	10:35 PM, Thursday, May 30, 2019	15-min	-	-	-	65.4	-					
	1:01 AM, Friday, May 31, 2019	15-min	-	-	-	-	63.4					
M17	12:30 PM, Friday, May 31, 2019	15-min	-	67.4	-	-	-					
	11:18 PM, Thursday, May 30, 2019	15-min	-	-	-	69.2	-					
	1:42 AM, Friday, May 31, 2019	15-min	-	-	-	-	66.9					

- Notes:
- ^a 24-hour measurements taken at locations M1 through M5 over the course of four days. Three separate 15-minute measurements taken at locations M6 through M17 to represent three time periods.
 - ^b Daytime hours are from 7:00 a.m. to 10:00 p.m., and nighttime hours are from 10:00 p.m. to 7:00 a.m.
 - ^c Average 24-hour CNEL calculated from four days of data.
 - ^d Average daytime Leq calculated from four days of data (hours 7:00 a.m. - 10:00 p.m.).
 - ^e Average nighttime Leq calculated from four days of data (hours 10:00 p.m. - 7:00 a.m.).
 - ^f Average Leq calculated from four days of data for the 9:30 p.m. - 11:30 p.m. time period.
 - ^g Average Leq calculated from four days of data for the 12:00 a.m. - 2:00 a.m. time period.

J.1.3 Noise Meter Outputs – Short-Term Measurements (Day)

Summary

File Name on Meter LxT_Data.011
 File Name on PC SLM_0004436_LxT_Data_011.00.ldbin
 Serial Number 0004436
 Model SoundTrack LxT®
 Firmware Version 2.302
 User
 Location M6
 Job Description
 Note

Measurement

Description
 Start 2018-05-10 08:52:00
 Stop 2018-05-10 09:07:00
 Duration 00:15:00.0
 Run Time 00:15:00.0
 Pause 00:00:00.0

 Pre Calibration 2018-05-10 07:46:24
 Post Calibration None
 Calibration Deviation ---

Overall Settings

RMS Weighting A Weighting
 Peak Weighting Z Weighting
 Detector Slow
 Preamp PRMLxT2B
 Microphone Correction Off
 Integration Method Exponential
 Overload 142.1 dB

 Under Range Peak A C Z
 98.4 95.4 100.4 dB
 Under Range Limit 47.4 45.4 53.4 dB
 Noise Floor 34.3 35.0 42.6 dB

J.1.4 Noise Meter Outputs – Short-Term Measurements (Evening)

Summary

File Name on Meter LxT_Data.014
 File Name on PC SLM_0005055_LxT_Data_014.00.ldbin
 Serial Number 0005055
 Model SoundTrack LxT®
 Firmware Version 2.302
 User
 Location M6
 Job Description
 Note

Measurement

Description
 Start 2019-05-30 21:33:43
 Stop 2019-05-30 21:48:43
 Duration 00:15:00.0
 Run Time 00:15:00.0
 Pause 00:00:00.0

 Pre Calibration 2019-05-30 21:17:02
 Post Calibration None
 Calibration Deviation ---

J.1.5 Noise Meter Outputs – Short-Term Measurements (Night)

Summary

File Name on Meter LxT_Data.020
 File Name on PC SLM_0005055_LxT_Data_020.00.ldbin
 Serial Number 0005055
 Model SoundTrack LxT®
 Firmware Version 2.302
 User
 Location M6
 Job Description
 Note

Measurement

Description
 Start 2019-05-31 00:01:47
 Stop 2019-05-31 00:16:47
 Duration 00:15:00.0
 Run Time 00:15:00.0
 Pause 00:00:00.0
 Pre Calibration 2019-05-30 21:17:02
 Post Calibration None
 Calibration Deviation ---

Summary

File Name on Meter LxT_Data.099
 File Name on PC SLM_0004285_LxT_Data_099.00.ldbin
 Serial Number 0004285
 Model SoundTrack LxT®
 Firmware Version 2.302
 User
 Location M9
 Job Description
 Note

Measurement

Description
 Start 2019-05-31 01:30:45
 Stop 2019-05-31 01:45:45
 Duration 00:15:00.0
 Run Time 00:15:00.0
 Pause 00:00:00.0
 Pre Calibration 2019-05-30 21:14:54
 Post Calibration None
 Calibration Deviation ---

	u188	64.8			58.1				0.0				

a Modeling takes into consideration the overlap of construction phases as specified in the Resource Loaded Schedule. The overlap scenario with the worst-case construction noise at the West Parking Garage Site was modeled, combined with construction activity that would occur at the other 3 project site locations.

