vehicles + light duty trucks (LDTs).

The Proposed Project would be consistent with the State ZEV mandate by providing a minimum of 8 percent of on-site parking spaces with EV charging capability.

City of Inglewood ECAP

As shown in Table 4.7-2, total reductions from ECAP implementation are expected to reduce emissions by 18.8 percent below 2005 levels by 2020, enabling the City to meet its 2005 target. However, the City would need to reduce emissions by an additional 111,702 MTCO_{2e} per year by 2035 to meet its 2035 emissions reduction goal.

⁹⁹ Energy + Environmental Economics (E3), 2018. *Deep Decarbonization in a High Renewables Future. Updated Results from the California PATHWAYS Model*. Available: https://www.ethree.com/wp-content/uploads/2018/06/Deep_Decarbonization_in_a_High_Renewables_Future_CEC-500-2018-012-1.pdf. Accessed March 18, 2019. June 2018.

¹⁰⁰ EMFAC2017 estimates the future percentage of the state's ZEVs based on compliance with the State's ZEV mandate. EMFAC2017's forecasted ZEV population for 2030 is approximately 3.6 percent of all passenger and light duty vehicles, but the 3.6 percent figure represents the equivalent percentage of all vehicles operating as a pure zero emission vehicle (e.g., 100 percent battery electric), whereas the actual population would include PHEVs that operate partially on fossil fuels.

The ECAP includes the following strategies and actions that are applicable to the Proposed Project:

- **Strategy 2: Increase Energy Efficiency.** Specific actions under this strategy include making commercial buildings more efficient and increasing the energy efficiency of street and traffic lights. The Proposed Project would be designed and constructed to meet LEED Gold certification requirements, which would require the incorporation of energy efficiency measures. Although the specific LEED credits and project features that will allow the Proposed Project to be certified as LEED Gold are currently uncertain, achieving LEED Gold certification would likely require extensive energy efficiency measures including, but not limited to, the use of 100 percent LED lighting indoors and outdoors throughout the Proposed Project; and implementation of high efficiency HVAC systems.
- **Strategy 3: Support Renewable Energy Generation.** This strategy is focused on City actions that promote more renewable energy generation in the community, like permit streamlining and support for funding and financing programs that help make renewable energy affordable. The Proposed Project design is in the conceptual stage, so the specific LEED credits and project features that would be selected to achieve LEED Gold certification are uncertain, but receiving LEED Gold certification would include a 700 kW on-site solar PV system, generating approximately 1,085,000 kW-hrs of carbon free energy annually.
- **Strategy 4: Improve Transportation Options and Manage Transportation Demand.** Specific actions under this strategy include improving the safety and efficiency of existing roadways, improving transit systems, improving bicycle facilities, making parking more efficient, reducing commute trips, and encourage land use intensification and diversity. The Proposed Project TDM Program would be consistent with these goals by encouraging use of transit, active transportation and alternatives to single-occupant vehicle travel.
- **Strategy 5: Reduce Consumption and Waste.** Specific actions under this strategy include using less water, producing less waste, and promote local food production. The Proposed Project design is in the conceptual stage, so the specific LEED credits and project features that would be selected to achieve LEED Gold certification are uncertain, but achieving LEED Gold certification is likely to include credits under the Water Efficiency and Materials and Resources categories. The Proposed Project would likely include use of recycled water for landscaping, ultra-low flow fixtures in restrooms such as low-flow faucets with aerators, dual flush toilets, and waterless urinals, and recycling of at least 75 percent of demolition materials. Achievement of this amount of waste reduction and diversion would exceed the City of Inglewood target of 50 percent demolition waste recycling and would be in accordance with State goals to divert a minimum of 75 percent of construction and demolition materials from landfill disposal.

Based on the concept designs available at this time and the Proposed project's commitment to achieve LEED Gold Certification in part with planned energy efficiency strategies discussed above, the Proposed Project would be consistent with the City's ECAP.

Conclusion

For the reasons described above, the Proposed Project would not be inconsistent with applicable plans, policies and regulations adopted for the purpose of reducing the emissions of GHGs, including the CARB 2017 Scoping Plan Update, SCAG 2016 RTP/SCS, Executive Order S-3-05,

Mobile Source Strategy and Executive Order B-48-18, and the City of Inglewood ECAP. Therefore, the impact is considered **less than significant**.

Mitigation Measures

None required.

Although no mitigation measures are required to achieve consistency of the Proposed Project with applicable plans, policies, and regulations adopted for the purpose of reducing emissions of GHGs, implementation of Mitigation Measure 3.14-2(b) would require the implementation of a comprehensive TDM program that would reduce vehicular trip making and associated GHG emissions, and Mitigation Measures 3.7-1(a) and 3.7-1(b) would require incorporation of physical design features, on-site GHG reduction measures, and any necessary off-site GHG reduction measures, and would result in no net new Proposed Project GHG emissions. The implementation of these measures would further ensure consistency of the Proposed Project with State, regional, and local GHG reduction plans.

3.8 Hazards and Hazardous Materials

This section describes and evaluates potential impacts related to hazards and hazardous materials that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing land uses of the Project Site and surrounding areas as they pertain to hazardous materials use, as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, State, and local regulations related to hazards or hazardous materials; and (3) an analysis of the potential impacts related to hazards and hazardous materials associated with the implementation of the Proposed Project, as well as identification of potentially feasible measures that could mitigate significant impacts.

Comments received in response to the NOP for the EIR regarding hazards and hazardous materials can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to hazards and hazardous materials as a result of implementation of the Proposed Project are analyzed within this section.

The analysis of hazardous materials included in this section was developed based on publicly available information from the State Water Resources Control Board (SWRCB), California Department of Toxic Substances Control (DTSC), and California Department of Forestry and Fire Protection (CAL FIRE). In addition, two site specific technical memoranda prepared by Environment & Water, Incorporated (EKI) provided information regarding the potential presence of contamination in subsurface materials on the Project Site (see Appendix O); these memoranda were peer reviewed by ESA and considered in the analysis. The EKI technical memorandum titled *Inglewood Basketball and Entertainment Center Project Investigations* presents information developed in 2017, and did not originally include a database search of the Well Relocation Site.¹ Therefore, data regarding the potential for contamination in subsurface materials was supplemented with a database search conducted by GeoSearch in accordance with American Society for Testing and Materials E 1527-13 (see Appendix O).² A subsequent investigation in 2019 and presented in a technical memorandum titled *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations* provided soil and gas sampling data for the Well Relocation Site and the West Parking Garage Site which were also not covered in the 2017 investigation effort.³ Portions of the Project Site were also the subject of past phase I environmental site assessments that were included as part of this analysis and referenced, as relevant, below.

This section also addresses the potential of creating both temporary and permanent hazards related to the proximity of the Project Site to navigable airspace associated with airports in the vicinity. An obstruction evaluation and airspace analysis technical memorandum for the Proposed

¹ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019.

² GeoSearch, 2018. *Preliminary Radius Report*. December 27, 2018.

³ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019.

Project was prepared by Capitol Airspace Group (CAG) (see Appendix P).⁴ The technical memorandum was peer reviewed by airport planners from ESA, including confirmation that all information from each of the relevant airports is current; the results of the peer review was that the technical memorandum was accurate and objective, and appropriate for use in this Draft EIR.

3.8.1 Environmental Setting

The study area for evaluation of hazards and hazardous materials impacts includes the Project Site and surrounding areas. The EKI technical memoranda included an environmental database search that considered selected radii that are as much as 1 mile from the site; however, the analysis focused on the Project Site and the immediately adjacent area (within 0.25 miles from the Project Site). Sites beyond the immediately adjacent area (within 0.25 miles from the Project Site) would have a remote chance of affecting subsurface materials beneath the Project Site since releases of hazardous materials tend to be localized.

In addition, a radius of up to 0.25 miles from the Project Site is considered relative to proximity to schools and the radius of up to 2 miles is similarly considered relative to proximity to airports, both in accordance with the CEQA Guidelines.

Definitions and Background

Hazardous Materials

A hazardous material is defined as any material that, because of quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment (California Health and Safety Code Chapter 6.95, section 25501(o)). The term “hazardous materials” refers to both hazardous substances and hazardous wastes. Under federal and state laws, any material, including wastes, may be considered hazardous if it is specifically listed by statute as such or if it is toxic (causes adverse human health effects), ignitable (has the ability to burn), corrosive (causes severe burns or damage to materials), or reactive (causes explosions or generates toxic gases).

Hazardous wastes are hazardous substances that no longer have practical use, such as materials that have been spent, discarded, discharged, spilled, contaminated, or are being stored until they can be disposed of properly (Title 22 California Code of Regulations [CCR] section 66261.10). Soil that is excavated from a site containing hazardous materials is a hazardous waste if it exceeds specific criteria established in sections 66261.20 through 66261.24 of the CCR Title 22. Hazardous substances are regulated by multiple agencies, as described in the Regulatory Setting below, and cleanup requirements of hazardous releases are determined on a case-by-case basis according to the agency (e.g., DTSC or SWRCB) with lead jurisdiction over a contaminated site.

Potential Receptors/Exposure

The sensitivity of potential receptors in the areas of known or potential hazardous materials contamination is dependent on several factors, the primary factor being the potential pathway for human exposure. Exposure pathways include external exposure, inhalation, and ingestion of contaminated soil, air, water, or food. The magnitude, frequency, and duration of human exposure can cause a variety of health effects, from short-term acute symptoms to long-term chronic effects. Potential health effects from exposure can be evaluated in a health risk assessment. The principal elements of health risk assessments typically include:

- Evaluation of the fate and transport processes for hazardous materials at a given site;
- Identification of potential exposure pathways;
- Identification of potential exposure scenarios;
- Calculation of representative chemical concentrations; and
- Estimation of potential chemical uptake.

Hazardous Building Materials Associated with Demolition and Renovation

Because of the age of some buildings and structures within the Project Site, the potential exists for the structures to contain hazardous building materials. Older buildings and structures can contain building materials that include hazardous components such as lead-based paint (LBP), asbestos-containing materials (ACMs), mercury, and polychlorinated biphenyls (PCBs).

Among its numerous uses and sources, lead can be found in paint, water pipes, solder in plumbing systems, and in soils around buildings and structures painted with LBP. Old peeling paint can contaminate near surface soil, and exposure to residual lead can have adverse health effects especially in children. LBP was phased out in the United States beginning with the passage of the Lead-Based Paint Poisoning Prevention Act in 1971. Prior to the US Environmental Protection Agency (US EPA) ban in 1978, LBP was commonly used on interior and exterior surfaces of buildings. Structures built prior to 1978 may have LBP and some paints manufactured after 1978 for industrial or marine uses legally contain more than 0.06 percent lead. Pathways of exposure to lead can occur through inhalation, ingestion, dermal absorption, or absorption from retained/embedded leaded foreign body. Exposure to lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems, and the cardiovascular system, and affects the oxygen carrying capacity of blood. Children are particularly susceptible to potential lead-related health problems because it is easily absorbed into developing systems and organs.

Asbestos, a naturally occurring fibrous material, was used as a fireproofing and insulating agent in building construction before such uses were terminated due to liability concerns in the late 1970s. From 1973 through 1990, several laws were passed banning the manufacture and use of

ACM.⁵ Some materials are still allowed to contain asbestos. The demolition of structures with ACM can result in airborne fibers. Inhalation of the tiny asbestos fibers can lead to lung disease. Structures that predate 1981 and structural materials installed before 1981 are presumed to potentially contain asbestos. Because it was widely used prior to the discovery of its health effects, asbestos can be found in a variety of building materials and components such as insulation, walls and ceilings, floor tiles, and pipe insulation. Friable (easily crumbled) materials are particularly hazardous because inhalation of airborne fibers is the primary mode of asbestos entry into the body. Non-friable asbestos is generally bound to other materials such that it does not become airborne under normal conditions. Non-friable asbestos and encapsulated friable asbestos do not pose substantial health risks. Asbestos exposure is a human respiratory hazard. Asbestos-related health problems include lung cancer and asbestosis. Any activity that involves cutting, grinding, or drilling during building renovation or demolition or relocation of underground utilities could release friable asbestos fibers unless proper precautions are taken. Inhalation of airborne fibers is the primary mode of asbestos entry into the body, making friable materials the greatest potential health risk.

Spent fluorescent light tubes commonly contain mercury vapors, the exposure to which can have both long-term (e.g., anxiety, loss of appetite, fatigue, changes in vision or hearing) and/or short-term (e.g., sore throat, shortness of breath, chest pain, headache, vision problems) health effects. In February 2004, regulations took effect in California that classified all fluorescent lamps and tubes as hazardous waste. When these lamps or tubes are broken, mercury is released to the environment and can become airborne. When inhaled, mercury vapors can be absorbed through the lungs and into the bloodstream. Released mercury that is not vaporized can also be washed by rain water and into waterways. Mercury switches may also be present in some buildings. A mercury switch (also known as a mercury tilt switch) is a switch which opens and closes an electrical circuit through a small amount of liquid mercury.

PCBs are organic oils that were formerly used primarily as insulators in many types of electrical equipment such as transformers and capacitors. After PCBs were determined to be carcinogenic in the mid-to-late 1970s, the US EPA banned PCB use in most new equipment and began a program to phase out certain existing PCB-containing equipment.⁶ Fluorescent lighting ballasts manufactured after January 1, 1978, do not contain PCBs and are required to have a label clearly stating that PCBs are not present in the unit. PCBs are highly persistent in the environment, and exposure to PCBs has been demonstrated to cause cancer, as well as a variety of other adverse health effects on the immune system, reproductive system, nervous system, and endocrine system. The primary route of exposure to PCBs in the general population is the consumption of contaminated foods, particularly meat, fish, and poultry. Occupational exposure to PCBs occurs mainly through inhalation and dermal contact routes.

⁶ US Environmental Protection Agency, 2018. *Policy and Guidance for Polychlorinated Biphenyl (PCBs)*. Available: <https://www.epa.gov/pcbs/policy-and-guidance-polychlorinated-biphenyl-pcbs>. Last Updated April 25, 2017. Accessed November 14, 2018.

Soil and Groundwater Contamination

Many commercial and light industrial businesses, as well as some agricultural practices, use materials and generate wastes that are considered hazardous by federal and State standards. Such businesses and practices, which include automobile service, industrial manufacturing, and dry cleaners, are required to contain, manage, and transport their hazardous materials in conformance with established State regulations to ensure hazardous materials that can become a health hazard are not released to subsurface soils and groundwater.

Some historical and current uses on properties within and near the Project Site have resulted in contamination of the surface soil and groundwater through leaking underground tanks or surface spills of hazardous materials and petroleum. Most of these sites are under regulatory assessment and remediation orders (described further below).

Underground storage tanks (USTs), in particular, are a common contamination source in urban areas, and are also found on sites historically used for agriculture. Until the mid-1980s, most USTs were made of single-walled bare steel, which can corrode over time and result in leakage. Faulty installation or maintenance procedures can also lead to UST leakage, as well as to potential releases associated with spills. Recently revised UST regulations have significantly reduced the incidents of leakage and consequential soil and groundwater contamination from new UST systems. However, there are still some older UST systems that remain in service, and many sites contaminated by leaking USTs in the past are still under investigation and undergoing clean-up. Similarly, spills resulting from poor maintenance or improper installation associated with aboveground storage tanks (ASTs) can result in localized, shallow soil contamination. USTs installed prior to the mid-1980s that have leaked, as well as improperly installed USTs and ASTs that have resulted in fuel spills, can present contamination issues.

Dry cleaning operations are also commonly a cause of soil and groundwater contamination due to past loose practices in the handling of the dry cleaning products (also referred to as solvents) that include volatile organic compounds (VOCs) that are known to be hazardous to human health and the environment. VOCs include a variety of chemicals, some of which may have short- and long-term adverse health effects. The ability of VOC chemicals to cause health effects varies greatly and depend on a number of factors including exposure level and length of time exposed but can be anywhere from being highly toxic, to having no known health effect. Health effects may include eye, nose, and throat irritation; headaches; skin irritation, nausea, damage to liver, kidney, and central nervous system; and cancer. Dry cleaning solvents generally consist of tetrachloroethylene (PCE) and trichloroethylene (TCE) which have a high solubility factor making them easily transmitted in groundwater to off-site locations. Contamination from PCE, TCE, its degradation products (including vinyl chloride) and other chlorinated compounds can be very difficult to remove from the environment, especially once they reach groundwater.

Project Site

Arena Site

The majority of the Arena Site is currently vacant land that is owned by the City or Successor Agency with 10 parcels owned by other parties that are used for commercial land uses. The vacant parts of the Project Site were previously developed, but were purchased by the City and cleared of uses that were incompatible with noise levels in compliance with Federal Aviation Administration (FAA) grants. In addition, the Arena Site includes an existing City water supply well and associated infrastructure. Historically, the Project Site was predominantly occupied by single-family residential properties and vacant/agricultural land uses starting in approximately 1923.⁷ Based on historical aerial photographs from 1928 to 1947, the land uses continued as residential, with possible apartment development in the eastern portion of the site by 1947. In 1952 there is evidence of a mobile home/trailer park. An automobile service station was also developed in the northwestern corner of the Arena Site by 1952, which operated until the 1970s when it was demolished and replaced by a fast food restaurant. More apartments and/or hotels are indicated in photographs from 1963 and continue as such during the time period of 1977 to 1994. Beginning in the mid-1980s, the FAA issued noise grants to the City of Inglewood as part of the LAX Noise Control/Land Use Compatibility Program, with the objective of disposing and recycling incompatible land uses to land uses which are compatible with the noise levels of airport operations. Under that program, the FAA and the City of Inglewood approved the acquisition of a number of parcels on the Project Site, and, as a result, many residential structures were acquired by the City and demolished. By 2002,⁸ the eastern and southern portions of the Arena Site were vacant. The Arena Site is relatively level with an elevation of approximately 89 feet above mean sea level and a slight topographic gradient towards the south-southwest.

West Parking Garage Site

The two surface parking lots that are part of the West Parking Garage Site are both currently vacant, unpaved lots; however, they have a history of land uses that include residential and commercial properties. Prior to residential development that began in the 1920s and 1930s, the parking sites were likely used for agriculture. According to review of aerial photographs, residential land uses continue throughout the period from the 1930s up until 2013, although some residences had begun to be demolished by the early 2000s. Some commercial/retail uses along West Century Boulevard show up in the period between 1977 and 1983. The northern surface parking lot site was completely cleared in 2013, and the southern lot was completely cleared in 2002.⁹

East Transportation and Hotel Site

The East Transportation and Hotel Site is currently a vacant, unpaved lot with a history of residential land uses. Initially, this site was developed with single family residences and small-

⁷ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 4.

⁸ Timeline is largely developed from the review of aerial photographs in the EKI, 2017 Technical Memorandum which skips from 1994 to 2002.

⁹ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 6.

scale agricultural properties in the 1920s and 1930s. Later uses included a trailer park, and all buildings were demolished in 1989. Similar to the surrounding area, the site is relatively level.

Well Relocation Site

The Well Relocation Site is also vacant and unpaved with no improvements other than fencing around the perimeter of the site. According to a review of permit records, Sanborn maps, and historic aerial photographs, the two parcels that make up this site were developed with residential uses as early as 1924.¹⁰ Agricultural uses may have occurred prior to the 1920s. By 1962, the Well Relocation Site was subdivided, and the larger parcel was redeveloped with an apartment complex, which was then demolished sometime between 1994 and 2003. The smaller parcel was used for residential land uses up until they were demolished sometime between 2012 and 2014.

Database Search Project Site

The EKI technical memorandum included a database search of the Project Site and surrounding vicinity that was completed by Environmental Data Resources, Incorporated (EDR).¹¹ The results of the database search by EDR included the following (see **Figure 3.8-1**):

Arena Site

1. The property at 3900 West 102nd Street is listed as “Various City Properties” in the National Pollutant Discharge Elimination System (NPDES) database for discharges associated with demolition and construction activities. This database listing is not an indication of any release or violation.
2. The existing City water well site at 3901 West 102nd Street is listed as “Well No. 6” in the SWRCB Enforcement Action and SWRCB Waste Discharge System databases. This database listing is not an indication of any release or violation.
3. The property at 3901 West 102nd Street is also listed as “Inglewood Redevelopment Agency” in the DTSC Hazardous Waste Manifest database, which reported the disposal of 33 tons of asbestos-containing waste to a landfill. This database listing is not an indication of any release or violation.
4. The property at 3901 West 102nd Street is also listed as “Well No. 1NA 2NA 4 & 6” in the Facility Index System (FINDS) database as a water supply well or wells. This database listing is not an indication of any release or violation.
5. The property at 10220 South Prairie Avenue is listed as “E & M German Car Repair” in the 1990–1992 historical EDR auto databases. Based on other data sources that were reviewed as part of the EKI technical memorandum, this address was determined to be erroneous, and the auto repair facility is associated with the 10223 South Prairie Avenue property to the west, across South Prairie Avenue (discussed further below under “Surrounding Areas”).
6. The property at 3822 West Century Boulevard is listed as “Omega Carpet & Uphl Stm Cleani” in the EDR historical cleaner database from 1992. Dry cleaners often used solvents such as PCE or TCE. Dry cleaning operations that used solvents have commonly released

¹⁰ ESA, *Well Relocation Site – Historic Uses*, Technical Memorandum, December 28, 2018. Note, the Well Relocation Site was not included as part of the EKI technical memorandum. However, the ESA memorandum takes a similar approach to identifying land use history that the EKI memorandum uses.

¹¹ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 12.

solvents to the subsurface and because of their solubility can easily be dispersed by groundwater. Laboratory analysis of VOC compounds is the method used to identify whether there is a release of solvents to the subsurface. This listing is an indication that a potential release could have occurred at this location based on the land use.

West Parking Garage Site

The database search did not include any addresses that appeared to coincide with the West Parking Garage Site, however former land uses that included a print and press shop (from approximately 1977 to 1983), as well as a former mobile home park (from approximately 1947 to 1994) were identified in the description of past land uses.¹² In addition, the adjoining property on the east was occupied by a Unocal service station that operated from approximately 1963 to 1990.

East Transportation and Hotel Site

The database search did not include any addresses that appeared to coincide with the East Transportation and Hotel Site.

Well Relocation Site

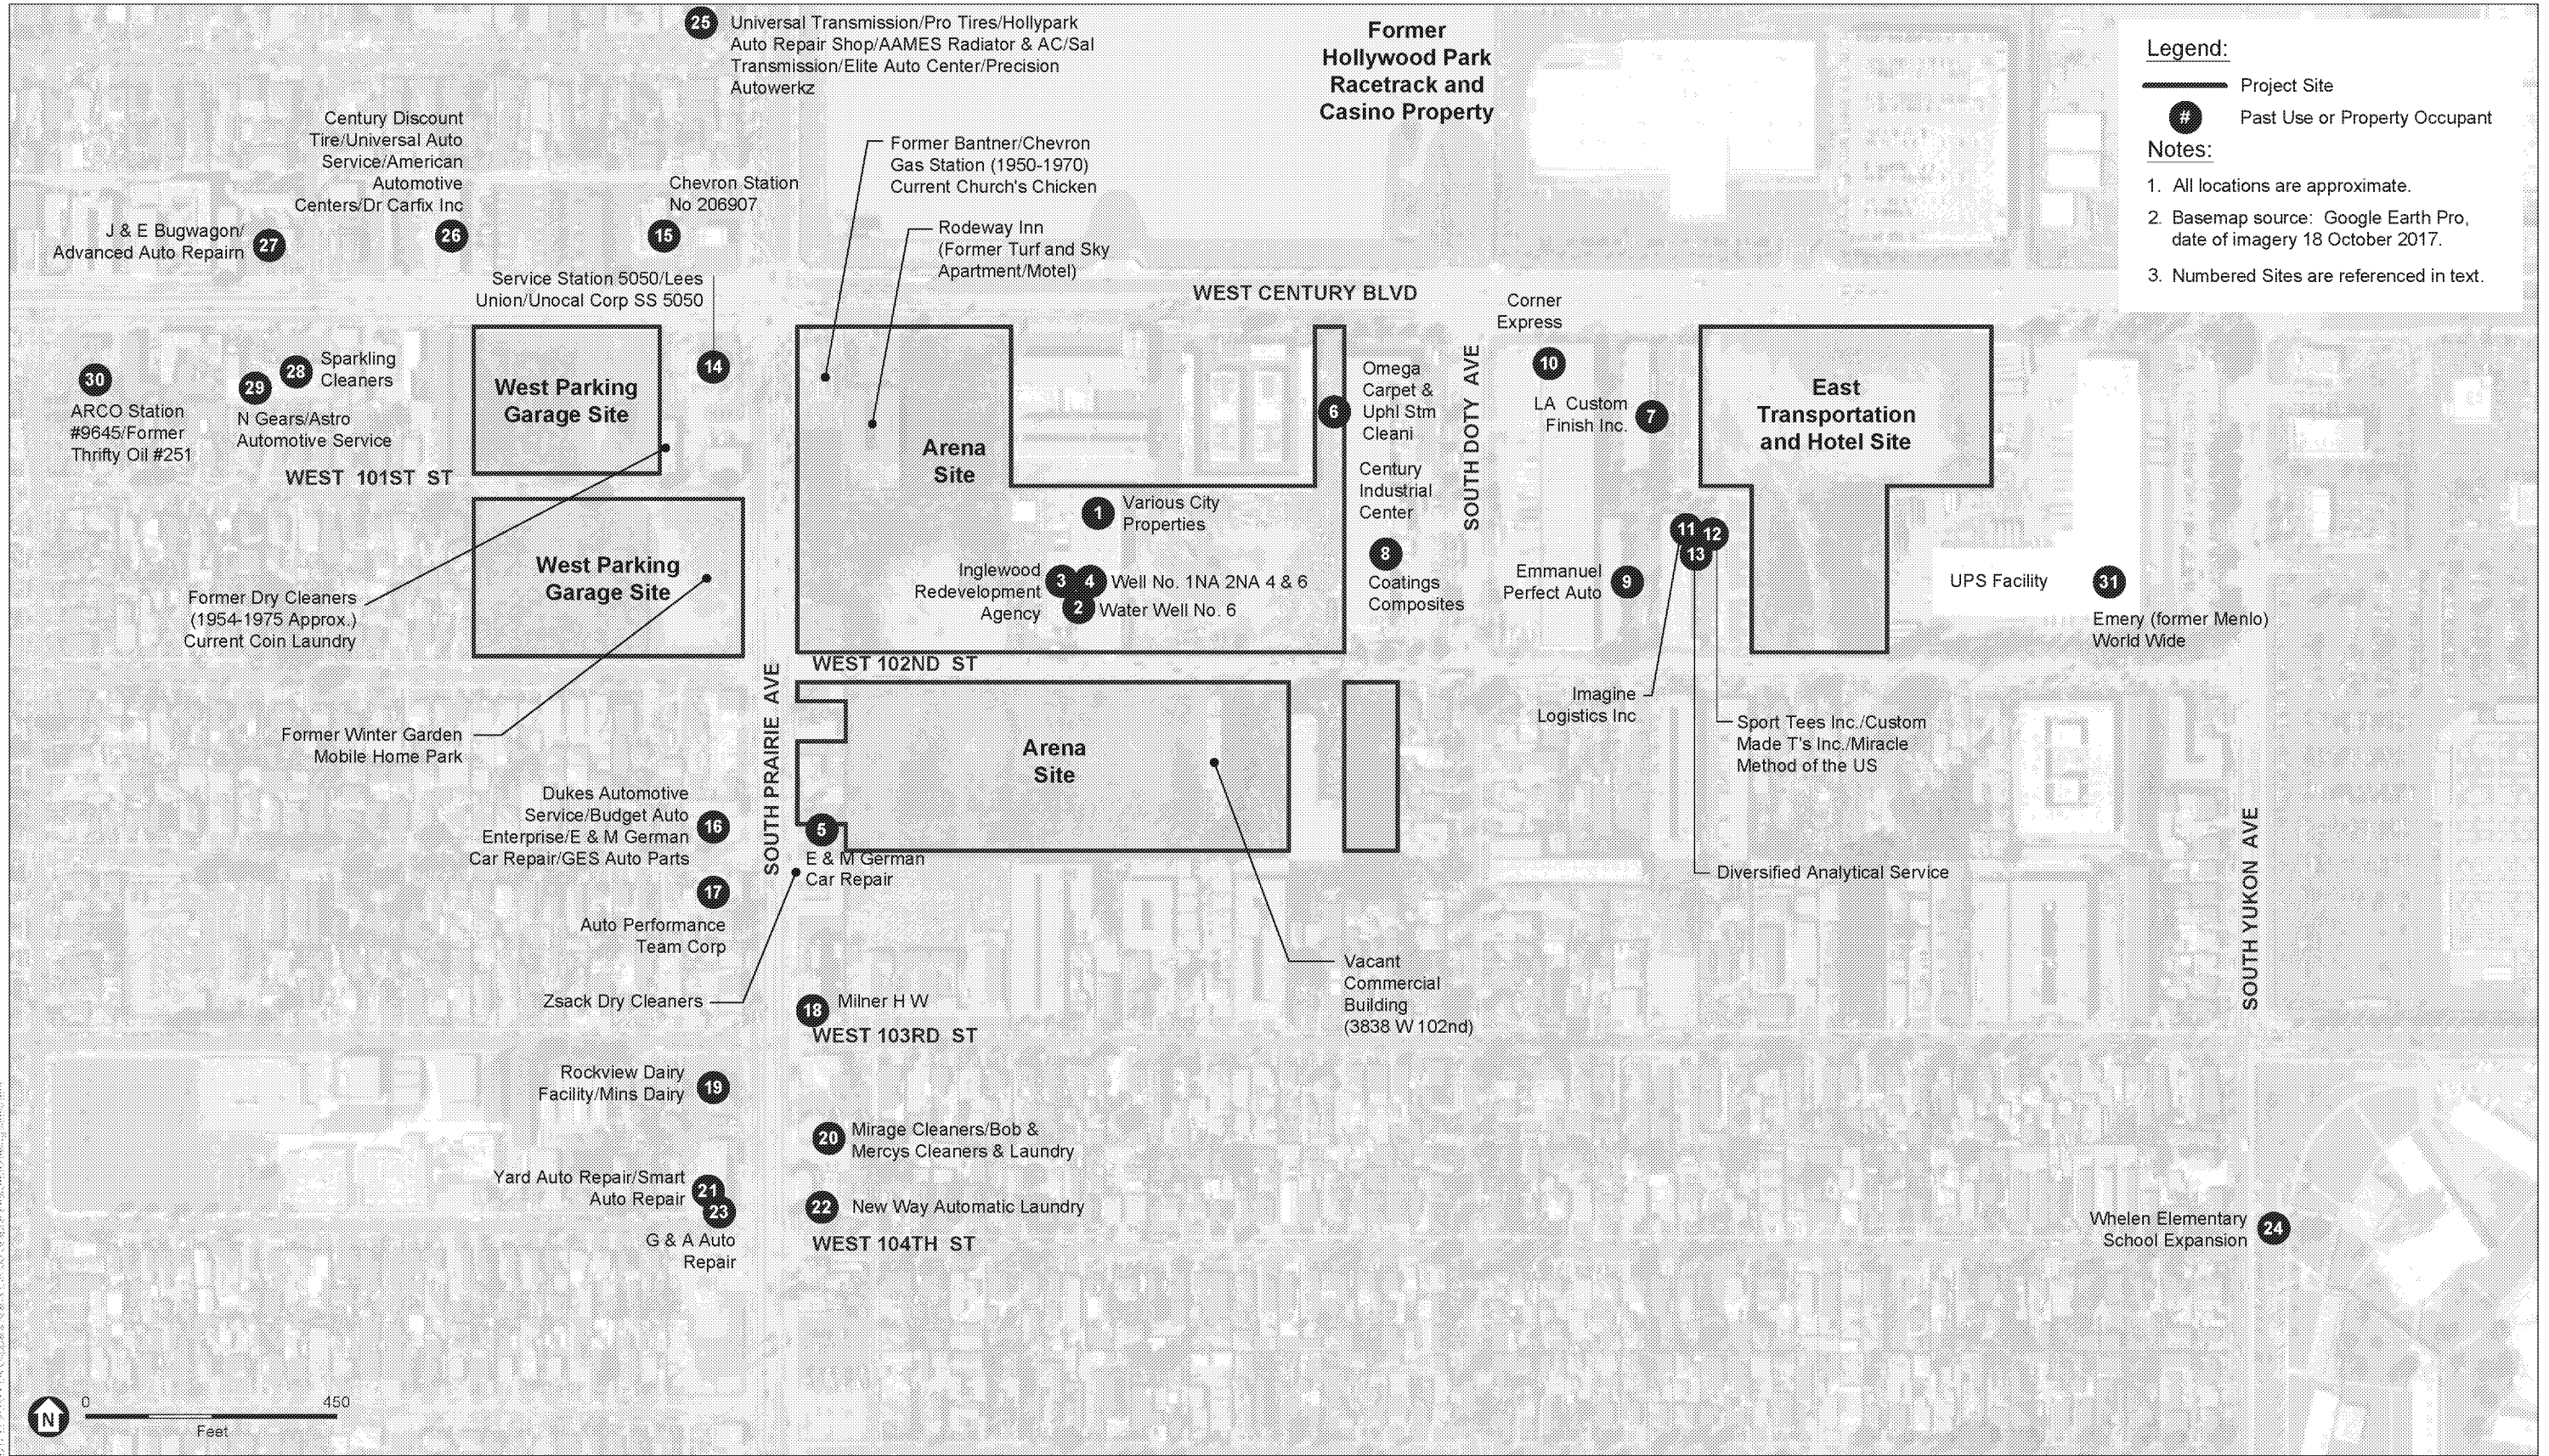

The findings from the database search in the EKI report did not find any addresses that appeared to coincide with the Well Relocation Site. However, a separate database search conducted specifically for this site included the Well Relocation Site as part of the Hazardous Waste Tanner Summary (HWTS) database records of hazardous waste manifests from the DTSC during 1993–2016.¹³ The site name associated with this listing in the database search is the Inglewood Redevelopment Agency. This record of a hazardous waste manifest is an indication that hazardous waste was transported from this site and is not necessarily an indication of any release at the site.

