#### 1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed Moreno Valley Walmart ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, describes the local regulatory setting, provides the study methods and procedures for traffic noise analysis, and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term operational noise impacts and short-term construction noise impacts.

#### 1.1 SITE LOCATION

The proposed Moreno Valley Walmart development is located west of Perris Boulevard and south of Gentian Avenue in the City of Moreno Valley as shown on Exhibit 1-A. The Project site is currently vacant.

**EXHIBIT 1-A: LOCATION MAP** 

#### 1.2 STUDY AREA

The Project site is located within area developed mostly with residential and commercial land uses as shown on Exhibit 1-B. The existing residential community located approximately 1,500 west of the site across Indian Street includes a six-foot high masonry perimeter sound wall. The residential homes located approximately 700 feet north of the project site include a combination of fencing materials (wood and chain-link) that provide limited noise attenuation potential.

The March Middle School and Rainbow Ridge Elementary School are situated approximately 1,300 feet southwest of the Project site. The commercial land use located south the Project consists of an existing Home Depot. The land uses east of the Project site across Perris Boulevard include residential and a large parcel reserved for the use as the City Yard. To ensure that the noise analysis presents the worst-case future noise impacts associated with development of the Project, this analysis also identifies the impacts for the planned adjacent residential areas that are currently vacant to the north and west of the Project site.

#### 1.3 PROJECT DESCRIPTION

The Project includes the development of a 185,761 square foot free-standing discount superstore and a 16 vehicle fueling position gas station with convenience market and car wash. It is assumed that the Project will be constructed and occupied by 2018. Exhibit 1-C illustrates a preliminary conceptual site plan

**EXHIBIT 1-B: EXISTING LAND USES** 

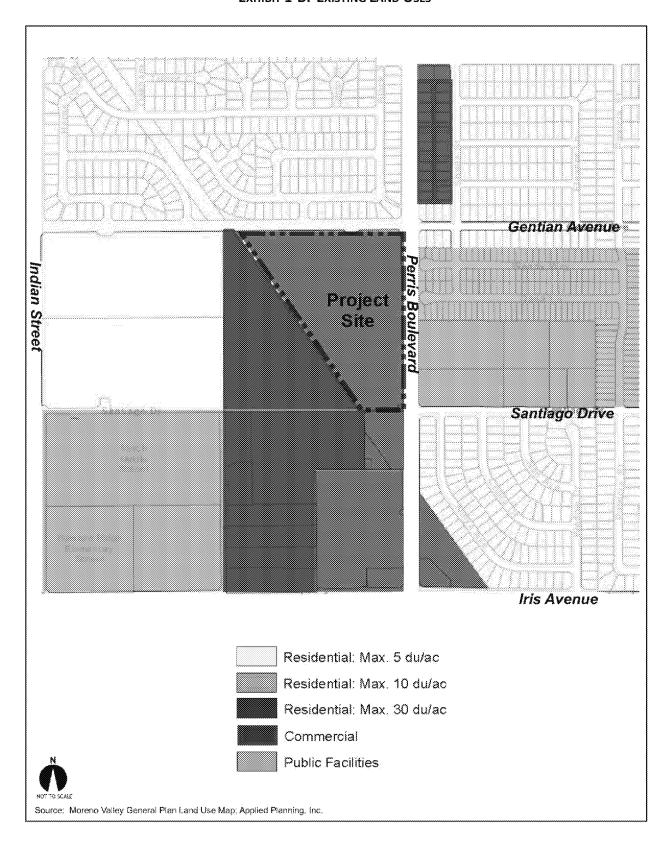

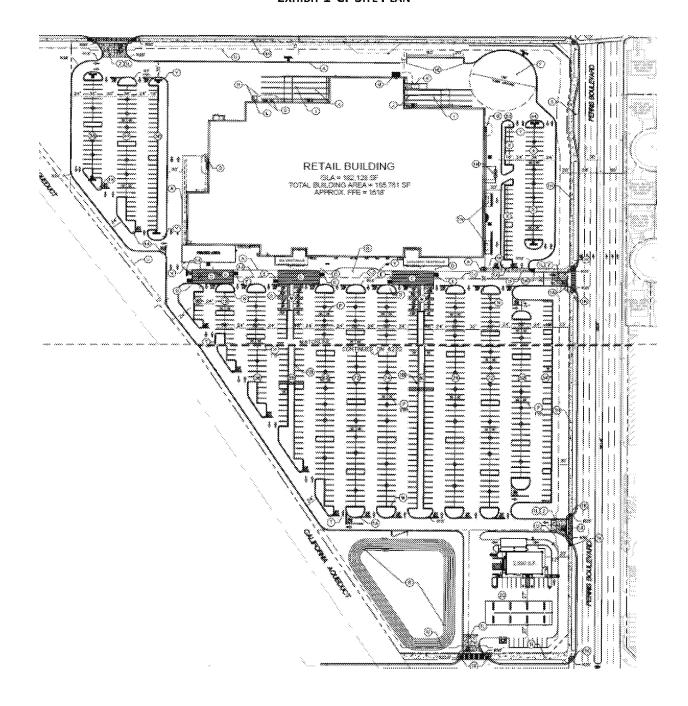

EXHIBIT 1-C: SITE PLAN

#### 2 FUNDAMENTALS

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

**EXHIBIT 2-A: TYPICAL NOISE LEVELS**

#### 2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud.(1) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA at approximately 100 feet, which can cause serious discomfort.(2) Another

important aspect of noise is the duration of the sound and the way it is described and distributed in time.

#### 2.2 Noise Descriptors

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (Leq). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (Leq) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite twenty-four hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of 5 decibels to dBA Leq sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA Leq sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any particular time, but rather represents the total sound exposure. The City of Moreno Valley relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

#### 2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The manner in which noise reduces with distance depends on the following factors.

#### 2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source.

#### 2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receptor is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also

been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receptor, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receptor such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source.

#### 2.3.3 ATMOSPHERIC EFFECTS

Receptors located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 ft) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects.

#### 2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receptor can substantially attenuate noise levels at the receptor. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an "out of sight, out of mind" effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receptor. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure.

#### 2.4 Traffic Noise Prediction

Vehicle noise is a combination of the noise produced by the engine, exhaust, and tires on the roadway. According to the *Highway Traffic Noise Analysis and Abatement Policy and Guidance*, provided by the Federal Highway Administration, the level of traffic noise depends on three primary factors: the volume of the traffic, the speed of the traffic, and the vehicle mix within the flow of traffic. Generally, the loudness of traffic noise is increased by heavier traffic volumes, higher speeds, and a greater number of trucks.(3) A doubling of the traffic volume, assuming that the speed and vehicle mix do not change, results in a noise level increase of 3 dBA. The vehicle mix on a given roadway may also have an effect on community noise levels. As the number of medium and heavy trucks increases and becomes a larger percentage of the vehicle mix, adjacent noise level impacts will increase.

#### 2.5 Noise Control

Noise control is the process of obtaining an acceptable noise environment for a particular observation point or receptor by controlling the noise source, transmission path, receptor, or all three. This concept is known as the source-path-receptor concept. In general, noise control measures can be applied to any and all of these three elements.

#### 2.6 Noise Barrier Attenuation

Effective noise barriers can reduce noise levels by 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receptor. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the view of the noise source. (3)

#### 2.7 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches and residences are more sensitive to noise intrusion than are commercial or industrial activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process.

The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (4)

#### 2.8 COMMUNITY RESPONSE TO NOISE

Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon each individual's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level of the receptor;
- Noise receptor's perception that they are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Receptor's belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Another twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (5) Surveys have shown that about ten percent of the

people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (5)

Despite this variability in behavior on an individual level, the population as a whole can be expected to exhibit the following responses to changes in noise levels. An increase or decrease of 1 dBA cannot be perceived except in carefully controlled laboratory experiments, a change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (3)

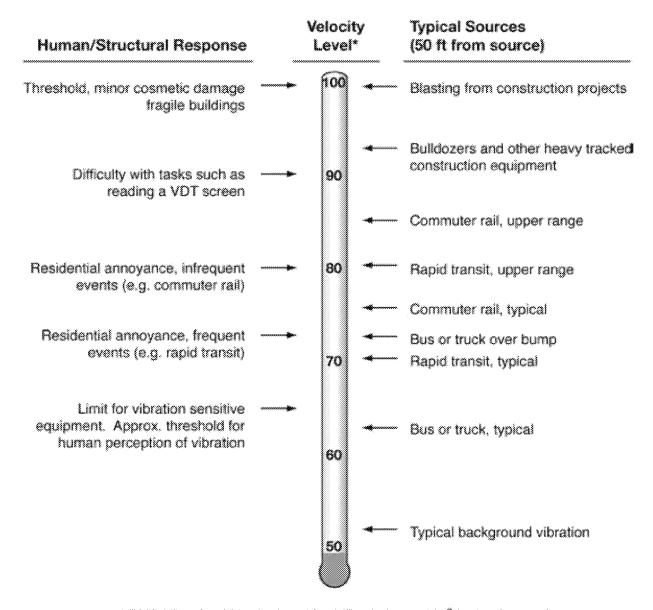

#### 2.9 VIBRATION

According to the Federal Transit Administration (FTA) Transit Noise Impact and Vibration Assessment (6), vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency. Vibration is often described in units of velocity (inches per second), and discussed in decibel (dB) units in order to compress the range of numbers required to describe vibration. Vibration impacts are generally associated with activities such as train operations, construction and heavy truck movements.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-B illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-B: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

\* RMS Vibration Velocity Level in VdB relative to 10<sup>-6</sup> inches/second

Source: Federal Transit Administration (FTA) Transit Noise Impact and Vibration Assessment

#### 3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains fairly constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

#### 3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared according to guidelines adopted by the Governor's Office of Planning and Research. (7) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

#### 3.2 STATE OF CALIFORNIA BUILDING CODE

The State of California's noise insulation standards are codified in the California Code of Regulations, Title 24, Building Standards Administrative Code, Part 2, and the California Building Code. These noise standards are applied to new construction in California for the purpose of controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as residential buildings, schools, or hospitals, are developed near major transportation noise sources, and where such noise sources create an exterior noise level of 60 dBA CNEL or higher. Acoustical studies that accompany building plans for noise-sensitive land uses must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new residential buildings, schools, and hospitals, the acceptable interior noise limit for new construction is 45 dBA CNEL.