Modeling takes into consideration the overlap of construction phases as specified in the Resource Loaded Schedule. The overlap scenario with the worst-case construction noise at each of the project site locations was modeled, combined with construction activity that would occur at the other 3 project site locations (total of 4 overlap scenarios).
 a The maximum worst-case overall construction noise level is summarized.

Notes:

- ^a Maximum concurrent construction activity to occur at the Well Relocation Site modeled for two locations of the site to ensure maximum impacts considered for all receivers.
- ^b Maximum concurrent construction activity to occur at the West Parking Garage Site modeled at within one area of the site.
- ^c Maximum concurrent construction activity to occur at the East Transportation and Hotel Site modeled for two locations of the site to ensure maximum impacts considered for all receivers.
- ^d Maximum concurrent construction activity to occur at the Arena Site (within specified activity areas) modeled for nine locations of the site to ensure maximum impacts considered for all receivers.

IBEC Daytime Constr.

Notes:

- ^a Maximum concurrent construction activity to occur at the Well Relocation Site modeled for two locations of the site to ensure maximum impacts considered for all receivers.
- ^b Maximum concurrent construction activity to occur at the West Parking Garage Site modeled at within one area of the site.
- ^c Maximum concurrent construction activity to occur at the East Transportation and Hotel Site modeled for two locations of the site to ensure maximum impacts considered for all receivers.
- ^d Maximum concurrent construction activity to occur at the Arena Site (within specified activity areas) modeled for nine locations of the site to ensure maximum impacts considered for all receivers.

Notes:

AM and PM peak hour traffic volume data collected by Fehr & Peers.

- Existing traffic data not collected.

Assumed that average peak hour traffic volumes consist of 10% of average daily traffic (ADT) volumes.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

J.4.3 Adjusted Baseline

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,831	38	19	67.6	67.9

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,021	21	11	65.1	65.4

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,024	21	11	65.1	65.4

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,645	34	17	67.2	67.5

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	827	17	9	64.2	64.5

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,831	38	19	67.6	67.9

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	N/A	N/A	N/A	N/A	N/A

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	N/A	N/A	N/A	N/A	N/A

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,887	39	19	67.7	68.0

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Figueroa St between Manchester Blvd and Century Ave	Hard	50	35	35	35	1,053	22	11	65.2	65.5

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Notes:

- a The model accounts for multiple receiver points within an EIR receptor group.
- b Range of daytime ambient noise levels under existing conditions has been estimated based on the distance of receiver points to roadways and ambient measurement locations.
- c Range of composite operational noise levels within each EIR receptor group is based on the range of noise levels estimated for each receiver point within the receptor group.
- d Threshold of significance: 3 dBA Leq increase in ambient.
- e Range of ambient noise levels (during the 9:30 PM - 11:30 PM time period) under existing conditions has been estimated based on the distance of receiver points to roadways and ambient measurement locations.

Notes:

- a The model accounts for multiple receiver points within an EIR receptor group.
- b Range of daytime ambient noise levels under existing conditions has been estimated based on the distance of receiver points to roadways and ambient measurement locations.
- c Range of composite operational noise levels within each EIR receptor group is based on the range of noise levels estimated for each receiver point within the receptor group.
- d Threshold of significance: 3 dBA Leq increase in ambient.

Notes:

a The model accounts for multiple receiver points within an EIR receptor group.

b Range of daytime ambient noise levels under existing conditions has been estimated based on the distance of receiver points to roadways and ambient measurement locations.

c Range of composite operational noise levels within each EIR receptor group is based on the range of noise levels estimated for each receiver point within the receptor group.

d Threshold of significance: 3 dBA Leq increase in ambient.