Surrounding Area

The Project Site is located in a developed urban area with a mixture of commercial, entertainment, industrial, and residential land uses surrounding the site. Industrial land uses include warehouse/manufacturing facilities and automobile service stations, while commercial uses include hotels, retail, and restaurants.

¹² EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 5-6.

¹³ GeoSearch, 2018. *Radius Report*. December 31, 2018, p. 18. The GeoSearch records search is comparable to the EDR database search contained within the EKI report.

SOURCE: EKI, 2017

Inglewood Basketball and Entertainment Center

Figure 3.8-1
Database Search Results

This page intentionally left blank

To the north of the Arena Site is the location of the former Hollywood Park Racetrack and Casino property, which is currently undergoing redevelopment. Prior to the racetrack, the property was used for agricultural purposes and the northeastern portion of the property was part of an oilfield where petroleum hydrocarbons have been detected. The racetrack opened in 1938 and the casino was added in 1994. Portions of the racetrack were also used for automobile fueling and maintenance, dry cleaning, wastewater treatment, and a veterinary hospital.¹⁴

According to the EKI technical memorandum, three areas were identified on the racetrack property where previous investigations had indicated the presence of chemicals of concern in the subsurface that could require additional assessment or remediation.¹⁵ These areas included a former dry cleaner on the racetrack property, the Cypress Fee site groundwater plume, and elevated methane in shallow soil gas at two locations on the racetrack property. A soil management plan (SMP) was prepared by EKI in 2007 that will be implemented as part of construction of the new development at the racetrack site. Localized areas of contamination would be addressed during construction such that following completion of activities, no known areas of the property would have contaminants of concern above the criteria established in the SMP.¹⁶ In 2008, as part of an earlier separate evaluation, EKI installed four groundwater monitoring wells on the racetrack property and monitored them for four quarters. Groundwater flow direction was highly variable and the water quality results indicated that chemicals of concern detected were part of regional plumes associated with widespread past agricultural land uses. However, there were no chemical uses on the property that were known to have migrated to the Project Site.¹⁷

Other surrounding properties identified in the EKI technical memorandum include the following sites with reported chemical use and/or releases that are upgradient of or adjacent to the Project Site (see Figure 3.8-1):

1. LA Custom Finish Inc., 3738 West Century Boulevard, between the Arena Site and East Transportation and Hotel Site along West Century Boulevard. This property is listed with use of unspecified solvent and organic mixtures, and is reportedly a painting business. This listing is an indication that a potential release could have occurred at this location based on the land use.
2. Coatings Composites, 10105 South Doty Avenue, between the Arena Site and East Transportation and Hotel Site. This property is listed as a hazardous waste generator of organic and inorganic chemicals, laboratory wastes, and solvents with no reports of releases. Despite no reported releases, the land use would indicate a potential for a release to have occurred.
3. Emmanuel Perfect Auto, 3742 West Century Boulevard, Suite 4, between the Arena Site and East Transportation and Hotel Site. This property is listed as an automotive repair shop in 1995–1996, and could have used total petroleum hydrocarbon (TPH)-containing compounds

¹⁴ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 17-18.

¹⁵ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 17-18.

¹⁶ City of Inglewood, 2008. *Draft Environmental Impact Report, Hollywood Park Redevelopment Project, Hazards and Hazardous Materials Section IV.F*, SCH No. 2007111018, October 9, 2008.

¹⁷ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Investigations*, Technical Memorandum, June 28, 2019, p. 18.

and solvents. This listing is an indication that a potential release could have occurred at this location based on the land use.

4. Corner Express, 3750 West Century Boulevard, between the Arena Site and East Transportation and Hotel Site. This property is listed as a generator of oil-containing waste, possibly from automotive repair shop operations. This listing is an indication that a potential release could have occurred at this location based on the land use.
5. Imagine Logistics Inc., 3734 West Century Boulevard, Suite 7, between the Arena Site and East Transportation and Hotel Site. This property is listed as a generator of organic chemicals. The property use is not listed, and there are no reports that a release of hazardous substances has occurred. This listing is an indication that a potential release could have occurred at this location based on the land use.
6. Sport Tees Inc./Custom Made T's Inc./Miracle Method of the US, 3732 West Century Boulevard, between the Arena Site and East Transportation and Hotel Site. This property is listed as a generator of organic chemicals, acids, hydrocarbon solvents, and organic solvents, and is listed as a laundry/dry cleaner. No indication of any releases are reported for the site. However, this listing is an indication that a potential release could have occurred at this location based on the land use.
7. Diversified Analytical Service, 3732 West Century Boulevard, Unit 3, between the Arena Site and East Transportation and Hotel Site. This property is listed as a generator of aqueous anionic solution, organic solids, contaminated soil from site cleanup, liquids with metals, and oil-water separation sludge. There are no reports that a release of hazardous substances has occurred. However, this listing is an indication that a potential release could have occurred at this location based on the land use.
8. Service Station 5050/Lees Union/Unocal Corp SS 5050, 4000 West Century Boulevard, at southwestern corner of South Prairie Avenue and West Century Boulevard. This property is a former vehicle fueling and service station with USTs. It was replaced by a fast food restaurant that is now shuttered and is currently a Starbucks cafe. TPH and benzene, toluene, ethylbenzene, and xylenes (BTEX) were detected in groundwater samples from 1993 to 1996, when the monitoring wells were destroyed and the case was closed by the Regional Water Quality Control Board (RWQCB). The groundwater gradient was observed to the northeast. When last monitored in 1996, concentrations of residual fuel-related compounds in groundwater on the subject property were low, and the RWQCB closed the site. As a result, this listing does not indicate a potential for a release that could extend onto the Project Site.
9. Chevron Station No 206907, 4015 West Century Boulevard, north of the West Parking Garage Site at northwestern corner of South Prairie Avenue and West Century Boulevard. The site is a current vehicle fueling and service station with USTs, and the site is shared with a fast food restaurant. Two USTs were installed in 1998 at the site: a 15,000-gallon gasoline UST and a 20,000-gallon gasoline UST. The available records do not list releases to the subsurface, and no soil or groundwater data are available for this site. However, this listing is still an indication that a potential release could have occurred at this location based on the land use.
10. Dukes Automotive Service/Budget Auto Enterprise/E & M German Car Repair/GES Auto Parts, 10223 South Prairie Avenue, approximately 250 feet south of the surface parking lots and across South Prairie Avenue from the Arena Site. This site is an auto repair shop with records dating from 1969 to the present. Records show that tanks were reportedly removed in 1987. However, in 1988, records show the site contained one 2,000-gallon UST and two 4,000-gallon USTs for storage of "product" which could represent replacement tanks for the

ones removed. The available records do not indicate releases to the subsurface, and no soil or groundwater data are available for this site. This listing is an indication that a potential release could have occurred at this location based on the land use.

11. Auto Performance Team Corp, 10305 South Prairie Avenue, 130 feet southwest of the Arena Site. This site is listed as an auto repair shop from 2006 to 2014, and was observed to be an auto repair shop during the site visit on October 24, 2017. This listing is an indication that a potential release could have occurred at this location based on the land use.
12. Milner H W, 10324 South Prairie Avenue/10396 South Prairie Avenue, approximately 90/320 feet south of the Arena Site. These addresses are listed for the same property also are listed as a historical gasoline and oil service station in 1927 and 1940, no other records indicating property use are available. A relatively newer structure currently occupies the site that appears to be for commercial retail offices. The historical land use, however, indicates a potential for a release to have occurred, however, the age of the land use would indicate that if any releases had occurred, natural attenuation would likely have reduced any potential threat to human health or the environment for most petroleum hydrocarbons.
13. Rockview Dairy Facility/Mins Dairy, 10411 South Prairie Avenue, 490 feet south of the Arena Site. This property is listed as a convenience store from 1988 to 1996, and was part of a RWQCB cleanup site from 1993 to 1997. USTs were reportedly removed from the site in 1993. The GeoTracker database lists the soil as impacted by gasoline, and the case was closed in 1997.¹⁸ Closure would indicate that no further threat to human health or the environment remains.
14. Mirage Cleaners/Bob & Mercys Cleaners & Laundry, 10412 South Prairie Avenue, 490 feet south of the Arena Site. This property is listed as a dry cleaner or laundry from 1971 to 2006, and reportedly handled PCE. The site no longer appears to be a cleaner or laundry. This listing is an indication that a potential release could have occurred at this location based on the land use.
15. Yard Auto Repair/Smart Auto Repair, 10421 South Prairie Avenue, 490 feet south of the West Parking Garage site. This site is listed as an auto repair facility from 1987 to 2005, and appeared to be a block with three to four connected auto repair shops. This listing is an indication that a potential release could have occurred at this location based on the land use.
16. New Way Automatic Laundry, 10424 South Prairie Avenue, 430 feet south of the Arena Site. This site is listed as a historical laundry or dry cleaner in 1964. This listing is an indication that a potential release could have occurred at this location based on the land use.
17. G & A Auto Repair, 10427 South Prairie Avenue, 450 feet south of the Arena Site. This site is listed as an auto repair facility from 1990 to 2014. This listing is an indication that a potential release could have occurred at this location based on the land use.
18. Whelen Elementary School Expansion, West 104th/105th Street, 420 feet south of the West Parking Garage Site. This school site is listed in the DTSC database, with reported investigation of LBP from demolished residential buildings conducted from 1999 to 2006. The buildings reportedly were built in the 1950s. The lead concentrations in soil were below the DTSC screening level of 255 milligrams per kilogram (mg/kg), and the site was closed by the DTSC. Closure would indicate that no further threat to human health or the environment remains.
19. Universal Transmission/Pro Tires/Hollypark Auto Repair Shop/AAMES Radiator & AC/Sal Transmission/Elite Auto Center/Precision Autowerkz, 1201 South Prairie Avenue, 500 feet

¹⁸ GeoTracker is the environmental database maintained by the SWRCB that tracks sites with a history of releases to the subsurface that are overseen by the local Regional Water Resources Control Board.

north of the West Parking Garage Site. This site is listed as an auto repair facility from 1940 to 2014. 1203 and 1205 South Prairie Avenue have entries for Ralph's Automotive Service and Tri-State Gasoline, and appear to be for the same strip mall property containing multiple auto repair facilities. In 1987, the LADPW received an application for a 550-gallon double walled fiberglass tank that was for vehicle waste oil. No spills or leaks for the property are reported in available agency files. This listing is an indication that a potential release could have occurred at this location based on the land use.

20. Century Discount Tire/Universal Auto Service/American Automotive Centers/Dr Carfix Inc., 4055 West Century Boulevard, immediately north of the West Parking Garage Site across West Century Boulevard. This site is listed as an auto repair facility from 1988 to 2014. This listing is an indication that a potential release could have occurred at this location based on the land use.
21. J & E Bugwagon/Advanced Auto Repair, 4101 West Century Boulevard, 330 feet west of the West Parking Garage Site, across West Century Boulevard: this site is listed as an auto repair facility from 1988 to 2014. This listing is an indication that a potential release could have occurred at this location based on the land use.
22. Sparkling Cleaners, 4102 West Century Boulevard, 330 feet west of the West Parking Garage Site. This site is listed as a historic laundry or dry cleaner in 1964, but no current laundry or dry cleaning facility appears to be present at this property. This listing is an indication that a potential release could have occurred at this location based on the land use.
23. All N Gears/Astro Automotive Service, 4110 West Century Boulevard, 420 feet west of the West Parking Garage Site. This site is listed as an auto repair facility from 1986 to 2014. This listing is an indication that a potential release could have occurred at this location based on the land use.
24. ARCO Station #9645/Former Thrifty Oil #251, 4130 West Century Boulevard, 690 feet west of the West Parking Garage Site. This site is listed with six USTs: one 8,000-gallon UST for gasoline, one 15,000-gallon UST for gasoline, one 10,000-gallon UST for gasoline, one 6,000-gallon UST for gasoline, one 280-gallon UST for waste oil, and one UST of unknown capacity for waste oil. A different listing of USTs from a different database indicates the site had five USTs: three 12,000-gallon USTs for gasoline, one 15,000-gallon UST for gasoline, and one UST of unknown size and use. The site is also listed with a leaking UST case currently under regulatory oversight, and as a small quantity hazardous waste generator. The site disposed of aqueous solution with less than 10 percent organics, organic solids, waste oil, and oil/water separation sludge. TPH, BTEX, and methyl tertiary butyl ether (MTBE) were detected in soil samples collected during UST removal activities, and approximately 900 cubic yards of soil were excavated and removed. Groundwater has not been sampled at this site. This listing is an indication that a potential release could have occurred at this location based on the land use and ongoing regulatory oversight.
25. Emery (former Menlo) World Wide, 3600 West Century Boulevard, 360 feet east of the East Transportation and Hotel Site. The site has recorded UST use. One 10,000-gallon gasoline UST was removed in July 2002. A 20,000-gallon diesel UST remains at the site and was permitted and in use as of 2007. Diesel fuel was detected in soil samples collected from the surface to 30 feet below ground surface (bgs) near the existing diesel UST in 1994. Groundwater at the site has reportedly not been investigated. Diesel fuel in soil at depths of up to 40–50 feet bgs were observed in later investigations. The RWQCB closed the case in 2015 after concurring with additional investigations by the responsible party showing groundwater was not affected by releases from the site. Closure indicates that no further threat to human health or the environment remains.

Shallow Soil Sampling at Project Site

As part of the evaluation to determine the potential presence of legacy contaminants in the subsurface soils at the Project Site, EKI also collected surface soil samples for laboratory analysis. The samples were collected at locations on the Arena Site and the East Transportation and Hotel Site, and also included sampling the existing soil stockpiles on the Arena Site. The West Parking Garage Site and Well Relocation Site were also sampled in a subsequent effort in March 2019.¹⁹ The samples in both investigations were analyzed for presence of TPH, VOCs, metals, polynuclear aromatic hydrocarbons (PAHs), PCBs, pesticides, and herbicides. Samples were collected at the near surface (0 to 1 foot bgs) and between 4 and 5 feet bgs (locations are shown in **Figure 3.8-2**).

The analytical results were compared to the US EPA Regional Screening Levels (RSLs) for residential and also commercial/industrial land uses, as modified by DTSC Human and Ecological Risk Office (HERO) Note 3. These screening levels are referred to as the “HERO Note 3-modified RSLs” and are not considered to be cleanup threshold concentrations, but screening levels that are intended to be a health-conservative preliminary evaluation of potential risk and hazard based on planned land uses. The HERO Note 3 modified RSLs for residential land uses are lower than the commercial/industrial land uses because residential land uses are what would potentially be most sensitive, representing the highest potential exposure to health risk.

Total Petroleum Hydrocarbons

The laboratory analytical results for TPH in soil samples showed that diesel- and motor-oil-range TPH were detected above the HERO Note 3-modified RSLs for residential land use (96 and 2,500 mg/kg, respectively) in four samples: the 0 to 1-foot-bgs samples in sampling areas PC-4 (Arena Site – north), PC-6 (East Transportation and Hotel Site) and PC-9 (Arena Site – south), and the stockpile sample in area PC-9 (see Figure 3.8-2). Diesel- and motor-oil-range TPH was not detected above the residential screening levels at the West Parking Garage Site or Well Relocation Site. The highest detected concentrations of diesel- and motor-oil-range TPH at 940 mg/kg and 2,700 mg/kg, respectively, were found in the sample collected from 0 to 1 foot bgs in area PC-6. Gasoline-range TPH was not detected above the HERO Note 3-modified RSL for residential land use (82 mg/kg) in any of the samples collected. The motor-oil-range TPH detections for all samples were below the HERO Note 3-modified RSL for commercial/industrial land use (33,000 mg/kg), but the diesel-range TPH detections were above the HERO Note 3-modified RSL for commercial/industrial land use (440 mg/kg).

¹⁹ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 1.

Metals

The laboratory analytical results for metals (including hexavalent chromium and mercury) in soil samples showed concentrations all below the respective HERO Note 3-modified RSLs for residential land use with the exception of hexavalent chromium and thallium.²⁰

Hexavalent chromium was detected in one sample (PC-2) from the 4- to 5-foot-bgs depth on the northern portion of the Arena Site at a concentration of 0.490 mg/kg, which is above the screening level of 0.3 mg/kg.²¹ Hexavalent chromium was also detected above the HERO Note 3-modified RSLs at the West Parking Garage Site and Well Relocation Site in all of the 0- to 1-foot and 4- to 5-foot samples, ranging from 0.34 to 0.60 mg/kg.²² However, the laboratory also reported hexavalent chromium in the method blank, a quality assurance/quality control (QA/QC) measure, that would indicate a laboratory contaminant may have affected results.²³

Thallium was detected in the sample collected from 0 to 1 foot bgs in area PC-11 (West Parking Garage Site) at 0.858 mg/kg, just above the residential land use screening level of 0.78 mg/kg.

The surface soil samples (0 to 1 foot bgs) were also analyzed using a portable field method for the presence of arsenic and lead. The analytical results for arsenic showed one sample slightly above the DTSC regional background level in the northern portion of the Arena Site (12.1 mg/kg in PC-2 compared to background threshold of 12 mg/kg). Lead was detected above the HERO Note 3-modified RSL for residential land use of 80 mg/kg in 11 of the 52 soil samples analyzed in 2017 and 2 of 25 samples analyzed in 2019 using the field method, at concentrations up to 221 mg/kg (PC-7). Lead was not detected above the HERO Note 3-modified RSL for commercial/industrial land use of 320 mg/kg.

VOCs, PAHs, PCBs, organochlorine pesticides, organophosphorus pesticides, and chlorinated herbicides were not detected above the respective HERO Note 3-modified RSLs for residential land use.

²⁰ Arsenic levels were compared to DTSC background concentrations for Southern California. DTSC calculated an upper bound of 12 mg/kg as an appropriate threshold for determining any presence of arsenic above background for school sites in Southern California (DTSC, 2008 as cited in the EKI technical memorandum). Arsenic was not detected above the DTSC concentration of 12 mg/kg in any of the soil samples analyzed.

²¹ The reporting limit (i.e., the lowest level that can be confidently reported) for hexavalent chromium from the analytical laboratory is actually above the HERO Note 3-modified RSL for residential land use of 0.3 mg/kg, however, the method detection limit (i.e., the lowest level the laboratory equipment can quantify but not confirm so it becomes an estimate) provided by the laboratory is lower than 0.3 mg/kg, and no estimated detections of hexavalent chromium between the reporting limit and the method detection limit are reported by the laboratory.

²² EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 4.

²³ In accordance with standard laboratory procedures for QA/QC, a method blank which is an analyte free matrix, is carried through the complete preparation and analytical procedure. The method blank is used to evaluate contamination resulting from the complete preparation and analytical procedure.

Soil Sample Locations

This page intentionally left blank

Schools and Daycare Centers

The public schools nearest to the Project Site (i.e., Arena Site, West Parking Garage Site, East Transportation and Hotel Site, or Well Relocation Site) are the Dolores Huerta Elementary School (4125 West 105th Street, Lennox) located approximately 620 feet (0.12 miles) to the southwest of the southwest corner of the Arena Site, and Morningside High School (10500 Yukon Avenue South, Inglewood,) located approximately 985 feet (0.19 miles) southeast of the East Transportation and Hotel Site. Both public schools are located within 0.25 miles of the Project Site.

In addition, an early childhood education use is located at 3937 West 104th Street, immediately adjacent to the southern boundary of the Arena Site, on the same property as the Inglewood Southside Christian Church.

There are no daycare centers located within 0.25 miles of the Project Site. The daycare center closest to the Project Site is the Daycare Family Lopez (4220 West 107th Street, Lennox), which is approximately 1,950 feet (0.37 miles) southwest of the southwest corner of the West Parking Garage Site.

Airports

The nearest public use airports to the Project Site include Los Angeles International Airport (LAX) and Jack Northrop Field/Hawthorne Municipal Airport (HHR). The Project Site is located approximately 2 miles east of LAX, along the extended centerlines of Runways 25R and 25L, and approximately 1.4 miles due north of Runway 7-25 at HHR. There are no private airstrips located in the vicinity of the Project Site.

The Project Site is located within the planning boundary/airport influence area (AIA) established for LAX in the Los Angeles County Airport Land Use Plan (ALUP); it is not within the planning boundary or AIA for HHR. The planning boundary for LAX represents the combined areas around the airport subject to potential noise impacts and safety hazards associated with airport operations. The ALUP provides noise and safety policies governing development of compatible future land uses in areas around LAX. The Project Site is located within the CNEL 65 dB contour established for LAX in the ALUP, but is not located within the CNEL 65 dB contour for HHR. As a result of its exposure to noise from LAX, the Proposed Project is subject to the noise policies in the ALUP.

Wildland Fire

The City of Inglewood is a fully developed urban area that is not associated with wildland fires. According to the Fire Hazard Severity Zone mapping done by the California Department of Forestry and Fire Protection, the Project Site is located in an incorporated city that is considered

to be Non-Very High Fire Hazard Safety Zone (non-VHFHSZ).²⁴ The City is responsible for fire protection in the area, which is implemented in part by enforcement of Fire Code requirements contained within the Building Code, as well as fire protection services provided by the City of Inglewood Fire Department (see Section 3.13, Public Services).

3.8.2 Adjusted Baseline Environmental Setting

Section 3.8, Hazards and Hazardous Materials, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. The HPSP Adjusted Baseline projects that will be constructed immediately northeast of the intersection of West Century Boulevard and South Prairie Avenue are expected to include the use, storage, and disposal of hazardous materials. Construction of these improvements will not likely have any direct effect on the hazards and hazardous materials associated with the Proposed Project, as the improvements being constructed would be expected to have only site-specific hazard issues.

As described in the SMP that is being implemented as part of construction for the NFL Stadium and other HPSP Adjusted Baseline projects, following completion of construction, no known areas of the NFL Stadium site would contain contaminants of potential concern that are above the criteria set in the SMP.²⁵ Remediation has or will occur during grading and site preparation activities. The regulatory oversight required for these types of remediation activities would be required prior to completion of construction and would require that no potential for off-site migration could adversely affect down-gradient locations, including the Project Site. Also, the HPSP Adjusted Baseline projects will not be associated with substantive routine emissions of hazardous materials or wastes and any incidents such as accidental and upset conditions would likely be isolated and localized events. Therefore, while the amount of hazardous materials being transported, stored, handled and disposed of with these new land uses will increase, they would not substantively alter the analysis for the Proposed Project under current existing conditions.

3.8.3 Regulatory Setting

Federal

The primary federal agencies with responsibility for hazards and hazardous materials management include the US EPA, US Department of Labor Occupational Safety and Health Administration (Fed/OSHA), and the US Department of Transportation (US DOT). Federal laws, regulations, and responsible agencies are summarized in **Table 3.8-1**.

²⁴ California Department of Forestry and Fire Protection, 2011. Fire and Resource Assessment Program. Very High Fire Hazard Severity Zones in LRA as Recommended by CAL FIRE. Los Angeles County. September. Accessed January 17, 2019.

²⁵ Erler & Kalinowski, Incorporated, 2007. *Soil Management Plan*, July 3, 2007, p. 1-1.

**TABLE 3.8-1
 FEDERAL LAWS AND REGULATIONS RELATED TO HAZARDS AND HAZARDOUS MATERIALS MANAGEMENT**

Classification	Federal Law or Responsible Federal Agency	Description
Federal Aviation	FAA	The FAA's primary role is to promote aviation safety and control the use of airspace. Federal regulations and FAA Advisory Circulars applicable to compatible land use and/or safety include, but are not limited to, 14 Code of Federal Regulations Part 77 (14 CFR Part 77), Safe, Efficient Use, and Preservation of the Navigable Airspace; FAA Advisory Circular 150/5200-33B, Hazardous Wildlife Attractants on or near Airports; and FAA Order 5200.5A, Waste Disposal Sites on or near Airports.
Hazardous Waste Handling	Resource Conservation and Recovery Act of 1976 (RCRA)	Under RCRA, the US EPA regulates the generation, transportation, treatment, storage, and disposal of hazardous waste from "cradle to grave."
	Hazardous and Solid Waste Act	Amended RCRA in 1984, affirming and extending the "cradle to grave" system of regulating hazardous wastes. The amendments specifically prohibit the use of certain techniques for the disposal of some hazardous wastes.
	Toxic Substances Control Act	Code of Federal Regulations Title 40 Chapter 1, Subchapter R – Toxic Substances Control Act – Part 761 Polychlorinated Biphenyls (PCBs) – covers the identification and sampling requirements for PCBs for disposal purposes.
Hazardous Materials Management	Community Right-to-Know Act of 1986 (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA))	Imposes requirements to ensure that hazardous materials are properly handled, used, stored, and disposed of and to prevent or mitigate injury to human health or the environment in the event that such materials are accidentally released.
Hazardous Materials Transportation	US DOT	US DOT has the regulatory responsibility for the safe transportation of hazardous materials. The US DOT regulations govern all means of transportation except packages shipped by mail (49 CFR).
	US Postal Service (USPS)	USPS regulations govern the transportation of hazardous materials shipped by mail.
Occupational Safety	Occupational Safety and Health Act of 1970	Fed/OSHA sets standards for safe workplaces and work practices, including the reporting of accidents and occupational injuries (29 CFR).
Structural and Building Components (lead-based paint, polychlorinated biphenyls, and asbestos)	Toxic Substances Control Act	Regulates the use and management of PCBs in electrical equipment, and sets forth detailed safeguards to be followed during the disposal of such items.
	US EPA	The US EPA monitors and regulates hazardous materials used in structural and building components and their effects on human health.

State and local agencies often have either parallel or more stringent rules than federal agencies. In most cases, state law mirrors or overlaps federal law and enforcement of these laws is the responsibility of the state or of a local agency to which enforcement powers are delegated. For these reasons, the requirements of federal law and its enforcement are discussed under either the state or local agency section.

Federal Aviation Regulations Part 77 Safe, Efficient Use and Preservation of the Navigable Airspace

In fulfilling its role in managing the nation's airspace, the FAA regulates objects with the potential to affect navigable airspace. This is accomplished through evaluation of certain projects to determine whether they are hazards to air navigation. For both public use airports in the vicinity of the Proposed Project, Federal Aviation Regulations (FAR) Part 77 Safe, Efficient Use and Preservation of the Navigable Airspace (14 Code of Federal Regulations Part 77)²⁶ establishes notification criteria and defines various airport imaginary surfaces²⁷ for the operating environments (airspace) surrounding the airport. Part 77 stipulates that any proposed construction or alteration that is more than 200 feet above ground level (AGL) at its site, or that would exceed the established imaginary surfaces of an airport triggers a requirement to notify the FAA through its Obstacle Evaluation/Airport Airspace Analysis (OE/AAA) system or by filing Form 7460-1, "Notice of Proposed Construction or Alteration," (Form 7460-1), often referred to as a 7460-1 application. This notification prompts the FAA to conduct an aeronautical study to determine whether a project would constitute a hazard to air navigation. During such an aeronautical study, the FAA would evaluate the potential of a project to impact air traffic operations at both airports as well as nearby communication, navigation, and surveillance systems. Furthermore, the ALUP includes policies requiring compliance with Part 77.

Part 77 includes a large number of criteria that protect the airspace around an airport. The most relevant of these to the Project Site include notification criteria, horizontal imaginary surface criteria, and obstacle clearance surface criteria, each of which is discussed below.

Notification Criteria

Under Part 77 notification criteria are triggered by any permanent or temporary construction or alteration that is more than 200 feet AGL at its site or that exceeds imaginary surfaces associated with runways at public-use or military-use airports, or any airport with an FAA-approved instrument approach procedure. The size and slope of the imaginary notification surfaces for an airport are directly related to the length of the longest runway at that airport. Exceedance of any notification criterion triggers a requirement to file notice of construction with the FAA by filing a Form 7460-1. Once the FAA receives a Form 7460-1 application it conducts an aeronautical study to ensure that the construction or alteration would not result in an adverse effect on the safety and efficiency of air navigation.

Imaginary Surfaces

The FAA uses level and sloping imaginary surfaces delineated around airports to determine if proposed structures would represent an obstruction to air navigation (for public use airports, see 14 CFR Part 77.19). If a project would penetrate the imaginary airspace surfaces defined for an

²⁶ Federal Aviation Administration, 2010. 14 Code of Federal Regulations Part 77 *Safe, Efficient, Use and Preservation of the Navigable Airspace*, Federal Register Volume 75, Number 139, July 21, 2010.

²⁷ This federal regulation establishes five different imaginary surfaces (primary, approach, transitional, horizontal, and conical) for each runway to protect the ability for aircraft to safely fly into and out of the airport. These surfaces are incorporated as part of the Los Angeles County ALUP.

airport it is automatically assumed by the FAA to be an obstruction. The imaginary airspace surfaces around civil airports include primary surfaces (ground level, immediately surrounding the runways), horizontal surfaces (a horizontal plane 150 feet above the established airport elevation extending out to a maximum of 10,000 feet from above the end of the primary surface), conical surfaces (extending upward from the periphery of the horizontal surface [150 feet above airport elevation] for 4,000 feet at a slope of 20 to 1), approach surfaces (extending upward and outward from the end of the primary surface along the runway centerline), and transitional surfaces (extending from the primary surfaces to the horizontal and approach surfaces at a slope of seven to one).

At the Project Site, the height of the HHR imaginary surface ranges from 137 to 148 feet above median sea level (AMSL). Any temporary or permanent object that penetrates the horizontal surface requires notification to the FAA through the Form 7460-1 process, described above. Any proposed structures that exceed a 14 CFR Part 77 imaginary surface will require marking and lighting in accordance with FAA requirements. This requirement, however, does not automatically result in a Determination of Hazard by the FAA.

Obstacle Clearance Surfaces

The FAA has also established obstruction standards for determining whether objects, temporary (e.g., construction cranes) or permanent (e.g., buildings, trees, flagpoles, power poles, antennae), would constitute obstructions in the airspace. An obstacle clearance surface is established for every approach and departure flight path and procedure. The lowest obstacle clearance surfaces overlying the Project Site are associated with the LAX Localizer Approach to Runway 25L. This instrument approach procedure provides course guidance, and minimum altitudes, for aircraft to descend towards the southernmost runway. The associated obstacle clearance surfaces, or height constraints, associated with LAX Localized Approach to Runway 25L over the Project Site range from 290 to 450 feet AMSL from west to east.