#### 3.3 CITY OF MORENO VALLEY NOISE ELEMENT

The City Noise Element typically provides the standards for land use compatibility for community noise exposure. However, the City of Moreno Valley General Plan does not include a noise element or specific transportation related noise standards. Rather, noise is considered in the Environmental Safety section of the General Plan Safety Element included in Appendix 3.1. (8) While the General Plan provides background and noise fundamentals, it does not identify criteria to assess the impacts associated with off-site transportation related noise

impacts. Therefore, for the purpose of this analysis, the transportation noise criteria are derived from standards contained in the General Plan Guidelines, a publication of the California Office of Planning and Research. These land use / noise compatibility standards included on Figure 2 in Appendix 3.2 are used by many California cities and counties and specify the maximum noise levels allowable for new developments impacted by transportation noise sources

The purpose of the transportation noise criteria is to protect, create, and maintain an environment free from noise and vibration that may jeopardize the health or welfare of sensitive receptors, or degrade quality of life. City General Policies (City of Moreno Valley General Plan, pp.9-31, 9-32) act to ensure that when exterior noise levels exceed 65 dBA CNEL at sensitive receptors, mitigation is provided to ensure that interior noise levels of 45 dBA CNEL are maintained. General Plan Policies in this regard are consistent with, and support, the California Building Code interior noise standards.

#### 3.4 CITY OF MORENO VALLEY MUNICIPAL CODE STANDARDS

The Project operational stationary/area source noise impacts are governed by the City of Moreno Valley Municipal Code, Title 11, Chapter 11, Regulation (Sections 11.80.010 through 11.80.060). These limits are used to describe the time-varying character of the stationary/area source operational noise levels and they do not compare with the 24-hour total sound exposure transportation related CNEL noise level limits.

#### 3.4.1 OPERATIONAL STATIONARY/AREA SOURCE NOISE

The Noise Ordinance included in the City of Moreno Valley Municipal Code provides performance standards and noise control guidelines for determining and mitigating non-transportation or stationary/area noise source impacts from operations at private properties. The maximum allowable stationary/area-source noise levels are regulated pursuant to the City of Moreno Valley Municipal Code, Chapter 11.80 Noise Regulation (Sections 11.80.010 through 11.80.060). The City of Moreno Valley Noise Ordinance is included in Appendix 3.3.

To conform with applicable provisions of the Municipal Code, the maximum allowable noise generated by area/stationary sources when measured at 200 feet from any property line, shall not exceed 65dBA Leq during daytime hours (8:00 a.m. to 10:00 p.m. the same day); and shall not exceed 60 dBA Leq during nighttime hours (10:01 p.m. to 7:59 a.m. the following day).

#### 3.4.2 CONSTRUCTION NOISE

As a subset of its stationary/area-source noise regulations, the City Municipal Code establishes additional restrictions on construction-source noise. More specifically, Municipal Code Section 11.80.030.D.7, *Construction and Demolitions*, provides the following limits to the hours of general construction equipment operations:

No person shall operate or cause operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise

disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee.

However, grading operations shall be limited to the hours identified in Section 8.21.050 (O) of 7:00 a.m. to 6:00 p.m., Monday through Friday, and 8:00 a.m. to 4:00 p.m. on weekends and holidays or as approved by the City Engineer. In addition to the hours of operations limitations provided in the Noise Ordinance, Section 11.80.030 (C.), *Non-impulsive Sound Decibel Limits* states the following:

No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any non-impulsive sound which exceeds the limits set forth for the source land use category in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance. (9)

Even though the City of Moreno Valley Municipal Code does not identify specific construction noise limits; it does provide noise level limits for the source land use category when measured at a distance of 200 feet. Since the source land use (commercial) is other than residential, 65 dBA Leq at a distance of 200 feet is used as the limit for this analysis to assess the construction noise level impacts. Therefore, to conform with applicable provisions of the Municipal Code, the maximum allowable noise generated by on-site construction activities when measured at 200 feet from any property line, shall not exceed 65dBA Leq. To ensure that Project construction activities do not adversely affect ambient noise conditions during the nighttime hour of 7:00 a.m. to 8:00 a.m., and to demonstrate compliance with provisions of Municipal Code Section 11.80.030.D.7, noise-generating Project construction activities shall be prohibited between the hours of 8:00 p.m. to 8:00 a.m. for general construction operations. Grading operations shall be prohibited between the hours of 6:00 p.m. to 8:00 a.m. on weekdays, and 4:00 p.m. to 8:00 a.m. on weekends and holidays.

#### 3.5 VIBRATION STANDARDS

The United States Department of Transportation Federal Transit Administration (FTA) provides guidelines (6) for maximum-acceptable vibration criteria for different types of land uses. These guidelines allow 80 VdB for residential uses and buildings where people normally sleep.

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. Occasionally large bulldozers and loaded trucks can cause perceptible vibration levels at close proximity. The FTA guidelines of 80 VdB for sensitive land uses provide the basis for determining the relative significance of potential Project related vibration impacts.

This page intentionally left blank

#### 4 THRESHOLDS OF SIGNIFICANCE

This section outlines the applicable thresholds of significance that were used assess the potential project noise impacts.

#### 4.1 STANDARDS OF SIGNIFICANCE

Based on the noise criteria presented in Section 3, and direction provided within the CEQA Guidelines as implemented by the City of Moreno Valley, Project noise impacts would be considered potentially significant if the Project is determined to result in or cause the following conditions:

- Exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- A substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project; or
- A substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project.
- Exposure of persons to, or generation of, excessive groundborne vibration or groundborne noise levels.
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the Project area to excessive noise levels.
- For a project within the vicinity of a private airstrip, expose people residing or working in the Project area to excessive noise levels.

#### 4.2 Noise Impact Significance Criteria

Noise impact significance criteria germane to the Project are discussed below. 1

• Potential to expose persons to, or generate, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

**Project Stationary/Area-Source Noise Exceeding City Standards Would be Considered Potentially Significant.** The City of Moreno Valley Municipal Code Chapter 11.80 Noise Regulation, Table 11.80.030-2 *Maximum Sound Levels for Source Land Uses* shown on Table 4-1 establishes the maximum acceptable noise levels that can be generated by stationary/area noise sources as received at off-site land uses.

1

<sup>&</sup>lt;sup>1</sup> As substantiated in the EIR Initial Study, the Project's potential impacts under the following topics are determined to be less-than-significant, and are not further discussed in this Analysis:

<sup>•</sup> For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the Project area to excessive noise levels.

For a project within the vicinity of a private airstrip, expose people residing or working in the Project area to excessive noise levels.

TABLE 4-1: MAXIMUM SOUND LEVELS (IN DBA((A)) FOR SOURCE LAND USES

| Kes     | IMCITTAL  |         | nmercial  |
|---------|-----------|---------|-----------|
| Daytime | Nighttime | Daytime | Nighttime |
| 60      | 55        | 65      | 60        |

Source: City of Moreno Valley Municipal Code Chapter 11.80 Noise Regulation, Table 11.80.030-2

Notes: Nighttime: 10:01 p.m. to 7:59 a.m. the following day; Daytime: 8:00 a.m. to 10:00 p.m. the same day.

The City Municipal Code also establishes additional restrictions on construction-source noise. More specifically, Municipal Code Section 11.80.030.D.7, *Construction and Demolitions*, provides the following for general construction operations:

No person shall operate or cause operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee.

Grading operations shall be prohibited between the hours of 6:00 p.m. to 8:00 a.m. on weekdays, and 4:00 p.m. to 8:00 a.m. on weekends and holidays based on Section 8.21.050.0 of the Municipal Code.

**Project Vehicular-Source Noise Exceeding City Standards Would be Considered Potentially Significant.** City General Policies (City of Moreno Valley General Plan, pp.9-31, 9-32) establish parameters for vehicular source noise along City roadways. In this regard City General Plan Policies act to ensure that when exterior noise levels exceed 65 dBA CNEL at sensitive receptors mitigation is provided to ensure that interior noise levels of 45 dBA CNEL are maintained. Project vehicular-source noise that would cause or result in noise levels exceeding 65 dBA CNEL would potentially expose persons to noise levels in excess of standards established in the local general plan, and would therefore be potentially significant.

#### 4.2.1 SIGNIFICANCE SUMMARY

Project stationary/area-source noise exceeding Municipal Code Noise Regulations identified at Table 11.80.030-2; or that would violate provisions of Municipal Code Section 11.80.030.D.7, *Construction and Demolitions* would potentially expose persons to, or generate, noise levels in excess of standards established in the local noise ordinance, and would therefore be potentially significant.

Additionally, Project vehicle-source noise that would result in exposure of land uses to noise levels greater than 65 dBA CNEL as established under City General Plan Policies, would potentially expose persons to, or generate, noise levels in excess of standards established in the local general plan, and would therefore be potentially significant.

• Potential to result in or cause a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project; or

 Potential to result in or cause a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project.