Notes:

- a The model accounts for multiple receiver points within an EIR receptor group.
- b Range of daytime ambient noise levels under existing conditions has been estimated based on the distance of receiver points to roadways and ambient measurement locations.
- c Range of composite operational noise levels within each EIR receptor group is based on the range of noise levels estimated for each receiver point within the receptor group.
- d Threshold of significance: 3 dBA Leq increase in ambient.
- e Range of ambient noise levels (during the 9:30 PM - 11:30 PM time period) under existing conditions has been estimated based on the distance of receiver points to roadways and ambient measurement locations.

memorandum

date July 29, 2019
to City of Inglewood
from Susumu Shirayama, ESA
subject **Inglewood Basketball and Entertainment Center Noise Contours**

1.0 INTRODUCTION

Based on the most current available information, ESA developed noise contour maps for the proposed Inglewood Basketball and Entertainment Center (IBEC) located in the City of Inglewood. This technical memorandum describes the methodology used for the assessment and presents the results with noise contour maps. Six scenarios were assessed for this technical memorandum: 1) Friday pre-game events and concert, 2) Friday post-game events, 3) During game, 4) 2000 Person Event, 5) 7500 Person Event, and 6) Non Event.

2.0 NOISE FUNDAMENTALS

Noise is generally defined as unwanted sound. Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement. The dB scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the threshold of human hearing and 120 to 140 dB corresponding to the threshold of pain. Pressure waves traveling through air exert a force registered by the human ear as sound.

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but rather a broad band of frequencies varying in levels of magnitude. When all the audible frequencies of a sound are measured, a sound spectrum is plotted consisting of a range of frequency spanning 20 to 20,000 Hz. The sound pressure level, therefore, constitutes the additive force exerted by a sound corresponding to the sound frequency/sound power level spectrum.

The typical human ear is not equally sensitive to all frequencies of the audible sound spectrum. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 Hz and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to extremely low and extremely high frequencies. This method of frequency weighting is referred to as A-weighting and is expressed in units of A-weighted decibels (dBA). A-weighting follows an international standard methodology of frequency de-emphasis and is typically applied to community noise measurements.

An individual's noise exposure is a measure of noise over a period of time. While a noise level is a measure of noise at a given instant in time, community noise varies continuously over a period of time with respect to the contributing sound sources of the community noise environment. Community noise is primarily the product of many distant noise sources, which constitute a relatively stable background noise exposure, with the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources such as traffic. What makes community noise variable throughout a day, besides the slowly changing background noise, is the addition of short-duration, single-event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual.

These successive additions of sound to the community noise environment change the community noise level from instant to instant, requiring the measurement of noise exposure over a period of time to accurately characterize a community noise environment and evaluate cumulative noise impacts. This time-varying characteristic of environmental noise is described using statistical noise descriptors. The most frequently used noise descriptors are summarized below:

- L_{eq} : The L_{eq} , or equivalent sound level, is the energy-mean dBA during a measured time interval. It is the "equivalent" constant sound level that would have to be produced by a given source to equal the acoustic energy contained in the fluctuating sound level measured.
- L_{max} : The maximum, instantaneous noise level experienced during a given period of time.
- L_{min} : The minimum, instantaneous noise level experienced during a given period of time.
- CNEL: The Community Noise Equivalent Level (CNEL), is the equivalent A-weighted noise level during a 24-hour day, that includes an addition of a 5 dB penalty to noise levels between the evening hours of 7:00 p.m. to 10:00 p.m., and an addition of 10 dB to noise levels between the night hours of 10:00 p.m. to 7:00 a.m., to account for noise sensitivity in the evening and nighttime, respectively.

Noise levels from a particular source generally decline as distance to the receptor increases. Other factors, such as weather, reflective surfaces, or barriers also help intensify or reduce the noise level at any given location. A commonly used rule of thumb for roadway noise is that for every doubling of distance from the source, the noise level is reduced by approximately 3 dBA at acoustically "hard" locations (i.e., the area between the noise source and the receptor is nearly complete asphalt, concrete, hard-packed soil, or other solid materials) and 4.5 dBA at acoustically "soft" locations (i.e., the area between the source and receptor is normal earth or has vegetation, including grass). Noise from stationary or point sources is reduced by about 6 to 7.5 dBA for every doubling of distance at acoustically hard and soft locations, respectively. Noise levels may also be reduced by intervening structures – generally, a single row of buildings between the receptor and the noise source reduces the noise level by about 5 dBA, while a solid wall or berm reduces noise levels by 5 to 10 dBA.