If required, an FAA aeronautical study would evaluate the potential for impacting visual flight rules (VFR) or instrument flight rules (IFR) air traffic operations. This study would include analyzing various segments of airspace that overlie the Project Site. Examples include instrument departures and approaches, usable VFR traffic pattern airspace, diverse vector areas (DVA), visual glideslope indicators (VGSI), minimum vectoring altitudes (MVA), and low altitude en-route airways. Each of these segments of airspace have differing level or sloping obstacle clearance surfaces to ensure the appropriate clearance between the aircraft and terrain or other obstacles.

State

California Environmental Protection Agency and Unified Program

California's Secretary for Environmental Protection has established a unified hazardous waste and hazardous materials management regulatory program (Unified Program) as required by Senate Bill 1082 (1993).

The California Environmental Protection Agency (Cal/EPA) oversees the implementation of the Unified Program. The Unified Program consolidates, coordinates, and makes consistent the administrative requirements, permits, inspection and enforcement activities of six environmental and emergency response programs. The state agencies responsible for these programs set the standards for their respective programs while local governments implement the standards.

The Unified Program is implemented at the local level by 86 government agencies certified by the Secretary of Cal/EPA. These Certified Unified Program Agencies (CUPAs) have typically been established as a function of a local environment health or fire agency. Some CUPAs also have contractual agreements with one or more other local agencies called “participating agencies (PAs),” which implement one or more program elements, under the oversight of the CUPA.

The state agency partners involved in the Unified Program have the responsibility of setting program element standards, working with Cal/EPA on ensuring program consistency and providing technical assistance to the CUPAs and PAs. The following state agencies are involved with the Unified Program:

- **California Environmental Protection Agency (Cal/EPA).** The Secretary of Cal/EPA is directly responsible for coordinating the administration of the Unified Program. The Secretary certifies Unified Program Agencies. The Secretary has certified 86 CUPAs to date. These 86 CUPAs carry out the responsibilities previously handled by approximately 1,300 state and local agencies.
- **Department of Toxic Substances Control (DTSC).** The Department of Toxic Substances Control provides technical assistance and evaluation for the hazardous waste generator program including on-site treatment (tiered permitting).
- **Governor’s Office of Emergency Services (OES).** The Governor’s Office of Emergency Services is responsible for providing technical assistance and evaluation of the Hazardous Material Release Response Plan (Business Plan) Program, the California Accidental Release Response Plan (CalARP) Programs, and carrying out FEMA requirements to prepare the State Multi-Hazard Mitigation Plan also known as the State Hazard Mitigation Program.
- **Office of the State Fire Marshal (OSFM).** The Office of the State Fire Marshal is responsible for ensuring the implementation of the Aboveground Petroleum Storage Act (APSA). They are also responsible for oversight of the Hazardous Material Management Plans and the Hazardous Material Inventory Statement Programs. These programs tie in closely with the Business Plan Program.
- **State Water Resources Control Board (SWRCB).** The SWRCB provides technical assistance and evaluation for the UST program.

Hazardous Waste Control Act

The hazardous waste management program enforced by DTSC was created by the Hazardous Waste Control Act (California Health and Safety Code section 25100 et seq.), which is implemented by regulations described in CCR Title 22, Social Security, Division 4.5, Environmental Health Standards for the Management of Hazardous Waste. This act implements the RCRA “cradle-to-grave” waste management system in California, but is more stringent in its regulation of non-RCRA wastes, spent lubricating oil, small-quantity generators, transportation

and permitting requirements, as well as in its penalties for violations. The act also exceeds federal requirements by mandating the recycling of certain wastes, requiring certain generators to document a hazardous waste source reduction plan, requiring permitting for federally exempt treatment of hazardous wastes by generators, and implementing stricter regulation of hazardous waste facilities.

California Department of Industrial Relations, Division of Occupational Safety and Health Administration

The California Department of Industrial Relations, Division of Occupational Safety and Health Administration (Cal/OSHA), assumes primary responsibility for developing and enforcing workplace safety regulations within the state. Cal/OSHA standards are more stringent than federal OSHA regulations, and are presented in CCR Title 8. Standards for workers dealing with hazardous materials include practices for all industries (General Industry Safety Orders); specific practices are described for construction and hazardous waste operations and emergency response. Cal/OSHA conducts on-site evaluations and issues notices of violation to enforce necessary improvements to health and safety practices. CCR Title 8 also includes standards for the identification, abatement, and handling of asbestos containing materials (8 CCR 1529 and 5208) and LBP (8 CCR 1532.1).

California Highway Patrol and Department of Transportation

The California Highway Patrol and California Department of Transportation (Caltrans) are the enforcement agencies responsible for hazardous materials transportation regulations. Hazardous materials and waste transporters are responsible for complying with all applicable packaging, labeling, and shipping regulations. California Vehicle Code Division 13, Chapter 5, Article 1, sections 31303–31309, regulates the transport of hazardous materials. The provisions of this section apply to the highway transportation of hazardous materials and hazardous waste and include restrictions on labeling/placards, transportation routes, and other measures to ensure safe transport of regulated materials.

State Water Resources Control Board

The SWRCB has primary responsibility to protect water quality and supply through the respective RWQCBs. As described in Section 3.9, Hydrology and Water Quality, RWQCBs are authorized by the Porter-Cologne Water Quality Control Act of 1969 to protect the waters of the state. The RWQCBs provide oversight for sites where the quality of groundwater or surface waters is threatened. Extraction and disposal of contaminated groundwater due to investigation/remediation activities or due to dewatering during construction require a permit from the RWQCBs if the water were discharged to storm drains, surface water, or land.

CCR Title 23, Chapter 15, requires that non-hazardous liquid (greater than 42 gallons) or solid (greater than 10 cubic yards) waste must be reported to the RWQCB. Domestic wastewater and refuse releases are required to be reported under different non-Chapter 15 regulations.

California State Aeronautics Act

Public Utilities Code section 21001 et seq. is also known as the State Aeronautics Act, which is designed to further protect the public interest in aeronautics and aeronautical progress. Measures in the Act include:

- (a) Fostering and promoting safety in aeronautics.
- (b) Effecting uniformity of the laws and regulations relating to aeronautics consistent with federal aeronautics laws and regulations.
- (c) Developing, in cooperation with the private sector, airport management, local jurisdictions, federal authorities, and the general public, informational programs to increase the understanding of current air transportation issues including, but not limited to, aviation safety, planning, airport noise, airport development and management, and the role of aviation in the economic development of the state, as an integral part of the state's transportation system.

Article 2.7 of the Act addresses regulation of obstructions to airports and navigational facilities by outlining the notification requirements for different types of projects. For any new structures, such as those identified for the Proposed Project, Article 2.7 specifies that a permit from the California Division of Aeronautics must be obtained for any objects affecting the navigable airspace as defined in 14 CFR Part 77, which primarily relate to height. This permit is not required if the FAA has determined that the new construction does not constitute a hazard to air navigation.

California Fire Code

The 2016 California Fire Code is published by the California Building Standards Commission and incorporates by adoption the 2015 International Fire Code of the International Code Council. The California Fire Code is contained as Part 2 of the California Building Code and includes minimum requirements consistent with nationally recognized good practices to safeguard the public health, safety and general welfare from the hazards of fire, explosion or dangerous conditions in new and existing buildings, structures and premises, and to provide safety and assistance to fire fighters and emergency responders during emergency operations. The City of Inglewood has adopted the California Fire Code with amendments.

Regional

Los Angeles County Airport Land Use Plan

Pursuant to California Public Utilities Code sections 21670–21679.5, with certain exceptions, each county in California with a public use airport is required to establish an Airport Land Use Commission (ALUC). The Los Angeles County Regional Planning Commission acts as the ALUC for Los Angeles County. The ALUC's purpose is to coordinate land use planning in areas around airports to provide for future development of the airport while protecting the public health, safety and welfare. To further this purpose, each ALUC must develop a compatible land use plan that promotes and ensures compatibility between airports and surrounding land uses. The Los Angeles ALUP was adopted on December 19, 1991 (revised December 2004), and includes policies applicable to future land uses in areas around the County's airports, as well as delineating the planning boundaries/AIAs in which these policies are applicable. This purpose is further

achieved through ALUC review of proposed development within the planning boundaries/AIAs to ensure consistency with the Los Angeles County ALUP. The following policies from the Los Angeles County ALUP are applicable to the Proposed Project:

Policies Related to Safety:

Policy G-4: Prohibit any uses which will negatively affect safe navigation.

Policy S-5: Prohibit uses which would attract large concentrations of birds, emit smoke, or which may otherwise affect safe air navigation.

Policy S-6: Prohibit uses which would generate electrical interference that may be detrimental to the operation of aircraft and/or aircraft instrumentation.

Policy S-7: Comply with the height restriction standards and procedures set forth in 14 CFR Part 77.

South Coast Air Quality Management District and Rule 1403

Asbestos is a carcinogen and is categorized as a hazardous air pollutant by US EPA. The EPA has delegated the authority to enforce the federal asbestos regulations to the South Coast Air Quality Management District (SCAQMD). Air Quality Management District Rule 1403, adopted by SCAQMD on October 6, 1989, establishes survey, notification, and work practice requirements to prevent asbestos emissions from emanating during building renovation and demolition activities.

Local

County of Los Angeles Health Hazardous Materials Division

In 1982, the Los Angeles County Board of Supervisors established the Hazardous Materials Control Program in the Department of Health Services for the inspection of businesses generating hazardous waste. In 1991, the program merged into the Fire Department and it became the Health Hazardous Materials Division (HHMD). All Hazardous Material Specialists are sworn and badged Los Angeles County Deputy Health Officers.

In 1997, the HHMD became a CUPA to administer the following programs within Los Angeles County: the Hazardous Waste Generator Program, the Hazardous Materials Release Response Plans and Inventory Program (also referred to as Hazardous Materials Business Plans [HMBPs]), the California Accidental Release Prevention Program, the Aboveground Storage Tank Program, and the UST Program. The HHMD is a division of the Department's Prevention Services Bureau, and includes the following sections and units:

- Inspection Section,
- Emergency Operations Section,
- Special Operations Section, and
- Administration/Planning Section.

HMBPs are required for any facility that will handle a hazardous material or a mixture containing a hazardous material that has a quantity at any one time during the reporting year that is equal to, or greater than, 55 gallons for materials that are liquids, 500 pounds for solids, or 200 cubic feet for compressed gas, as defined in subdivision (i) of section 25501 of the California Code (Health and Safety Code Division 20, Chapter 6.95, Article 1, Business and Area Plans [25500–25519]). Other requirements include submitting a chemical inventory information sheet pursuant to section 11022 of Title 42 of the United States Code. As the CUPA agency, HMMD would be responsible for ensuring compliance with these regulations.

City of Inglewood General Plan

The Safety Element of the Inglewood General Plan was adopted in July 1995. The following policies are articulated as “mitigation measures” in the City of Inglewood General Plan Safety Element and are relevant to Hazards and Hazardous Materials.

Safety Element

- Enforcement of the State law that requires businesses involved with hazardous materials to disclose the quantities of hazardous materials, their locations, their disposal and a management plan designed to decrease risks to the public.
- Private businesses and government agencies must continue to update and prepare the proper emergency responses in the event of a spill or explosion.
- The City must have continuous coordination among its staff (e.g., Planning Division, Fire Department, etc.) to ensure that hazardous material operations are located in zones and facilities that are appropriate and safe for such use.
- The City must ensure that these uses are located safe distances from residences, schools, hospitals, large assemblages of people, etc.

The Proposed Project would be consistent with these policies through the reparation and implementation of a HMBP (see discussion above under County of Los Angeles HMMD), which would ensure that the storage, handling, and disposal of hazardous materials is done in accordance with practices that minimize exposure and inadvertent releases.

City of Inglewood Multi-Hazard Mitigation Plan

The Office of Emergency Services (OES) achieves its mission of preparing for emergencies and disasters by serving the City of Inglewood through effective collaboration in preparing for, protecting against, responding to, recovering from, and mitigating the impacts of all hazards and threats. The City has an Emergency Plan (City of Inglewood Multi-hazard Mitigation Plan [MHMP]), which is in the process of being updated at the time of preparation of this section.²⁸ The existing 2010 MHMP generally provides a means to prepare and maintain systems, supplies and other logistical items to support emergency/disaster response and recovery among city

²⁸ City of Inglewood, *Emergency Preparedness*, http://v1.cityofinglewood.org/depts/admin/emergency_preparedness.asp. Accessed December 28, 2018.

departments to address natural and man-made hazards for all past, existing, and future development. The current MHMP includes the following overall hazard mitigation goals:

- Minimize the loss of life and property from natural hazard events
- Protect public health and safety
- Increase public awareness of risk from natural hazards
- Enhance emergency services including warning systems

3.8.4 Analysis, Impacts and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for the analysis of impacts to hazards and hazardous materials. The following thresholds of significance have been adapted from CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
3. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 miles of an existing or proposed school;
4. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, would create a significant hazard to the public or the environment;
5. For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area or create a hazard to navigable airspace and/or operations at a public airport;
6. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or
7. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

Methodology and Assumptions

Hazardous Materials Impacts

The potential for the creation of significant impacts related to hazards and/or hazardous materials through construction and operation of the Proposed Project were determined by a review of the existing conditions, with particular attention paid to the known or potential presence of hazardous materials and hazardous wastes associated with past operations on properties on the Project Site and nearby vicinity. Because regulatory requirements have evolved over time, and the regulations related to handling and disposal of hazardous materials have become increasingly stringent, it is reasonably understood that land uses that operated prior to the creation of the current regulatory

regime have a greater likelihood to have resulted in release of hazardous materials, if such materials were associated with the past use, than land uses that have operated only in recent years. Thus, the identification of past land uses is a key element of the evaluation process.

Exposure risks are affected by a variety of factors such as the chemical of concern, concentration level, medium (i.e., soil, groundwater, or soil vapor), and/or exposure pathway. Exposure can occur through direct physical contact as a result of disturbance from earthwork activities during demolition, excavation, or construction. Exposure can also take place through inhalation of off-gassing constituents (e.g., VOCs) that may be present in the soil or groundwater exposed during construction, or during project operations from vapor intrusion of gasses that can seep through foundations into new structures where people are present. This analysis relies on the select soil sampling that was conducted as part of the two EKI technical memorandums to characterize the existing subsurface conditions at the Project Site (see below). Where site-specific data is either limited or unavailable, this analysis makes conservative assumptions regarding the potential for encountering legacy contaminants.

Human health risks can occur from either acute or chronic exposure to subsurface contamination, and both are considered in this analysis. In order to quantitatively estimate exposure risks, a human health impact analysis or health risk assessment is necessary. A risk assessment of this type is typically conducted as part of the regulatory oversight of sites with known past releases of hazardous materials. Because none of the areas within the Project Site are currently under regulatory oversight, no such risk assessments have been conducted.

The EKI technical memoranda, along with publicly available resources, including existing environmental databases, were reviewed in order to determine the potential for hazardous impacts that would occur from the construction and/or operation of the Proposed Project. The EKI technical memoranda identified known hazardous materials sites that are near, but not on the Project Site, some of which are under regulatory oversight. The status of the investigation and cleanup of these sites is described above, and it is recognized that the status will change over time as these sites progress through the regulatory oversight process (i.e., complete characterization of extent of contamination and/or remediation to the point of no further threat to human health or the environment remaining). Because local and state agencies are reasonably expected to continue to enforce applicable requirements, compliance with applicable federal, State, and local health and safety laws and regulations by land owners and businesses in the area, including the project applicant in the event that hazardous materials are discovered during the excavation and construction of the Proposed Project, is assumed in this analysis.

The EKI technical memoranda also included a description of the soil sampling that was performed on the Project Site. The samples were submitted to a certified laboratory for analysis. The sampling results were compared to the US EPA RSLs for residential and commercial/industrial land uses, as modified by DTSC HERO Note 3. These screening levels are referred to as the “HERO Note 3-modified RSLs” and are not considered to be cleanup threshold concentrations, but screening levels that are intended to be a health-conservative preliminary

evaluation of potential risk and hazard based on planned land uses. The HERO Note 3-modified RSLs are less restrictive for commercial/industrial land uses compared to residential, since residential land uses tend to result in higher levels of exposure and associated health risk than for commercial/industrial land uses.

The analysis of potential impacts related to legacy contaminants relies on these sampling results because they are considered to be the best available representation of existing subsurface conditions. The use of the HERO Note 3-modified RSLs provide a conservative approach to evaluate potential health risks from implementation of the Proposed Project, recognizing that residential land uses are not proposed. As a result, screening levels for commercial/industrial land uses were also provided along with the residential levels for comparison.

Airport-Related Hazards

In order to evaluate the potential for the Proposed Project to result in the creation of airspace hazards, CAG prepared a comprehensive obstruction evaluation and airspace analysis for the Proposed Project in September 2017. This analysis was updated by CAG in May 2019, to include the most current heights identified for the temporary construction equipment and permanent structures included in the Proposed Project.²⁹ ESA aviation and airport planners conducted a peer review of the CAG analysis, and concluded that the analysis is accurate and objective, and appropriate for inclusion in this Draft EIR.

The results of the CAG analysis indicate that the Proposed Project construction cranes could trigger the 200-foot AGL notification criteria, and that temporary construction equipment and the proposed Arena Structure could penetrate the approximate 125-foot AGL (215-foot AMSL) 14 CFR Part 77.19 imaginary airspace horizontal surface for HHR. In addition, the CAG analysis determined that temporary construction cranes used as part of the construction of the Proposed Project potentially could exceed slightly the 290-foot obstacle clearance surface for the final approach segment of the Localizer Approach to Runway 25L at LAX.

The CAG memoranda are included in Appendix P.

Issues Determined to be Less Than Significant

Upon review of the Proposed Project, the City of Inglewood determined that due to the physical characteristics of the Project Site and the Proposed Project, several environmental issues or resources would not be affected by the Proposed Project and need not be further considered in the

²⁹ Capitol Airspace Group, 2017. *Project Condor Obstruction Evaluation & Airspace Analysis*, Technical Memorandum, September 13, 2017, and Capitol Airspace Group, 2019. *IBEC Project A description of Aeronautical Study Process and Results of an Obstruction Evaluation & Airspace Analysis*, Technical Memorandum, May 10, 2019.

Draft EIR.³⁰ The discussion below provides a brief statement of reasons for the City's determination that these issues do not warrant further consideration in the EIR.

With respect to significance criterion (7), as described under Environmental Setting, the Proposed Project is located in a developed urban area served by the City of Inglewood Fire Department and is not located within a very high or high fire hazard severity zone. The following discussion further addresses these criteria.

The Proposed Project would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

The Project Site is located in a developed urban area served by the City of Inglewood Fire Department and is not located within a very high or high fire hazard severity zone. As such, the Proposed Project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires. Thus, there would be **no impact** of the Proposed Project related to this significance criterion. Potential impacts associated with other fire-related services are discussed in Section 3.13, Public Services, of this EIR.

Impacts and Mitigation Measures

Impact 3.8-1: Construction and operation of the Proposed Project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. (Less than Significant)

Construction

Project-related construction activities would include demolition and removal of existing buildings on the Project Site and use of hazardous materials during construction of new buildings, structures, and other features of the Proposed Project. The potential for exposure of the public or the environment to hazardous materials during these construction activities is addressed below.

Exposure to Hazards in Existing Buildings

The Proposed Project would include demolition of approximately 54,098 square feet of existing on-site vacant and commercial uses in structures of varying ages. Some structures within the Project Site were built prior to 1978 and, as a result, could contain hazardous building materials. Exposure to hazardous building materials during demolition, including ACMs, LBP, or PCBs, mercury and other hazardous materials in structures would only occur during demolition activities, but could result in adverse health effects if not managed appropriately as required by existing laws and regulations. Once the structures have been removed, there would be no further exposure during operation of the Proposed Project.

³⁰ Public Resources Code section 21003(e) states that “[t]o provide more meaningful public disclosure, reduce the time and cost required to prepare an environmental impact report, and focus on potentially significant effects on the environment of a proposed project, lead agencies shall, in accordance with Section 21100, focus the discussion in the environmental impact report on those potential effects on the environment of a proposed project which the lead agency has determined are or may be significant. Lead agencies may limit discussion on other effects to a brief explanation as to why those effects are not potentially significant.”

As described under the Regulatory Setting, above, existing federal, State, and local regulations require demolition or renovation activities that may disturb or require the removal of materials that consist of, contain, or are coated with ACM, LBP, PCBs, mercury, and other hazardous materials to be inspected and/or tested for the presence of hazardous materials. Further, all hazardous materials must be managed and disposed of in accordance with laws and regulations described in the Regulatory Setting and further described below.

The identification, removal, and disposal of ACM is regulated under 8 CCR 1529 and 5208. The identification, removal and disposal of LBP is regulated under 8 CCR 1532.1. For both ACM and LBP, all work must be conducted by a State-certified professional. If ACM and/or LBP is determined to exist on site, a site-specific hazard control plan must be prepared and submitted to the appropriate agency detailing removal methods and specific instructions for providing protective clothing and equipment for abatement personnel (South Coast Air Management District for asbestos and Cal/OSHA for lead). If necessary, a State-certified LBP and an asbestos removal contractor would be retained to conduct the appropriate abatement measures as required by the plan. Wastes from abatement and demolition activities would be disposed of at a landfill(s) licensed to accept such waste. Once all abatement measures have been implemented, the contractor would conduct a clearance examination and provide written documentation to the City that testing and abatement have been completed in accordance with all federal, state, and local laws and regulations.

In the case of PCBs, the identification, removal, and disposal is regulated by the EPA under the Toxic Substances Control Act (Title 40, Chapter 1, Subchapter R, Part 761) and California regulations (22 CCR 66263.44). Electrical transformers and older fluorescent light ballasts not previously tested and verified to not contain PCBs must be tested. If PCBs are detected above action levels, the materials must be disposed of at a licensed facility permitted to accept the materials. Upon completion of abatement measures, if applicable, the contractor would provide written documentation to the City that testing and abatement have been completed in accordance with all federal, state, and local laws and regulations.

In the case of mercury in fluorescent light tubes and switches, the identification, removal, and disposal is regulated under 22 CCR 67426.1–67428.1 and 66261.50. Under these regulations, the light tubes must be removed without breakage and disposed of at a licensed facility permitted to accept the materials. Upon completion of abatement measures, if applicable, the contractor would provide written documentation to the City that testing and abatement have been completed in accordance with all federal, state, and local laws and regulations.

Existing abatement laws and regulations, combined with enforcement mechanisms by agencies including SCAQMD, Cal/OSHA require compliance with applicable federal, State, and local laws and regulations that would prevent the exposure of individuals and the environment to the hazards during demolition of structures built before newer regulatory requirements were enacted (1978 for LBP and PCBs, 1981 for ACMs, and 2004 for mercury in fluorescent lighting). The Proposed Project would involve demolition and removal of structures of varying ages, the oldest being the

Rodeway Inn motel that dates back to the mid-1950s. Such structures could potentially contain hazardous building materials, however pursuant to federal, State, and local regulations, including HBMP programs overseen and enforced by the HHMD, the demolition permit process would require appropriate surveying, identification and disposal of any identified hazardous building materials. Therefore, exposure to asbestos containing materials, LBP and/or other hazardous building materials that would create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials would be **less than significant**.

Use of Hazardous Materials during Construction

Construction activities would also likely require the use of limited quantities of hazardous materials such as fuels, oils, and lubricants for construction equipment; paints and thinners; and solvents and cleaners. These hazardous materials are typically packaged in consumer quantities and used in accordance with manufacturer recommendations, and would be transported to and from the Project Site. The improper handling and transport of hazardous materials could result in adverse health effects to workers or the public.

As discussed in the Regulatory Setting, transportation of hazardous materials is regulated by US DOT and Caltrans. Together, federal and State agencies determine driver-training requirements, load labeling procedures, and container specifications designed to minimize the exposure of hazardous materials. In addition, businesses that use hazardous materials, including construction companies, are required to prepare and implement HMBPs describing procedures for the handling, transportation, generation, and disposal of hazardous materials. As the CUPA agency, HHMD would be responsible for ensuring compliance with these regulations including, but not limited to, the Hazardous Waste Control Act, the Hazardous Waste Generator Program, the Hazardous Materials Release Response Plans and Inventory Program, the California Accidental Release Prevention Program, and the Aboveground Storage Tank Program.

As discussed above a comprehensive set of federal, State, and local laws and regulations regulate the transportation, management, and disposal of hazardous materials and wastes so as to reduce the potential risks of human exposure. For these reasons, the potential for construction of the Proposed Project to result in a significant hazard due to exposure of the public or the environment to hazardous materials or wastes to through the routine transport, use, or disposal of hazardous materials would be a **less-than-significant impact**.

Operation

The use of common hazardous materials would occur as part of the operation of the Proposed Project, primarily associated with maintenance activities as well as storage of diesel for the backup generator and biomedical supplies for the sports medicine clinic. Hazardous chemicals common in other commercial/retail/hotel and support settings include paints, lubricants, solvents, cleaning supplies and relatively small quantities of fuels, oils, and other petroleum-based products. Activities such as landscaping, can also become sources of releases of hazardous materials with pesticides and herbicides.

Because general arena and commercial/retail/hotel hazardous materials are typically handled and transported in small quantities, and because the health effects associated with them are generally not as serious as industrial uses, operation of a majority of the new uses at the site would not cause an adverse effect on the environment with respect to the routine transport, use, or disposal of general office and household hazardous materials.

The sports medicine clinic would likely include relatively small quantities of bio-hazards and other chemicals, such as medical supplies, oxygen tanks and other treatment supplies that fit the classification of a hazardous material or waste. In addition, any administration of medication hypodermically would produce bio-hazard waste. As part of adhering to local CUPA requirements, the clinic would be required to prepare and submit a Hazardous Materials Management Plan and HMBP to the County HHMD, as well as comply with any applicable fire code requirements as enforced by the City fire department.

For the arena and commercial/retail/hotel uses, the existing regulatory framework requires appropriate training of employees in the use, storage, and disposal of any hazardous materials and wastes. As required by the HHMD, any business that would store hazardous materials and/or waste at its site would be required to submit business information and hazardous materials inventory forms contained in Hazardous Materials Management Plan and HMBP. In addition, all hazardous materials handlers are subject to inspection every 3 years. The HHMD, as the CUPA, requires all new commercial and other users to follow applicable regulations and guidelines regarding storage and handling of hazardous waste. All hazardous materials are required to be stored and handled according to manufacturer's directions and local, State, and federal regulations including the Hazardous Waste Control Act (California Health and Safety Code section 25100 et seq.), which is implemented by regulations described in CCR Title 22. With adherence to existing regulatory requirements, the impact of the routine transport, use or disposal of hazardous materials associated with future uses at the site would be a **less-than-significant impact**.

Mitigation Measures

None required.

Impact 3.8-2: Construction and operation of the Proposed Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. (Less than Significant)

Construction

As noted above in Impact 3.8-1, construction activities would require the use of limited quantities of hazardous materials that are normal requirements of the construction process, including fuels, oils, and lubricants for construction equipment; paints and thinners; and solvents and cleaners. These materials would be transported to and from the Project Site for use during construction activities. The improper handling and transport of hazardous materials could result in accidental release of hazardous materials, thereby exposing the public or the environment to hazardous materials.

As discussed in the Regulatory Setting, the transport of hazardous materials is regulated by US DOT and Caltrans. The transport regulations ensure safe transport of the regulated materials by addressing how hazardous materials are labeled, identifying approved transport routes, and include provisions that restrict containment during highway transportation of hazardous materials and wastes.

Construction activities would disturb more than one acre and, thus, would be required to implement requirements of the NPDES General Construction Permit. This permit requires implementation of best management practices (BMPs) that would include measures to address the safe handling of hazardous materials, and in the unlikely event of an inadvertent release, also requires spill response measures to contain any release of hazardous materials. The use of construction BMPs implemented as part of a Stormwater Pollution Prevention Plan (discussed further in Section 3.9, Hydrology and Water Quality) as required by the NPDES General Construction Permit would minimize the potential adverse effects from accidental release of hazardous materials or wastes. These BMPs could include, but are not necessarily limited to, the following:

- Establishment of a dedicated area for fuel storage and refueling activities that includes secondary containment protection measures and spill control supplies;
- Requirements to follow manufacturer's recommendations on use, storage and disposal of chemical products used in construction;
- Avoidance of overtopping construction equipment fuel gas tanks;
- Proper containment and removal of grease and oils during routine maintenance of construction equipment; or
- Proper disposal of discarded containers of fuels and other chemicals.

In general, aside from refueling needs for heavy equipment, the hazardous materials typically used on a construction site would be brought onto the site by the construction contractor, packaged in consumer quantities, and used in accordance with manufacturer recommendations. The overall quantities of these materials on the site at any one time would not result in large bulk amounts that, if spilled, could cause significant soil or groundwater contamination. If a spill of hazardous materials on the construction sites were to occur, the spilled materials would be localized because of the relatively small quantities involved, and would be cleaned up in a timely manner in accordance with identified BMPs. See Impact 3.8-4 for a discussion of potential impacts related to encountering previously released (i.e., legacy contaminants) hazardous materials or wastes.

As described above, refueling activities of heavy equipment would be conducted in a dedicated and controlled area with secondary containment and protective barriers to minimize any potential hazards that might occur with an inadvertent release. Given the required protective measures (i.e., BMPs) and the quantities of hazardous materials typically needed for construction projects, such as the Proposed Project, the threat of exposure to the public or contamination to soil and/or groundwater from construction-related hazardous materials is considered a **less-than-significant impact**.

Operation

Operation of the Proposed Project arena, hotel, and associated facilities would involve the use of relatively small quantities of common hazardous materials, including paints and thinners, cleaning solvents, and fuels, oils, and lubricants. For uses in the Proposed Project, these materials would be typically packaged in consumer quantities, as compared to bulk deliveries for industrial land uses, and used in accordance with manufacturer recommendations. Some limited quantities of bio-hazards and other chemicals could also be associated with the sports medicine clinic; these too would be managed pursuant to federal and State regulations of biomedical wastes.

The Proposed Project would include the storage of diesel for backup generators,³¹ which, if released, could cause adverse effects to the public and the environment. Pursuant to the provisions of programs administered by the Los Angeles County HHMD, storage of all hazardous materials on site, including the diesel fuel, would be required to adhere to facility-specific HMBPs. The preparation and implementation of facility-specific HMBPs would be required for the arena and hotel, and the HMBPs would identify safe measures to store, handle, and dispose of hazardous materials such that accident and upset conditions are minimized. The HMBPs would also include spill response measures to ensure that in the unlikely event that a release does occur, protocols would be implemented to contain and control any accidental release in a manner that is protective of human health and the environment. Such protocols could include employee training, the location of absorbent materials to contain a release, and notification requirements to ensure that human health and the environment is protected from any exposure. The adequacy of and compliance with the HMBPs would be overseen and enforced by the HHMD. Because a comprehensive set of enforced laws and regulations govern the transportation and management of hazardous materials to reduce the potential hazards to the public and environment, this impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.8-3: Construction and operation of the Proposed Project could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 miles of an existing or proposed school. (Less than Significant)

Construction

Construction of the Proposed Project would require use of limited quantities of hazardous materials, including fuels, oils and lubricants for construction equipment; paints and thinners; and solvents and cleaners. There are three existing schools that have been identified within 0.25 miles of the Project Site. Two of the schools are public schools operated by the Inglewood Unified

³¹ One exterior standby diesel engine generator located in the utility yard on the east side of the Arena Structure. Three additional generators would be provided for emergency power: one for the parking garage within the West Parking Garage Site, one for the hotel within the East Transportation and Hotel Site, and one for the retail, restaurant, and community space buildings within the plaza at the Arena Site.