Perceptible Project Stationary/Area-Source Noise Exceeding Maximum Acceptable Ambient Conditions Would be Considered Substantial and Potentially Significant. For the purposes of this analysis, the City's Maximum Sound Levels for Source Land Uses (65 dBA daytime/60 dBA nighttime) is also defined as the maximum acceptable ambient condition when considering stationary/area-source noise impacts. In this regard, the maximum acceptable ambient noise conditions established in this analysis reflect local standards for acceptable noise conditions; correlate with Policies established in the City General Plan; and are consistent with applicable California Office of Planning and Research (OPR) Land Use/Noise Compatibility Guidelines. (7)

When ambient noise conditions are within acceptable parameters (65 dBA daytime/60 dBA nighttime) and perceptible (3.0 dBA or greater) Project stationary/area-source noise (whether temporary/periodic or permanent) would individually or in combination with ambient noise levels, exceed 65 dBA daytime/60 dBA nighttime, Project-source increases in ambient conditions could adversely affect area land uses, and land use/noise compatibility standards may not be maintained. Project stationary/area-source noise of 3.0 dBA or greater that would cause ambient conditions to exceed 65 dBA daytime/60 dBA nighttime would on this basis be considered substantial and potentially significant.

Perceptible Project Vehicular-Source Noise Exceeding Maximum Acceptable Ambient Conditions Would be Considered Substantial and Potentially Significant. Similarly, when considering vehicular-source noise, the City's 65 dBA CNEL standard reflected in the City General Plan is defined as the maximum acceptable ambient condition when considering vehicular-source noise impacts. When ambient noise conditions are within acceptable parameters (65 dBA CNEL) and perceptible (3.0 dBA or greater) Project vehicular-source noise would, individually or in combination with ambient conditions, exceed 65 dBA CNEL, Project-source increases in ambient conditions could adversely affect area land uses, and land/use noise compatibility standards may not be maintained. Project vehicular-source noise of 3.0 dBA or greater that would cause ambient conditions to exceed 65dBA CNEL would on this basis be considered substantial and potentially significant.

When Noise Levels Exceed Maximum Acceptable Ambient Conditions, Project Stationary/Area-Source Noise Increases of 1.5 dBA or Greater Would be Considered Substantial and Potentially Significant. If however, ambient conditions already exceed minimum acceptable standards, subsequent increases in noise levels may be considered substantial as they would contribute to already deficient conditions. Neither the City nor the State have established a quantified incremental increase in noise levels that could be considered substantial in instances where ambient conditions may already be considered unacceptable. Guidance in this regard is however, provided at the federal level through the

Federal Interagency Committee on Noise (FICON). (10) In this regard, FICON guidance facilitates assessment of project-generated increases in noise levels that take into account ambient noise conditions. Although the FICON guidance was specifically developed to assess aircraft noise impacts, this guidance is broadly relevant to all environmental noise assessments in determining perceived effects of noise. Germane to this analysis, the FICON guidance indicates that when ambient noise conditions are at or above normally acceptable standards, increases in noise of 1.5 dBA or greater would contribute to existing deficiencies, potentially resulting in increased community annoyance, citizen complaints, and potential litigation.

FICON guidance as applied within this analysis would indicate that when ambient conditions equal or exceed the City's maximum acceptable standards for stationary/area-sources (65 dBA daytime/60 dBA nighttime), Project stationary/area-source noise increases of 1.5 dBA or greater in ambient conditions could result in increased community annoyance, citizen complaints, and potential litigation. For the purposes of this analysis then, when ambient conditions equal or exceed maximum acceptable standards for stationary/area-sources, Project stationary/area-source noise increases of 1.5 dBA more in ambient conditions would therefore be considered *substantial*, and therefore potentially significant.

When Noise Levels Exceed Maximum Acceptable Ambient Conditions, Project Vehicular-Source Noise Increases of 1.5 dBA or Greater Would be Considered Substantial and Potentially Significant. Similarly, when ambient noise conditions are at or above the City's normally acceptable standards for vehicular sources (65 dBA CNEL), Project vehicular-source increases of 1.5 dBA or greater in ambient conditions would contribute to existing deficiencies, and could result in increased community annoyance, citizen complaints, and potential litigation. For the purposes of this analysis then, when ambient conditions equal or exceed maximum acceptable standards for vehicular sources, Project vehicular-source noise increase of 1.5 dBA more in ambient conditions would therefore be considered *substantial* and therefore potentially significant.

In summary a substantial temporary or permanent increase in ambient noise conditions would occur if Project-source noise would:

- Result in an perceptible increase in noise levels (3.0 dBA or greater) that would cause the maximum acceptable ambient condition (65 dBA daytime/60 dBA nighttime for stationary/areasources; 65 dBA CNEL for vehicular sources) to be exceeded; or
- Result in an increase of 1.5 dBA in ambient conditions when the noise environment at receptor land uses already exceeds the maximum acceptable ambient noise condition (65 dBA daytime/60 dBA nighttime for stationary/area-sources; 65 dBA CNEL for vehicular sources).

#### 4.3 VIBRATION IMPACT SIGNIFICANCE CRITERIA

The following vibration impact significance criteria are based on guidance provided by Appendix

G of the California Environmental Quality Act (CEQA) Guidelines.

• Potential to expose persons to, or generate, excessive groundborne vibration or groundborne noise levels.

Received vibration levels exceeding the FTA maximum acceptable vibration standard of 80 vibration decibels (VdB) for sensitive land uses would be considered excessive, and therefore potentially significant.

This page intentionally left blank

#### 5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, five long-term noise level measurements were taken at receptor locations in the Project study area. The noise level measurement locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. The noise level measurements were recorded by Urban Crossroads, Inc. on Wednesday, October 2, 2013 and Friday, October 4<sup>th</sup>, 2013. Appendix 5.1 includes study area photos.

#### 5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment meets American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-1983 (R2006)/ANSI S1.4a-1985 (R2006).(11)

#### 5.2 Noise Measurement Locations

The long-term noise level measurements were positioned at the nearest noise sensitive receptor locations to assess the existing ambient hourly noise levels surrounding the Project site. It is not necessary to collect measurements at each individual building or residence, because each receptor measurement represents a group of buildings that share acoustical equivalence. In other words, the area represented by the receptor shares similar shielding, terrain, and geometric relationship to the reference noise source. While receptors represent a location of noise sensitive areas, they also represent noise modeling locations used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receptor locations allows for a comparison of the before and after Project noise levels.

100

**EXHIBIT 5-A: NOISE MEASUREMENT LOCATIONS** 

LONG-TERM NOISE MEASUREMENT LOCATION

#### **5.3** Noise Measurement Results

The results of the noise level measurements are presented in Table 5-1. Table 5-1 identifies the hourly daytime (8:00 a.m. to 10:00 p.m.) and nighttime (10:01 p.m. to 7:59 a.m.) noise levels at each noise level measurement location. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

- Located in front of the backyard wall of homes on Ninya Avenue, location LT-1 represents the off-site unmitigated exterior noise levels in front of the backyard wall at the southeast corner of the Project site. Based on the noise level measurements, the existing daytime hourly ambient noise levels ranged from 68.7 to 72.3 dBA Leq resulting in an energy (logarithmic) average daytime noise level of 70.2 dBA Leq. During the nighttime hours, the measured ambient noise levels ranged from 61.7 to 71.9 dBA Leq producing an energy (logarithmic) average nighttime noise level of 68.4 dBA Leq. The 24-hour noise level calculated at this location is 74.9 dBA CNEL which is considered normally unacceptable for single-family residential land use by the Land Use Compatibility criteria in the General Plan Guidelines.(7)
- Location LT-2 represents the adjacent residential homes located east of the Project site across
  Perris Boulevard on Wendy Way. The hourly noise levels measured at Location LT-2 ranged
  from 69.9 to 72.7 dBA Leq during the daytime hours and from 62.9 to 74.3 dBA Leq during the
  nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 71.7
  dBA Leq with an average nighttime noise level of 70.4 dBA Leq. A review of the 24-hour
  Community Noise Equivalent Level (CNEL) at this location indicates that the overall unmitigated
  exterior noise level is 77.0 dBA CNEL which is considered normally acceptable for residential
  land use by the Land Use Compatibility General Plan Guidelines (Figure 2). (7)
- Location LT-3 represents the area north of the Project site near the adjacent residential land use with a combination of fencing materials (wood and chain-link). At Location LT-3, the homes are located some distance from the traffic noise level impacts of Indian Street and Perris Boulevard. As a result, the background ambient noise levels ranged from 41.4 to 50.0 dBA Leq during the daytime hours to levels of 39.0 to 43.3 dBA Leq during the nighttime hours. The energy (logarithmic) average daytime noise level was calculated at 44.1 dBA Leq with an average nighttime noise level of 41.0 dBA Leq. A review of the 24-hour Community Noise Equivalent Level (CNEL) indicates that the overall unmitigated exterior noise level is 48.3 dBA CNEL which is considered normally acceptable for residential land use by the Land Use Compatibility General Plan Guidelines (Figure 2). (7)
- To represent the existing ambient noise levels near the March Middle School and the Rainbow Ridge Elementary School, noise level measurement location LT-4 was placed north of the baseball diamond. At this location, the 24-hour noise level was calculated at 49.2 dBA CNEL, which is considered normally acceptable by the General Plan Guidelines.(7) The existing daytime hourly noise levels were measured at 42.0 to 54.2 dBA Leq with the nighttime hours ranging from 37.6 to 47.4 dBA Leq. The energy (logarithmic) average daytime noise level was calculated at 46.7 dBA Leq with an average nighttime noise level of 41.9 dBA Leq.
- Located west of the project site in an existing residential community, location LT-5 represents
  the off-site noise levels west of the project site across Indian Street. Based on the noise level
  measurements, the existing daytime hourly ambient noise levels ranged from 65.4 to 74.2 dBA
  Leq resulting in an energy (logarithmic) average daytime noise level of 69.0 dBA Leq. During the
  nighttime hours, the measured ambient noise levels ranged from 58.2 to 73.6 dBA Leq

producing an energy (logarithmic) average nighttime noise level of 66.7 dBA Leq. A review of the 24-hour Community Noise Equivalent Level (CNEL) indicates that the overall unmitigated exterior noise level is 72.4 dBA CNEL which is considered *normally unacceptable* for residential land use by the Land Use Compatibility General Plan Guidelines (Figure 2). However, with the existing six-foot high masonry perimeter sound wall and typical noise insulation features with standard building construction, the residential homes located across Indian Street are likely considered *conditionally acceptable*.