3.0 METHODOLOGY

This section describes methodologies used for this noise impact assessment.

3.1 Noise Model

The Computer Aided Noise Abatement (CadnaA) noise propagation program (Version 2019) was used to estimate the propagation of noise from the Proposed Project.

CadnaA is a Windows-based software program that predicts and assesses noise levels in the vicinity of noise sources based on International Organization for Standardization 9613-2 algorithms for noise propagation calculations. The calculations account for classical sound wave divergence plus attenuation factors resulting from air absorption, basic ground effects, and barrier/shielding.

Following settings were used for CadnaA modeling:

- Temperature 50 degrees Fahrenheit
- 70% relative humidity
- Calm wind
- 0.5 ground absorption
- Reflection order of 2

3.2 Scenarios, Noise Sources, and Assumptions

A total of six scenarios were assessed: 1) Friday pre-game events and concert, 2) Friday post-game events, 3) During game, 4) 2,000 Person Event, 5) 7,500 Person Event, and 6) Non Event. Tables 1 and 2 present noise sources with available specifications as well as sources included in scenarios of 1, 2, and 3, and scenarios 4, 5, and 6, respectively. Notes in Tables describe assumptions for each noise source.

**TABLE 1
NOISE SOURCES FOR SCENARIOS 1, 2, AND 3**

Notes:

- a. Sound Power Level
- b. Sound Pressure Level at 1 meter
- c. Sound Pressure Level at 50 feet
- 1 Four HVAC units were included. The source is based on CadnaA's global source library, based on the operational capacity of 34 cubic meters per second of airflow at 750 pascals pressure.
- 2 Six transformers were included. The source is based on CadnaA's global source library, based on a normal capacity of 3000 kVA.
- 3 One fire pump was included. The source is based on the calculation methodology described in Engineering Noise Control 5th Edition, based on 265 horse power.
- 4 One fire pump was included. The source is based on the calculation methodology described in Engineering Noise Control 5th Edition, based on 135 horse power.
- 5 CadnaA was used to validate crowd noise level at the entrance door based on 18,000 attendees shout in the Arena.
- 6 FHWA's Traffic Noise Model was used to calculate the noise level from 12 medium trucks at 10 mph.
- 7 Noise level is per truck. The noise level is based on the actual measurement conducted by ESA staff for a project.
- 8 FTA General Assessment methodology was used. Noise level is based on 650 vehicles.
- 9 FHWA's Traffic Noise Model was used to calculate the noise level from 650 vehicles at 10 mph.
- 10 FTA General Assessment methodology was used. Noise level is based on 365 vehicles.
- 11 FHWA's Traffic Noise Model was used to calculate the noise level from 365 vehicles at 10 mph.
- 12 FTA General Assessment methodology was used. Noise level is based on 182 passenger vehicles, 20 charter coach buses, and 23 mini buses.
- 13 FHWA's Traffic Noise Model was used to calculate the noise level from 182 passenger vehicles, 20 charter coach buses, and 23 mini buses at 10 mph.
- 14 FHWA's Traffic Noise Model was used to calculate the noise level from 3,110 vehicles at 10 mph.
- 15 Raised voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed 50 people on the bridge.
- 16 Raised voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed a total of 454 people on the sidewalk along Century Blvd and Prairie Avenue.
- 17 Raised voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed 5,334 people for Friday Post Event scenario and 1,334 people for During Game scenario.
- 18 Assumed 2,666 people in the vicinity of the stage. Shout, Loud, and Raised voices per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions were used. The 2,666 people were divided into three voices.
- 19 A total of five speakers were placed at the top of the stage shell. CadnaA was validated to be 92 dBA at Front of House (100 feet from the stage) from five speakers.
- 20 Normal voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed 1,000 people on the rooftop restaurant.