School District: the Dolores Huerta Elementary School (4125 West 105th Street Lennox California), located approximately 620 feet (0.12 miles) from the southwest of the southwest corner of the Arena Site, and Morningside High School (10500 Yukon Avenue South), located approximately 985 feet (0.19 miles) southeast of the East Transportation and Hotel Site.³² In addition, as described under Environmental Setting, there is a publicly accessible Head Start and Early Head Start preschool operated by TRF and located at 3937 West 104th Street, immediately adjacent to the south of the Arena Site. There are no schools included as part of the Proposed Project, and there are no other new schools proposed within 0.25 miles of the Project Site.

Hazardous materials would be transported to and from the Project Site and could pass near these schools. The improper handling and transport of hazardous materials could result in accidental release of hazardous materials near schools, thereby exposing school occupants to hazardous materials. However, as discussed in the Regulatory Setting (and also above in Impact 3.8-1), the transportation of hazardous materials is regulated by US DOT and Caltrans. Together, federal and State agencies establish driver-training requirements, load labeling procedures, and container specifications designed to minimize the risk of accidental release.

Businesses that use hazardous materials, including construction companies, are required to prepare and implement HMBPs describing procedures for the handling, transportation, generation, and disposal of hazardous materials in accordance with the Hazardous Waste Control Act (California Health and Safety Code section 25100 et seq.), which is implemented by regulations described in CCR Title 22. Finally, construction on sites larger than one acre would be required to comply with the Construction General Permit and implement a SWPPP and its associated BMPs to control and limit any releases of hazardous materials.

A comprehensive and enforced set of laws and regulations minimize the risks associated with the transportation and management of hazardous materials, as articulated in the Regulatory Setting. Because these laws and regulations would reduce potential hazards associated with construction of the Proposed Project to levels that minimize health risks, this impact would be **less than significant**.

Operation

Operation of the Proposed Project would involve the use of relatively small quantities of common hazardous materials including paints and thinners, cleaning solvents, fuels, oils, low risk medical wastes, and lubricants. The operation of the Proposed Project would not involve the types of hazardous emissions that are typical of industrial land uses and which require source regulation and permitting. Hazardous materials, including diesel fuel for backup generators and any medical materials or wastes, would be stored within appropriate storage containers in accordance with regulatory requirements, such as the Hazardous Waste Control Act. This would ensure that there would be no unregulated emissions of hazardous materials.

³² Inglewood Unified School District, 2018. *2018–2023 Strategic Plan*, updated November 2018.

As previously discussed, transportation of hazardous materials is regulated by US DOT and Caltrans, which together determine driver-training requirements, load labeling procedures, and container specifications designed to minimize the risk of accidental release. In addition, and as discussed in the Regulatory Setting, all businesses in the Proposed Project that handle, generate, and dispose of hazardous materials would be required to prepare and implement facility-specific HMBPs under the auspices of the HHMD and in accordance with the Hazardous Waste Control Act (California Health and Safety Code section 25100 et seq.) pursuant to regulations contained in CCR Title 22. Compliance with these regulations ensure that hazardous materials on site are appropriately stored and handled and would not result in hazardous emissions. Because a comprehensive and enforced set of laws and regulations govern the transportation and management of hazardous materials so as to reduce the potential hazards to levels that minimize health risks, this impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.8-4: Construction and operation of the Proposed Project would be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, could have the potential to create a significant hazard to the public or the environment. (Less than Significant with Mitigation)

As described above under Environmental Setting, the investigations that occurred in 2017 determined whether the Project Site and surrounding area contained sites listed on environmental databases that might indicate the potential presence of contamination in the subsurface.³³ The information from these databases include lists of properties that contain businesses that handle hazardous materials and/or wastes with no record of releases, properties with relatively minor incidents having little to no threat to human health or the environment, or properties with a history of extensive releases that require remediation efforts in order to get conditions to acceptable levels (i.e., no substantive threat to human health or the environment).

The EKI report determined that some parcels located within the Project Site were included on environmental databases that were searched by EDR, as described above in the Setting (i.e., Database Search Project Site).³⁴

Typically, sites with known previous releases that are included on these lists are either in the process of further investigation or are already undergoing remediation such that exposure hazards

³³ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019, p. 12.

³⁴ Previous Phase I Environmental Site Assessments covering portions of the Project Site were also reviewed and did not include any additional records showing the site to be included on any environmental databases. Ninyo & Moore, 2012. *Phase I Environmental Site Assessment, Site A, Between West Century Boulevard and West 101st Street, Inglewood, CA*, December 5, 2012. Ninyo & Moore, 2012. *Phase I Environmental Site Assessment, Site B, Between West 101st Street and West 102nd Street, Inglewood, CA*, December 5, 2012.

are reduced. Investigations and remediation are overseen by federal, State, and/or local regulatory agencies, such as the US EPA, California DTSC or the Los Angeles RWQCB. Agencies such as these review sites on a case by case basis and evaluate potential health hazards based on land uses, characteristics of the contaminants of concern, and exposure pathways.

While there are no known properties within the Project Site that are under active investigation or remediation, based on the historic uses on the Project Site the possibility exists for future improvements associated with the Proposed Project to disturb previously unidentified contamination. If not understood and managed appropriately, future visitors or workers at the Project Site could be exposed to legacy contaminants through contact with contaminated soils during excavation or other ground disturbing activities, or through future vapor intrusion into Proposed Project structures.

As described above, the EKI report determined that seven parcels located within the Arena Site were included on environmental databases that were searched by EDR.³⁵ In addition, a number of sites located up gradient or adjacent to the Project Site have documented use and/or releases of hazardous materials and/or wastes. EKI also collected surface soil samples from the Project Site in two separate efforts (2017 and 2019) to further determine the potential presence of legacy contaminants across the different areas of the Project Site.^{36,37}

The known past uses and likelihood of contamination on each part of the Project Site is discussed below:^{38,39}

Arena Site

The Arena Site includes various addresses (3900 and 3901 West 102nd Street, 10220 South Prairie Avenue, and 3822 West Century Boulevard) that were found in environmental databases reviewed by EKI. The Arena Site was occupied by residential properties and agricultural uses beginning in about 1923. The northwestern corner of the Arena Site (the current Church's Fried Chicken) once had an automobile service station and the property at 3822 West Century Boulevard was previously dry cleaner that may have used dry cleaning chemicals (not all dry cleaner facilities handle these chemicals).

To the north of the Arena Site, across West Century Boulevard, the former Hollywood Park Racetrack and Casino property also has potential to adversely affect the site if the documented releases at that site have migrated onto the Project Site. Groundwater monitoring of the racetrack

³⁵ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019a, p. 12.

³⁶ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Investigations*, Technical Memorandum, June 28, 2019, p. 20.

³⁷ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 3.

³⁸ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Investigations*, Technical Memorandum, June 28, 2019a, p. 22.

³⁹ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 5.

site was conducted in 2009 and did not indicate any substantive risks to human health or the environment. As a result, the wells were destroyed in 2014.

Soil samples collected on the Arena Site by EKI found that diesel-range TPH, chrome and also lead were detected at concentrations above the residential screening level (HERO Note 3-modified RSL), but below the screening level criteria for commercial/industrial land uses like those in the Proposed Project. The source of the TPH is unknown but the lead could be attributed to LBP from buildings previously located on the site.

Based on the land use history and results of soil sampling on the Arena Site, during demolition and excavation phases of construction workers could be exposed to diesel--range TPH, chrome, and lead which can have adverse health effects depending on exposure levels and length of exposure. This impact is considered **potentially significant**.

West Parking Garage Site

The land within the West Parking Garage Site was once used for agriculture before being developed with residential land uses in the 1920s and 1930s. Those residential uses were cleared in the 1990s and early 2000's pursuant to the City's participation in the FAA's noise mitigation grant program.

Nearby the West Parking Garage Site, from approximately 1970 to 1990 there was an automobile service station (former Unocal service station) located on southwestern corner of West Century Boulevard and South Prairie Avenue on a site currently occupied by a Starbucks café (see Figure 3.8-2). Further to the south on West 101st Street, just west of South Prairie Avenue, a dry cleaning facility was located immediately east of the West Parking Garage Site. Chemicals previously known to be used in dry cleaning processes commonly included VOCs PCE, TCE, and/or their byproducts like vinyl chloride, which can have adverse effects on human health. The past land uses of an automobile service station and a dry cleaning business suggest a relatively high probability of releases to the subsurface which may have adversely affected subsurface soil or groundwater.

Soil samples collected by EKI in 2019 on the West Parking Garage Site detected concentrations above the residential screening level (HERO Note 3-modified RSL) but below the screening level criteria for commercial/industrial land uses, of the following contaminants: hexavalent chromium in six of the seven samples analyzed from this area, thallium (a metal not found in nature) in one sample, and lead in two samples (analyzed with field equipment).⁴⁰ Hexavalent chromium was also detected in the method blank, suggesting that the results of the soil samples could have been affected by laboratory contamination.⁴¹ Two of the 21 soil samples analyzed using portable field equipment detected lead results above the residential screening level of 80 mg/kg (89 and

⁴⁰ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 4-5.

⁴¹ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 5.

126 mg/kg), but all were below the screening level criteria of 320 mg/kg for commercial/industrial land uses such as those that would be included in the Proposed Project.

The 2019 EKI report also evaluated contaminants of concern in the soil gas because of the former dry cleaning facility that was located adjacent to the West Parking Garage Site. A sample was analyzed for VOCs and also compared to residential screening levels. The analytical results of the sample were found to be below residential screening levels, which indicates that the soil or groundwater under the West Parking Garage Site was not adversely affected by the former dry cleaning facility operations.

Overall, analysis of the soils on the West Parking Garage Site detected levels of contaminants, including possibly hexavalent chromium, thallium, and lead, that are above residential screening levels but below commercial/industrial screening levels. Exposure of people or the environment to contaminated soils or groundwater could occur during construction of the Proposed West Parking Garage. For these reasons, the impact is considered **potentially significant**.

East Transportation and Hotel Site

The East Transportation and Hotel Site is currently undeveloped, but had a history of past residential, small scale agricultural, and hotel land uses. By 1989, all buildings had been demolished, and the site was cleared. There is no documented account of any release at the site; however, there is a potential to encounter legacy contaminants associated with the past uses. Soil sampling conducted by EKI in 2017 identified one sample in which diesel- and motor-oil-range TPH concentrations were above the residential HERO Note 3-modified RSLs, with the diesel-range concentration also above the screening level criteria for commercial/industrial land uses. While this detection is not necessarily an indication of any substantive presence of legacy contaminants, without additional investigation and potential remediation, the potential exists for workers during ground disturbing activities to be exposed to diesel- and motor-oil-range TPH above the HERO Note 3-modified RSL. Exposure of people or the environment to contaminated soils or groundwater could occur during construction of the Proposed East Transportation Hub and Hotel. For these reasons, the impact is considered **potentially significant**.

Well Relocation Site

The Well Relocation Site is located in approximately 100 feet east of the Arena Site, as well as other commercial and light industrial land uses. The database search for this site revealed one data entry connected with a hazardous waste manifest for transport of hazardous materials.⁴² The database entry is attributed to the Inglewood Redevelopment Agency and indicates that hazardous waste was transported from the Well Relocation Site.

Two soil samples were collected on the Well Relocation Site by EKI in 2019. In one sample taken from 0 to 1 foot bgs, chlordane (a pesticide compound) was detected at a concentration above the residential screening level (HERO Note 3-modified RSL), but below the

⁴² GeoSearch, 2018. *Preliminary Radius Report*. December 27, 2018, p. 21.

commercial/industrial screening level criteria.⁴³ In both samples analyzed hexavalent chromium was found above the residential screening level, but below commercial/industrial screening levels. Hexavalent chromium was also detected in the method blank, suggesting that the results of the soil samples could have been affected by laboratory contamination.⁴⁴

In light of the lack of any further details regarding the database entry for this site, the history of hazardous materials use for the immediate area and the detections of chlordane and hexavalent chromium, indicate the potential for legacy contaminants to be present on the Well Relocation Site. Exposure of people or the environment to contaminated soils or groundwater could occur during construction of the Proposed Replacement Well. This impact is considered **potentially significant**.

As described above, based on available information about past uses and existing levels of contaminants in soil samples analyzed from each part of the Project Site, the potential exists to create a significant hazard to the public or the environment as a result of exposure to existing contamination. This impact is potentially significant.

Mitigation Measure 3.8-4

Prior to initiating any ground disturbing activities on the Project Site, the project applicant shall prepare a Soil Management Plan (SMP) that is submitted and approved by the Los Angeles County Health Hazardous Materials Division (HHMD). The SMP shall be prepared by a Registered Environmental Assessor (REA) or other qualified expert, and shall address the findings of the two EKI technical memoranda dated June 28, 2019, and/or subsequent relevant studies.

During construction, the contractor shall implement the SMP. If unidentified or suspected contaminated soil or groundwater evidenced by stained soil, noxious odors, or other factors, is encountered during site preparation or construction activities on any portion of the Project Site, work shall stop in the excavation area of potential contamination. Upon discovery of suspect soils or groundwater, the contractor shall notify the HHMD and retain an REA or qualified professional to collect soil samples to confirm the type and extent of contamination that may be present.

If contamination is confirmed to be present, any further ground disturbing activities within areas of identified or suspected contamination shall be conducted according to a site specific health and safety plan, prepared by a California state licensed professional. The contractor shall follow all procedural direction given by HHMD and in accordance with the SMP to ensure that suspect soils are isolated, protected from runoff, and disposed of in accordance with transport laws and the requirements of the licensed receiving facility.

If contaminated soil or groundwater is encountered and identified constituents exceed human health risk levels, ground disturbing activities shall not recommence within the contaminated areas until remediation is complete and a “no further action” letter is obtained from the appropriate regulatory agency or direction is otherwise given that

⁴³ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 4-5.

⁴⁴ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019, p. 4.

construction can commence. The project applicant shall submit the “no further action” letter or equivalent notification to the City prior to resumption of any ground disturbing activity on the relevant portion of the Project Site.

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.8-4, the Proposed Project would not create a significant hazard to the public or the environment as a result of exposure to existing contamination or hazardous release sites. Thus, this impact would be considered **less than significant**.

Impact 3.8-5: Construction and operation of the Proposed Project would be located within an airport land use plan area and could result in a safety hazard or excessive noise for people residing or working in the project area or could create a hazard to navigable airspace and/or operations at a public airport. (Less than Significant with Mitigation)

Excessive Noise Exposure

The Project Site is located within the Planning Boundary/AIA for LAX as designated within the ALUP. The Planning Boundary/AIA is based in part on the 65 dB CNEL contour included in the ALUP, as shown in Figure 2-4 in Chapter 2, Project Description. Parts of the Project Site located between West 102nd Street and West Century Boulevard are generally located in areas exposed to CNEL 65 to 70 dB in the ALUP CNEL contour. This includes both the West and East Parking Garage sites, the Plaza area, the Employee Entry Pavilion, the Hotel, and part of the Arena and Practice and Athletic Training Facility, Office, and Sports Medicine Clinic. Parts of the Project Site south of West 102nd Street are generally located in areas exposed to CNEL 70 to 75 dB in the ALUP CNEL contour. This includes part of the Arena and Practice and Athletic Training Facility, Office, and Sports Medicine Clinic, as well as the Parking Structure south of the Arena.

Pursuant to ALUP Policies G-1 and N-3, the compatibility of proposed land uses is determined by consulting the land use compatibility table provided in Section V of the ALUP. The land use compatibility table identifies land use by category, including residential, commercial, and industrial land use. The Proposed Project components would all generally fall within the commercial and recreational land use categories. The compatibility criteria provided in the land use compatibility table is the same for both commercial and recreational land uses. The compatibility criteria require that commercial and recreational land uses located in areas exposed to noise levels of CNEL 65 to 75 dB must be reviewed for noise insulation needs. Noise insulation is unlikely to be required for elements of the Proposed Project that are not considered noise sensitive, including the Arena outdoor plaza areas, the West Parking Garage, or the East Transportation Hub and Parking Garage. Standard building construction practices for the commercial structures in the Plaza area and for the Hotel would typically reduce interior noise levels to acceptable levels although some level of additional insulation may be appropriate, especially for the proposed hotel use. With such actions typically undertaken in the design and building inspection process, the Proposed Project would comply with ALUP Policies G-1 and N-3, and would not expose people residing (staying in the hotel), working in the project area, or attending events in the Arena to excessive noise levels.

Safety Hazards/Hazards to Air Navigation

As discussed under Methodology, above, an obstruction evaluation and airspace analysis for the Proposed Project was conducted by CAG in September 2017, followed by an update in May 2019.⁴⁵ The purpose of the CAG evaluations were to identify whether temporary or permanent structures associated with construction and/or operation of the Proposed Project would create a hazard to air navigation. The CAG evaluations are included in this Draft EIR as Appendix P.

The results of the CAG evaluations indicate that the Proposed Project could exceed three criteria that require notification of, and evaluation by, the FAA. More specifically, (1) the Proposed Project construction cranes could exceed the 200-foot AGL notification criteria, (2) temporary construction cranes and the Arena Structure would penetrate the 14 CFR Part 77.19 imaginary airspace horizontal surface for HHR, and (3) although the Proposed Project construction cranes are planned to be no greater than 290 feet AMSL, some cranes involved in arena construction could temporarily exceed slightly the 290 feet AMSL obstacle clearance surface for the final approach segment of the Localizer Approach to Runway 25L at LAX. Each of these exceedances is discussed further below. None of the construction equipment for other project structures, including the Plaza retail and community buildings, West Parking Garage, East Transportation Hub and Parking Structure, Hotel, and Replacement Well would exceed the imaginary airspace surfaces for either HHR or LAX.

Notification Surfaces

As discussed above, the FAA requires notification of proposed temporary or permanent structures that could exceed 200 feet AGL, as well as those that could exceed imaginary surfaces associated with runways at public-use or military-use airports, or any airport with an FAA approved instrument approach procedure. The size and slope of the imaginary notification surfaces for an airport are directly related to the length of the longest runway at that airport.

Pursuant to section 77.9(b)(1), the HHR notification surface is the lowest notification surface overlying the Project Site, ranging from 137 to 148 feet AMSL where it overlies the Project Site. At up to 150-foot AGL, the proposed Arena Structure would exceed this surface and require notification to the FAA. In addition, the construction cranes for the proposed Arena Structure are planned to reach up to 290 feet AMSL, but could potentially exceed that height slightly, and thus these features would exceed the notification surface.

HHR Horizontal Surface

At up to 150 feet AGL, the proposed Arena Structure would exceed HHR imaginary horizontal surface at the Project Site. As described above, because the Arena Structure construction cranes are anticipated to reach up to 200 feet AGL (approximately 290 feet AMSL), but could potentially exceed that height slightly during operation of the equipment, the temporary construction equipment would also exceed HHR imaginary horizontal surface. According to the

⁴⁵ Capitol Airspace Group, 2017. *Project Condor Obstruction Evaluation & Airspace Analysis*, Technical Memorandum, September 13, 2017, and Capitol Airspace Group, 2019. *IBEC Project A description of Aeronautical Study Process and Results of an Obstruction Evaluation & Airspace Analysis*, Technical Memorandum, May 10, 2019.

CAG analysis included in Appendix P, the proposed Arena Structure and associated construction cranes that exceed these surfaces would be identified as obstructions. As a result, the FAA would conduct further study and would require marking and lighting on these structures. Exceeding an imaginary surface, however, would not automatically trigger a Determination of Hazard. Proposed structures that remain below established obstacle clearance surfaces, or are deemed to not affect a significant volume of operations, can receive a Determinations of No Hazard.

LAX Obstacle Clearance Surface

The minimum descent altitude for instrument approaches in the final stepdown segment for LAX Runway 25L is 540 feet AMSL; the resulting lowest obstacle clearance surface is 290 feet AMSL. At 150 feet AGL, the proposed Arena Structure would be well below the 290-foot AMSL obstacle clearance surface. The temporary construction cranes are anticipated to reach up to 200 feet AGL (290 feet AMSL), but could potentially exceed slightly that height, and thus could exceed this obstacle clearance surface. According to the CAG evaluation included in Appendix P, the temporary construction cranes that would potentially exceed the obstacle clearance surface could require a temporary increase to instrument approach procedure minimum descent altitudes, to be determined as part of the FAA aeronautical study described below.

FAA Notification and Evaluation Process

Because the Proposed Project would result in exceedance of notification criteria, and consistent with ALUP Policy S-7, the Proposed Project would trigger the requirement to file a Form 7460-1, "Notice of Proposed Construction or Alteration" with the FAA. The Form 7460-1 application or notification through the OE/AAA system would be required to be submitted to the FAA at least 45 days prior to the start of any construction. This filing would prompt the FAA to conduct an aeronautical study to determine if the Proposed Project would create any obstructions into the airspace that would constitute a hazard to air navigation.

Certain information related to the Proposed Project must be provided as part of the FAA Form 7460-1 application process, including details on the Project Site and the dimensions of the Proposed Project temporary and permanent structures. The FAA would conduct an initial review of the Proposed Project and would determine whether to issue a Notice of Presumed Hazard (NPH) or a "Does Not Exceed" determination. The penetration of a FAR Part 77 imaginary airspace surface, such as that which could occur due to the temporary construction equipment that would penetrate the horizontal surface for HHR, would typically result in the issuance of an NPH. The FAA would conduct further evaluation of the Proposed Project effects on the airspace, taking into account the employment of recommended lighting and marking by the project applicant, and would either issue a "Determination of Hazard," indicating that the Proposed Project would exceed an obstruction standard and cause airspace or radar impacts that constitute a substantial adverse effect on air navigation, or a "Determination of No Hazard," allowing the Proposed Project to proceed, with recommendations for lighting and marking as provided for in the FAA's Advisory Circular (AC) 70/7460-1 "Obstruction Marking and Lighting."

As discussed above, to evaluate whether the Proposed Project components would constitute a potential hazard to air navigation, the CAG evaluation analyzed all 14 CFR Part 77 imaginary surfaces, published instrument approach and departure procedures, VFR operations, FAA MVAs, minimum IFR altitudes, and en-route operations. The following sections summarize the results of the CAG evaluation of the Proposed Project.

Construction Impacts

Construction cranes that would be employed at the Project Site through a majority of the construction period at the Arena Site would be anticipated to reach up to approximately 200 feet AGL (290 feet AMSL), but could exceed slightly this height depending on final design and construction planning, and required crane operations. The CAG evaluations determined that these temporary structures could potentially exceed 200 feet AGL at the Project Site, and thus would potentially penetrate the obstacle clearance surface for Localizer Approach to Runway 25L at LAX. In addition, the construction cranes would penetrate an imaginary surface that extends outward and upward at a 100:1 slope within 20,000 feet of HHR (see FAR Part 77.9(b)(1)). These would both trigger notification criteria established by the FAA in FAR Part 77.9.

Furthermore, as discussed above, the temporary construction cranes would penetrate the horizontal surface for HHR as defined in FAR Part 77.19. The triggering of the notification criteria as well as the penetration of imaginary horizontal and obstacle clearance surfaces may or may not be potentially deemed a hazard to air navigation by the FAA. Only the FAA final determination pending completion of the aeronautical study can determine whether the construction equipment would constitute a hazard to air navigation. Accordingly, this impact is considered **potentially significant**.

Operation

The largest permanent structure in the Proposed Project would be the up to 150-foot high Arena Structure. The 2017 and 2019 CAG evaluations determined that the Arena Structure would penetrate the horizontal surface for HHR. As discussed above, the penetration of an imaginary airspace surface would require the project applicant to submit Form 7460-1 with the FAA, prompting preparation of an aeronautical study to determine if the obstruction is a hazard to air navigation. Only the FAA's final determination pending completion of the aeronautical study can determine whether the construction equipment would constitute a hazard to air navigation. Accordingly, this impact is considered **potentially significant**.

The Los Angeles County ALUP. Safety Policy S-7 requires that projects located within the planning boundary/AIA for each airport comply with the height restriction standards and procedures set forth in Part 77. Conformity with the ALUP policies is required to obtain a consistency determination from the ALUC. Because the FAA final determination on the Proposed Project compliance with Part 77 is pending, the potential exists for an inconsistency with ALUP Safety Policy S-7. Accordingly, this impact is considered **potentially significant**.

Mitigation Measure 3.8-5

The project applicant shall submit an application to the Airport Land Use Commission (ALUC) for a determination that that the Project is consistent with the Airport Land Use Plan. The project applicant shall submit Form 7460-1, "Notice of Proposed Construction or Alteration," to the Federal Aviation Administration (FAA) or notify the FAA through the Obstacle Evaluation/Airport Airspace Analysis system, consistent with the requirements of 14 Code of Federal Regulations (CFR) Part 77, prompting completion of an aeronautical study to determine whether the Project would constitute a hazard to air navigation. A copy of the 14 CFR Part 77 notification shall be included in the compatibility review application for the Project.

Prior to the issuance of building permits, the project applicant shall provide the City with a copy of the ALUC-issued consistency determination, and the FAA-issued "Determination of No Hazard to Air Navigation." The project applicant shall implement all recommendations made by the FAA, including those for marking and lighting of project components that are determined to constitute obstructions in federal airspace, and any requirements set forth in the ALUC consistency determination regarding height restrictions.

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.8-5, the Proposed Project would not create a hazard to air navigation as a result of the penetration of imaginary airspace surfaces or obstacle clearance surfaces, and would not be inconsistent with the ALUP. Thus, this impact would be considered **less than significant**.

Impact 3.8-6: Construction and operation of the Proposed Project could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (Less than Significant)

The City's OES acts in coordination, conjunction and collaboration with all city departments to maximize the City's potential to prevent, prepare for, respond to, and recover from both natural and man-made emergencies and disasters. The 2010 MHMP generally provides a means to prepare and maintain systems, supplies and other logistical items to support emergency/disaster response and recovery among city departments. According to the MHMP, "all future development/redevelopment projects will be constructed to current design standards and building codes, and are not expected contribute to community vulnerability from natural or technological hazards."⁴⁶ The overall mitigation goals of the plan are to:⁴⁷

- Minimize the loss of life and property from natural hazard events
- Protect public health and safety
- Increase public awareness of risk from natural hazards
- Enhance emergency services including warning systems

⁴⁶ City of Inglewood, 2010. Multi-Hazard Mitigation Plan, March 23, 2010. p. 21.

⁴⁷ City of Inglewood, 2010. Multi-Hazard Mitigation Plan, March 23, 2010. p. 107.

The Proposed Project would be constructed in accordance with current design standards and building codes as discussed in Section 3.6, Geology and Soils, which is therefore consistent with the MHMP. Implementation of these standards and codes would minimize the loss of life and property from natural hazard events and protect public health and safety. As a development project, the Proposed Project would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services (also discussed more fully in Section 3.13, Public Services) and warning systems. Therefore, the Proposed Project would not substantively impair or interfere with the MHMP and the potential impact is **less than significant**.

For analysis of emergency access and traffic see Section 3.14, Transportation and Circulation.

Mitigation Measures

None required.

Cumulative Impacts

This section presents an analysis of the cumulative effects of the Proposed Project and other cumulative projects. While hazardous materials and hazard impacts are generally localized to specific sites and do not combine with one another in a way to create a greater or more severe hazard, because of the relative infrequencies and the variances in timing, the geographic scope for cumulative hazards and hazardous materials impacts varies based on the hazard and the significance threshold being analyzed. Impacts relative to hazardous materials usually depend on the nature and extent of the hazardous materials release, and existing and future soil and groundwater conditions. For example, hazardous materials incidents tend to be limited to a smaller more localized area surrounding the immediate location and extent of a release, and could only be cumulative if two or more hazardous materials releases overlapped spatially and contemporaneously.

The timeframe during which the Proposed Project could contribute to cumulative hazards and hazardous materials effects includes the construction and operations phases. Similar to the geographic limitations discussed above, it should be noted that impacts relative to hazardous materials are generally time-specific. Hazardous materials events could only be cumulative if two or more hazardous materials releases occurred at overlapping times.

For cumulative impacts on schools within 0.25 miles of the Project Site, the cumulative context includes cumulative projects that would be located within 0.25 miles of one of the schools in proximity to the Project Site.

For other types of hazards, the cumulative context is different. For cumulative aircraft hazards, the analysis addresses a total of 35 cumulative projects that would be constructed within the LAX Planning Boundary/AIA. For consideration of cumulative impacts on emergency response, the evaluation is undertaken based on cumulative transportation analysis presented in Section 3.14, Transportation and Circulation, and includes the Proposed Project, plus 145 cumulative projects identified in Section 3.0, Table 3.0-2, along with accounting for other regional growth in the region.

Impact 3.8-7: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. (Less than Significant)

A cumulative impact related to transport, use, or disposal of hazardous materials could occur if there were hazards releases in the vicinity and at the same time as a release associated with the construction or operation of the Proposed Project. For the purposes of this analysis, the geographic scope considered for analysis of this criterion is a 1-mile-radius area from the Project Site. A 1-mile radius is reasonable in light of the relatively small amounts and types of hazardous materials that would be associated with construction and operation of the Proposed Project.

The Proposed Project in conjunction with other cumulative projects would include the use, storage, and disposal of varying quantities of hazardous materials. The Proposed Project does not include any substantive emissions of hazardous materials such as might be associated with industrial land uses (e.g., manufacturing, chemical processing, handling of bulk quantities of hazardous materials or wastes). Just as with the Proposed Project, all commercial uses/businesses would be required to submit business information and hazardous materials inventory forms contained in a Hazardous Materials Management Plan and Hazardous Materials Business Plan. The HHMD, as the CUPA, and other CUPA agencies for the cumulative projects outside of HHMD jurisdiction, requires all new commercial and other users to follow applicable regulations and guidelines regarding storage and handling of hazardous waste. All hazardous materials are required to be stored and handled according to manufacturer's directions and local, state and federal regulations. With adherence to existing regulatory requirements, releases from routine transport, use or disposal of hazardous materials would be minimized, and in the unlikely event of a release, would likely be localized in extent.

As noted above, adherence to the regulatory requirements would ensure that incidents at the Proposed Project and other cumulative projects within a 1-mile radius are infrequent, and thus unlikely to occur simultaneously in a way that could result in the public or environment being exposed to multiple releases of hazardous materials. For the reasons described above, the Proposed Project, in conjunction with other cumulative projects, would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.8-8: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. (Less than Significant)

As described above, the geographic context considered for analysis of this criterion is a 1-mile radius around the Project Site because, while there is a potential for upset conditions associated with transportation of hazardous materials or wastes anywhere in the region, the most likely area where an accidental release from a cumulative project would cumulatively relate to a release associated with the Proposed Project would be within proximity to the Project Site.

Construction and operation of the Proposed Project, like the other largely residential and commercial cumulative projects identified in Section 3.0, Introduction to the Analysis, Table 3.0-2, would include the use of relatively small quantities of hazardous materials and generation of small amounts of hazardous wastes. The Proposed Project and other cumulative projects would not require the transport, storage, use, or disposal any unusually large, toxic, or explosive quantities of hazardous materials or hazardous wastes. The Proposed Project and other cumulative residential and commercial projects, would use, store, handle, and dispose of relatively limited quantities of hazardous materials, such as cleaning fluids, lubricants, paints, and fuels. Similarly, these types of projects generate small quantities of hazardous wastes, including small leftover amounts of hazardous materials previously discussed, paint cans, medical wastes and the like.

The Proposed Project and cumulative projects and their associated businesses would be required to adhere to the comprehensive set of existing federal, State, and local regulatory requirements, including the HMBP programs administered by the HHMD. These programs require all users of hazardous materials to implement employee training, safe storage, and appropriate handling requirements to ensure that upset and accident conditions are minimized. In the unlikely event that an accidental release was to occur, these programs require spill response measures to ensure that incidents are quickly contained and, therefore, would not travel off site in a way that could cumulatively combine to affect large numbers of people or affect substantial parts of the environment.