<sup>&</sup>lt;sup>1</sup>See Exhibit 5-A for the location of the monitoring sites.

<sup>&</sup>lt;sup>2</sup> Energy (logarithmic) average hourly levels. The long-term measurements printouts are included in Appendix 5.2.

#### 6 METHODS AND PROCEDURES

The following section outlines the methods and procedures used to model and analyze the future traffic noise environment.

#### 6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The estimated roadway noise impacts from vehicular traffic were calculated using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108.(12) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels.(13) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period.

#### 6.2 Traffic Noise Prediction Model Inputs

Table 6-1 presents the roadway parameters used to assess the Project's off-site transportation noise impacts. Table 6-1 identifies the 105 study area roadway segments, the functional roadway classifications according to the General Plan Circulation Element, the number of lanes and the vehicle speeds. For the purpose of this analysis, soft site conditions were used to analyze the traffic noise impacts for the Project study area. Soft site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation.

The Existing, Year 2018, and Year 2035 average daily traffic volumes used for this study are presented in Table 6-2 and were provided by the *Moreno Valley Walmart Traffic Impact Analysis* prepared by Urban Crossroads, Inc. (14) Table 6-3 presents the time of day vehicle splits and Table 6-4 presents the traffic flow distributions (vehicle mix) used for this analysis. The vehicle mix provides the hourly distribution percentages of automobile, medium trucks and heavy trucks for input into the FHWA noise prediction model.

### 6.3 VIBRATION ASSESSMENT

This analysis focuses on the potential ground-borne vibration associated with vehicular traffic and construction activities. Ground-borne vibration levels from automobile traffic are generally overshadowed by vibration generated by heavy trucks that roll over the same uneven roadway surfaces. However, due to the rapid drop-off rate of ground-borne vibration and the short duration of the associated events, vehicular traffic-induced ground-borne vibration is rarely perceptible beyond the roadway right-of-way, and rarely results in vibration levels that cause damage to buildings in the vicinity.

However, while vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Ground vibration levels associated with various types of construction equipment are summarized on Table 6-5. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the human response (annoyance) using the following vibration assessment methods defined by the FTA. To describe the human response (annoyance) associated with vibration impacts the FTA provides the following equation:  $L_{VdB}(D) = L_{VdB}(25 \text{ ft}) - 30 \log(D/25)$ 

TABLE 6-5: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

| Equipment       | Vibration Decibels (VdB)<br>at 25 feet <sup>1</sup> |
|-----------------|---|
| Small bulldozer | 58  |
| Jackhammer      | 79  |
| Loaded Trucks   | 86  |
| Large bulldozer | 87  |

# 7 OFF-SITE TRANSPORTATION NOISE IMPACTS

To assess the off-site transportation CNEL noise level impacts associated with development of the proposed Project, noise contours were developed based on the *Moreno Valley Walmart Traffic Impact Analysis*.(14) Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise contours were developed for the following traffic scenarios:

- <u>Existing Without / With Project</u>: This scenario refers to the existing present-day noise conditions, without the Project and with the construction of the proposed Project.
- Year (2018) Without / With Project: This scenario refers to the background noise conditions at future Year 2018 with and without the proposed Project. This scenario corresponds to 2018 conditions, and includes all cumulative projects identified in the Traffic Impact Analysis.
- Year (2035) Without / With Project: This scenario refers to the background noise conditions at future Year 2035 with and without the proposed Project. This scenario corresponds to 2035 conditions, and includes all cumulative projects identified in the Traffic Impact Analysis.

### 7.1 OFF-SITE TRAFFIC NOISE CONTOURS

To quantify the Project's traffic noise impacts on the surrounding areas, the changes in traffic noise levels on 105 roadway segments surrounding the Project were calculated based on the changes in the average daily traffic volumes. The noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. Based on the noise impact significance criteria described in Section 4.2, a substantial temporary or permanent increase in ambient noise conditions would occur if Project-source noise would:

- Result in an perceptible increase in noise levels (3.0 dBA or greater) that would cause the maximum acceptable ambient condition (65 dBA daytime/60 dBA nighttime for stationary/areasources; 65 dBA CNEL for vehicular sources) to be exceeded; or
- Result in an increase of 1.5 dBA in ambient conditions when the noise environment at receptor land uses already exceeds the maximum acceptable ambient noise condition (65 dBA daytime/60 dBA nighttime for stationary/area-sources; 65 dBA CNEL for vehicular sources).

Noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, 60 and 55 dBA noise levels. The noise contours do not take into account the effect of any existing noise barriers or topography that may affect ambient noise levels. In addition, since the noise contours reflect modeling of vehicular noise along area roadways, they appropriately do not reflect noise contribution from the surrounding commercial and industrial uses within the Project study area. Tables 7-1 through 7-6 presents a summary of the unmitigated exterior traffic noise levels for the 105 study area roadway segments analyzed from the without Project to the with Project conditions in each of three timeframes: Existing; Year 2018 and Year 2035 conditions. Appendix 7.1 includes a summary of the traffic noise level contours for each of the six traffic scenarios.

# 7.2 Existing Project Traffic Noise Level Contributions

Table 7-7 presents a comparison of the existing without and with Project conditions CNEL noise levels. From this we can see that the unmitigated exterior noise levels are expected to range from 53.6 to 70.2 dBA CNEL. Existing with Project noise level contours are expected to range from 54.0 to 70.3 dBA CNEL. Overall the Project is expected to generate an unmitigated maximum exterior noise level increase of up to 1.2 dBA CNEL. In no instances would Project vehicular-source noise result in or cause noise levels along potentially affected roadway segments to transition from an acceptable ambient noise environment (<65 dBA CNEL) to a noise environment greater than 65 dBA CNEL.

#### 7.3 YEAR 2018 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-8 presents a comparison of the Year 2018 without and with Project conditions CNEL noise levels. Table 7-3 shows that the unmitigated exterior noise levels are expected to range from 54.8 to 72.5 dBA CNEL. Table 7-4 presents the Year 2018 with Project conditions noise level contours that are expected to range from 55.0 to 72.5 dBA CNEL. As shown on Table 7-8 the Project is expected to generate an unmitigated exterior noise level increase of up to 1.0 dBA CNEL. In no instances would the Project generate perceptible (3.0 dBA or greater) vehicular-source noise that would result in or cause noise levels along potentially affected roadway segments to transition from an acceptable ambient noise environment (<65 dBA CNEL) to a noise environment greater than 65 dBA CNEL.

#### 7.4 YEAR 2035 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-9 presents a comparison of the Year 2035 without and with Project conditions CNEL noise levels. Table 7-5 shows that the unmitigated exterior noise levels are expected to range from 56.8 to 73.0 dBA CNEL. Table 7-6 presents the Year 2035 with Project conditions noise level contours that are expected to range from 57.2 to 73.0 dBA CNEL. As shown on Table 7-9 the Project is expected to generate an unmitigated exterior noise level increase of up to 0.8 dBA CNEL. In no instances would the Project generate perceptible vehicular-source noise that would result in or cause noise levels along potentially affected roadway segments to transition from an acceptable ambient noise environment (<65 dBA CNEL) to a noise environment greater than 65 dBA CNEL.

# 7.5 PROJECT TRAFFIC NOISE IMPACTS

The off-site traffic noise analysis shows that the Project will create noise level increases of up to 1.2 dBA CNEL for Existing with Project conditions. This increase is expected to decrease to 1.0 dBA CNEL by Year 2018 conditions and to 0.8 dBA CNEL by Year 2035 conditions. Generally, the Project's incremental traffic-related noise level increases at land uses adjacent to roadways conveying Project traffic will diminish over time. This occurs as the background traffic on the study area roadway segments increases and the Project represents a smaller percentage of the overall traffic volume. This analysis shows that the Project will not create a substantial permanent increase in traffic-related noise levels or expose persons to noise levels in excess of the exterior noise level standards, and therefore, no off-site traffic noise mitigation is required.

In no instances would the Project generate perceptible vehicular-source noise that would result in or cause noise levels along potentially affected roadway segments to transition from an acceptable ambient noise environment (<65 dBA CNEL) to a noise environment greater than 65 dBA CNEL. On this basis, Project vehicular-source noise would not result in exposure of persons to, or generation of, noise levels in excess of standards established in the City's General Plan, and potential impacts in this regard would be less-than-significant.

# 8 SENSITIVE RECEPTORS

To assess the long-term operational and short-term construction noise impacts, the following eleven sensitive receptor locations as shown on Exhibit 8-A were identified. Sensitive receptors are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise sensitive land uses are generally considered to include: schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include: multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses which are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, natural open space, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

Sensitive receptors in the vicinity of the Project site include the existing single-family residential development tracts located at receptor locations R1 to R3, R5, and R7 to R9. Future residential development in the Project study area is represented by receptor locations R10 and R11. The closest noise-sensitive receptor is represented by location R9 where an existing single-family residential dwelling is located east of the Project site across Perris Boulevard.

- R1: Located approximately 750 feet north of the Project site, R1 represents the existing single-family residential dwellings along Fay Avenue.
- R2: Location R2 represents the existing single-family residential dwellings along Fay Avenue located roughly 710 feet north of the Project Site. A long-term noise level measurement was taken at this location, LT-3, to describe the existing ambient noise environment.
- R3: Location R3 represents the existing single-family residential dwellings situated approximately 1,540 feet west of the Project site. A long-term noise level measurement was taken at this location, LT-5, to describe the existing ambient noise environment.
- R4: Location R4 represents March Middle School located approximately 1,180 feet southwest of the Project site. Long-term noise level measurement Lt-4 is used to describe the existing ambient noise conditions at this location.
- R5: At a distance of approximately 750 feet southwest of the Project site, location R5 represents the existing single-family residential dwelling along Emma Lane.
- R6: At a distance of 470 feet south of the Project site, R6 describes the existing Home Depot located west of Perris Boulevard and north of Iris Avenue.
- R7: Location R7 represents the single-family land use located approximately 250 feet southeast of the Project site. Long-term measurement location LT-1 is used to describe the existing ambient noise conditions at this location.
- R8: Located approximately 2,020 feet west of the Project site, R8 represents the existing single family residential homes on Indian Street.
- R9: Location R9 represents the existing single-family residential dwellings across Perris Boulevard approximately 100 feet east of the Project site.