TABLE 2
NOISE SOURCES FOR SCENARIOS 4, 5, AND 6

Notes:

- a. Sound Power Level
- b. Sound Pressure Level at 1 meter
- c. Sound Pressure Level at 50 feet
1. Four HVAC units were included. The source is based on CadnaA's global source library, based on the operational capacity of 34 cubic meters per second of airflow at 750 pascals pressure.
2. Six transformers were included. The source is based on CadnaA's global source library, based on a nominal capacity of 3000 kVA.
3. Two emergency generators were included. The source is based on the calculation methodology described in Engineering Noise Control 5th Edition, based on 2,153 horse power.
4. One fire pump was included. The source is based on the calculation methodology described in Engineering Noise Control 5th Edition, based on 265 horse power.
5. One fire pump was included. The source is based on the calculation methodology described in Engineering Noise Control 5th Edition, based on 135 horse power.
6. FTA General Assessment methodology was used. For Scenario 4, Noise level of 56 dBA at 50 feet was used for 935 vehicles. For Scenario 5, Noise level of 58 dBA at 50 feet was used for 1,471 vehicles. For Scenario 6, Noise level of 56 dBA at 50 feet was used for 835 vehicles.
7. FHWA's Traffic Noise Model was used. For Scenario 4, Noise level of 53.9 dBA at 50 feet was used for 935 vehicles at 10 mph. For Scenario 5, Noise level of 55.9 dBA at 50 feet

- was used for 1,471 vehicles at 10 mph. For Scenario 6, Noise level of 53.4 dBA at 50 feet was used for 835 vehicles at 10 mph.
- 8 FTA General Assessment methodology was used. Noise level is based on 305 passenger vehicles.
- 9 FHWA's Traffic Noise Model was used. Noise level is based on 305 passenger vehicles at 10 mph.
- 10 FTA General Assessment methodology was used. Noise level is based on 182 passenger vehicles, 20 charter coach buses, and 23 mini buses.
- 11 FHWA's Traffic Noise Model was used to calculate the noise level from 182 passenger vehicles, 20 charter coach buses, and 23 mini buses at 10 mph.
- 12 FTA General Assessment methodology was used. For Scenario 4, Noise level of 62 dBA at 50 feet was used for 3,519 vehicles. For Scenario 5, Noise level of 63 dBA at 50 feet was used for 4,616 vehicles. For Scenario 6, Noise level of 59 dBA at 50 feet was used for 2,017 vehicles.
- 13 Raised voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed 50 people on the bridge.
- 14 Raised voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed a total of 429 people on the sidewalk.
- 15 Raised voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed 1334 people for each scenario.
- 16 Normal voice per male person included in Average Speech Levels and Spectra in Various Speaking/Listening Conditions. Assumed 1,000 people on the rooftop restaurant.

This noise modeling accounts for the proposed design of the Arena including the structure height, building shape, locations of entries and exits, and site grading and topography. This analysis also takes into account the capacity of the arena for all types of anticipated events, noise anticipated from those crowds, and specific locations of event stages. Further, the model inputs include details about the topography of the surrounding area, as well as surrounding existing and proposed building heights, locations, and site coverage.

3.3 Vehicular Traffic

Noise due to vehicular traffic was also included in the model. Peak hour project-only traffic volumes for the roadways in the vicinity of the Project Site were provided by Fehr & Peers. Roadway noise levels were calculated using a spreadsheet model developed based on the methodologies provided in FHWA's TNM Technical Manual. Tables 3 and 4 present the roadway and noise levels included in scenarios of 1, 2, and 3, and scenarios 4, 5, and 6, respectively.

N/A = Not Available

Negative traffic volumes indicate that the project would reduce the traffic volumes for those roadway segments.

3.4 Existing Structures

It is important to include existing structures with appropriate height because those structures would serve as barriers and block the noise from the Proposed Project. The building footprint data in the vicinity of the Proposed Project site was downloaded from the Los Angeles County GIS Data Portal and included in the noise model.