For the reasons described above, the Proposed Project, in conjunction with other cumulative projects, would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.8-9: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 miles of an existing or proposed school. (Less than Significant)

The geographic scope considered for analysis of this criterion is a 0.25-mile-radius area from the three schools that are within 0.25 miles of the Project Site. Based on an evaluation of the Cumulative Projects List presented in Section 3.0, Introduction to the Analysis, Table 3.0-2, there are three relevant cumulative projects:

- Cumulative Project #65, 3660 West 107th Street. A 3-unit apartment project that would be located 0.13 miles to Morningside High School;
- Cumulative Project #67, Hollywood Park Specific Plan. A major mixed use development currently under construction with cumulative development that would be located 0.24 miles from the TRF Head Start and Early Head Start preschool; and
- Cumulative Project #73, 3900 West Century Boulevard. The former Airport Park View Hotel that would be renovated and is located 0.21 miles from the TRF Head Start and Early Head Start preschool.

None of the other cumulative projects would be located within 0.25 miles of any of the three schools located within 0.25 miles of the Project Site.

As discussed above, construction and operations of the Proposed Project and relevant cumulative projects would require the use of limited quantities of typical and rather low risk hazardous materials, such as fuels, oils, and lubricants for construction and operational mechanical equipment; paints and thinners; and solvents and cleaners. These materials would be transported to the Project Site and cumulative project sites, and could travel on routes near one of the three relevant schools. If not handled and transported properly and safely, the transport of hazardous materials could result in accidental releases near schools, exposing students, employees, and other visitors to hazardous materials. The greater the number of projects under construction or in operational phases, the greater the likelihood that some sort of accident could occur resulting in a release and exposure of people or the environment. Further, in the unlikely event that two or more accidental releases occurred at the same time and within 0.25 miles of a school, the potential exists for a larger release than would occur with just the project or an individual cumulative project.

The Proposed Project, and the three relevant cumulative projects, are all the type of residential and commercial uses that use hazardous materials and create hazardous wastes that are typical of the project vicinity. None of these projects would use types or quantities of hazardous materials that create risks beyond those that exist in the vicinity under existing conditions. As discussed in the Regulatory Setting, transportation of hazardous materials is regulated by US DOT and Caltrans. Together, these federal and State agencies determine driver-training requirements, load labeling procedures, and container specifications designed to minimize the risk of accidental release. In addition, as discussed in the Regulatory Setting, businesses that use hazardous materials, including construction companies (short-term construction) and operating businesses and facilities (long-term operations), are required to prepare and implement HMBPs describing procedures for the handling,

transportation, generation, and disposal of hazardous materials. The Proposed Project, along with all cumulative projects and operating businesses would be required to comply with the same regulations. Compliance with these enforceable federal, State, and local regulations would reduce the risks of exposure to hazardous materials or wastes in the vicinity of Delores Huerta Elementary School, Morningside High School, and/or the TRF Head Start and Early Head Start preschool.

Because a comprehensive and enforceable set of federal, State, and local laws and regulations govern the transport, storage, use and disposal of hazardous materials and wastes to reduce the potential for accidental release and exposure of people and the environment, and because the type and quantity of hazardous materials used at the Proposed Project and other cumulative projects would be small and typical of current development and business operations, the risk of the emission of hazardous materials within 0.25 miles of a school would be negligible.

For the reasons described above, the Proposed Project, in conjunction with other relevant cumulative projects, would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 miles of an existing or proposed school. Therefore, this cumulative impact is **less than significant**.

Mitigation Measures

None required.

Impact 3.8-10: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could be located on sites that are included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and, as a result, could create a significant hazard to the public or the environment. (Less than Significant)

For the most part, the types of hazardous materials that result in sites being listed pursuant to California Government Code section 65962.5 involve soil or limited groundwater contamination associated with past uses of the project site. For many of these types of contaminants, including those that are known or suspected to occur on the Project Site, the potential hazards to the public or environmental are isolated to the site and are not cumulative in nature. Nevertheless, to conduct a conservative analysis of hazards related to past contamination, this Draft EIR has established a geographic scope for analysis of this criterion that is an area with a 1-mile radius from the Project Site.

As noted above in Section 3.8.1 and within the 2019 EKI Technical Memorandum, the Project Site and vicinity within a 1-mile radius includes numerous sites with documented past uses that are indicative of a potential to find contamination present, as well as documented unauthorized releases of hazardous materials. The sampling of surface soils on the Project Site conducted in 2017 and 2019 detected contaminants at levels above residential screening levels, but in most cases below commercial/industrial screening levels.⁴⁸

⁴⁸ EKI Environment & Water Incorporated, 2019. *Inglewood Basketball and Entertainment Center Project Soil and Soil Gas Investigations*, Technical Memorandum, June 28, 2019.

Most of the cumulative projects located within 1 mile of the Project Site would include earthwork activities that could encounter legacy contaminants from releases that occurred in the past. Potential cumulative impacts could occur if the earthwork activities of the Proposed Project would take place concurrently with other cumulative construction activities, creating the potential for multiple exposures to legacy contaminants. Potential cumulative impacts could also occur if cumulative projects that require remediation would combine to create emissions or exposure hazards from remediation activities, including off-site disposal.

The likelihood of more than one of the cumulative projects having had a substantial hazardous materials release that affects the same resources within the same temporal period as the Proposed Project is low based on the fact that the sites are dispersed throughout the area, exposure risks vary considerably, and many of these hazardous materials sites that do require more investigation or remediation are in varying stages of progress. In general, impacts related to hazardous materials from previous releases are more site-specific and can only combine through limited mechanisms: releases through routine transport of hazardous materials and waste to or from the site during remediation that use the same roadways or releases of hazardous materials through accidental upset conditions of those transported materials.

Due to the stringent regulations governing the transport of hazardous materials, including regulations on the type of container used for transport, the probability of such transport resulting in emissions or releases from accidents that would cause a significant cumulative impact is low. While upset and accident conditions could occur, they generally occur as isolated events that do not combine with other projects because the types of soil-borne contaminants are relatively stable and unlikely to be widely spread, unlike other types of hazardous materials that can be explosive or spread quickly through vapors or other gaseous emissions. All cumulative projects in the vicinity would be required to comply with similar transportation regulations, which proscribe the transport of hazardous materials safely to and from their destination.

For the reasons described above, the risks of exposure caused by release of legacy contaminants on the sites of cumulative projects in the vicinity of the Project Site would not combine with the risks of exposure associated with the Proposed Project. Therefore, the Proposed Project, in conjunction with other cumulative projects, would not create a significant hazard to the public or the environment as a result of being included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5. This cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.8-11: Construction and operation of the Proposed Project, in conjunction with other cumulative development, would be located within an airport land use plan area and could cumulatively result in a safety hazard or excessive noise for people residing or working in the project area, or could create a hazard to navigable airspace and/or operations at a public airport. (Less than Significant)

The Proposed Project along with all other past, present, or reasonably foreseeable future projects located within the County's ALUP Planning Area/AIA are required to be consistent with the ALUP policies. In addition to the Proposed Project, a total of 35 projects on the Cumulative Project List in Section 3.0, Introduction to the Analysis, Table 3.0-2, would be located within the LAX Planning Boundary/AIA.

As discussed above under Impact 3.8-5, ALUP Policies G-1 and N-3 state that the compatibility of proposed land uses is determined by consulting the land use compatibility table provided in Section V of the ALUP. The ALUP Land Use Compatibility Table identifies land use by category, including residential, commercial, and industrial land use. The elements of the Proposed Project generally fall within the commercial and recreational land use compatibility categories. Almost all the cumulative projects are residential or commercial in nature. The compatibility criteria provided in the Land Use Compatibility Table advises review of noise insulation needs for residential, commercial, and recreational land uses in areas exposed to CNEL 65 to 70 dB within the ALUP CNEL Contour. The same criteria apply to commercial and recreational land uses in areas exposed to exposed to CNEL 70 to 75 dB within the ALUP CNEL Contour. While the ALUP advises avoiding development of residential uses, reduction of interior noise levels to acceptable levels is typically achieved through standard residential and commercial building construction practices, and thus is reasonably foreseeable that no significant noise impacts would occur within the cumulative projects. As such, people residing or working in the cumulative projects that would occur within the LAX Planning Boundary/AIA would not be exposed to excessive noise from airport operations.

A cumulative safety hazard, or the creation of a cumulative hazard to navigable airspace or operations could occur where the design and location of a new structure or temporary construction equipment associated with the Proposed Project or other cumulative projects within an airport planning boundary or AIA would penetrate imaginary surfaces established for an airport and interfere with safe operation of aircraft. ALUP Policy G-4 prohibits any land use which will negatively affect air navigation and Policy S-7 requires all projects located within the planning boundaries/AIAs for the County's airports comply with the height restriction standards and procedures set forth in 14 CFR Part 77. This regulation requires that projects higher than 200 feet AGL and/or with potential to penetrate the imaginary airspace surfaces file notification with the FAA via Form 7460-1. Filing Form 7460-1 prompts the FAA to complete an aeronautical study to determine if the Proposed Project would be an obstruction to the airspace that could serve as a hazard to aircraft. If an aeronautical study undertaken for a cumulative project were to indicate that a project would serve as a hazard to aircraft operating in the area, it would be unlikely the Proposed Project would be approved unless or until it was altered to eliminate the potential airspace hazard. Accordingly, the Proposed Project, in conjunction with

other cumulative projects within the LAX Planning Boundary/AIA not result in a safety hazard or create a hazard to navigable airspace and/or operations at a public airport.

For the reasons discussed above, the Proposed Project, in conjunction with other cumulative development, would not cumulatively result in a safety hazard or excessive noise for people residing or working in the project area, or could create a hazard to navigable airspace and/or operations at a public airport. Therefore, this cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.8-12: Construction and operation of the Proposed Project, in conjunction with other cumulative development, could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. (Less than Significant)

The geographic scope considered for the analysis of this criterion is the City of Inglewood and the geographic area considered in the MHMP. The City is vulnerable to several hazards identified in the plan including earthquakes, hazmat release, and human threat events/terrorism. The City's OES acts in coordination, conjunction and collaboration with all city departments to maximize the City's potential to prevent, prepare for, respond to and recover from these hazards. The MHMP considers future projects that are constructed in accordance with current design standards and building codes as not being vulnerable to natural or technological hazards.⁴⁹ The plan is structured to identify community policies, actions and tools for implementation over the long-term that will result in a reduction in risk and potential for future losses community wide.

The Proposed Project in conjunction with other cumulative projects that would similarly be constructed to current design standards and building codes, would not impair or interfere with the MHMP or the City's ability to prevent, prepare or respond to and recover from the identified hazards because existing codes are designed to minimize hazards and protect public health and safety. Implementation of these standards and codes would minimize the loss of life and property from natural hazard events and protect public health and safety with requirements for safety, access, and evacuation. Therefore, the Proposed Project would not combine with other cumulative projects to become cumulatively considerable and the potential impact would be **less than significant**.

Mitigation Measures

None required.

⁴⁹ City of Inglewood, 2010. Multi-Hazard Mitigation Plan, March 23, 2010. p. 21.

3.9 Hydrology and Water Quality

This section describes and evaluates potential impacts related to hydrology and water quality that could result from construction and operation of the Proposed Project. The section contains: (1) a description of the existing hydrology and water quality conditions of the Project Site and the surrounding areas, as well as a description of the Adjusted Baseline Environmental Setting; (2) a description of the regulatory federal, State, and local regulations related to hydrology and water quality; and (3) an analysis of the changes in hydrology and water quality associated with the implementation of the Proposed Project, as well as the identification of potentially feasible measures that could mitigate significant impacts. Comments received in response to the NOP for the EIR can be found in Appendix B; however, no specific comments regarding hydrology and water quality were provided.

The analysis included in this section was developed based on information contained in the City of Inglewood General Plan, City of Inglewood Urban Water Management Plan, Golden State Water Company (GSWC) Urban Water Management Plan, Federal Emergency Management Agency (FEMA) Digital Flood Insurance Rate Maps (FIRMs), Groundwater Basins Master Plan, Enhanced Watershed Management Program for the Dominguez Channel Watershed, Los Angeles Regional Water Quality Control Board (RWQCB) Plan, the project-specific Water Supply Assessment (Appendix M), the *Inglewood Basketball and Entertainment Center Low Impact Development (LID) Report (LID Report)* (Appendix Q), and the *Inglewood Basketball and Entertainment Center Preliminary Hydrology Report (Preliminary Hydrology Report)* (Appendix Q). The LID Report outlines the proposed LID strategies and best management practices (BMPs) that would be implemented to comply with the stormwater requirements for the Proposed Project. The Preliminary Hydrology Report outlines the on-site hydrology and existing storm drain infrastructure that serves the Project Site as well as on-site hydrology (e.g., proposed drainage features, quantified stormwater flows, and new drainage infrastructure necessary to accommodate flows) of the Proposed Project.

3.9.1 Environmental Setting

Surface Water

The City of Inglewood is located in the Dominguez Channel Watershed, within the Upper Dominguez Channel drainage area. The Project Site is located approximately one-mile north of the start of the man-made Dominguez Channel, which begins at the City of Hawthorne and City of Inglewood boundary and discharges into the Los Angeles and Long Beach Harbors.¹

The Dominguez Channel Watershed encompasses approximately 133 square miles of land and water in the southern portion of the Los Angeles Basin.² Approximately 81 percent of the

¹ City of Los Angeles Stormwater Program, 2018. *Dominguez Channel Watershed*. Available: <http://www.lastormwater.org/about-us/about-watersheds/dominguez-channel/>. Accessed October 2, 2018.
² Los Angeles County Department of Public Works, 2018. *Dominguez Watershed*. Available: <https://dpw.lacounty.gov/wmd/watershed/dc/>. Accessed October 2, 2018.

watershed has been developed. Residential development covers nearly 40 percent of the watershed and another 41 percent is made up by industrial, commercial, and transportation uses. Overall, the watershed is approximately 61 percent impervious. While constructed waterways are predominant, some small natural creeks are located in the hills of the Palos Verdes Peninsula. Because the majority of the watershed is urban, drainage is primarily conducted through an extensive network of underground storm drains.

The Dominguez Channel Watershed is designated as Hydrologic Unit 405.12 by the State Water Resources Control Board (SWRCB) and as the San Gabriel Hydrologic Unit by the Los Angeles RWQCB.³ Water bodies within the hydrologic unit include the Dominguez Channel, Wilmington Drain, Torrance/Carson Channel (“Torrance Lateral”), Machado Lake, Los Angeles and Long Beach Harbors, and Cabrillo Beach.

Approximately 70 square miles of the Dominguez Channel Watershed drains to the 15.7-mile-long Dominguez Channel, which is the largest drainage feature in the Dominguez Channel Watershed. The remaining portion of the Dominguez Channel Watershed drains to retention basins for groundwater recharge; into Wilmington Drain, which empties into Machado Lake; or to the Los Angeles Harbor or Long Beach Harbor independently of the Dominguez Channel.

Flows in the Dominguez Channel Watershed are influenced by the volume of surface runoff, local groundwater, and rainfall. The Los Angeles Basin has a Mediterranean climate with moderate, dry summers and cool winters, consistent with coastal Southern California. Precipitation in the region occurs primarily as rain from November through March, with an average annual rainfall of 12.02 inches.⁴ In general, stormwater runoff within the City of Inglewood, including the Project Site, flows into the Los Angeles County Flood Control District storm drain system.

Soil Drainage

The Project Site currently consists of both pervious and impervious surfaces, including a fast-food restaurant, a motel, a light manufacturing/warehouse facility, a commercial catering business, a groundwater well and related facilities, and large portions of vacant land.

The Project Site is currently made up of approximately 15 percent impervious surfaces and 85 percent pervious surfaces. Preliminary investigations of the Project Site indicate that the site’s native soil characteristics have poor drainage with a low infiltration rate.^{5,6} According to the Los Angeles County Guidelines for LID Stormwater Infiltration, in order for soil to be pervious enough for stormwater to infiltrate the soil, subsurface materials must allow infiltration at a rate

³ State Water Resources Control Board, 2014. *Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties*. Available: https://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/basin_plan_documentation.html. Accessed October 4, 2018.

⁴ City of Inglewood, 2016. *2015 Urban Water Management Plan*. p. 3-4.

⁵ AECOM, 2018. *Inglewood Basketball & Entertainment Center Project Low Impact Development (LID) Report*. August 23, 2018. p. 2.

⁶ AECOM, 2018. *Preliminary Geotechnical Investigation*. September 14, 2018. p. 34.

equal to or greater than 0.3 inches per hour.⁷ Preliminary percolation tests were conducted at five selected locations at the Project Site. Based on the results, infiltration rates for the soils in the upper 10 feet ranged from 0.32 to 3.52 inches per hour. However, the subsurface native soils at the Project Site consist predominately of clayey soils with estimated infiltration rates lower than 0.3 inches per hour and with few or no connectivity to permeable soil horizons. Moreover, there is no evidence that the underlying, predominantly clayey soils at the Project Site have experienced saturation. These characteristics indicate that the Project Site has a low infiltration rate, and provides very little groundwater recharge through percolation of soils.

Drainage Infrastructure

Arena Site

The Arena Site is the central part of the Project Site that would include the arena, public plaza, community space, practice facility, sports medicine clinic, team offices, retail/restaurants, a parking structure, and related development. The Arena Site currently includes a fast-food restaurant, a motel, a light manufacturing/warehouse facility, a commercial catering business, a City groundwater well and related facilities, and large portions of vacant land.

West 102nd Street crosses through the Arena Site in an east-west direction. Storm drainage facilities serving this portion of the Project Site include a 60-inch-diameter storm drain pipeline within South Prairie Avenue, known as the Los Angeles County Department of Public Works (LACDPW) Storm Drain Line Project 681.^{8,9,10} In addition, an existing catch basin is located at the intersection of West 102nd Street and South Prairie Avenue.

West Parking Garage Site

The West Parking Garage Site is currently vacant, with West 101st Street crossing through the site in an east-west direction. This site would include a multi-level parking structure to serve patrons of the Arena Site.

The West Parking Garage Site is served by a 24-inch-diameter storm drain pipeline (the LACDPW Storm Drain Line Project 4402) that begins in West 101st Street, travels north to West Century Boulevard, turns east along West Century Boulevard, and then turns north and south along South Prairie Avenue, connecting to the abovementioned 60-inch-diameter storm drain pipeline within South Prairie Avenue (LACDPW Storm Drain Line Project 681).

East Transportation and Hotel Site

This portion of the Project Site is located east of the Arena Site and would include a three-story parking garage along West Century Boulevard, with the first floor serving as a transportation hub. The transportation hub includes a staging area for private or charter buses and a drop-off, staging,

and pick-up area for TNC vehicles and taxis serving the Arena Site. The second and third floors of the garage would provide parking for patrons of the Arena Site. The east side of the East Transportation and Hotel Site would include a limited-service hotel and associated parking facilities.

The East Transportation and Hotel Site is currently vacant. Storm drainage pipelines serving this portion of the Project Site are located within South Doty Avenue (LACDPW Storm Drain Line Project 4401, which is 84 inches in diameter). In addition, a 48-inch-diameter storm drainage pipeline crosses under parcels to the west of the East Transportation and Hotel Site, extending north through West Century Boulevard and south through West 102nd Street (LACDPW Storm Drain Line Project DDI #8).

Well Relocation Site

The Well Relocation Site is located east of the Arena Site and would contain a City-owned and operated potable water well. The Well Relocation Site is currently vacant. This portion of the Project Site is adjacent to storm drainage pipelines within West 102nd Street (LACDPW Storm Drain Line Project DDI #8) and South Doty Avenue (LACDPW Storm Drain Line Project 4401), detailed above.

Groundwater

The City of Inglewood is located over two groundwater basins: the West Coast Groundwater Basin (WCGB) and the Central Basin. While the Project Site is located only within the WCGB, the Proposed Project would be served by the GSWC, which produces water from both the WCGB and Central Basin. Characteristics of both the WCGB and Central Basin are described below.

West Coast Groundwater Basin

The WCGB is approximately 160 square miles and occupies 37 percent of the southwestern part of the Los Angeles Coastal Plain.¹¹ The WCGB is bounded to the north by the Ballona Escarpment (an abandoned erosion channel from the Los Angeles River), on the east by the Newport-Inglewood fault zone and the Central Basin, and on the south and west by the Pacific Ocean.

Aquifers in the WCGB are generally confined and receive the majority of their natural replenishment from adjacent groundwater basins or from the Pacific Ocean through seawater intrusion.¹² Both the Newport-Inglewood Uplift fault and the Charnock fault are partial barriers to groundwater flow, causing differences in water levels on opposite sides of each fault system. Most of the groundwater in the WCGB is at an elevation below sea level due to historic over pumping, making maintenance of seawater barrier wells important to prevent intruding saltwater.

¹¹ City of Inglewood, 2016. *2015 Urban Water Management Plan*. p. 6-7.

¹² Water Replenishment District of Southern California, 2016. *Groundwater Basins Master Plan*. Available: https://www.wrd.org/sites/pr/files/GBMP_FinalReport_Text%20and%20Appendicies.pdf. Accessed October 3, 2018. p. 1-4.

The WCGB is underlain by various geologic formations. Water bearing formations include Holocene, Pleistocene, and Pliocene age sediments.¹³ The Silverado aquifer, underlying most of the Basin, is the primary production aquifer and yields between 80 and 90 percent of the groundwater extracted from the WCGB. Other aquifers within the WCGB include the Semiperched, Bellflower, Gaspur, Gardena, Gage, and Lynwood aquifers.¹⁴ The groundwater in the underlying aquifers is confined throughout most of the WCGB; however, the Gage and Gardena aquifers are unconfined where water levels have dropped below the Bellflower aquitard.¹⁵ The Gage and Gardena aquifers merge with adjacent aquifers, particularly near the Redondo Beach area.

The WCGB has a total storage capacity of 6,500,000 acre-feet (AF).¹⁶ Prior to the adjudication of groundwater rights in the early 1960s, annual pumping of the WCGB reached levels as high as 94,000 AF per year (AFY). Due to serious overdraft, water levels declined, groundwater was lost from storage, and seawater intruded into the aquifer. To remedy this problem, the courts adjudicated the basin to limit pumping, and the WCGB adjudication has an established limit on pumping of 64,468 AFY. The City of Inglewood's adjudicated share of water rights to the WCGB is 4,449 AFY, and the GSWC's adjudicated share of water rights to WCGB is 7,502 AFY.

The natural replenishment of the WCGB is limited to underflow from the Central Basin, which has been estimated to be between 20,000 and 30,000 AFY.¹⁷ The total authorized pumping of the WCGB was set higher than the natural replenishment amounts, creating an annual deficit known as the annual overdraft. In order to offset this annual overdraft, the Water Replenishment District of Southern California (WRD), which is the entity responsible for maintaining the WCGB, purchases and recharges additional water to make up for the overdraft.

The City of Inglewood and the GSWC own and operate wells that extract groundwater from the WCGB. The City of Inglewood currently produces groundwater from the WCGB via four active groundwater wells. Water Wells #1, 2, 4, and 6, were constructed in 1974, 1974, 1990, and 2003, respectively, and together have been producing an average of 1,646 gallons per minute (gpm) over the period of 2008 to 2015.¹⁸ In March 2021, the City of Inglewood is planning on completing the construction of Water Well #7. Water Well #7 is designed to operate at 1,500 gpm.

GSWC operates ten wells within their Southwest System, eight of which are located within the WCGB and five of which are located within the City of Inglewood (Water Wells #1, 2, 4, 6, and 7).¹⁹ **Table 3.9-1** shows historical well production from the WCGB for both the City of

^b Water Replenishment District 2017 and 2018 Watermaster Service Reports. Note the Watermaster reports use an Administrative Year which is July 1 to June 30.

The City of Inglewood Water Well #6 is located within the Project Site. As part of the Proposed Project, the existing Water Well #6 would be demolished, and a new Water Well #68 would be constructed on the Well Relocation Site. The existing Water Well #6 was constructed in 2003 and has been experiencing declining pumping capacity over the years.²¹ Table 3.9-2 shows the City’s historical well production from Water Well #6. The original recommended flow rate for Well #6 was 2,800 gpm. The well pump was replaced in 2011 with a reduced flow of 1,400 gpm; however, mechanical issues and emergency repairs reduced the average day use to approximately 1,200 gpm (or approximately 1,550 AFY). As shown in Table 3.9-2, in 2017, the most recent year for which data is available, Water Well #6 produced a total of 1,026 AF. Water Well #6 is scheduled for emergency repair and rehabilitation to increase its capacity to 1,500 gpm. The rehabilitation work would seal off holes in the casing and cleaning perforations.

below existing grade.²² The existing Water Well #6 is screened at approximately 400 feet below grade.

Central Basin

The Central Basin, or southeastern portion of the Los Angeles Coastal Plain, has a surface area of approximately 270 square miles.²³ The Central Basin is bounded to the north by the Hollywood Basin and the Elysian, Repetto, Merced, and Puente Hills; to the east by the Los Angeles County/Orange County line; and to the south and west by the Newport-Inglewood fault zone and the WCGB.

Similar to the WCGB, water bearing deposits in the Central Basin include the unconsolidated and semi-consolidated marine and alluvial sediments of Holocene, Pleistocene, and Pliocene ages.²⁴ The Central Basin is divided into four sections, including the Los Angeles Forebay,²⁵ the Montebello Forebay, the Whittier Area, and the Pressure Area.²⁶ The two forebays represent areas of unconfined aquifers that allow percolation of surface water down to deeper production aquifers to replenish the rest of the basin. The Whittier Area and Pressure Area are confirmed aquifer systems that receive relatively minimal recharge from surface water, but are replenished from the upgradient forebay areas or other groundwater basins. As detailed above, the Newport-Inglewood Uplift fault is a partial barrier to groundwater flow, causing differences in water levels on opposite sides of the fault system. Groundwater flows between the WCGB and Central Basin are based on the groundwater elevations on either side of the fault. Most of the groundwater in the Central Basin remains at an elevation below sea level due to historic over pumping.

The Central Basin has an estimated storage capacity of approximately 13.8 million AF.²⁷ The Central Basin was adjudicated by the courts in 1965 due to over pumping and a decline in water levels. The Central Basin adjudication was originally set at 267,900 AFY and adjusted to 217,367 AFY to impose stricter control.²⁸ The GSWC's adjudicated share of water rights is 16,439 AFY.²⁹ Similar to the WCGB, WRD is responsible for maintaining water levels in the Central Basin, and determines replenishment requirements.

The City of Inglewood does not own or operate wells within the Central Basin. The GSWC operates two wells that are located within the Central Basin (Bellhaven Number 3 and Bellhaven

Flooding

Natural flooding within the City of Inglewood is not a common occurrence, as the region’s largest river, the Los Angeles River, does not flow through the City’s boundaries. The Dominguez Channel, which begins at the City of Hawthorne and City of Inglewood boundary convergence, does not have a history of flooding into the adjacent neighborhoods. In addition, the Project Site is flat with only gentle slopes and is not near the Pacific Ocean, and, thus, is not located within a seiche or tsunami flooding inundation zone.

FEMA administers the National Flood Insurance Program (NFIP) that delineates areas subject to flood hazards on FIRMs for each community participating in the NFIP. The FIRMs show the areas subject to inundation by a flood that has a 1 percent chance or greater of being equaled or exceeded in any given year. This type of flood is commonly referred to as the 100-year or base flood. Areas on FIRMs are divided into geographic areas, or zones, that FEMA has defined according to varying levels of flood risk. **Table 3.9-4** includes a description of the risk associated with each zone.

The Project Site is designated as Zone X (unshaded), which means the Project Site is in an area above the 500-year flood level.³¹ Over time, climate change may increase the potential for localized and regional flooding to occur.³² However, in the event that flooding would occur in the Dominguez Channel, the channel is located downstream of the Project Site.

³⁰ Golden State Water Company, 2016. *2015 Urban Water Management Plan, Southwest*. p. 6-8.

³¹ Federal Emergent Management Agency, 2018. *FEMA Flood Map Service Center, City of Inglewood, Map Number 06037C1780G*. Available: <https://msc.fema.gov/portal/search#searchresultsanchor>. Accessed February 9, 2019.

³² California Governor’s Office of Planning and Research, 2018. *California’s Fourth Climate Change Assessment Los Angeles Region Report*. Available: <http://www.climateassessment.ca.gov/regions/docs/20180928-LosAngeles.pdf>. Accessed February 27, 2019.

**TABLE 3.9-4
 FEMA FLOOD ZONE DESIGNATIONS**

Zone	Description
Moderate to Low Risk Areas	
B and X (shaded)	Area of moderate flood hazard, usually the area between the limits of the 100-year and 500-year events. Are also used to designate base floodplains of lesser hazards, such as areas protected by levees from 100-year event, or shallow flooding areas with average depths of less than 1 foot or drainage areas less than 1 square mile.
C and X (unshaded)	Area of minimal flood hazard, usually depicted on FIRMs as above the 500-year flood level.
High Risk Areas	
A	Areas with a 1% annual chance of flooding and a 26% chance of flooding over the life of a 30-year mortgage. Because detailed analyses are not performed for such areas; no depths or base flood elevations are shown within these zones.
AE	The base floodplain where base flood elevations are provided. AE Zones are now used on new format FIRMs instead of A1-A30 Zones.
A1-30	These are known as numbered A Zones (e.g., A7 or A14). This is the base floodplain where the FIRM shows a BFE (old format).
AH	Areas with a 1% annual chance of shallow flooding, usually in the form of a pond, with an average depth ranging from 1 to 3 feet. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Base flood elevations derived from detailed analyses are shown at selected intervals within these zones.
AO	River or stream flood hazard areas, and areas with a 1% or greater chance of shallow flooding each year, usually in the form of sheet flow, with an average depth ranging from 1 to 3 feet. These areas have a 26% chance of flooding over the life of a 30-year mortgage. Average flood depths derived from detailed analyses are shown within these zones.
AR	Areas with a temporarily increased flood risk due to the building or restoration of a flood control system (such as a levee or a dam). Mandatory flood insurance purchase requirements will apply, but rates will not exceed the rates for unnumbered A zones if the structure is built or restored in compliance with Zone AR floodplain management regulations.
A99	Areas with a 1% annual chance of flooding that will be protected by a Federal flood control system where construction has reached specified legal requirements. No depths or base flood elevations are shown within these zones.
Undetermined Risk Areas	
D	Areas with possible but undetermined flood hazards. No flood hazard analysis has been conducted. Flood insurance rates are commensurate with the uncertainty of the flood risk.

Water Quality

Surface Water Quality

Ambient water quality in the Dominguez Channel Watershed is influenced by numerous natural and artificial sources depending on location within the Dominguez Channel Watershed, including pollutants, sediment toxicity, bacteria, algae and eutrophic conditions, and trash.³³ **Table 3.9-5** shows water bodies within the Dominguez Channel Watershed that are considered impaired because water quality standards are exceeded. **Table 3.9-5** includes those waterbodies that exceed total maximum daily load (TMDL), those listed on the State’s 303(d) list as impaired, and those

³³ Dominguez Channel Watershed Management Area Group, 2016. *Enhanced Watershed Management Program*. p. 2-8. February 2016.

without an associated TMDL or on the State’s 303(d), list but showing exceedances of water quality criteria.