- R10: Located approximately 110 feet southwest of the Project site, R10 represents the future development of single family residential tract homes on an existing vacant lot.
- R11: Location R11 represents the future development of single family residential tract homes on an existing vacant lot, located approximately 130 feet north of the Project site.

## 9 OPERATIONAL NOISE IMPACTS

This section analyzes the potential operational noise impacts resulting from the development of the proposed Moreno Valley Walmart. Using a stationary-source noise prediction model, calculations of the Project operational noise level impacts were completed.

#### 9.1 OPERATIONAL NOISE STANDARDS

The Noise Ordinance included in the City of Moreno Valley Municipal Code provides performance standards and noise control guidelines for determining and mitigating non-transportation or stationary/area noise source impacts from operations at private properties. The maximum allowable stationary/area-source noise levels are regulated pursuant to the City of Moreno Valley Municipal Code, Chapter 11.80 Noise Regulation (Sections 11.80.010 through 11.80.060). The City of Moreno Valley Noise Ordinance is included in Appendix 3.3.

To conform with applicable provisions of the Municipal Code, the maximum allowable noise generated by area/stationary sources when measured at 200 feet from any property line, shall not exceed 65dBA Leq during daytime hours (8:00 a.m. to 10:00 p.m. the same day); and shall not exceed 60 dBA Leq during nighttime hours (10:01 p.m. to 7:59 a.m. the following day).

## 9.2 OPERATIONAL NOISE SOURCES

The operational noise impacts associated with the proposed Project are expected to include loading docks, trash compactors, roof-top air condenser units, shopping cart carousels, parking lot, and car wash activities as indicated on Exhibit 9-A. The proposed Project design features which include an 8-foot high barrier at the northeast corner of the Project site and 10-foot high barriers at the trash compactor and truck loading areas are shown on Exhibit 9-A. Exhibit 8-A identifies the location of the eleven noise receptor locations used to assess the operational noise level impacts, as well as the existing barrier locations. Noise sensitive receptor locations R10 and R11 represent the residential neighborhoods planned north and west of the Project site.

#### 9.3 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 9-1 used to estimate the Project operational noise impacts. It is important to note that the following projected noise levels assume the worst-case noise environment with the loading docks, trash compactors, roof-top air condenser units, shopping cart carousels, parking lot and car wash activities all operating simultaneously. In reality, these noise level impacts will vary throughout the day.

<sup>&</sup>lt;sup>1</sup>As measured at the Huntington Beach Walmart by Urban Crossroads, Inc. on 4/14/2011.

## 9.3.1 LOADING DOCKS

As part of its operations, the proposed Moreno Valley Walmart will include truck doors and loading facilities at the rear of the store. Loading docks will be located along the store's northerly (rear) elevation to accommodate truck and vendor deliveries. Truck deliveries may occur 24 hours per day, and would consist of both semi-trucks (larger deliveries would be accomplished by way of 3+ axle tractor-trailer combinations with trailers up to 53 feet in length), and small to medium size (two-axle) trucks.

It is expected that the loading docks would be constructed to allow trailers to seal to the docks, thereby directing the unloading noise into the store, rather than onto neighboring uses. The loading dock areas would also be screened by a proposed 10-foot high wall as shown in Exhibit 9-A. In order to evaluate the noise impacts associated with the delivery truck tractor trailer unloading/loading activities, reference noise level measurements were taken at the Huntington Beach Walmart located at the southwest corner of Goldenwest Street and Edinger Avenue by Urban Crossroads Inc. on April 14th, 2011.

The primary noise generated by tractor trailer unloading is the noise of the truck arriving, backing into the dock area, detaching the cab, attaching the cab to the empty trailer, and exiting the loading dock. Because the trailer seals to the loading dock, employees unload the tractor trailer from the inside of the store. The receiving crew places a 20' long rolling conveyor assembly inside the trailer to roll merchandise (on pallets or in boxes) into the store. The unmitigated noise level was measured at 77.3 dBA Leq at a distance of 20 feet from the tractor trailer. Delivery truck delivery activities will last an average of 3–6 minutes per truck, depending on whether or not the loading bay is empty at the time of arrival. In the event idling does occur, idling time would be limited to no more than 5 minutes under California State law (Cal Code Regs. 2485). Delivery trucks are generally equipped with an engine shutdown system that automatically turns off the engine after 5 minutes of idling. In order to analyze a worst-case condition for noise impacts related to delivery, it is assumed that there would be a

<sup>&</sup>lt;sup>2</sup> As measured at the Irvine Walmart Supercenter located on 16555 Von Karman Avenue by Urban Crossroads, Inc. on 1/23/2014.

<sup>&</sup>lt;sup>3</sup> As measured by Urban Crossroads, Inc. on 10/13/2010 at the Rancho Cordova Walmart #2457.

<sup>&</sup>lt;sup>4</sup>As measured by Urban Crossroads, Inc. on 5/30/2012 at the Laguna Niguel Walmart located at 27470 Alicia Parkway.

 $<sup>^{5}</sup>$  As measured by Urban Crossroads, Inc. on 11/8/2013 at the Plano Trabuco Shell Gas Station Car Wash.

<sup>&</sup>lt;sup>6</sup> Duration (minutes within the hour) of noise activity during peak hourly conditions.

maximum of three delivery trucks coming to the loading docks and completing delivery activities within a 1-hour period for both daytime and nighttime hours. For the purpose of this noise analysis, a maximum average delivery time of 6 minutes per delivery is used for a total of 18 minutes of activity during the peak noise hour.

#### 9.3.2 Trash Compactors

In order to assess the impacts created by the trash compactors planned on the Project site, reference noise levels were gathered from the Irvine Walmart Supercenter located on 16555 Von Karman Avenue, by Urban Crossroads Inc. on Thursday, January 23<sup>rd</sup>, 2014. The unmitigated exterior noise levels were measured at 75.5 dBA Leq at a distance of 5 feet from the compactor. A review of the site plan shows a proposed trash compactor located behind the planned 10-foot high screen wall. It is expected the trash compactor will operate for a maximum of 20 minutes during typical hourly daytime and nighttime conditions.

#### 9.3.3 AIR CONDENSER UNITS

In order to assess the impacts created by the roof-top air conditioning units at the planned Project site, reference noise levels measurements were taken at the Rancho Cordova Walmart on October 13<sup>th</sup>, 2010. Located at 10655 Folsom Boulevard in the City of Rancho Cordova, the noise level measurements describe a cluster of mechanical rooftop condensers. The cluster consists of two Krack MXE-04 4-fan units and one MXE-02 2-fan unit. At a distance of 5 feet for the cluster of rooftop condensers, the exterior noise levels were measured at 81.9 dBA Leq. For the purpose of this noise analysis, the air condenser units were observed to be located on the roof at a noise elevation of 25 feet and are estimated to operate for approximately 30 minutes during typical daytime and nighttime conditions. The potential noise attenuation provided by a parapet wall was not included as part of this analysis.

## 9.3.4 Shopping Cart Carousel (Metal Carts)

To evaluate the noise level impacts from shopping carts placed by customers into assigned shopping cart areas, Urban Crossroads collected noise level measurements at the Laguna Niguel Walmart located at 27470 Alicia Parkway on May 30<sup>th</sup>, 2012. At a distance of 5 feet from the noise source, the noise associated with the placement of the shopping carts into the carousel was measured at 72.9 dBA Leq. The noise impacts are mainly due to the metal shopping carts crashing into other carts already placed in the carousel as well as striking the side rails. This noise impact analysis includes the noise level impacts associated with the adjacent shopping cart carousels with noise impacts expected for approximately 20 minutes an hour for the typical daytime and nighttime conditions.

#### 9.3.5 PARKING LOT ACTIVITY

To determine the noise level impacts associated with parking lot noise, Urban Crossroads collected reference noise level measurements at the at the Laguna Niguel Walmart located at 27470 Alicia Parkway on May 30<sup>th</sup>, 2012. The fifteen minute noise level measurement indicates that the parking lot activity generates a noise level of 60.1 dBA Leq at a distance of 5 feet. The parking lot noise levels are mainly due to cars pulling in and out of spaces, car alarms sounding,

and customers moving shopping carts. Noise associated with parking lot activity is expected during the typical daytime and nighttime conditions for the entire hour (60 minutes).

#### 9.3.6 CAR WASH

To describe the potential noise level impacts associated with the planned car wash at the southeast corner of the Project site, a reference noise level measurement was collected on November 8<sup>th</sup>, 2013 at the Plano Trabuco Shell Gas Station car wash. The reference noise level measurement includes one complete car wash cycle. The high powered blowers that are used to dry the car at the end wash cycle represent the primary source of car wash noise. As shown on Table 9-1, at a distance of 10 feet from the exit tunnel and blowers, a reference noise level of 76.5 dBA Leq was measured. Noise associated with car wash activity is expected during the typical daytime and nighttime conditions for approximately 30 minutes an hour.

## 9.4 Project Operational Noise Levels

Based upon the reference noise levels, it is possible to estimate the Project operational stationary/area source noise levels at a distance of 200 feet and at each of the eleven noise receptor locations. The operational noise level calculations shown on Tables 9-2 and 9-3 account for the distance attenuation provided due to geometric spreading, when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. With geometric spreading, sound levels attenuate (or decrease) at a rate of 6 dB for each doubling of distance from a point source.