3.5 Designed Walls

There were four designed permanent walls included in the model. The locations of four walls were included in the noise contour maps. The height of both walls around the residential properties adjacent to the Arena Site to the east are 12 feet. The height of the wall along the southern Arena Site property line is 15 feet. The height of the wall around the hotel, north of the Arena Site, is 12 feet. The height of the wall near the exit to W. 102nd Street is 8 feet. It should be noted that the sound transmission loss (STL) was not incorporated into the model due to the assumption that the wall would be constructed of solid concrete. Noise transmitted through a concrete wall would be minimal and would be masked by the noise diffracted over the wall.

4.0 FINDINGS

Noise sensitive receivers were placed at the property line, 1.5 meters above ground closest to the Project Site. A total of 153 receivers were included in the model. Figure 1 presents the locations of noise sensitive receivers. Note that noise sensitive receivers include single-family and multi-family residences as well as a church located north of W 104th Street. In addition to the noise levels at noise sensitive receivers, noise contour maps were developed. The noise contour maps present noise contours that ranged from 50 dBA to 75 dBA in 5 dBA increment for each scenario.

4.1 Noise Sensitive Receivers

Tables 5 and 6 present overall project noise levels for scenarios of 1, 2, and 3, and scenarios 4, 5, and 6, respectively. Noise sources for each scenario were included in Tables 1 and 2. Note that noise sensitive receivers were placed on the receiver property line closest to the Project Site.

4.2 Friday Pre-Game Events and Concert

As presented in Figure 2, noise levels would be most acute at the areas nearest to the outdoor stage, with noise rippling mostly to the north. These noise levels are a result of the Arena structure and West Parking Garage providing a noise attenuation shield for areas to the west and south. As a result, residences to the north would be exposed to noise levels above 60 dBA. Noise levels of 60 dBA would also extend toward the southwest due to the gap between the Arena structure and West Parking Garage.

4.3 Friday Post-Game Events

The difference between Pre-Game and Post-Game scenarios is that the Post-Game scenario does not include a concert at the outdoor stage or the associated outdoor concert crowd. Figure 3 presents noise contours under the Post-Game scenario. Residences near W. 102nd Street and South Doty Avenue would experience 50 to 55 dBA.

4.4 During Game

The During Game scenario does not include parking related noise sources because it is assumed that event attendees would already be in the Arena. Compared to the Pre-Game and Post-Game scenarios, this scenario includes less parking related noise sources. Attendees are inside of the arena and less activities would occur outside of the arena. Figure 4 presents the noise contours under the During Game scenario.

4.5 2,000-Person Event

This scenario involves less activities compared to a game day event scenario as discussed above. Figure 5 indicates the noise activities are vehicular traffic, mechanical equipment, and parking garages. The loudest noise sources in this scenario would be the HVAC and Transformers sources, located on the southeast corner of the Arena building.