**TABLE 3.9-5
 LOCAL WATERBODIES EXCEEDING WATER QUALITY STANDARDS**

Water body	TMDL	303(d) List	Other
Dominguez Channel (lined portion above Vermont Avenue)	Copper, Lead, Zinc, Toxicity	Indicator Bacteria, Ammonia, Diazinon	Cadmium, Chromium, Mercury, Thallium, Bis (2-Ethylhexyl) phthalate, pH, Dissolved Oxygen
Torrance Lateral	Copper, Lead, Zinc	Coliform Bacteria	Cadmium, Cyanide, pH, Ammonia, PCBs, DDT
Dominguez Estuary (unlined portion below Vermont Avenue)	Cadmium, Copper, Lead, Zinc, DDT, Chlordane, Dieldrin, PAHs, Benthic Community Effects, Sediment Toxicity	Ammonia, Coliform Bacteria	Arsenic, Chromium, Silver, Nickel, Mercury, Thallium
Machado Lake	Trash, Total Phosphorus, Total Nitrogen, Ammonia, Chlorophyll-a, PCBs, DDT, Chlordane, Dieldrin, Dissolved Oxygen	None	E. coli, pH
Wilmington Drain	None	Coliform Bacteria, Copper, Lead	Total Nitrogen, DDT, PCBs, Chlordane, Dieldrin
LA Harbor – Cabrillo Marina	DDT, PCBs, PAHs	None	None
LA Harbor – Consolidated Slip	Cadmium, Chromium, Copper, Lead, Mercury, Zinc, DDT, PCBs, PAHs, Chlordane, Dieldrin, Toxaphene, Benthic Community Effects, Sediment Toxicity	None	Arsenic, Silver, Nickel
LA Harbor – Fish Harbor	Copper, Lead, Mercury, Zinc, DDT, PCBs, Chlordane, PAHs, Sediment Toxicity	None	None
LA/Long Beach Inner Harbor	Copper, Zinc, DDT, PCBs, PAHs, Benthic Community Effects, Sediment Toxicity, Indicator Bacteria	None	Copper, Silver
LA/Long Beach Outer Harbor	DDT, PCBs, Sediment Toxicity	None	Cadmium, Nickel, Silver, Copper, Mercury
LA Harbor – Inner Cabrillo Beach	Indicator Bacteria, DDT, PCBs	None	None

NOTE:

Clean Water Act (CWA) section 303(d) requires the identification of water bodies that do not meet, or are not expected to meet, water quality standards (i.e., impaired water bodies), and these water bodies are placed on the 303(d) List of Water Quality Limited Segments. The affected water body, and associated pollutant or stressor, is then prioritized in the 303(d) list. Once a water body is placed on the 303(d) list, it remains on the list until a TMDL is adopted and the water quality standards are attained or there are sufficient data to demonstrate that water quality standards have been met and delisting should take place.

SOURCE: Dominguez Channel Watershed Management Area Group, 2016. *Enhanced Watershed Management Program*. p. 2-8. February 2016.

Dominguez Channel drains a highly industrialized area with numerous sources of pollution. These pollutants include polycyclic aromatic hydrocarbons (PAHs), remnants of persistent legacy pesticides, polychlorinated biphenyls (PCBs), and elevated concentrations of metals, all of which

contribute to poor sediment quality both within the channel and adjacent harbor areas.³⁴ Historically, oil pumping was prevalent in the area and some oil wells remain in operation.

In addition, the pollutant dichlorodiphenyltrichloroethane (DDT), a once common herbicide, is highest (compared to the rest of the Dominguez Channel Watershed) in the Dominguez Channel estuary and Consolidated Slip³⁵ sediments, along with being present throughout the harbors. Elevated concentrations are present in sediment at some locations in the inner harbors, and at the Consolidated Slip. The presence of these sediment pollutants has adversely affected water quality.

Beneficial uses identified by the Los Angeles RWQCB for the surface water bodies in the Dominguez Channel Watershed are summarized in **Table 3.9-6**.

TABLE 3.9-6

³⁵ Consolidated Slip is a part of the Inner Harbor of Los Angeles Harbor immediately downstream of Dominguez Channel.

Groundwater Quality

City of Inglewood wells in the WCGB, and GSWC have historically produced and currently produce groundwater that meets federal and state water quality standards.^{36,37} However, the WCGB has water quality constituents of concern, including iron, manganese, hydrogen sulfide odor, and total dissolved solids. In order to address these constituents, WCGB wells have treatment processes and are monitored closely. Groundwater is treated for iron and manganese at the City of Inglewood's Sanford M. Anderson Water Treatment Plant to meet water quality standards.

The Salt and Nutrient Management Plan for the Central Basin and WCGB, which is a tool to monitor and manage salt and nutrient levels in these groundwater basins was adopted by the Los Angeles RWQCB, on February 12, 2015.^{38,39} WCGB groundwater aquifers do not meet water quality objectives of the Los Angeles RWQCB because of historical seawater intrusion due to excessive over-pumping.⁴⁰ However, existing and planned implementation measures (including barrier projects, desalters, recharge projects, and other programs) are designed to ensure that salt and nutrient levels in groundwater would achieve water quality objectives.⁴¹

3.9.2 Adjusted Baseline Environmental Setting

Section 3.9, Hydrology and Water Quality, assumes the HPSP Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis.

In its current (2019) condition, a portion of the HPSP area is under construction, largely resulting in pervious exposed soils, haul roads, and some paved areas. Compared to the site's previous use as a horse racetrack and current construction conditions, the HPSP Adjusted Baseline projects will add impervious surfaces. At the time of the opening of the Proposed Project, the permeability of the HPSP Adjusted Baseline projects area would be limited to landscaped areas and retention basins, which would be designed to reduce runoff and treat pollutants of concern in accordance with drainage control regulatory requirements.

Drainage infrastructure at the HPSP area associated with the previous horse racetrack is currently being rerouted and replaced as necessary and additional drainage infrastructure will be constructed to accommodate the new HPSP Adjusted Baseline projects. New drainage infrastructure includes various on-site drains, open-channel drainage, an off-site bypass north of the HPSP area, catch basins, vegetated bio-retention areas, and an Arroyo and Lake Park

stormwater treatment system. The HPSP Adjusted Baseline projects will include BMPs as required by the site-specific Stormwater Pollution Prevention Plan (SWPPP) to reduce runoff flows and treat runoff water leaving the site, in accordance with federal, state, and local regulations. The storm drainage calculations included in the Proposed Project Preliminary Hydrology Report (Appendix Q) include drainage and stormwater flows from build out of the HPSP Adjusted Baseline projects in addition to the Proposed Project.

3.9.3 Regulatory Setting

Federal

Clean Water Act

Water quality objectives for all waters of the United States are established under applicable provisions of federal Clean Water Act (CWA) section 303. The CWA prohibits the discharge of pollutants to navigable waters from a point source unless authorized by a National Pollutant Discharge Elimination System (NPDES) permit. Point sources are defined as any discernible, confined, and discrete conveyance including but not limited to any pipe, ditch, channel, tunnel, well, or vessel from which pollutants are discharged. Nonpoint sources come from many diffuse sources including land runoff, precipitation, drainage, seepage, or hydrologic modification. Because implementation of these regulations has been delegated to the State, additional information regarding this permit is discussed under the “State” subheading, below.

National Pollutant Discharge Elimination System Permits

The NPDES permit system was established in the CWA to regulate municipal and industrial point discharges to surface waters of the US. Each NPDES permit for point discharges contains limits on allowable concentrations of pollutants contained in discharges. CWA sections 401 and 402 contain general requirements regarding NPDES permits. CWA section 307 describes the factors that the US Environmental Protection Agency (EPA) must consider in setting effluent limits for priority pollutants.

The CWA was amended in 1987 to require NPDES permits for non-point source (e.g., stormwater) pollutants in discharges. Stormwater sources are diffuse and originate over a wide area rather than from a definable point. The goal of NPDES stormwater regulations is to improve the quality of stormwater discharged to receiving waters to the “maximum extent practicable” through the use of structural and non-structural BMPs. BMPs can include the development and implementation of various practices including educational measures (e.g., workshops informing public of what impacts results when household chemicals are dumped into storm drains), regulatory measures (e.g., local authority of drainage facility design), public policy measures, and structural measures (e.g., filter strips, grass swales and detention ponds). The NPDES permits that apply to activities in the City of Inglewood are described under local regulations below.

Code of Federal Regulations

Federal regulations governing development in a floodplain are set forth in Code of Federal Regulations Title 44, Part 60. FEMA imposes building regulations on development within flood

hazard areas depending upon the potential for flooding within each area. Building regulations are incorporated into the municipal code of jurisdictions participating in the NFIP. FEMA does not regulate buildings or require flood insurance in areas designated Zone X, such as the Project Site.

State

Porter-Cologne Water Quality Control Act

The SWRCB and Los Angeles RWQCB are delegated authority from the EPA to implement portions of the CWA, and to also implement the state's water quality law, the Porter-Cologne Water Quality Control Act (Porter-Cologne Act). These agencies have established water quality standards that are required by CWA section 303 and the Porter-Cologne Act. The Porter-Cologne Act states that a Water Quality Control Plan, or Basin Plan, will consist of beneficial uses, water quality objectives, and a program of implementation for achieving water quality objectives. A Basin Plan, prepared by the Los Angeles RWQCB, establishes water quality numerical and narrative standards and objectives for rivers and their tributaries within the area subject to the Basin Plan. In cases where the Basin Plan does not contain a standard for a particular pollutant, other criteria apply such as EPA water quality criteria developed under CWA section 304(a). The Basin Plan that applies to the Project Site is described under local regulations below.

General Construction Activity Stormwater Permit

In accordance with NPDES regulations, to minimize the potential effects of construction runoff on receiving water quality, the State requires that any construction activity affecting one acre or more obtain coverage under a General Construction Activity Stormwater Permit (General Construction Permit). The current General Construction Permit is the NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities, Order No. 2009-0009-DWQ, NPDES No. CAS000002, effective July 1, 2010. General Construction Permit applicants are required to prepare and implement a SWPPP which includes implementing BMPs to reduce construction effects on receiving water quality by implementing erosion and sediment control measures and reducing or eliminating non-stormwater discharges. Examples of typical construction BMPs in SWPPPs include, but are not limited to: using temporary mulching, seeding, or other suitable stabilization measures to protect uncovered soils; storing materials and equipment so as to ensure that spills or leaks cannot enter the storm drain system or surface water; developing and implementing a spill prevention and cleanup plan; and installing sediment control devices such as gravel bags, inlet filters, fiber rolls, or silt fences to reduce or eliminate sediment and other pollutants from discharging to the City drainage system or receiving waters.

Construction activity that results in soil disturbances of less than one acre is subject to the General Construction Permit if there is potential for significant water quality impairment resulting from the activity as determined by the Los Angeles RWQCB.

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act of 2014 consists of three legislative bills—Senate Bill (SB) 1168, Assembly Bill 1739, and SB 1319 (or California Water Code Division 6,

Parts 2.74 through 2.78)—that provide a framework for long-term sustainable groundwater management across California. Under the legislation, local and regional authorities in medium and high priority groundwater basins will form Groundwater Sustainability Agencies that oversee the preparation and implementation of a local Groundwater Sustainability Plan. Groundwater within the WCGB and Central Basin is adjudicated by court order to protect the underground water supply within the basins. As such, these basins are already managed and are not required to submit a Groundwater Sustainability Plan, but are required to submit groundwater monitoring data annually to the California Department of Water Resources.

Regional

Los Angeles Regional Water Quality Control Board

As previously detailed, the Project Site is located within the jurisdiction of the Los Angeles RWQCB. The Los Angeles RWQCB authorizes NPDES permits that ensure compliance with wastewater treatment and discharge requirements. The Los Angeles RWQCB enforces wastewater treatment and discharge requirements for properties near and surrounding the Project Site.

Municipal Separate Storm Sewer System Permit

Los Angeles County and 84 incorporated cities, including the City of Inglewood, have a joint Municipal Separate Storm Sewer System NPDES permit (MS4 Permit) (Permit Order No. R4-2012-0175, NPDES Permit No. CAS004001) that was granted on November 8, 2012, and recently modified in July 2018. The MS4 Permit is intended to implement BMPs to reduce pollutants in stormwater discharges to the maximum extent practicable. The permittees listed under the joint permit have the authority to develop, administer, implement, and enforce storm water management programs within their own jurisdiction. On June 27, 2013, the cities of El Segundo, Hawthorne, Inglewood, Carson, Lawndale, Lomita, Los Angeles (including the Port of Los Angeles), and the Los Angeles County Flood Control District formed the Dominguez Channel Watershed Group to develop a collaborative approach to meet the requirements of the MS4 Permit.

Urban storm water runoff is defined in the MS4 Permit as including stormwater and dry weather flows from a drainage area that reaches a receiving water body or subsurface. The permit regulates the discharge of all wet and dry weather urban storm water runoff within the County of Los Angeles (with the exception of the City of Long Beach). Part VI.C of the Los Angeles County MS4 permit allows permittees the flexibility to develop Watershed Management Programs or Enhanced Watershed Management Programs (EWMPs) to implement the requirements of the permit on a watershed scale through customized strategies, control measures, and BMPs. The Dominguez Channel Watershed Management Area Group developed a EWMP that was approved by the Los Angeles Water Board on February 26, 2016.⁴² The EWMP includes water quality priorities for the Dominguez Channel Watershed Management Area, watershed control measures consisting of both structural and non-structural BMPs, financial strategies, and

⁴² Dominguez Channel Watershed Management Area Group, 2016. *Enhanced Watershed Management Program*. February 2016.

legal authority (permittees have the necessary legal authority to implement the BMPs identified in the EWMP or the legal authority exists to compel implementation of the BMPs).

County of Los Angeles Low Impact Development Standards Manual

In 2014, the County of Los Angeles prepared the LID Standards Manual to comply with the requirements of the NPDES MS4 Permit for stormwater and non-stormwater discharges from the MS4 within the coastal watersheds of Los Angeles County.⁴³ The LID Standards Manual provides guidance for the implementation of stormwater quality control measures in new development and redevelopment projects in unincorporated areas of the County with the intention of improving water quality and mitigating potential water quality impacts from stormwater and non-stormwater discharges. The City of Inglewood implements these standards for projects within the city.

Groundwater Basins Master Plan

As detailed above, the WCGB and Central Basin were adjudicated in 1961 and 1965, respectively, due to over pumping.^{44,45} The adjudication limits the allowable annual extraction of groundwater per water rights holder within the basin in order to prevent seawater intrusion and an unhealthy groundwater level. As part of the adjudication, the court appointed the California Department of Water Resources to serve as Watermaster to account for all water rights and groundwater extraction amounts per year.

Since the adjudicated groundwater production is higher than the natural recharge of the basin, the California Legislature created the WRD to manage, regulate, and replenish the WCGB and Central Basin. Each year through WRD's Regional Groundwater Monitoring Program, WRD determines the amount of supplemental recharge that is needed for the WCGB and Central Basin based upon annual groundwater extractions and groundwater levels. In 2016, WRD published the Groundwater Basins Master Plan, which provides a single reference document for parties operating within and maintaining the WCGB and Central Basin. The Groundwater Basins Master Plan provides options for meeting replenishment requirements and options for expanding the use of the basins' storage to increase reliability of water supplies.

Local

City of Inglewood General Plan

The City of Inglewood General Plan Conservation Element, adopted on October 21, 1997, sets forth goals, objectives and policies that address the conservation, development and utilization of natural resources found within the jurisdiction of the City. Chapters III through IV of the Conservation Element address resource conservation and management and contain several goals,

⁴³ County of Los Angeles Department of Public Works, 2014. *Low Impact Development Standards Manual*. February 2018.

⁴⁴ West Basin Municipal Water District, 2018. West Coast Groundwater Basin. Available: <http://www.westbasin.org/water-supplies-groundwater/west-coast-groundwater-basin>. Accessed October 8, 2018.

⁴⁵ Water Replenishment District of Southern California, 2016. *Groundwater Basins Master Plan*. Available: https://www.wrd.org/sites/pr/files/GBMP_FinalReport_Text%20and%20Appendicies.pdf. Accessed October 3, 2018.

objectives, and policies related to hydrology and water quality. The following policies from the City of Inglewood General Plan Conservation Element are applicable to the Proposed Project:

Water Production

Policy 1: Protect aquifers and water sources (which includes prevention of contamination of ground water by surface contaminants leaching into the soil).

Policy 2: Reduce the ever-increasing demand being placed on the aquifers and on the statewide water sources.

Storm Drains and Waste Water

Policy 2: Require periodic sweeping to remove oil, grease and debris from parking lots of 25 spaces or more.

The Proposed Project would appear to be consistent with each of the policies listed above. Consistent with Water Production Policy 1, and as further detailed below in Impact 3.9-1, the Proposed Project would be required to comply with federal, state, and local regulations and implement BMPs to reduce erosion and runoff to protect aquifer and water sources. Consistent with Water Production Policy 2, and as detailed in Impact 3.9-2 below, the Proposed Project would not interfere with groundwater recharge or demand being placed on aquifers. In addition, consistent with Storm Drains and Waste Water Policy 2, and as detailed in Impact 3.9-1 below, the Proposed Project would implement periodic sweeping of parking lots to remove oil, grease, and debris. The responsibility for the final determination of consistency with the City's General Plan is the responsibility of the City of Inglewood City Council.

Standard Urban Stormwater Mitigation Plan and City of Inglewood Municipal Code Low Impact Development Requirements

In 2000, the Los Angeles RWQCB approved the Standard Urban Stormwater Mitigation Plan (SUSMP) as part of the MS4 program to address stormwater pollution from new construction and redevelopment. The SUSMP contains a list of minimum BMPs that must be employed to infiltrate or treat stormwater runoff, control peak flow discharge, and reduce post-project discharge of pollutants from stormwater conveyance systems. Based upon land type, the SUSMP defines the types of practices that must be included and issues that must be addressed as appropriate to the development type and size. One of the most important requirements of the SUSMP is the specific sizing criteria for stormwater treatment BMPs for new development and significant redevelopment projects.

In 2015, the City replaced the SUSMP with City of Inglewood Municipal Code Chapter 10, Article 16, section 10-208 (LID Requirements for New Development and Redevelopment). This portion of the Municipal Code builds on the SUSMP and establishes requirements for construction activities and facility operations of development projects to comply with the current MS4 Permit. These include requirements to lessen the water quality impacts of development by using smart growth practices and integrate LID practices and standards for stormwater pollution mitigation.

City of Inglewood Water Conservation and Water Supply Shortage Program

City of Inglewood Municipal Code Chapter 10, Article 19, section 10-260 (City of Inglewood Water Conservation and Water Supply Shortage Program). This water conservation and water supply program was established to reduce water consumption in the City through conservation and water supply planning, ensure beneficial use of water, prevent waste of water, and maximize the efficient use of water in the City to avoid and minimize the effect and hardship of water shortage. The Code establishes permanent water conservation standards intended to alter behavior related to water use efficiency at all times and further establish three levels of water supply shortage response actions during times of declared water shortage, with increasing restrictions on water use in response to worsening drought.

City of Inglewood Green Street Policy

The City of Inglewood Public Works Department adopted the Green Street Policy to implement Green Street BMPs for the addition of new streets, redevelopment projects, and roadway improvement projects. The policy was enacted to demonstrate compliance with the NPDES MS4 Permit for the Los Angeles Region. According to the policy, green streets are an amenity that can provide many benefits including water quality improvement, groundwater replenishment, creation of attractive streetscapes, creation of parks and wildlife habitats, and pedestrian and bicycle accessibility. Green streets are defined as right-of-way areas that incorporate infiltration, biofiltration, and/or storage and use of BMPs to collect, filter, retain, or detain storm water runoff as well as promote attractive streetscape designs. Implementation of BMPs within roadways require that drainage patterns be considered such that drainage may be routed to the BMPs prior to entering the storm drain facility. BMPs include, but are not limited to vegetated curb extensions, bioswales, permeable pavers, alternative street widths, and infiltration basins, as feasible.

3.9.4 Analysis, Impacts, and Mitigation

Significance Criteria

The City has not adopted thresholds of significance for analysis of impacts to hydrology and water quality. The following thresholds of significance are consistent with CEQA Guidelines Appendix G. A significant impact would occur if the Proposed Project would:

1. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;
2. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
3. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
 - i. Result in substantial erosion or siltation on or off site;
 - ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site;

- iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
 - iv. Impede or redirect flow.
4. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; or
 5. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

Methodology and Assumptions

Impacts on water quality were evaluated qualitatively by considering the type of pollutants the Proposed Project would generate during construction and operational phases and whether meeting the requirements of applicable regulations would reduce potential impacts to a less-than-significant level. On-site drainage impacts were evaluated quantitatively by comparing calculations of existing and post-development stormwater runoff to Los Angeles County Department of Public Works allowable flow rates into the storm drainage system, in accordance with the department's Hydrology Manual as detailed in the Proposed Project Preliminary Hydrology Report (Appendix Q). The City's plan check and building inspection functions would ensure that all aspects of the Proposed Project would comply with applicable local, state, and federal laws, regulations, design standards, and plans.

The analysis of impacts to groundwater considers how development of the Proposed Project would influence groundwater recharge based on increases in impervious surfaces as a result of the Proposed Project and the existing and projected condition of the groundwater basin, along with the relocation of an existing well (Water Well #6).

An analysis of impacts to water supply, sewer, and stormwater infrastructure is included in Section 3.15, Utilities and Service Systems. An analysis of the consistency of the Proposed Project with the City's General Plan Conservation Element Storm Drains and Waste Water Policy 2 is discussed below, under Impact 3.9-1, and a discussion of the consistency of the Proposed Project with the City's Water Production Policy 1 and Policy 2 are discussed below under Impact 3.9-2.

Issues Determined to Be Less than Significant

The City of Inglewood has determined that due to the physical characteristics of the Project Site and the Proposed Project, several environmental resources addressed in the significance criteria would not be affected by the Proposed Project and need not be further considered in the Draft

EIR.⁴⁶ The discussions below provide brief statements of reasons for the City's determination that these issues do not warrant further consideration in the EIR.

The Proposed Project would not be in a flood hazard, tsunami, or seiche zone, and would not risk release of pollutants due to project inundation. (No Impact)

The Project Site is not within a 100-year flood hazard area as mapped on the FIRM by FEMA.⁴⁷ The closest mapped flood hazard area is 2.1 miles slightly to the northwest; this mapped area is in a 500-year flood zone. Therefore, the Proposed Project would not be located within a flood hazard area as mapped on a federal Flood Hazard Boundary or FIRM or other flood hazard delineation map.

A seiche occurs when there is a temporary disturbance or oscillation of a body of water in an enclosed or semi-enclosed basin, such as a reservoir, harbor, lake, or storage tank, often as a result of earthquakes or other large environmental disturbances. There are no lakes or reservoirs proximate to the Project Site, with the nearest being the Morningstar Park Reservoir, approximately 1.1 miles to the northeast of the Project Site. Due to the distance from the reservoir, the Project Site is not located within a seiche hazard zone which typically affects only areas immediately adjacent to enclosed or semi-enclosed water bodies.

The hazards from tsunamis are relatively low in southern California because of its wide geographical offshore borderland. Regardless, there is no immediate danger to Inglewood from this type of natural hazard because the City's location at over four miles inland from the Pacific Ocean is well outside of any tsunami hazard zone.⁴⁸

The Proposed Project would not be located in a flood, seiche, or tsunami inundation zone, and, therefore, would not be susceptible to risk of release of any pollutants due to inundation. Thus, there would be **no project-level or cumulative impacts** of the Proposed Project related to this significance criterion.

⁴⁶ Public Resources Code section 21003(e) states that “[t]o provide more meaningful public disclosure, reduce the time and cost required to prepare an environmental impact report, and focus on potentially significant effects on the environment of a proposed project, lead agencies shall, in accordance with Section 21100, focus the discussion in the environmental impact report on those potential effects on the environment of a proposed project which the lead agency has determined are or may be significant. Lead agencies may limit discussion on other effects to a brief explanation as to why those effects are not potentially significant.”

⁴⁷ AECOM, 2018. *Preliminary Geotechnical Investigation*. September 14, 2018. p. 12.

⁴⁸ City of Inglewood, Department of Community Development and Housing, 1995. Safety Element of the Inglewood General Plan. Adopted July 1995, p. 51.

Impacts and Mitigation Measures

Impact 3.9-1: Construction and operation of the Proposed Project could have the potential to violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality, or conflict with or obstruct implementation of a water quality control plan. (Less than Significant with Mitigation)

Construction

The use of construction equipment and other vehicles could result in spills of oil, grease, gasoline, brake fluid, antifreeze, or other vehicle-related fluids and pollutants. Improper handling, storage, or disposal of fuels and materials or improper cleaning of machinery could result in accidental spills or discharges that could degrade water quality. In addition, the use of equipment and ground disturbing activities could increase erosion, in turn potentially increasing sediment discharged into storm water that could degrade water quality. As discussed in the Regulatory Setting, above, the Proposed Project would be required to comply with a number of regulations designed to reduce or eliminate construction-related water quality effects, including the NPDES General Construction Permit and the City's Municipal Code section 10-208 (Low Impact Development Requirements).

Before any construction activities commence, an application for coverage under the General Construction Permit would be submitted to the Los Angeles RWQCB. In addition, compliance with Municipal Code section 10-208 requires the project applicant to prepare and submit a LID Report to the City, which would implement LID standards and practices for stormwater pollution mitigation consistent with the County's LID Standards Manual. The LID Report prepared for the Proposed Project demonstrates how the Proposed Project would comply with the MS4 Permit; the report is provided as Appendix Q.

Before construction could begin, a SWPPP would be developed and a Notice of Intent (NOI) filed with the Los Angeles RWQCB. After the Los Angeles RWQCB and the City of Inglewood confirm the applicability of the General Construction Permit, and approve the LID Report and the SWPPP, construction could commence. Construction would, thereafter, be required to implement and maintain the BMPs outlined in the LID Report and SWPPP. BMPs could consist of a wide variety of measures taken to reduce pollutants in stormwater and other non-point source runoff, such as biofiltration and/or stormwater planters. The City would complete inspections to verify that the LID Report and SWPPP are implemented correctly as part of the building permit process.

The City's Municipal Code section 10-208 also requires BMPs to minimize the potential for and effects from discharge (defined as any spill or release of substances) and pollutants (including metals, fuels, solvents, petroleum substances, and more) during construction activities for all contractors. If a spill were to occur, City's Municipal Code section 10-208 also requires the contractor to notify the City, and take action to contact the appropriate safety and clean-up crews to ensure that a prevention program is followed. In addition, the City would investigate any spills reported. A written description of reportable releases would be submitted to the Los Angeles RWQCB and the California Department of Toxic Substances Control (DTSC) by the contractor

or land owner. If an appreciable spill were to occur and it were determined that construction activities have adversely affected surface water or groundwater quality, a detailed analysis would be performed to the specifications of DTSC to identify the likely cause of contamination. This analysis would include recommendations for reducing or eliminating the source or mechanisms of contamination. Based on this analysis, contractors would select and implement measures to control contamination, with a performance standard that surface and/or groundwater quality must be returned to baseline conditions. These measures would be subject to approval by the City and/or the Los Angeles RWQCB.

Compliance with the NPDES General Construction Permit and Inglewood Municipal Code regulations as outlined above would prevent the substantial degradation of water quality during construction of the Proposed Project. While these regulatory instruments are designed to ensure that construction projects result in water quality discharges that are not in violation of SWRCB objectives, because final plans have not yet been approved by the City or Los Angeles RWQCB, construction impacts would be **potentially significant**.

Operation

During operation of the Proposed Project, runoff from the Project Site would contain pollutants common in urban runoff, including metals, oils and grease, pesticides, herbicides, nutrients, pet waste, and garbage/litter. Without BMPs and periodic sweeping to remove these pollutants, the Proposed Project could conflict with the City's General Plan Storm Drains and Waste Water Policy 2, detailed above in the Regulatory Setting, and could degrade the quality of receiving waters, including the Dominguez Channel. However, through compliance with the LID Standards Manual, consistent with the requirements of the NPDES MS4 Permit, the Proposed Project would be required to reduce operational stormwater pollution to the maximum extent practicable and eliminate prohibited non-stormwater discharges as part of the Project drainage design.

Operation of the Proposed Project would also be required to comply with the County's LID Standards Manual. A Project-specific LID Report has been prepared to reduce the volume of stormwater runoff and potential pollutants in stormwater runoff at the Project Site.⁴⁹ According to the LID Report, the Proposed Project would utilize a combination of biofiltration planters and biofiltration systems, including non-proprietary standard systems identified in the Los Angeles County LID Standards Manual or proprietary systems approved by the City of Inglewood to treat the stormwater. Runoff would be directed from drainage areas to on-site biofiltration plants and bio-swales. The biofiltration systems are designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to replicate pre-developed conditions. Sizing and capacity analysis of the proposed biofiltration systems would be calculated following the design guidelines issued by the Los Angeles

⁴⁹ AECOM, 2018. *Inglewood Basketball & Entertainment Center Project Low Impact Development (LID) Report*. August 23, 2018. pp. 3 through 6.

RWQCB.⁵⁰ The Proposed Project would be required to comply with these design standards and regulatory requirements. The Proposed Project development process includes identification of BMPs that respond to the design and construction methods of the Proposed Project. The BMPs would be implemented to ensure that water quality would not be degraded and the violation of water quality or waste discharge objectives set by the SWRCB would not occur. City review would confirm that BMP implementation complies with all applicable local, state, and federal regulations. The LEED certification process also requires extensive coordination with the USGBC, and through that coordination, would identify measures that ensure that water pollutant removal would be implemented in full compliance with the LEED program and certification requirements.⁵¹

Because the design of the Proposed Project is in an early phase, and specific BMPs have not been identified and approved by the City or the Los Angeles RWQCB, operational impacts would be **potentially significant**.

The Proposed Project includes parking facilities. These facilities, if not properly maintained, may be a significant source of pollutants associated with the operation of vehicles, including the discharge of oil, grease, and other automotive fluids. Periodic sweeping of parking facilities can serve as an effective means of reducing pollutants in stormwater runoff from such facilities, as required by the General Plan Storm Drains and Waste Water Policy 2, which requires the periodic sweeping of parking lots. If not properly managed, the surface water quality from run-off from parking facilities could adversely affect water quality and is considered **potentially significant**.

Mitigation Measure 3.9-1(a)

Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB. The project applicant shall comply with the MS4 permit regulations, NPDES General Construction Permit, Inglewood Municipal Code regulations, the County's LID Standards Manual, and the USGBC's LEED program. A LID Report and SWPPP shall be prepared to the satisfaction of the City and Los Angeles RWQCB to ensure the prevention of substantial water quality degradation during construction and operation of the Project. These plans shall be approved by the City and Los Angeles RWQCB to confirm that these permit and regulatory requirements have been satisfied before construction commences on the site.

Mitigation Measure 3.9-1(b)

Sweeping. Operation of the Project shall include periodic sweeping to remove oil, grease, and debris from parking lots of 25 spaces or more. Such sweeping shall occur not less than weekly.

⁵⁰ Los Angeles Regional Water Quality Control Board, 2012. *Final Waste Discharge Requirements for Municipal Separate Storm Water System (MS4) Discharge within the Coastal Watersheds of Los Angeles County, Attachment H Bioretention/Biofiltration Design Guidelines*. Available: https://www.waterboards.ca.gov/rwqcb4/water_issues/programs/stormwater/municipal/losangeles.html.

⁵¹ There are two options for stormwater management: (1) During the performance period, implement a stormwater management plan that infiltrates, collects and reuses runoff or evapotranspirates runoff from at least 15% of the precipitation falling on the whole project site both for an average weather year and for the 2-year, 24-hour design storm; or (2) Use LID practices to capture and treat water from 25% of the impervious surfaces for the 95th percentile of regional or local rainfall events.

Level of Significance After Mitigation: With the implementation of Mitigation Measures 3.9-1(a), the Proposed Project would comply with applicable regulations as approved by the City and the Los Angeles RWQCB and would not result in an impact to water quality. With implementation of Mitigation Measure 3.9-1(b), the Proposed Project would be consistent with the City's General Plan Storm Drains and Waste Water Policy 2. Thus, this would be a **less-than-significant impact**.

Impact 3.9-2: Construction and operation of the Proposed Project could substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, or conflict with or obstruct implementation of sustainable groundwater management plan. (Less than Significant)

Groundwater Recharge

The Project Site is currently made up of approximately 15 percent impervious surfaces and 85 percent pervious surfaces. However, as detailed above in Section 3.9.1, preliminary investigations of the Project Site indicate that the site's native soil characteristics have poor drainage with a low infiltration rate.⁵² The underlying, predominantly clayey soils at the Project Site have never experienced saturation. This indicates that the Project Site currently provides very little groundwater recharge through percolation of soils.

Due to the development associated with the Proposed Project, it is estimated that approximately 90 percent of the Project Site would be covered by impervious surfaces.⁵³ However, because the existing condition of the Project Site is developed with impervious surfaces that have a low infiltration and groundwater recharge or are impervious surfaces, the net change of groundwater recharge at the Project Site would be negligible.