Table 9-2 presents the combined total operational noise level projections at a distance of 200 feet consistent with the City of Moreno Valley Municipal Code. Table 9-2 indicates that the unmitigated hourly noise levels for each noise source are expected to range from 28.1 dBA Leq for the Parking Lot activities to 52.1 dBA Leq for the Loading Dock Activities.

When combined with the existing ambient noise levels, the Project operational noise levels at a distance of 200 feet are estimated at 54.4 dBA Leq. The Project operational noise levels associated with the proposed Moreno Valley Walmart will not exceed the daytime and nighttime exterior noise level standards for commercial uses of 65 dBA Leq and 60 dBA Leq, respectively at a distance of 200 feet and, therefore, will be less than significant.

Table 9-3 presents the exterior noise levels including the barrier attenuation provided by the proposed 8-foot high barrier at the northeastern Project site boundary, the proposed 10-foot high barriers at the loading docks and trash compactor areas, and the existing noise barriers observed within the Project study area, as shown on Exhibit 9-A. Table 9-3 indicates that the hourly noise levels associated with the Moreno Valley Walmart at the eleven noise sensitive receptor locations are expected to range from 27.9 dBA Leq at receptor location R8 to 47.1 dBA Leq at receptor location R11. The operational noise level calculations are included in Appendix 9.1.

TABLE 9-2: OPERATIONAL NOISE LEVEL PROJECTIONS AT A DISTANCE OF 200 FEET

| Noise Source            | Reference<br>Noise Level<br>(dBA Leq) | Distance<br>Attenuation<br>at 200 feet<br>(dBA Leq) <sup>1</sup> | Hourly<br>Activity<br>(Minutes) <sup>2</sup> | Hourly<br>Activity<br>Adjustment<br>(dBA Leq) | Calculated<br>Noise Level<br>(dBA Leq)<br>at 200 feet |
|-------------------------|---------------------------------------|--|--|---|---|
| Loading Dock Activities | 77.3                                  | -20.0  | 18   | -5.2  | 52.1  |
| Trash Compactor         | 75.5                                  | -32.0  | 20   | -4.8  | 38.7  |

<sup>&</sup>lt;sup>1</sup> See Exhibit 8-A for the noise receptor locations. Appendix 9.1 for the stationary source noise analysis worksheets. Noise levels include the barrier attenuation provided by existing barriers at each receptor location and the proposed 8 and 10-foot barriers at the Project site.

<sup>&</sup>lt;sup>2</sup> Duration (minutes within the hour) of noise activity during peak hourly conditions.

## 9.5 PROJECT NOISE CONTRIBUTION

To describe the Project operational noise level contributions, the Project operational noise levels were combined with the existing ambient noise levels measurements. The difference between the combined Project and ambient noise levels describe the Project noise level contributions. Noise levels that would be experienced at area receptors when Project-source noise is added to ambient daytime and nighttime conditions are presented on Tables 9-4 and 9-5, respectively.

| R6                                | 33.8   | LT-4                                 | 41.9  | 42.5  | 0.6                                  | No                                    |
| R7                                | 36.3   | LT-1                                 | 68.4  | 68.4  | 0.0                                  | No                                    |
| R8                                | 27.9   | LT-5                                 | 66.7  | 66.7  | 0.0                                  | No                                    |
| R9                                | 43.3   | LT-2                                 | 70.4  | 70.4  | 0.0                                  | No                                    |
| R10                               | 47.0   | LT-4                                 | 41.9  | 48.2  | 6.3                                  | No                                    |
| R11                               | 47.1   | LT-3                                 | 41.0  | 48.0  | 7.0                                  | No                                    |

<sup>&</sup>lt;sup>1</sup> See Exhibit 8-A for the noise receptor locations.

As indicated in Tables 9-4 and 9-5, the Project would contribute operational stationary/area-source noise levels of up to 4.8 dBA Leq (daytime) and 7.0 dBA Leq (nighttime) at nearby receptor locations. However, in no instance would Project operational stationary area-source noise cause or result in exceedance of the maximum acceptable ambient condition (65 dBA daytime/60 dBA nighttime). Nor would Project operational stationary/area-source noise result in an increase of 1.5 dBA or greater in instances where noise levels without the Project already exceed the maximum acceptable ambient condition. On this basis, Project operational stationary/area-source noise would not result in a substantial temporary/periodic, or permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project, and impacts in these regards are less-than-significant.

#### 9.6 OPERATIONAL VIBRATION IMPACTS

Although the human threshold of perception for vibration is around 65 VdB, human response to vibration is not usually significant unless the vibration exceeds 70 VdB. Truck vibration levels are dependent on vehicle characteristics, load, speed and pavement condition. Typical vibration levels for heavy trucks on normal traffic speeds can reach levels below 65 VdB. Truck deliveries transiting on site will be travelling at very low speeds so it is expected that delivery truck vibration impacts nearby homes will be less than significant. Commercial developments typically do not operate machinery that can create significant long-term vibration impacts.

<sup>&</sup>lt;sup>6</sup> The noise level increase expected with the addition of the proposed Project activities.

## 10 CONSTRUCTION NOISE IMPACTS

This section analyzes potential impacts resulting from the short-term off-site construction activities associated with the development of the Project.

## 10.1 CITY OF MORENO VALLEY CONSTRUCTION NOISE STANDARDS

As a subset of its stationary/area-source noise regulations, the City Municipal Code establishes additional restrictions on construction-source noise. More specifically, Municipal Code Section 11.80.030.D.7, *Construction and Demolitions*, provides the following limits to the hours of general construction equipment operations:

No person shall operate or cause operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee.

However, grading operations shall be limited to the hours identified in Section 8.21.050 (O) of 7:00 a.m. to 6:00 p.m., Monday through Friday, and 8:00 a.m. to 4:00 p.m. on weekends and holidays or as approved by the City Engineer. In addition to the hours of operations limitations provided in the Noise Ordinance, Section 11.80.030 (C.), *Non-impulsive Sound Decibel Limits* states the following:

No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any non-impulsive sound which exceeds the limits set forth for the source land use category in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance. (9)

Even though the City of Moreno Valley Municipal Code does not identify specific construction noise limits; it does provide noise level limits for the source land use category when measured at a distance of 200 feet. Since the source land use (commercial) is other than residential, 65 dBA Leq at a distance of 200 feet is used as the limit for this analysis to assess the construction noise level impacts. Therefore, to conform with applicable provisions of the Municipal Code, the maximum allowable noise generated by on-site construction activities when measured at 200 feet from any property line, shall not exceed 65dBA Leq. To ensure that Project construction activities do not adversely affect ambient noise conditions during the nighttime hour of 7:00 a.m. to 8:00 a.m., and to demonstrate compliance with provisions of Municipal Code Sections 11.80.030.D.7 and 8.21.050.O, noise-generating Project construction activities shall be prohibited between the hours of 8:00 p.m. to 8:00 a.m. for general construction operations. Grading operations shall be prohibited between the hours of 6:00 p.m. to 8:00 a.m. on weekdays, and 4:00 p.m. to 8:00 a.m. on weekends and holidays.

## 10.2 CONSTRUCTION NOISE LEVELS

Construction noise represents a short-term impact on the ambient noise levels. Noise generated by construction equipment, including trucks, power tools, concrete mixers and portable generators can reach high levels. Project construction is expected to occur in four stages:

- Grading
- Utilities / Underground
- Curb, Gutter, Flatwork and Parking Lot
- Building / Painting

In January 2006, the Federal Highway Administration (FHWA) published the Roadway Construction Noise Model (RCNM) that includes a national database of construction equipment reference noise emission levels.(15) The RCNM equipment database, as shown in Appendix 10.1, provides a comprehensive list of the noise generating characteristics for specific types of construction equipment. In addition, the database provides an acoustical usage factor to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation. The usage factor is a key input variable of the RCNM noise prediction model that is used to calculate the average Leq noise levels using the Lmax noise levels measured at a distance of 50 feet

Noise levels generated by heavy construction equipment can range from approximately 70 dBA to in excess of 100 dBA when measured at 50 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 78 dBA measured at 50 feet from the noise source to the receptor would be reduced to 72 dBA at 100 feet from the source to the receptor, and would be further reduced to 66 dBA at 200 feet from the source to the receptor. The construction noise levels including the number and mix of construction equipment by construction phase are consistent with the data used to support the construction emissions in the *Moreno Valley Walmart Air Quality Impact Analysis* prepared by Urban Crossroads Inc. in November 2013. (16)

#### 10.3 Construction Noise Analysis

Using the stationary-source RCNM noise prediction model, calculations of the Project construction noise level impacts at a reference distance of 200 feet and at the eleven noise receptor locations were completed. Tables 10-1 to 10-4 present the short-term construction noise levels for each stage of construction at the eleven receptor locations. The analysis shows that the highest construction noise level impacts will likely occur during the grading phase of construction. As shown on Table 10-5, the unmitigated peak construction noise levels are expected to range from 50.6 to 81.4 dBA Leq at receptor locations R1 through R11. The noise levels at each receptor location include the additional attenuation provided by the existing barriers within the Project study area.

**TABLE 10-1: GRADING CONSTRUCTION NOISE LEVELS** 

| Equipment Type <sup>1</sup> | Quantity | Usage<br>Factor <sup>2</sup> | Hours Of<br>Operation <sup>3</sup> | Reference Noise<br>Level @ 50 Feet<br>(Lmax dBA) | Cumulative Level<br>@ 200 Feet (Leq<br>dBA) |

## **10.4** Construction Noise Abatement Measures

Based on the four stages of construction, the noise impacts associated with the proposed Project are expected to create temporary high-level noise impacts at receptor locations surrounding the Project site when certain activities occur near the Project property line. Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following mitigation measures would reduce any noise level increases produced by the construction equipment to the nearby noise sensitive residential land uses.