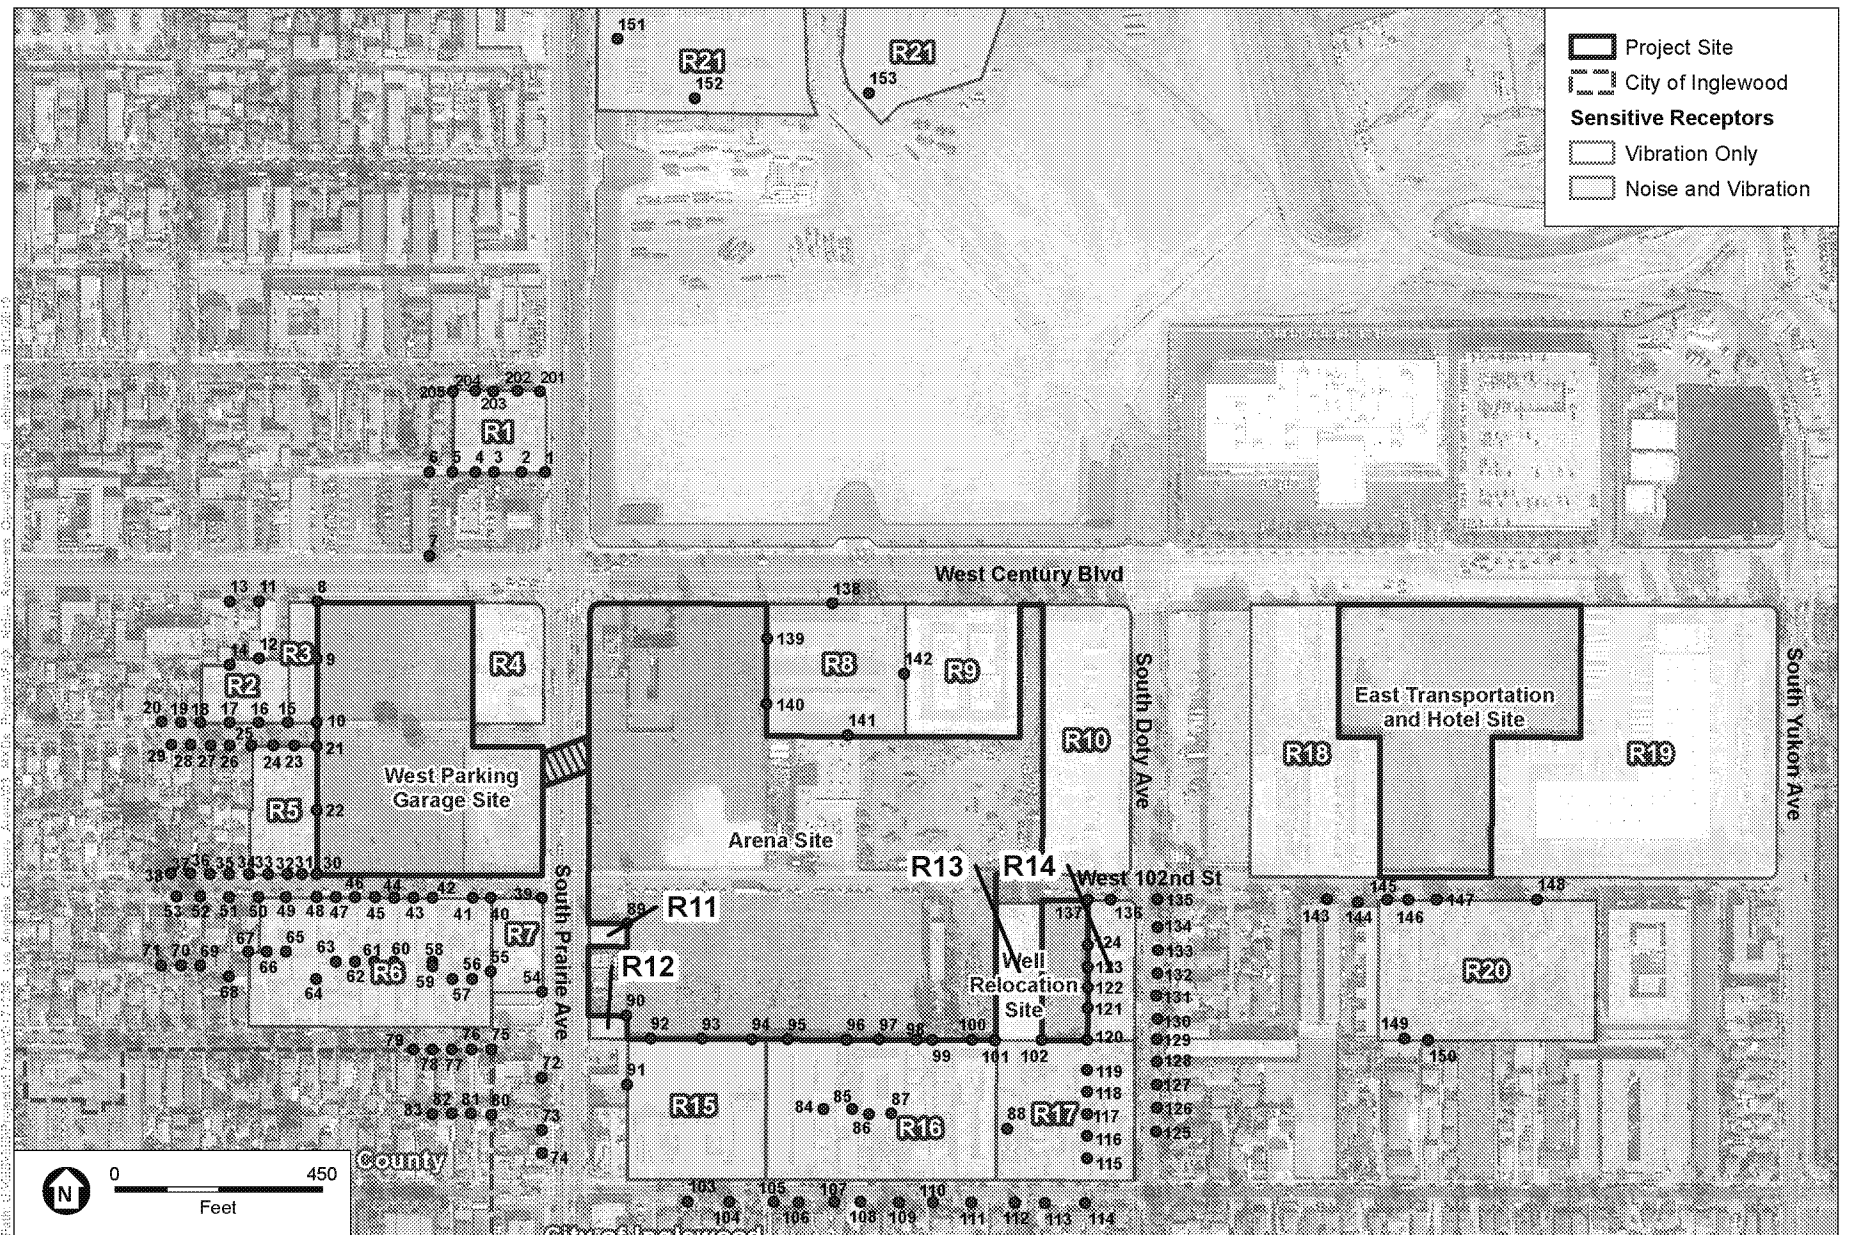

4.6 7,500-Person Event

Compared to the 2,000-Person scenario, this scenario includes more people, which generate more traffic and parking activities. Therefore, Figure 6 indicates a slightly larger noise contours than the 2,000-Person Event.

4.7 Non-Event

Under the Non-Event scenario, it is assumed that people would gather within the Plaza and vehicles would arrive and depart the parking garages. Necessary sources, such as HVAC and transformers would be in operation

regardless of events. Note that this scenario includes emergency generators co-located with other mechanical equipment. Figure 7 presents smaller noise contours.

Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018.

Notes:

* Values taken from Table 7-4.

** Based on the formula $VdB = 20 \times \log_{10}(v/v_{ref})$, where v_{ref} is equal to 1×10^{-6} in/sec (see page 111).

The approximate rms vibration velocity level (v) is calculated from PPV using a crest factor of 4 (see page 184).

*** Based on the formula $PPV(D) = PPV(25 ft) \times (25/D)^N$, where D is equal to the distance (see page 135).

N = soil type classification factor (typically ranges from 1 to 1.5)

Source:

Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018.

Notes:

* Values taken from Table 7-4.

** Based on the formula $VdB = 20 \times \log_{10}(v/v_{ref})$, where v_{ref} is equal to 1×10^{-6} in/sec (see page 111).

The approximate rms vibration velocity level (v) is calculated from PPV using a crest factor of 4 (see page 184).

*** Based on the formula $PPV(D) = PPV(25 ft) \times (25/D)^N$, where D is equal to the distance (see page 135).

N = soil type classification factor (typically ranges from 1 to 1.5)

Source

Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018.

Notes:

* Values taken from Table 7-4.

** Based on the formula $VdB = 20 \times \text{LOG}_{10}(v/v_{ref})$, where v_{ref} is equal to 1×10^{-6} in/sec (see page 111).

The approximate rms vibration velocity level (v) is calculated from PPV using a crest factor of 4 (see page 184).

*** Based on the formula $PPV(D) = PPV(25 ft) \times (25/D)^N$, where D is equal to the distance (see page 135).

N = soil type classification factor (typically ranges from 1 to 1.5)