As detailed above in Impact 3.9-1, the Proposed Project would include biofiltration planters and biofiltration systems, which can be effectively designed in low permeable soil conditions, to treat stormwater. Runoff would be directed from drainage areas to on-site biofiltration planters and bio-swales. The biofiltration systems would be designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to replicate pre-developed conditions or better. Consistent with the City of Inglewood General Plan Water Production Policy 1, detailed above in the Regulatory Setting, the Proposed Project would protect aquifers and water sources through the biofiltration treatment of runoff, preventing the contamination of groundwater.

As detailed in the Regulatory Setting, there are also several regulations and policies in place to prevent the degradation of water quality. Regulations include, but are not necessarily limited to, the MS4 permit, the County's LID Standards Manual, and the City's LID Requirements, all of

⁵² AECOM, 2018. *Inglewood Basketball & Entertainment Center Project Low Impact Development (LID) Report*. August 23, 2018. p. 2.

⁵³ AECOM, 2018. *Inglewood Basketball & Entertainment Center Project Low Impact Development (LID) Report*. August 23, 2018. p. 2.

which implement BMPs and stormwater quality control measures to reduce pollutants in stormwater discharges and improve water quality, preventing the contamination of groundwater.

Therefore, the potential for the Proposed Project to interfere with groundwater recharge would be negligible and would be a **less-than-significant impact**.

Well Relocation

The Proposed Project would include the relocation of Water Well #6, which is currently located within the Project Site (specifically the southeast of the Arena Site). Water Well #6 would be decommissioned and a new Water Well #8 would be located within the Well Relocation Site, which consists of two parcels south of West 102nd Street and west of South Doty Avenue. Water Well #8 discharge piping would connect to the existing City of Inglewood raw water main, located immediately in front of the proposed well site on West 102nd Street.⁵⁴

The potential well capacity would be approximately 2,500 gpm (or approximately 4,000 AFY). While the capacity of proposed Water Well #8 would provide for an increase from the existing capacity of Water Well #6 (which produced an average of 1,540 AFY from 2008 through 2015), regulations are in place to ensure that there would not be a deficit in aquifer volume. As detailed above in the Environmental Setting and Regulatory Setting, WRD is responsible for maintaining water levels in the Central Basin and WCGB. Each year through WRD's Regional Groundwater Monitoring Program, WRD determines the amount of supplemental recharge that is needed for the WCGB and Central Basin based upon annual groundwater extractions and groundwater levels. The Regional Groundwater Monitoring Program consists of a network of more than 300 monitoring wells at over 50 locations throughout the WRD service area.⁵⁵ WRD has dedicated staff that engage in year-round activities to closely monitor groundwater conditions. WRD performs extensive collection, analysis and reporting of groundwater data to ensure proper resource management. Source waters used for groundwater replenishment comes from annual precipitation, stormwater infiltration, and surface water imported by the Metropolitan Water District of Southern California and the State Water Project.

According to WRD's 2016-2017 Groundwater Monitoring Report, artificial replenishment activities combined with natural replenishment and controlled pumping have ensured a sustainable, reliable supply of groundwater in the WRD service area. Through this system of managing recharge in light of groundwater extraction, the overall level of groundwater resources is maintained over time. Thus, no demand would be placed on the aquifers due to this system of recharge and maintenance, making the Proposed Project consistent with the City's General Plan Water Production Policy 2.

Therefore, as the net change in groundwater recharge would be negligible with implementation of the Proposed Project, and as existing regulations would monitor the WCGB and Central Basin

⁵⁴ City of Inglewood, 2018. *Proposed Well Number 8 Preliminary Design Report*. July. pp. 4 through 5.

groundwater levels with the relocated well, the impact of the Proposed Project related to substantial depletion of groundwater supplies would be **less than significant**.

See Section 3.15, Utilities and Service Systems, for a discussion of project-level impacts related to water supply, including the provision of local groundwater to meet demand related to the Proposed Project.

Mitigation Measures

None required.

Impact 3.9-3: Construction and operation of the Proposed Project could have the potential to substantially alter the existing drainage patterns of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which has the potential to: result in substantial erosion or siltation on or off site; substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow. (Less than Significant with Mitigation)

A thorough analysis regarding the potential for substantial erosion or siltation on or off site is also addressed in Section 3.6, Geology and Soils, under Impact 3.6-1.

Erosion or Siltation, Runoff Flooding, and Redirection of Flows

Construction

There are no natural water or drainage features on the Project Site, and current flow of stormwater runoff is to existing storm drain facilities that ultimately flow to City maintained storm drain mains. The Proposed Project would include ground disturbing activities to construct the proposed improvements. Ground disturbing activities, including excavation and grading, would alter the ground surface, consequently altering drainage patterns. Altered drainage patterns have the potential to result in erosion or siltation, increase runoff volumes that could result in flooding or even redirect or concentrate flood flows.

As detailed above under Impact 3.9-1, construction of the Proposed Project would be required to comply with the NPDES General Construction Permit, the City's Municipal Code section 10-208, the County's LID Standards Manual, and the USGBC's LEED program. Through these regulations, the project applicant would be required to prepare and implement a LID Report (the LID Report can be found in Appendix Q) and a SWPPP that are approved by the City. These plans would include erosion and sediment control BMPs to minimize the potential for erosion and sedimentation to occur during construction as well as measures to control runoff volumes. BMPs would include, but would not necessarily be limited to, filtering runoff during construction, avoiding heavy grading and earthwork operations during the rainy season, and incorporating landscaping as early as possible. In

addition, prior to receiving grading and building permits from the City, the project applicant would be required to prepare a final geotechnical report in accordance with the California Building Code, which requires recommendations for surface and subsurface drainage, slope stabilization, erodible soils, and compliance with City drainage requirements.

Because the final LID Report and SWPPP have not yet been approved by the City or Los Angeles RWQCB and the City, construction impacts are considered to be **potentially significant**.

Operation

As detailed above under Impacts 3.9-1 and 3.9-2, approximately 90 percent of the Project Site would be covered by impervious surfaces.⁵⁶ Through compliance with the LID Standards Manual that is consistent with the NPDES MS4 requirements, the Proposed Project would be designed to reduce operational stormwater runoff, which, in turn, would reduce associated erosion, sedimentation, and/or flooding on and off the Project Site. In addition, compliance with the County's LID Standards Manual would ensure that the Proposed Project would utilize a combination of biofiltration planters and biofiltration systems to treat stormwater. Runoff would be directed from drainage areas to on-site biofiltration plants and bio-swales. The biofiltration systems would be designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to mimic pre-developed conditions.

Because the Proposed Project would be designed to capture runoff and replicate pre-developed conditions,⁵⁷ impacts to drainage patterns and associated erosion, sedimentation, and/or flooding during operation of the Proposed Project would be a **less-than-significant impact**.

Stormwater Drainage Capacity

Construction

Existing drainage from the Project Site flows to adjacent off-site storm drain facilities and ultimately in to the City-maintained storm drain mains located along all streets surrounding and traversing the Project Site. Construction of the Proposed Project would require the use of water on site for various purposes, including dust control, concrete mixing, and sanitation. Construction activities and materials would alter the drainage pattern of the Project Site, potentially increasing water runoff from dust control activities and as a result, risk of siltation into the existing drainage system.

With implementation of BMPs as required by the site-specific SWPPP in accordance with the NPDES General Construction Permit, erosion and other pollutants would be prevented from being discharged from the Project Site. Although specific BMPs have not been identified for the Proposed Project, typical construction BMPs may include the use of silt fences, fiber rolls, and

⁵⁶ AECOM, 2018. *Inglewood Basketball & Entertainment Center Project Low Impact Development (LID) Report*. August 23, 2018. pp. 2 through 6.

⁵⁷ AECOM, 2018. *Inglewood Basketball & Entertainment Center Project Low Impact Development (LID) Report*. August 23, 2018. p. 2.

compost blankets during construction activities. Implementation of BMPs would slow flows and reduce the rate of runoff leaving the Project Site. By controlling and limiting the flow of water, runoff to stormwater drainage systems would be reduced. With implementation of these NPDES regulations and BMPs, construction of the Proposed Project would not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or result in substantial additional sources of polluted runoff. However, final plans, including the SWPPP and specific BMPs, have not yet been approved by the City or Los Angeles RWQCB, and therefore, impacts related to the alteration of drainage patterns during construction causing an increase of runoff into the storm drainage system would be **potentially significant**.

Operation

The Proposed Project would include the following on-site drainage features and infrastructure improvements that would connect to existing storm drains within surrounding streets.

Arena Site

Under the Proposed Project, an approximately 900-foot linear section of West 102nd Street from South Prairie Avenue to a line approximately 335 feet west of South Doty Avenue would be vacated and incorporated into the Arena Site. The Proposed Project would construct new site access roads along the periphery of the arena. The existing catch basin at the intersection of West 102nd Street and South Prairie Avenue would be removed, along with the existing storm drain line within West 102nd Street. Stormwater pipelines, storm drains, and storm drain overflow pipes would be installed within and along the proposed site access roads. New 12-, 18-, and 24-inch-diameter storm drainage lines would be extended from existing drainage lines in South Prairie Avenue near West 103rd Street into the Project Site. The new stormwater pipelines within the proposed site access roads would connect to the existing storm drain lines within South Prairie Avenue. Grate opening catch basins, stormwater pipelines, and storm drain overflow pipelines would also be installed within the northern portion of the Arena Site to accommodate the public plaza, outdoor stage, community space, and retail/restaurant uses. In addition, an underground detention basin and pretreatment system would be constructed under the South Parking Garage on the Arena Site. Biofiltration systems would be installed throughout the Arena Site, including but not limited to, along South Prairie Avenue, along the proposed site access roads, and within the public plaza space.

West Parking Garage Site

With implementation of the Proposed Project, a parking garage would be constructed over an approximately 350-foot linear section of West 101st Street between South Prairie Avenue and South Freeman Avenue and other portions of the West Parking Garage Site, and new site access roads would be constructed along the periphery of the parking garage to redirect traffic. An underground precast detention and pretreatment system would be installed west of the parking garage under the westerly proposed site access road. Stormwater pipelines and a side opening catch basin would be installed within West 101st Street to connect the proposed detention and pretreatment system to the existing storm drain line within West 101st Street. Stormwater pipelines, storm drain overflow pipe, and biofiltration systems would be installed within the

proposed periphery site access roads. In addition, a trench drain would be installed at the southwest corner of the West Parking Garage Site.

East Transportation and Hotel Site

Under the Proposed Project, new 18-inch-diameter stormwater pipelines and storm drain overflow pipes would be installed along the boundary of the East Transportation and Hotel Site. An underground precast detention and pretreatment system would be installed at the southwest corner of the East Transportation and Hotel Site. Stormwater pipelines would be installed within West 102nd Street to connect the proposed detention and pretreatment system to existing storm drain line within West 102nd Street.

Well Relocation Site

No storm drain infrastructure improvements would occur on the Well Relocation Site under the Proposed Project.

Analysis

As detailed above, portions of West 101st Street and West 102nd Street that cross the Project Site would be vacated and constructed over, which would include the removal of drainage features within these roadways (including stormwater pipelines and an existing catch basin). This would occur after the construction of new facilities that would serve off-site properties. The Proposed Project would include new site access roads around the periphery of the Arena Site and the West Parking Garage Site, which would include new stormwater pipelines, storm drains, and storm drain overflow pipes. These features would also be constructed at the East Transportation and Hotel Site. In addition, the Proposed Project would include grate opening catch basins, side opening catch basins, underground precast detention and pretreatment systems, and biofiltration systems throughout the Project Site. All proposed on-site drainage features would be required to be approved by City engineers and comply with local regulations.

As previously described, the Proposed Project would be required to comply with all applicable drainage regulations and standards, including the NPDES General Construction Permit, the City's Municipal Code, and the County's LID Standards Manual. The Proposed Project would utilize biofiltration planters and biofiltration systems to treat the stormwater runoff. Runoff would be directed from drainage areas to on-site biofiltration plants and bio-swales, slowing the rate of runoff and in turn slowing the amount of water entering the stormwater drainage system. The biofiltration systems are designed to capture site runoff from roof drains, treat the runoff through biological reactions within the planter soil media, and discharge at a rate intended to mimic pre-developed conditions.

Table 3.9-7 presents operational stormwater flows with and without the above-described drainage infrastructure and underground detention basins. As shown in the table, post-development runoff flows without drainage infrastructure (59.28 cubic feet per second (cfs)) would exceed the

approved allowable discharge rates (21.76 cfs).⁵⁸ With implementation of underground detention basins, biofiltration systems, and other drainage infrastructure throughout the Project Site, the Proposed Project would discharge less than the allowable limits (approximately 21.37 cfs as compared to the allowable limit of 21.76 cfs).

**TABLE 3.9-7
 STORMWATER RUNOFF FLOWS WITH AND WITHOUT DRAINAGE INFRASTRUCTURE**

Scenario	Project 4402 (Storm Drain Line within West Century Boulevard) (cfs)	Project 681 (Storm Drain Line within South Prairie Avenue) (cfs)	DDI#8 (Storm Drain Line west of East Transportation and Hotel Site) (cfs)	Total (cfs)
Flows prior to detention and drainage infrastructure	6.36	41.63	11.29	59.28
Flows with proposed detention and drainage infrastructure	1.96	14.30	5.11	21.37
Los Angeles County Department of Public Works Allowable Flow Rates	2.31	14.32	5.13	21.76

NOTE:

The Los Angeles County Department of Public Works, Design Division provided the allowable flow rates that may be discharged to each of the downstream storm water drains adjacent to the Project Site. Consultation occurred between D&D Engineering Inc. and the County on October 26, 2017. Refer to Appendix A of the Preliminary Hydrology Report (Appendix Q) for the summary notice provided by the Los Angeles County Department of Public Works.

SOURCE: D&D Engineering Inc., 2019. Preliminary Hydrology Report.

With construction of on-site drainage features and infrastructure improvements that would connect to existing storm drains within surrounding streets, along with implementation of LID Stormwater Manual and required BMPs, the Proposed Project would not create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or result in substantial additional sources of polluted runoff as also described above in Impact 3.9-1.

However, because final plans, including the SWPPP, LID Report and operational BMPs, have not yet been approved by the City, impacts related to the alteration of drainage patterns during operation causing an increase of runoff into the storm drainage system would be **potentially significant**.

Mitigation Measure 3.9-3

Implement Mitigation Measure 3.9-1(a) and 3.9-1(b) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB and Sweeping).

Level of Significance After Mitigation: With the implementation of Mitigation Measure 3.9-3, construction of the Proposed Project would comply with applicable regulations as approved by the City and the Los Angeles RWQCB and would not result

⁵⁸ The Los Angeles County Department of Public Works, Design Division provided the allowable flow rates that may be discharged to each of the downstream storm water drains adjacent to the Project Site. Refer to Appendix A of the Preliminary Hydrology Report (Appendix Q) for the summary notice provided by the Los Angeles County Department of Public Works.

in a significant impact related to alteration of the existing drainage pattern of the site. Thus, this impact would be considered **less than significant**.

Cumulative Impacts

The geographic scope of analysis for cumulative impacts related to water quality includes the Dominguez Channel Watershed. Cumulative impacts have the potential to discharge pollutants, including erosion and siltation, off site during construction and operational activities, which could further degrade the receiving waters within the hydrologic unit.

The geographic scope of analysis for cumulative impacts related to surface water runoff and drainage capacity is the Dominguez Channel Watershed, as stormwater runoff flows throughout the Dominguez Channel Watershed.

The geographic scope of analysis for cumulative impacts related to groundwater recharge and supply is the WCGB and Central Basin.

Impact 3.9-4: Construction and operation of the Proposed Project, in conjunction with other cumulative development within the Dominguez Channel Watershed, could have the potential to cumulatively violate water quality standards or waste discharge requirements, or otherwise substantially degrade water quality or conflict with or obstruct implementation of a water quality control plan. (Less than Significant with Mitigation)

Cumulative projects have the potential to discharge pollutants, including erosion and siltation, off site during construction and operational activities, which could further degrade receiving waters within the Dominguez Channel Watershed. However, similar to the Proposed Project, cumulative projects would be required to implement project-specific BMPs and comply with federal, state, and local regulations related to water quality. These regulations include, but are not limited to, the NPDES General Construction Permit, the City's Municipal Code section 10-208, and the County's LID Standards Manual. If cumulative projects are greater than one acre, they would be required to prepare and implement a SWPPP to reduce pollutants in stormwater and other non-point source runoff. While these regulatory instruments are designed to ensure that projects result in water quality discharges that are not in violation of SWRCB objectives, because final plans of all cumulative development projects have not yet been determined or approved by the City or Los Angeles RWQCB, cumulative construction impacts would be potentially significant.

As detailed above in Impact 3.9-1, the design of the Proposed Project is in an early phase, and specific BMPs have not been identified and approved by the City or the Los Angeles RWQCB. Therefore, based on the above considerations, the Proposed Project, in conjunction with cumulative development, could result in **potentially significant** cumulative impacts related to water quality.

Mitigation Measure 3.9-4

Implement Mitigation Measure 3.9-1(a) and 3.9-1(b) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB and Sweeping).

Level of Significance After Mitigation: With the implementation of Mitigation Measures 3.9-4, the Proposed Project would comply with applicable regulations as approved by the City and the Los Angeles RWQCB, would be consistent with the City's General Plan Storm Drains and Waste Water Policy 2, and, therefore, would not result in an impact to water quality. Thus, the Proposed Project would not have a considerable contribution to a cumulative impact and would be considered **less than significant**.

Impact 3.9-5: Construction and operation of the Proposed Project, in conjunction with other cumulative development within areas served by the WCGB and Central Basin groundwater basins, could cumulatively decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, or conflict with or obstruct implementation of sustainable groundwater management plan. (Less than Significant)

As stated above, the geographic scope of analysis for cumulative impacts related to groundwater recharge is the WCGB and Central Basin. Groundwater infiltration relates to the infiltration rate of soils and the amount of impervious surfaces within the groundwater basin. Because the land that would provide infiltration and percolation into the WCGB and Central Basin is largely built out (including but not limited to the cities of Los Angeles, Long Beach, Carson, Torrance, Inglewood, Redondo Beach, Cerritos, Lawndale, Artesia, and Whittier), cumulative projects would not substantially increase the amount of impervious surfaces. If cumulative projects directly or indirectly effect groundwater supplies, existing regulations, including the WRD's Regional Groundwater Monitoring Program are in place to continuously monitor the WCGB and Central Basin groundwater levels.

As detailed above within Section 3.9.1 and Section 3.9.2, WRD is responsible for maintaining water levels within the WCGB and Central Basin, including through purchasing and recharging additional water to make up for overdraft.⁵⁹ Groundwater monitoring data for both basins is required to be submitted annually to the California Department of Water Resources. Source waters used for groundwater recharge and replenishment comes from annual precipitation, stormwater infiltration, and surface water imported by the Metropolitan Water District of Southern California and via the State Water Project. Artificial replenishment activities combined

⁵⁹ City of Inglewood, 2016. *2015 Urban Water Management Plan*. p. 6-9.

with natural replenishment and controlled pumping have ensured a sustainable, reliable supply of groundwater in the WRD service area.⁶⁰

Therefore, because existing regulations are in place to monitor the groundwater basins and because WRD ensures a sustainable, reliable supply of groundwater recharge into the basins, the Proposed Project, in conjunction with other cumulative projects, would not decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin, or conflict with or obstruct implementation of sustainable groundwater management plan. Therefore, the cumulative impact would be **less than significant**.

Mitigation Measures

None required.

Impact 3.9-6: Construction and operation of the Proposed Project, in conjunction with other cumulative development in the Dominguez Channel Watershed, could have the potential to cumulatively alter the drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site; substantially increase the rate or amount of surface runoff in a manner which would result in flooding on or off site; create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flow. (Less than Significant with Mitigation)

Erosion, Runoff Flooding, and Redirection of Flows

Cumulative projects would likely have ground disturbing activities that would alter drainage patterns, which, in turn, could result in erosion or siltation, flooding, or redirection of flows. However, similar to the Proposed Project, construction and operation of cumulative projects within the Dominguez Channel Watershed would be required to implement project-specific BMPs and comply with federal, state, and local regulations related to drainage. These regulations include, but are not necessarily limited to, the NPDES General Construction Permit, the City's Municipal Code section 10-208, and the County's LID Standards Manual. In addition, if cumulative projects are greater than one acre, these projects would be required to prepare and implement a SWPPP that would include BMPs to reduce erosion, reduce the rate of runoff, and flooding, and increase sediment control. As detailed above in Impact 3.9-3, because the design of the Proposed Project is in an early phase, and the final LID Report and SWPPP have not been approved by the City or the Los Angeles RWQCB, the Proposed Project would have a potentially significant impact. Additionally, final plans of cumulative projects have not yet been approved by

⁶⁰ In an effort to eliminate long-term overdraft conditions, WRD works closely with the Los Angeles County Department of Public Works, Metropolitan, and Sanitation Districts of Los Angeles County on current and future replenishment supplies. WRD depends on natural and artificial recharge programs to replace the annual overdraft. For example, in 2015, groundwater pumped from the WCGB was 28,700 AF, with 34,257 AF replenished to the WCGB through artificial replenishment (19,757 AF) and natural recharge (14,500 AF). Over the entire WCGB, the average water level change was a rise of 3.4 feet (City of Inglewood, 2016. *2015 Urban Water Management Plan*. p. 6-9).

the City or Los Angeles RWQCB. Based on the above considerations, the Proposed Project, in conjunction with cumulative development, could result in **potentially significant** cumulative impacts related to erosion, runoff, and flows during both construction and operation.

Stormwater Drainage

As stated above, the geographic scope of analysis for cumulative impacts related to surface water runoff and drainage capacity is the Dominguez Channel Watershed, as stormwater runoff flows throughout the Dominguez Channel Watershed. Because the Dominguez Channel Watershed is largely built out, cumulative projects (listed in Section 3.0, Introduction to the Analysis) would involve redevelopment of existing paved or developed sites and would not substantially increase the amount of impervious surfaces. Thus, the change of runoff to stormwater drainage systems would be negligible after development of cumulative projects.

Additionally, and as previously discussed, cumulative projects would be required to comply with applicable stormwater runoff regulations, including the NPDES General Construction Permit, the City's Municipal Code section 10-208, and the County's LID Standards Manual. BMPs associated with these regulations would reduce runoff, which would reduce the amount of stormwater entering the drainage systems. In addition, the redevelopment of parcels would likely eliminate outdated water drainage features that no longer meet current regulations. Older infrastructure would be replaced with newer infrastructure that would provide a higher quality of stormwater runoff than exists under current conditions. However, final plans for each of the cumulative projects may not be completed and approved by the City or the Los Angeles RWQCB; therefore, there could be a cumulatively considerable impact as it relates to stormwater drainage.

As detailed above in Impact 3.9-3, the design of the Proposed Project is also in an early phase, and the SWPPP and specific BMPs have not been approved by the City or the Los Angeles RWQCB. Based on the above considerations, the Proposed Project, in conjunction with cumulative development, could result in **potentially significant** cumulative impacts related to stormwater drainage during both construction and operation.

Mitigation Measure 3.9-6

Implement Mitigation Measure 3.9-1(a) and 3.9-1(b) (Comply with Applicable Regulations as Approved by the City and the Los Angeles RWQCB and Sweeping).

Level of Significance After Mitigation: With the implementation of Mitigation Measures 3.9-6, construction of the Proposed Project would comply with applicable regulations as approved by the City and the Los Angeles RWQCB and would not result in a significant impact related to alteration of the existing drainage pattern of the site. Thus, the Proposed Project would not have a considerable contribution to a cumulative impact, and would be considered **less than significant**.

3.10 Land Use and Planning

This section describes and evaluates potential impacts related to land use and planning that could result from implementation of the Proposed Project. The section contains: (1) a description of the existing environmental setting for land use and planning; (2) a summary of the federal, State, and local regulations related to land use and planning; and (3) an analysis of potential impacts to land use and planning associated with the implementation of the Proposed Project.

CEQA Guidelines section 15125 states that the EIR shall discuss “any inconsistencies between the proposed project and applicable general plans, specific plans and regional plans,” and accordingly, the regulatory framework discussion includes consideration of potential inconsistencies between the Proposed Project and relevant local and regional plans and policies. The relevant regional and local plans addressed within this section include Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and Regional Comprehensive Plan (RCP), the Los Angeles County Airport Land Use Plan (ALUP), the City of Inglewood General Plan, the City of Inglewood Zoning Code (Inglewood Municipal Code Chapter 12, Planning and Zoning), the Inglewood International Business Park (IIBP) Specific Plan, the City of Inglewood Redevelopment Project Area Plans, the New Downtown Inglewood & Fairview Heights TOD Plans. SCAG’s Regional Housing Needs Assessment is discussed in Section 3.12, Population, Employment, and Housing.

Comments received in response to the NOP for the EIR regarding land use and planning can be found in Appendix B. Any applicable issues and concerns regarding potential impacts related to land use and planning as a result of implementation of the Proposed Project are analyzed within this section.

The question of the environmental compatibility of the Proposed Project with adjacent and nearby land uses is not addressed in this section. Rather, the reader is referred to the various environmental resource evaluations presented in Chapter 3, Environmental Setting, Impacts, and Mitigation Measures, for a discussion of potential physical/environmental effects and potential incompatibilities that may be considered in the determination of physical environmental impacts. For example, land uses that produce excessive noise, light, dust, odors, traffic, or hazardous emissions may be undesirable when they intrude on places used for residential activities (residences, parks, etc.). Thus, certain industrial or commercial uses (which can produce noise and odors) may not be considered compatible with residential, educational, or healthcare uses, unless buffers, landscaping, or screening could protect residents from health hazards or nuisances. Any such potential land use incompatibilities are addressed in the applicable environmental resource sections in Chapter 3 instead of in this Section 3.10.

3.10.1 Environmental Setting

Regional Setting

The City of Inglewood was historically developed as a low-density single-family community. The City's land uses are comprised of residential (46.7 percent), right-of-way (23.5 percent), public/semi-public (20.3 percent), commercial (6.1 percent) and industrial (3.7 percent) uses.¹ Existing zoning allows 60 percent of residentially zoned land to be developed into two-family or multifamily (three or more) units. Today, there are currently more multifamily dwelling units than single-family units in the City.

In addition, development in the City is shifting as a result of new community planning goals such as revised zoning to focus on mixed-use development, walkability, density, and Transit-Oriented Development (TOD). The Project Site is situated in between the City's existing and proposed TOD Plans, which if approved would provide TOD planning near all Metro stops within the City.² The New Downtown Inglewood and Fairview Heights TOD Plans were approved in 2016, and the Crenshaw/Imperial TOD Plan, and the Westchester/Veterans Station Area TOD Plan are proposed and were the subject of a CEQA Notice of Preparation issued by the City on October 31, 2017. The existing and proposed TOD plans are designed to modify zoning and parking regulations to encourage economically robust, pedestrian-friendly and community-centered development, improve networks for biking and walking, and recommended policies for implementation.

A majority of the City's commercial uses are located along major arterials. The two major components of commercial land uses include retail service and automobile sales and service, representing 63 percent and 20 percent, respectively, of all commercial uses. The City is experiencing a growth of light industrial oriented uses focused on shipping in and out of Los Angeles International Airport (LAX). Light industrial is the predominate industrial zoning representing 75 percent of industrial land with heavy industrial representing the remaining 25 percent. Land uses included within the City's public/semi-public areas include parks, schools, government buildings and facilities, churches, the cemetery, and hospitals.

The City's right-of-way area includes 180 miles, or 1,337 acres, of streets and alleys. The City is primarily developed. A majority of the vacant land in the City is designated for industrial land uses with minimal vacant land designated for residential and commercial uses.³

The Project Site is located in the southwestern portion of the City in an area comprised of a mix of low- to medium-density one- and two-story residential, one-story commercial, one-story office, entertainment, industrial, trucking and parking uses and vacant parcels. West Century Boulevard,

¹ City of Inglewood, *City of Inglewood General Plan*, Land Use Element, Land Use Comparison table, Inglewood Land Use, p. 54, updated 2016. Available: <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>.

² The New Downtown Inglewood & Inglewood TOD Plans website. Available: <http://inglewood.arroyogroup.com/>, accessed September 2018.

³ City of Inglewood, *City of Inglewood General Plan*, Land Use Element, p. 10, updated 2016. Available: <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>.

a major commercial corridor, borders the Project Site on the north. The West Century Boulevard corridor, from South Prairie Avenue to Crenshaw Boulevard, is characterized by one -and-two story commercial development that includes fast food restaurants, motels, retail, and commercial shopping centers.

North of the Project Site (approximately 0.8 miles north) along South Prairie Avenue is The Forum, a multipurpose approximately 17,500-seat indoor arena that served as home of the Los Angeles Lakers basketball team and Los Angeles Kings hockey team until 1999. The Forum was substantially renovated in 2014 and is now a venue principally used for music and entertainment. The Forum is listed on the National Register of Historic Places and the California Register of Historical Resources.

South Prairie Avenue is another major commercial corridor that runs north–south through the City of Inglewood and borders the Arena Site on the west. Land uses along South Prairie Avenue near the Project Site include commercial development, including restaurants, automotive uses, small commercial shopping centers, and offices, interspersed with residential uses.

The Project Site is located approximately 2 miles east of LAX, along the extended centerlines of Runways 25R and 25L and approximately 1.5 miles due north of Jack Northrop Field/Hawthorne Municipal Airport (HHR). The Los Angeles County ALUP establishes planning boundaries/airport influence areas (AIAs) for areas around public-use airports in the County. The Project Site is located within the planning boundary/AIA established for LAX, but is outside the planning boundary/AIA for the HHR. ALUP policies are focused on development of compatible land uses in areas subject to potential noise impacts and safety hazards associated with aircraft operations. Because the Proposed Project is located within the planning boundary/AIA for LAX and would include a change to the zoning code for the City of Inglewood, it is subject to review by the Airport Land Use Commission (ALUC) to determine consistency with ALUP policies. ALUP Policy G-4 prohibits any land use which will negatively affect safe air navigation and ALUP Policy S-7 requires compliance with the height restriction standards and procedures set forth in 14 Code of Federal Regulations (CFR) Part 77 (Part 77), *Safe, Efficient Use and Preservation of the Navigable Airspace*. Part 77 establishes criteria for delineating imaginary airspace surfaces around airports for purposes of identifying potential obstructions to the airspace. Parts of the Proposed Project would penetrate the imaginary airspace surfaces for HHR and construction equipment may temporarily penetrate the imaginary airspace surfaces for both LAX and HHR. This penetration would trigger a requirement for submittal of notification to the FAA. Satisfaction of this obligation is required both under federal regulations and the ALUP policies. The notification requirement for HHR, as well as LAX, is discussed in Section 3.8, Hazards and Hazardous Materials.

Development History of the Project Site

As is described in Section 3.4, Cultural and Tribal Cultural Resources, the project area developed largely during the middle part of the 20th century. In 1928, the area remained sparsely developed but the agricultural properties appear uncultivated or developed with residential buildings. Before World War II, the area was largely agricultural with scattered homes and businesses. Between

1928 and 1963, the area became nearly fully developed with single- and multifamily residences, while the properties in the Project Site along West Century Boulevard and South Prairie Avenue transitioned from residential to commercial use. In the post-war years residential and commercial uses developed in support of the growing LAX approximately 2 miles to the west, HHR less than 1.5 miles to the south, and defense industries that developed in the vicinity.