- Install temporary noise control barriers that provide a minimum noise level attenuation of 17 dBA when Project construction occurs within 200 feet of existing residential structures. The noise control barrier must present a solid face from top to bottom. The noise control barrier must be high enough and long enough to block the view of the noise source. Unnecessary openings shall not be made.
  - The noise barriers must be maintained and any damage promptly repaired. Gaps, holes, or weaknesses in the barrier or openings between the barrier and the ground shall be promptly repaired.
  - The noise control barriers and associated elements shall be completely removed and the site appropriately restored upon the conclusion of the construction activity.
- Prior to approval of grading plans and/or issuance of building permits, plans shall include a note indicating that for other than grading activities, noise-generating Project construction activities shall not occur between the hours of 8:00 p.m. and 8:00 a.m. Grading operations shall be limited to between the hours of 8:00 a.m. to 6:00 p.m. weekdays, and 8:00 a.m. to 4:00 p.m. on weekends and holidays, or as otherwise approved by the City Engineer. The Project construction supervisor shall ensure compliance with the note and the City shall conduct periodic inspection at its discretion.
- During all Project site construction, the construction contractors shall equip all construction
  equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with
  manufacturers' standards. The construction contractor shall place all stationary construction
  equipment so that emitted noise is directed away from the noise sensitive receptors nearest the
  Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise sensitive receptors nearest the Project site (i.e., to the north and east) during all Project construction.
- The construction contractor shall limit haul truck deliveries to the same hours specified for general construction equipment operations, other than grading (i.e. deliveries are prohibited between the hours of 8:00 p.m. and 8:00 a.m.). The Project Applicant shall prepare a haul route exhibit for review and approval by the City of Moreno Valley Planning Division prior to commencement of construction activities. The haul route exhibit shall design delivery routes to minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.
- The construction contractor shall post a publicly visible sign with the telephone number and person to contact regarding noise complaints. The construction manager, within seventy-two

hours of receipt of a noise complaint, shall either take corrective actions or, if immediate action is not feasible, provide a plan or corrective action to address the source of the noise complaint.

#### 10.5 CONSTRUCTION NOISE THRESHOLDS OF SIGNIFICANCE

To control noise impacts associated with the construction of the proposed Project, the City of Moreno Valley has established limits to the hours of operation and noise level limits for the source land use category when measured at a distance of 200 feet. Since the source land use is other than residential, the 65 dBA Leq at a distance of 200 feet is used as the limit for this analysis to assess the Moreno Valley Walmart construction noise level impacts. Based on the construction noise analysis shown on Table 10-5, the unmitigated Project-related construction noise levels at receptor locations R7 and R9 to R11 will exceed the City of Moreno Valley 65 dBA Leq construction noise level limit for a non-residential source land use such as the proposed Project.

With the installation of temporary exterior noise control barriers with a minimum attenuation of 17 dBA at the perimeter of the Project site, noise levels at the nearby residential receptors are expected to be less than significant. Table 10-6 shows the mitigated peak construction noise levels with the attenuation provided by the temporary construction noise barriers and will not exceed the City of Moreno Valley 65 dBA Leq construction noise level limit. The construction related noise level impacts at the noise sensitive receptor locations are not expected to exceed the City of Moreno Valley 65 dBA Leq construction noise level limit with the installation of temporary construction noise control barriers. Therefore, as mitigated, the construction of the Project will result in a less-than-significant noise impact.

TABLE 10-5: UNMITIGATED CONSTRUCTION EQUIPMENT NOISE LEVELS

| Noise Daytime Receptor Condition | Ambient                           | Constru | ction Phase | Combined |          |                   |                                 |  |

| R11                            | 44.1   | 80.0   | -17.0                                     | 63.0  | 63.0                                      | No                        |

Noise receptor locations are shown on Exhibit 8-A.

#### 10.5.1 Soil Import and Construction Material Deliveries

Construction of the Project will require soil import and delivery of construction materials. The export/import materials will be transported via 16-cubic yard (cy) capacity dump trucks. Each truck will generate one (1) inbound and one (1) outbound trip, accounting for a total of two (2) truck trips per load of material exported or imported. Soil import is anticipated to consist of the import of 43,137 cubic yards of "fill" soil to the site. Construction material deliveries are anticipated to consist of the export/import of raw building materials, concrete, asphalt, etc.

In order to minimize the impact of construction truck traffic noise to the surrounding roadway network, it is recommended that trucks utilize the most direct route between the site and the I-215 Freeway via Cactus Avenue to Perris Boulevard. It is anticipated that the construction staging will be located off of Perris Boulevard. As such, the proposed construction access on Perris Boulevard will provide the most direct access.

It is recommended that the export and import of construction materials occur during off-peak hours in order to have a minimal traffic noise impact to the surrounding roadway network. It is also recommended that a construction traffic management plan be implemented for the duration of the construction phase, consistent with the *Moreno Valley Walmart Traffic Impact Analysis*.(14)

#### 10.6 CONSTRUCTION VIBRATION IMPACTS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

• Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to building, the

<sup>&</sup>lt;sup>2</sup> Construction noise calculations at a distance of 200 feet by phase are included in Appendix 10-2.

<sup>&</sup>lt;sup>3</sup> Estimated construction noise levels during peak operating conditions.

<sup>&</sup>lt;sup>4</sup> Does the peak construction noise level exceed the City of Moreno Valley acceptable construction noise standard of 65 dBA Leq?

vibration is usually short-term and is not of sufficient magnitude to cause building damage. It is not expected that heavy equipment such as large bulldozers would operate close enough to any residences to cause a vibration impact.

 Trucks: Trucks hauling building materials to construction sites can be sources of vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

Ground-borne vibration levels resulting from construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration. Construction activities that would occur within the Project site are expected to include grading, which would have the potential to generate low levels of ground-borne vibration. Using the vibration source level of construction equipment provided on Table 6-5 and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. Table 10-7 presents the expected Project related vibration levels at each of the eleven sensitive receptor locations.

**TABLE 10-7: CONSTRUCTION EQUIPMENT VIBRATION LEVELS** 

| Noise<br>Receptor <sup>1</sup> | Distance To<br>Property Line<br>(In Feet) |                    | Potential  |                  |                    |                   |                                     |

<sup>&</sup>lt;sup>1</sup>Noise receptor locations are shown on Exhibit 8-A.

Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference level of 87 VdB at a distance of 25 feet. At distances ranging from 100 to 2,020 feet from the Project site, construction vibration levels are expected to range from 0.8 to 68.9 VdB. Using the construction vibration assessment methods provided by the Federal Transit Administration (FTA) the proposed Project site will not include nor require equipment, facilities, or activities that would result in a perceptible human response (annoyance).

The Project construction is not expected to generate vibration levels exceeding the FTA maximum acceptable vibration standard of 80 (VdB). Further, impacts at the site of the closest

<sup>&</sup>lt;sup>2</sup> Based on the Vibration Source Levels of Construction Equipment included on Table 6-5.

<sup>&</sup>lt;sup>3</sup> Does the Peak Vibration exceed the FTA maximum acceptable vibration standard of 80 (VdB)?

sensitive receptor are unlikely to be sustained during the entire construction period, but will occur rather only during the times that heavy construction equipment is operating proximate to the Project site perimeter. Moreover, construction at the Project site will be restricted to daytime hours consistent with City requirements thereby eliminating potential vibration impact during the sensitive nighttime hours. On this basis the potential for the Project to result in exposure of persons to, or generation of, excessive ground-borne vibration is determined to be less than significant.

## 11 FINDINGS AND CONCLUSIONS

This report evaluated the potential noise impacts associated with the development of the proposed Project including Project related traffic noise, stationary noise impacts and temporary construction noise impacts. This section summarizes the Project noise impacts and the mitigation measures required to reduce the Project noise impacts to less than significant levels.

#### 11.1 OFF-SITE TRAFFIC NOISE IMPACTS

This report evaluated potential Project off-site traffic-related noise impacts to the study area. The off-site traffic noise analysis shows that the Project noise level increase of up to 1.2 dBA CNEL for Existing with Project conditions is expected to decrease to 1.0 dBA CNEL by Year 2018 conditions and to 0.8 dBA CNEL by Year 2035 conditions. Generally, the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic will diminish over time. This occurs as the background traffic on the study area roadway segments increases and the Project represents a smaller percentage of the overall traffic volume. This analysis shows that the Project will not create a substantial permanent increase in traffic-related noise levels or expose persons to noise levels in excess of the exterior noise level standards, and therefore, no off-site traffic noise mitigation is required.

In no instances would the Project generate perceptible vehicular-source noise that would result in or cause noise levels along potentially affected roadway segments to transition from an acceptable ambient noise environment (<65 dBA CNEL) to a noise environment greater than 65 dBA CNEL. On this basis, Project vehicular-source noise would not result in exposure of persons to, or generation of, noise levels in excess of standards established in the City's General Plan, and potential impacts in this regard would be less-than-significant.

#### 11.2 OPERATIONAL IMPACTS

The operational noise impacts associated with the proposed Project are expected to include loading docks, trash compactors, roof-top air condenser units, shopping cart carousels, parking lot and car wash activities. The analysis shows that the Project only operational noise levels will range from 28.1 to 52.1 dBA Leq at a distance of 200 feet.

When combined with the existing ambient noise levels, the Project operational noise levels at a distance of 200 feet are estimated at 54.4 dBA Leq. The Project operational noise levels associated with the proposed Moreno Valley Walmart will not exceed the daytime and nighttime exterior noise level standards for commercial uses of 65 dBA Leq and 60 dBA Leq, respectively at a distance of 200 feet and, therefore, will be less than significant.

The noise analysis shows that the Project would contribute operational stationary/area-source noise levels of up to 4.8 dBA Leq (daytime) and 7.0 dBA Leq (nighttime) at nearby receptor locations. However, in no instance would Project operational stationary area-source noise cause or result in an exceedance of the maximum acceptable ambient condition (65 dBA daytime/60 dBA nighttime). Nor would Project operational stationary/area-source noise result in an increase of 1.5 dBA or greater in instances where noise levels without the Project already

exceed the maximum acceptable ambient condition. On this basis, Project operational stationary/area-source noise would not result in a substantial temporary/periodic, or permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project, and impacts in these regards are less-than-significant.