Between 1952 and 1963, many of the single-family residences and lower-density multifamily residences east of South Prairie Avenue were replaced with apartment buildings, hotels and commercial buildings that took up most of any given parcel with zero or minimal lot line setbacks. By 1972, the majority of the parcels on and around the Project Site west of South Prairie Avenue remained smaller, single-family homes; however, the project area east of South Prairie Avenue appears to be dominated by apartment buildings with some commercial and single-family homes present. This level and type of development appears to have remained consistent into the 1980s. In 1967, The Forum was opened, approximately 0.75 miles north of the Project Site. In the 1970s, a new health center was built on Manchester, north of the Project Site, and high-rise office buildings were constructed on La Brea, to the northwest of the Project Site.⁴ A new civic center was dedicated in 1973. Airport Park View Hotel opened between Hollywood Park Race Track and The Forum.⁵

Proximity to nearby airports, especially LAX, has affected development on the Project Site. A portion of the Project Site is located within the Planning Boundary/AIA for LAX as designated in the Los Angeles County ALUP, which places conditions on the nature and type of development that can occur. The Aircraft Noise Mitigation Program (ANMP), which arises from federal and state regulations, established two strategies to manage the impacts of aircraft noise, including (1) sound insulation of structures and (2) property acquisition followed by the conversion of an incompatible land use to compatible land uses. In the 1990s, pursuant to the ANMP and the Federal Aviation Regulation (FAR) Part 150, the Los Angeles World Airports (LAWA) implemented a comprehensive program to provide residential sound proofing to homes impacted by an average noise level of 65 dB or more and also relocated hundreds of residential homes east of LAX. LAX has also adopted a Federal Aviation Administration (FAA)-approved Noise Control/Land Use Compatibility Program, which makes certain residential areas in the City of Inglewood and other surrounding jurisdictions near LAX eligible for FAA funding for sound mitigation, either through the addition of insulation or property acquisition.

Beginning in the mid-1980s, the FAA has issued noise grants to the City of Inglewood as part of the LAX Noise Control/Land Use Compatibility Program, with the objective of recycling incompatible land uses to land uses that are compatible with the noise levels of airport operations. Under that program, the FAA and the City of Inglewood approved the acquisition of a number of parcels on the Project Site. In compliance with FAA grant agreements, the City is obligated to

⁴ Waddingham, Gladys, 1994. *The History of Inglewood*. Historical Society of Centinela Valley. Los Angeles, California.

⁵ Waddingham, Gladys, 1994. *The History of Inglewood*. Historical Society of Centinela Valley. Los Angeles, California.

dispose of the land at fair market value, and ensure that the land is used for purposes that are compatible with specified airport noise levels of operation of the airport. This consequently restricts the uses to which these properties can be put and limits the type of development that can take place on them. The FAA has expressly stated that residential development of these noise-impacted properties is “inherently inconsistent with the intent of the City’s land acquisition/noise mitigation program, approved and funded by the FAA,” and that residential use of the properties “may be inconsistent with Grant Assurance #21, Compatible Land Use; and Grant Assurance 31, Disposal of Land.”⁶

Project Site Existing Land Uses

The entire Project Site is comprised of approximately 28 acres and encompasses four specific locations: the Arena Site; the West Parking Garage Site; the East Transportation and Hotel Site; and the Well Relocation Site (see Figure 2-2 in Chapter 2, Project Description). All but six of the parcels that make up the Project Site are currently vacant or undeveloped. The six developed parcels all within the Arena Site, include a fast food restaurant (on a privately owned parcel), a motel (on a privately owned parcel), a warehouse and light manufacturing facility (on two privately owned parcels), a commercial catering business (on a privately owned parcel), and a groundwater well and related facilities (on a City-owned parcel). The Arena Site encompasses a total of 41 parcels. Ten of these parcels are privately owned. Thirty-one parcels are City-owned or owned by the Successor Agency. The Well Relocation Site is owned by the City. All but one parcel within the West Parking Garage Site is owned by the City; the remaining parcel within the West Parking Garage Site is owned by the Successor Agency. The East Transportation and Hotel Site is entirely owned by the Successor Agency.

Arena Site

As can be seen on **Figure 3.10-1**, the approximately 17-acre Arena Site is primarily vacant with limited existing commercial and hotel uses and associated surface parking, unoccupied manufacturing uses, and a City well site. Within the Arena Site, at the southeast corner of West Century Boulevard and South Prairie Avenue, is an occupied Church’s Chicken fast-food restaurant located at 10004 South Prairie Avenue and an associated surface parking lot. Immediately to the east is an occupied two-story, 38-room motel (Rodeway Inn & Suites located at 3940 West Century Boulevard) and associated surface parking lots provided in the front and rear of the motel. Directly east of the Rodeway Inn & Suites fronting West Century Boulevard, is a vacant parcel surrounded by chain link fencing. The northeastern portion of the Arena Site is a narrow vacant parcel surrounded by chain link fencing and green screening. Located on this vacant parcel is an access road into the Arena Site that had previously been used to support the storage and staging of construction materials associated with a since completed street improvement project.

⁶ David F. Cushing, Manager, Los Angeles Airports District Office, U.S. Department of Transportation, Federal Aviation Administration, August 26, 2019.

Inglewood Basketball and Entertainment Center

Figure 3.10-1

Existing and Surrounding Land Uses:

Arena Site, Well Relocation Site, and West Parking Garage Site

Fronting West 102nd Street to the north, is a vacant parcel associated with the Arena Site that is surrounded by chain link fencing and screening. Further west, is the City of Inglewood Water Well #6 that is surrounded and secured by vertical blue metal fencing and an access gate. Also within the Arena Site to the west and north of Water Well #6, are unoccupied two-story warehouse/light manufacturing uses (located at 3915 West 102nd Street) and associated surface parking. To the west is a vacant parcel surrounded by chain link fencing that extends to South Prairie Avenue and West Century Boulevard. On the Arena Site, at the northeast corner of South Prairie Avenue and West 102nd Street, is a Clear Channel outdoor advertising display.

Fronting West 102nd Street to the south is a vacant parcel surrounded by chain link fencing. Also located on the Arena Site, is a vacant one- and two-story concrete commercial building (3838 West 102nd Street) that includes an access driveway. To the south is an occupied commercial use (Let's Have a Cart Party located at 10212 South Prairie Avenue).

West Parking Garage Site

The West Parking Garage Site is approximately 5 acres on the north and south sides of West 101st Street, bounded by West Century Boulevard to the north, South Prairie Avenue on the east, West 102nd Street to the south, and residential uses to the west. As shown in Figure 3.10-1, the site is currently vacant and is surrounded by chain link fencing.

East Transportation and Hotel Site

As shown in Figure 3.10-2, the approximately 5.16-acre East Transportation and Hotel Site consists of a vacant parcel surrounding by vertical metal fencing and intermittent green screening.

Well Relocation Site

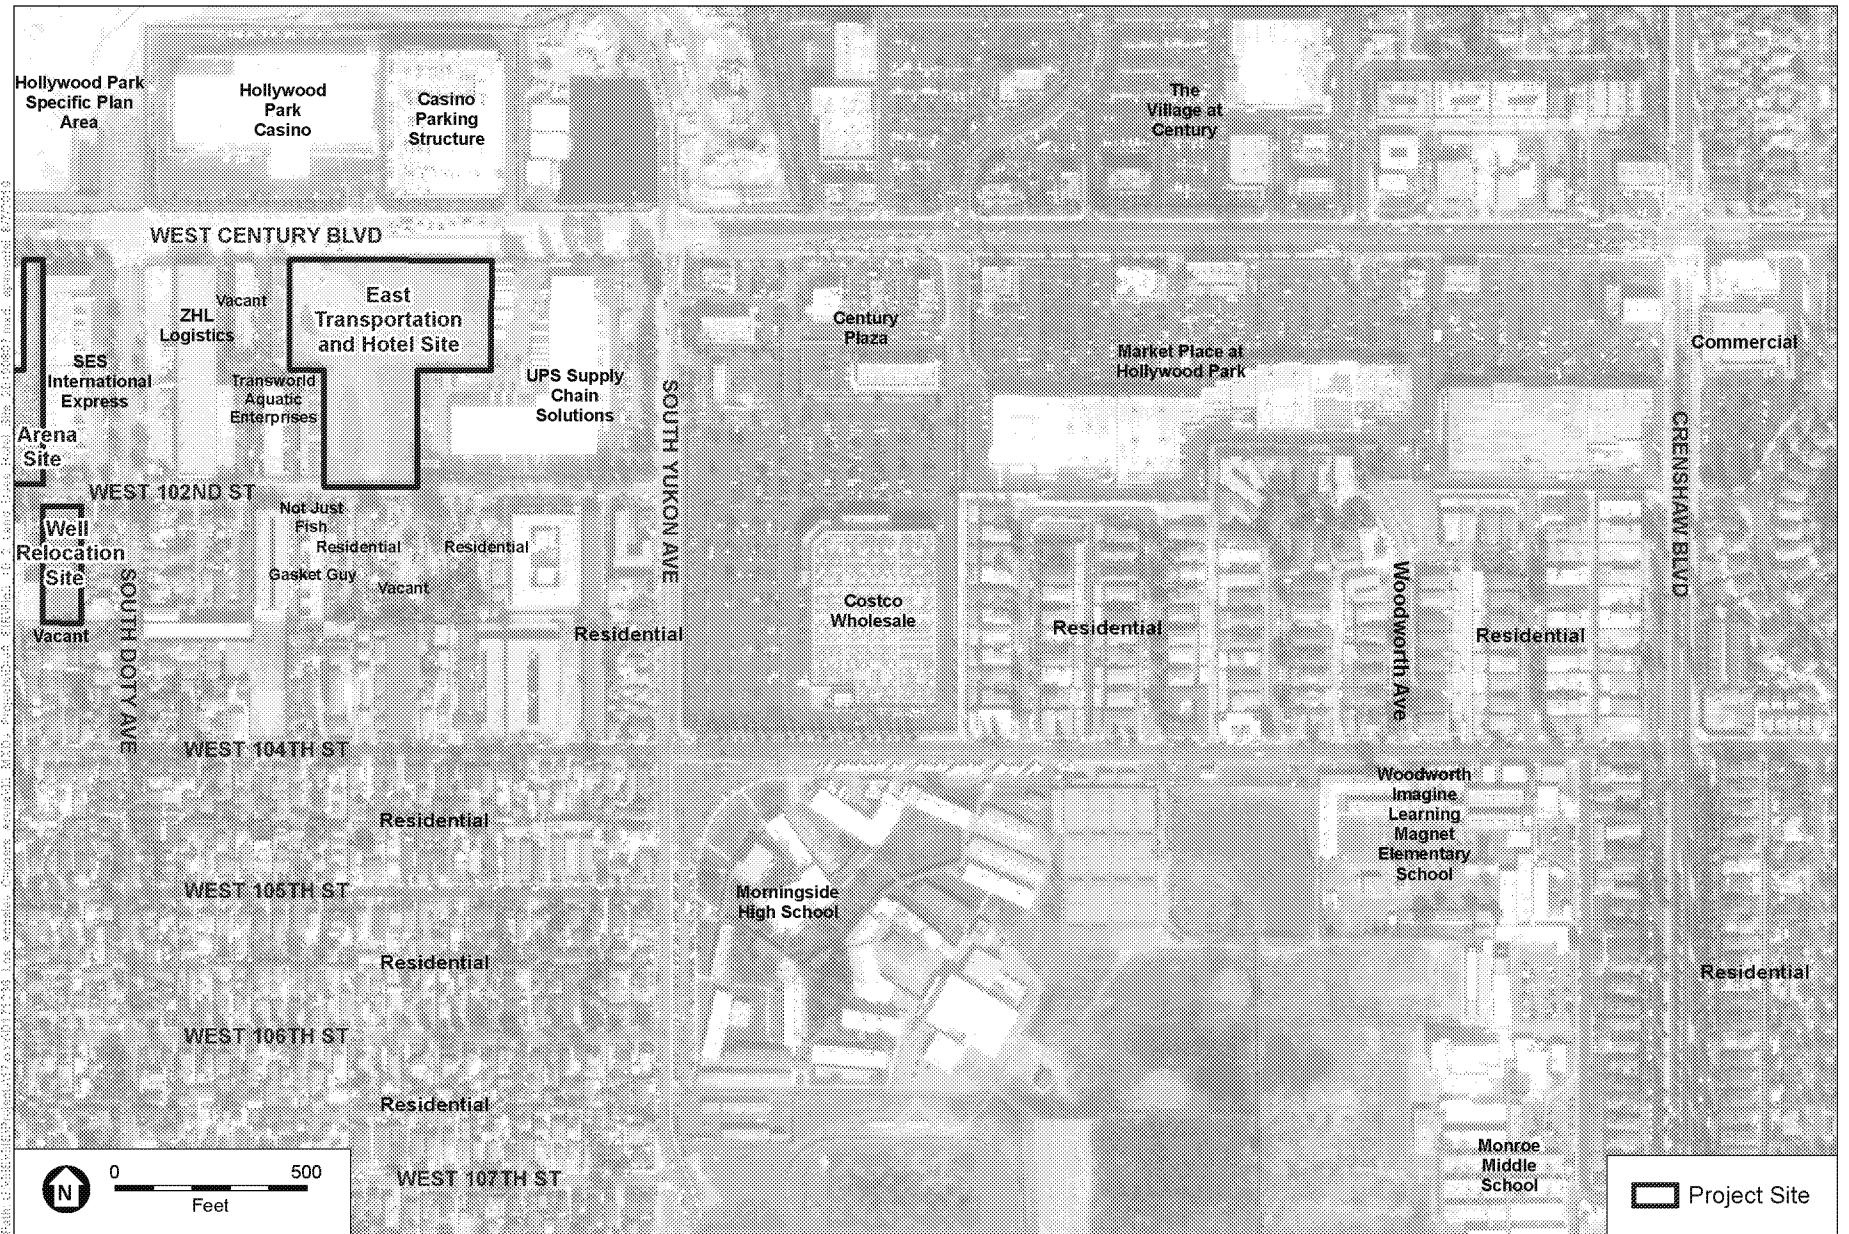

The 0.70-acre Well Relocation Site is currently vacant and is surrounded by chain link fencing (see Figure 3.10-1).

Surrounding Land Uses

Arena Site

As shown in Figure 3.10-1, located outside of the Arena Site, to the east of the vacant parcel along West Century Boulevard, is a non-operational three-story structure that was formerly operated as the Airport Park View Hotel (located at 3900 West Century Boulevard) and associated surface parking. The structure is dilapidated, and is currently undergoing substantial renovation before it can be reused for as a hotel. Located directly east of the hotel are occupied one- and two-story commercial buildings (Extra Space Storage located at 3846 West Century Boulevard) and associated surface parking.

Adjacent land uses bordering the Arena Site to the east include an occupied warehousing and shipping company (S.E.S. International Express located at 10105 South Doty Avenue, Unit A) and associated surface parking. The S.E.S. International Express buildings and associated surface parking extends the entire block between West Century Boulevard and West 102nd Street. To the

Inglewood Basketball and Entertainment Center
Figure 3.10-2
 Existing and Surrounding Land Uses:
 East Transportation and Hotel Site

immediate east of S.E.S. International Express buildings is South Doty Avenue. East of South Doty Avenue is a currently occupied two-story warehouse building (ZHL Logistics located at 3750–3780 West Century Boulevard) and associated truck loading area. The ZHL Logistics building and associated truck loading area extends the entire block between West Century Boulevard and West 102nd Street. To the east of the ZHL Logistics is a single-story vacant warehouse building (located at 3738 West Century Boulevard). East of the vacant warehouse building is an occupied single-story aquarium products business (Transworld Aquatic Enterprises, Inc. located at 3730 West Century Boulevard). Adjacent land uses further to the southeast of the Arena Site include an occupied commercial use (CDs Cabinets located at 3820 West 102nd Street), a vacant lot (the proposed Well Relocation Site), and single-family residences located on the south side of West 102nd Street near South Doty Avenue. Fronting West 104th Street and located immediately south of the Arena Site are single-family residences, multifamily residences, and a church (Inglewood Southside Christian Church located at 3947 West 104th Street) with associated surface parking and an early childhood education facility located on the premises.

Adjacent land uses to the west of the Arena Site along South Prairie Avenue between West 104th Street and West 103rd Street include residential uses and an occupied single-story automotive body shop (Auto Collision Team located at 10305 South Prairie Avenue). Uses along South Prairie Avenue between West 103rd Street and West 102nd Street include residences, an occupied single-story automotive shop (LAX Mercedes BMW Service and Repair located at 10223 South Prairie Avenue), and an occupied single-story religious facility and related buildings and associated surface parking (Being in Power Ministries located at 10201 South Prairie Avenue). Uses to the west of the Arena Site along South Prairie Avenue between West 102nd Street and West 101st Street include vacant parcels surrounded by chain link fencing (portion of the proposed West Parking Garage Site). Uses to the west of the Arena Site located along South Prairie Avenue between West 101st Street and West Century Boulevard include commercial uses (Starbucks located at 4000 West Century Boulevard, Liquor Warehouse located at 10023 South Prairie Avenue, and Sunshine Coin Laundry located at 10001 South Prairie Avenue).

To the north of the Arena Site, West Century Boulevard provides an east–west roadway connection through the City of Inglewood. From 1938 until 2013, except for a few years during World War II, the Hollywood Park horse racetrack operated on approximately 240 acres of land north of West Century Boulevard, and east of South Prairie Avenue. For a number of years prior to the closure of the track, it was apparent that the current and future economics of horse racing, combined with the increasing value of the property, would result in closure and redevelopment of the Hollywood Park property. In anticipation of the expected closure of the racetrack, the City approved and adopted the Hollywood Park Specific Plan (HPSP) on July 8, 2009. The HPSP was amended September 23, 2014, and then further amended through approval of an ordinance that adopted the City of Champions Revitalization Initiative on February 24, 2015.⁷ Based on the

⁷ *Hollywood Park Specific Plan*, Unofficial Reference Guide Only for Stadium Alternative Project, adopted July 8, 2009, amended September 23, 2014, further amended February 24, 2015. Available: <https://www.cityofinglewood.org/DocumentCenter/View/1347/Hollywood-Park-Specific-Plan>. Accessed September 2018.

Initiative, the HPSP area is planned for the location of an NFL Stadium and a mix of commercial, office, retail, residential, mixed use, civic, and recreational development.

As described in Section 3.0, Introduction to the Analysis, the NFL Stadium and other development in the HPSP area will be in operation prior to the Proposed Project's completion in 2024, and that development is included in the Adjusted Baseline discussed below. The NFL Stadium and 6,000 seat performance venue are under construction and scheduled to be completed in summer 2020, and approximately 518,000 square feet (sf) of retail and restaurant space, 466,000 sf of office space, 314 residential units, and an 11.86-acre open space (Lake Park) have been permitted and are expected to be completed by September 2021. The HPSP also provides for development of 2,186 additional residential units, 371,923 sf of commercial uses, 3,567,314 sf of office space, 300 hotel rooms, 13.06 acres of open space, and a 4-acre civic use, which are included within the cumulative projects (specifically cumulative project 67) in this EIR (see Section 3.0.6).

West Parking Garage Site

As can be seen on Figure 3.10-1, the area to the north of the site across West Century Boulevard includes occupied single-story commercial buildings (Chevron located at 4015 West Century Boulevard, McDonald's located at 4015 West Century Boulevard, Dr. Carfix/Tiki Smog located at 4055 West Century Boulevard, Jack In the Box located at 4069 West Century Boulevard, and Auto Motor Service located at 4101 West Century Boulevard), a vacant parcel, occupied two- and three-story motels (Holly Crest Hotel located at 4027 West Century Boulevard and Motel 6 located at 4123 West Century Boulevard) and an unoccupied and unnamed motel located at 4059 West Century Boulevard.

Uses located immediately to the east of the site include occupied commercial uses (Starbucks located at 4000 West Century Boulevard, Liquor Warehouse located at 10023 South Prairie Avenue, and Sunshine Coin Laundry located at 10001 South Prairie Avenue) and a vacant commercial use to the east along South Prairie Avenue.

The area to the south of the site includes West 102nd Street, an occupied single-story religious facility and related buildings and associated surface parking (Being in Power Ministries located at 10201 South Prairie Avenue), and residential uses.

To the immediate west along West Century Boulevard, is a motel (Airport Motel located at 4054 West Century Boulevard), a church (Iglesia Cristiana Pentecostes del Movimiento Misionero Mundial located at 4060 West Century Boulevard), and residential uses.

An approximately 345-foot linear section of West 101st Street between South Prairie Avenue and South Freeman Avenue would be vacated and developed as part of the parking structure. The vacated portion of West 101st Street would extend from the western boundary of the existing retail center (Starbucks/Warehouse Liquor Mart/Sunshine Coin Laundry) at the southwest corner of South Prairie Avenue and West Century Boulevard, to the alignment of the new north-south public roadway along the western boundary of the site proposed as part of the Proposed Project.

East Transportation and Hotel Site

As shown in Figure 3.10-2, adjacent land uses include the Hollywood Park Casino (located at 3883 West Century Boulevard) and associated three-story parking structure across West Century Boulevard to the north.

Adjacent to the East Transportation and Hotel Site to the east is a UPS facility (located at 3600 West Century Boulevard). East of the UPS facility is South Yukon Avenue, a north-south corridor. North of West 104th Street, Yukon Avenue is characterized by two large commercial shopping centers (Century Plaza and The Village at Century) with large-scale commercial development such as Costco and smaller commercial stores interspersed with residential development. Along South Yukon Boulevard to the southeast of the East Transportation and Hotel Site, is the Morningside High School, Monroe Middle School, and the Clyde Woodworth Transitional Kindergarten through 5th Grade Imagine Learning Magnet school campuses.

Uses south of the East Transportation and Hotel Site, across West 102nd Street, include a vacant lot, residential uses, and two commercial uses (Not Just Fish and Gasket Guy, co-located at 3716 West 102nd Street).

Adjacent uses to the east of the East Transportation and Hotel Site include an occupied single-story aquarium supply manufacturing business (Transworld Aquatic Enterprises, Inc. located at 3730 West Century Boulevard). To the west is a single-story vacant warehouse building (located at 3738 West Century Boulevard). Further to the west of the vacant warehouse building is an occupied two-story warehouse building (ZHL Logistics located at 3750-3780 West Century Boulevard) and associated truck loading area. The ZHL Logistics building and associated truck loading area extends the entire block between West Century Boulevard and West 102nd Street.

Well Relocation Site

As shown in Figure 3.10-1, to the north of the Well Relocation Site is West 102nd Street and an occupied warehousing and shipping company (S.E.S. International Express located at 10105 South Doty Avenue, Unit A) and associated surface parking. To the east of the site are residential uses and South Doty Avenue. A vacant lot and residential uses are located to the south. To the west of the site is an occupied commercial use (CDs Cabinets located at 3820 West 102nd Street).

3.10.2 Adjusted Baseline Environmental Setting

Section 3.10, Land Use and Planning, assumes the Adjusted Baseline Environmental Setting as described in Section 3.0, Introduction to the Analysis. Related to land use, the changes associated with the HPSP Adjusted Baseline projects replace vacant land immediately north of the Project Site, across West Century Boulevard, with retail, restaurant, commercial, residential, an NFL Stadium, other entertainment, and open space uses in the HPSP area. No other changes to the existing environmental setting related to land use and planning would occur under the Adjusted Baseline Environmental Setting.

3.10.3 Regulatory Setting

Federal

The Federal Aviation Act of 1958 created the FAA. The current name was adopted in 1967 when the agency became a part of the Department of Transportation. The FAA is tasked with, among other things, regulation of civil and commercial aviation. The FAA is required to review projects that entail construction or alteration of buildings more than 200 feet above ground level at the site. The project applicant, for any portion of a project (temporary or permanent) that exceeds 200 feet above ground level within the Project Site, is required to submit Form FAA 7460-1, Notice of Proposed Construction or Alteration, at least 45 days prior to the filing of an application for a construction permit.⁸ While the roof and appurtenances of the Proposed Project would rise no higher than 150 feet (permanent structure), if the temporary construction equipment exceeds 200 feet above ground level, then the FAA will still need to review the Proposed Project. Additional discussion of airport safety is discussed in Section 3.8, Hazards and Hazardous Materials. In addition, the FAA aeronautical study process is described in detail as part of the 2019 technical memorandum prepared by Capitol Airspace Group for the Proposed Project (see Appendix P).⁹

14 CFR Part 150, Airport Noise Compatibility Program, is discussed below.

State

Sustainable Communities and Climate Protection Act of 2008 (SB 375)

Senate Bill (SB) 375 (Chapter 728, Statutes of 2008) directs the California Air Resources Board to set regional targets for reducing greenhouse gas (GHG) emissions. The law establishes a “bottom up” approach to ensure that cities and counties are involved in the development of regional plans to achieve those targets.

SB 375 relates to land use planning by building on the existing framework of regional planning to tie together the regional allocation of housing needs and regional transportation planning in an effort to reduce GHG emissions from motor vehicle trips. Further, SB 375 established CEQA streamlining and relevant exemptions for projects that are determined to be consistent with the land use assumptions and other relevant policies of an adopted Sustainable Communities Strategy. Those exemptions and streamlining regulations are reflected in CEQA Guidelines sections 15064.4 and 15183.5. Additional discussion of SB 375, including consistency of the Proposed Project with SB 375, is addressed in Section 3.7, Greenhouse Gas Emissions.

⁸ Federal Aviation Administration, 2017. Form FAA 7460-1, Notice of Proposed Construction or Alteration, Section 77.9 Construction or alteration requiring notice, https://www.faa.gov/documentLibrary/media/Form/FAA_Form_7460-1_AJV-1-050117.pdf. Accessed September 2018.

2011 Caltrans Airport Land Use Planning Handbook

The Caltrans Division of Aeronautics is responsible for administering much of the California State Aeronautics Act (Public Utilities Code section 21001 *et seq.*). The State Aeronautics Act requires Caltrans Division of Aeronautics to provide guidance to ALUCs in preparing Airport Land Use Compatibility Plans (ALUCPs) through publication of the Caltrans Airport Land Use Planning Handbook (Caltrans Handbook).¹⁰ The Caltrans Handbook provides guidance on developing land use compatibility criteria and policies associated with noise, safety, airspace, and aircraft overflight. Public Resources Code section 21096 states that if a lead agency prepares an EIR for a project situated within ALUCP boundaries, the Airport Land Use Planning Handbook and other documents shall be utilized as a technical resource to assist in the preparation of the EIR in so much as it relates to airport-related safety hazards and noise problems.

The most recent version of the Caltrans Handbook was released in October 2011. The Caltrans Handbook is intended to provide information on compatible land use planning to ALUCs, their staff, airport proprietors, cities, counties, consultants, and the public; identify the requirements and procedures for preparing effective compatibility planning documents; and, define exceptions where applicable.¹¹ The Caltrans Handbook applies to all ALUCs responsible for providing compatible land use planning in the vicinity of each existing and new public-use airport within their jurisdiction. While the Caltrans Handbook provides guidance for complying with baseline safety and compatibility requirements, ALUCs may choose to be more restrictive based on local conditions. Caltrans is working on an update to the Airport Land Use Planning Handbook, but a schedule for that update process is not currently available.

Regional

To the extent that regional policies may be adopted for the purpose of avoiding or mitigating an environmental effect, those policies are discussed under Impact 3.10-2.

SCAG Regional Comprehensive Plan

SCAG prepared the 2008 RCP in response to SCAG's Regional Council directive in the 2002 Strategic Plan to define solutions to interrelated housing, traffic, water, air quality, and other regional challenges.¹² The 2008 RCP is an advisory document that describes future conditions if current trends continue, defines a vision for a healthier region, and recommends an Action Plan with a target year of 2035. The 2008 RCP may be voluntarily used by local jurisdictions in developing local plans and addressing local issues of regional significance. The plan incorporates principles and goals of the Compass Growth Vision Report (GVR) and includes nine chapters addressing land use and housing, transportation, air quality, energy, open space, water, solid waste, economy, and security and emergency preparedness. The action plans contained therein

¹⁰ California Department of Transportation, Division of Aeronautics, *California Airport Land Use Planning Handbook*, October 2011.

¹¹ California Department of Transportation, Division of Aeronautics, *California Airport Land Use Planning Handbook*, October 2011. p. vii.

¹² Southern California Association of Governments, Final 2008 Regional Comprehensive Plan: Helping Communities Achieve a Sustainable Future, October 2008.

provide a series of recommended near-term policies that developers and key stakeholders should consider for implementation, as well as potential policies for consideration by local jurisdictions and agencies when conducting project review.

The 2008 RCP includes a series of action plans intended to achieve the goals of the RCP, each of which contain a number of near-term policies and long-term strategies that have the potential for direct or indirect environmental benefits. Many of the policies and strategies provide suggested directions or actions that may be voluntarily implemented by SCAG or other agencies in the SCAG region. The following are the key policies or strategies that are relevant to the Proposed Project:

- **LU-6.2:** Developers and local governments should integrate green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program.
- **OSN-14:** Developers and local governments should implement mitigation for open space impacts through the following activities:
 - Individual projects should either avoid significant impacts to regionally significant open space resources or mitigate the significant impacts through measures consistent with regional open space policies for conserving natural lands, community open space and farmlands. All projects should demonstrate consideration of alternatives that would avoid or reduce impacts to open space.
 - Individual projects should include into project design, to the maximum extent practicable, mitigation measures and recommended best practices aimed at minimizing or avoiding impacts to natural lands, including, but not limited to FHWA's Critter Crossings, and Ventura County Mitigation Guidelines.
 - Project level mitigation for RTP's significant cumulative and growth-inducing impacts on open space resources will include but not be limited to the conservation of natural lands, community open space and important farmland through existing programs in the region or through multiparty conservation compacts facilitated by SCAG.
 - Project sponsors should ensure that transportation systems proposed in the RTP avoid or mitigate significant impacts to natural lands, community open space and important farmland, including cumulative impacts and open space impacts from the growth associated with transportation projects and improvements.
 - Project sponsors should fully mitigate direct and indirect impacts to open space resulting from implementation of regionally significant projects.
- **OSC-8:** Local governments should encourage patterns of urban development and land use, which reduce costs on infrastructure and make better use of existing facilities.
- **OSC-10:** Developers and local governments should promote infill development and redevelopment to revitalize existing communities.
- **OSC-11:** Developers and local governments should include land use principles, such as green building, that use resources efficiently, eliminate pollution and significantly reduce waste into their projects, zoning codes and other implementation mechanisms.

- **OSC-12:** Developers and local governments should promote water-efficient land use and development.
- **OSC-13:** Developers and local governments should encourage multiple use spaces and encourage redevelopment in areas where it will provide more opportunities for recreational uses and access to natural areas close to the urban core.
- **WA-9:** Developers and local governments should consider potential climate change hydrology and resultant impacts on available water supplies and reliability in the process of creating or modifying systems to manage water resources for both year-round use and ecosystem health.
- **WA-10:** Developers and local governments should include conjunctive use as a water management strategy when feasible.
- **WA-11:** Developers and local governments should encourage urban development and land uses to make greater use of existing and upgraded facilities prior to incurring new infrastructure costs.
- **WA-12:** Developers and local governments should reduce exterior uses of water in public areas, and should promote reduced use in private homes and businesses, by shifting to drought-tolerant native landscape plants (xeriscaping), using weather-based irrigation systems, educating other public agencies about water use, and installing related water pricing incentives.
- **WA-27:** Developers and local governments should maximize pervious surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. New impervious surfaces should be minimized to the greatest extent possible, including the use of in-lieu fees and off-site mitigation.
- **WA-32:** Developers and local governments should pursue water management practices that avoid energy waste and create energy savings/supplies.
- **EN-8:** Developers and local governments should include the following land use principles that use resources efficiently, eliminate pollution and significantly reduce waste into their projects, zoning codes and other implementation mechanisms:
 - Mixed-use residential and commercial development that is connected with public transportation and utilizes existing infrastructure.
 - Land use and planning strategies to increase biking and walking trips.
- **EN-10:** Developers and local governments should integrate green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. Energy saving measures that should be explored for new and remodeled buildings include:
 - Using energy efficient materials in building design, construction, rehabilitation, and retrofit.
 - Encouraging new development to exceed Title 24 energy efficiency requirements.
 - Developing Cool Communities measures including tree planting and light-colored roofs. These measures focus on reducing ambient heat, which reduces energy consumption related to air conditioning and other cooling equipment.

- Utilizing efficient commercial/residential space and water heaters: This could include the advertisement of existing and/or development of additional incentives for energy efficient appliance purchases to reduce excess energy use and save money.