## 11.3 CONSTRUCTION NOISE IMPACTS

Based on the four stages of construction, the noise impacts associated with the proposed Project are expected to create temporary high-level noise impacts at receptor locations surrounding the Project site when certain activities occur near the Project property line. Though construction noise is temporary, intermittent and of short duration, and will not present any long-term impacts, the following mitigation measures would reduce any noise level increases produced by the construction equipment to the nearby noise sensitive residential land uses.

- Install temporary noise control barriers that provide a minimum noise level attenuation of 17 dBA when Project construction occurs within 200 feet of existing residential structures. The noise control barrier must present a solid face from top to bottom. The noise control barrier must be high enough and long enough to block the view of the noise source. Unnecessary openings shall not be made.
  - The noise barriers must be maintained and any damage promptly repaired. Gaps, holes, or weaknesses in the barrier or openings between the barrier and the ground shall be promptly repaired.
  - The noise control barriers and associated elements shall be completely removed and the site appropriately restored upon the conclusion of the construction activity.
- Prior to approval of grading plans and/or issuance of building permits, plans shall include a note indicating that for other than grading activities, noise-generating Project construction activities shall not occur between the hours of 8:00 p.m. and 8:00 a.m. Grading operations shall be limited to between the hours of 8:00 a.m. to 6:00 p.m. weekdays, and 8:00 a.m. to 4:00 p.m. on weekends and holidays, or as otherwise approved by the City Engineer. The Project construction supervisor shall ensure compliance with the note and the City shall conduct periodic inspection at its discretion.
- During all Project site construction, the construction contractors shall equip all construction
  equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with
  manufacturers' standards. The construction contractor shall place all stationary construction
  equipment so that emitted noise is directed away from the noise sensitive receptors nearest the
  Project site.
- The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise sensitive receptors nearest the Project site (i.e., to the north and east) during all Project construction.
- The construction contractor shall limit haul truck deliveries to the same hours specified for general construction equipment operations, other than grading (i.e. deliveries are prohibited between the hours of 8:00 p.m. and 8:00 a.m.). The Project Applicant shall prepare a haul route exhibit for review and approval by the City of Moreno Valley Planning Division prior to commencement of construction activities. The haul route exhibit shall design delivery routes to

- minimize the exposure of sensitive land uses or residential dwellings to delivery truck-related noise.
- The construction contractor shall post a publicly visible sign with the telephone number and person to contact regarding noise complaints. The construction manager, within seventy-two hours of receipt of a noise complaint, shall either take corrective actions or, if immediate action is not feasible, provide a plan or corrective action to address the source of the noise complaint.

## 11.4 VIBRATION IMPACTS

The Project does not propose uses or activities that would result in permanent on-going vibration sources. The estimated 68.9 VdB due to Project construction activities received at the nearest residential property is below the FTA 80 VdB impact criteria level, and would therefore not be considered an annoyance or an interference at proximate residential land uses. Further, impacts at the site of the closest sensitive receptor are unlikely to be sustained during the entire construction period, but will occur rather only during the times that heavy construction equipment is operating proximate to the Project site perimeter. Moreover, construction at the Project site will be restricted to daytime hours consistent with City requirements thereby eliminating potential vibration impact during evening hours. On this basis the potential for the Project to result in exposure of persons to, or generation of, excessive ground-borne vibration is determined to be less-than-significant.

## APPENDIX 3.1:

CITY OF MORENO VALLEY GENERAL PLAN SAFETY ELEMENT (NOISE)

also promoted by way of educational programs.

Between July of 2004 and June of 2005, animal services staff responded to 17,077 calls for service. Animal services also returned 1,290 lost pets to their owners and arranged for the adoption of 2,034 pets.

Moreno Valley Animal Shelter

## 6.3.2Issues and Opportunities

Irrespective of the efforts of Animal Services and other organizations dedicated to reducing the population of unwanted pets, a large number of unwanted pets are produced every year. Unfortunately, the number of unwanted animals far surpasses the capacity of the shelter and the number of good homes available for adoption.

The need for animal services is expected to grow in proportion to the rate of growth in the local community.

#### **B. ENVIRONMENTAL SAFETY**

#### 6.4 NOISE

#### 6.4.1 Background

Noise has long been an accepted part of modern civilization, but excessive noise has become an important environmental concern. Excessive noise can disturb the peace and quiet of neighborhoods.

Excessive noise can cause physical and psychological responses. Temporary reactions include, but are not limited to, constriction of blood vessels, secretion of saliva and gastric fluids, changes in heart rate and a feeling of anxiety and discomfort.

Three effects of noise that are of particular concern are interference with speech, interruption of sleep and hearing loss. Sleep interruption can occur when the intruding noise exceeds 45 decibels. Speech interference becomes a problem when the intruding noise is above 60 decibels. Hearing loss can begin to occur with sustained noise levels above 75 decibels.

Section 1092 of Title 25, Chapter 1, Subchapter 1. Article 4. of the California Administrative Code includes insulation standards for new multi-family structures (hotels, motels, apartments, condominiums, and other attached dwellings) located within the 60 CNEL contour adjacent to roads, railroads, rapid transit lines, airports or industrial areas. An acoustic analysis is required showing that these multi-family units have been designed to limit interior noise levels with doors and windows closed to 45 CNEL in any habitable room. Title 21 of the California Administration Code (Subchapter 6, Article 2, Section 5014) also specifies that noise levels in all habitable rooms do not exceed 45 CNEL.

## 6.4.2 Noise Fundamentals

Noise levels are measured on a logarithmic scale in decibels. The measurements are then weighted and added over a specified time period to reflect not only the magnitude of the sound, but also its duration, frequencyand time of occurrence. In this manner, various acoustical scales and units of measurement have been developed such as: equivalent sound levels (Leq), day-night average sound levels (Ldn), Community Noise Equivalent Levels (CNEL's), and

Single Event Noise Exposure Levels (SENEL's).

A-weighted decibels (dBA) approximate the subjective response of the human ear to noise by discriminating against the very low and high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies audible to the human ear. The decibel scale has a value of 1.0 dBA at the threshold of hearing and 140 dBA at the threshold of pain. Each increase of 10 decibels indicates a ten-fold sound energy increase, which is perceived by the human ear as being roughly twice as loud.

Examples of the decibel level of various noise sources are the quiet rustle of leaves (10 dBA), a soft whisper (20 to 30 dBA) and the hum of a small electric clock (40 dBA). Additional examples include the ambient noise in a house kitchen (50dBA), normal conversation at 5 feet (55 dBA) and a busy street at 50 feet (75 dBA).

Day-night average sound levels (Ldn) are a measure of cumulative noise exposure. The Ldn value results from a summation of hourly noise levels over a 24-hour time period with an increased weighting factor applied to the period between 10:00 PM and 7:00 AM. This takes into account the fact that noise that occurs during normal sleeping hours is more annoying. Community Noise Equivalent Levels (CNEL's) is a measure similar to Ldn except it includes an additional penalty for noise that occurs between 7 p.m. and 10 p.m. CNEL values are typically less than one decibel higher than Ldn values.

The Single Event Noise Exposure Level (SENEL) is the appropriate rating scale for a single noise occurrence. The SENEL, given in decibels, is the noise exposure level of a single event measured over the time interval between the initial and final times for which it exceeds the threshold noise level.

For a "line source" of noise such as a heavily traveled roadway, the noise level drops off at

a nominal rate of 3.0 decibels for each doubling of distance between the noise source and noise receiver. Environmental factors such as the wind, temperature, the characteristics of the ground (hard or soft) and the air (relative humidity), the presence of grass, shrubs and trees, combine to increase the actual attenuation achieved outside laboratory conditions to 4.5 decibels per doubling of distance. Thus, a noise level of 74.5 decibels at 50 feet from the highway centerline would attenuate to 70.0 decibels at 100 feet, 65.5 decibels at 200 feet, and so forth.

In an area, which is relatively flat and free of barriers, the sound level resulting from a single "point source" drops by 6 decibels for each doubling of distance. This applies to fixed noise sources such as industrial sources and mobile noise sources that are temporarily stationary such as idling trucks.

Important noise sources within the study area include industrial and utility uses, mechanical equipment, loud speakers, aircraft and motor vehicles. Noise levels adjacent to roadways vary with the volume of traffic, the mean vehicular speed, the truck mix and the road cross-section. High traffic volumes and speed along State route 60 and arterial roadways contribute to high noise levels. Noise levels due to air traffic from the joint-use airport at March depend on aircraft characteristics, the number, path, elevation and duration of flights as well as the time of day that flights take place.

The results of the noise analysis prepared for the environmental impact report for the General Plan Update is shown in Figure 6-2. Figure 6-2 can be used as a general guide to determine potential "worst case" future noise levels for planning and design purposes.

## 6.4.3 Community Responses to Noise

People in general cannot perceive an increase or decrease of 1.0 dBA except in carefully controlled laboratory experiments. A

3.0 dBA increase is considered noticeable outside of the laboratory. An increase of 5.0 dBA is often necessary before any noticeable change in community response (i.e. complaints) would be expected.

Studies have shown that people respond to changes in long-term noise levels. About 10 percent of the people exposed to traffic noise of 60 Ldn will report being highly annoyed with the noise and 2 percent more people become highly annoyed with each unit of Ldn increase in traffic noise. When traffic noise exceeds 60 Ldn or aircraft noise exceeds 55 Ldn, people begin complaining. Group and legal actions to stop the noise may occur at traffic noise levels near 70 Ldn and aircraft noise levels near 65 Ldn.

Approximately 10 percent of the population has such a low tolerance for noise that they object to any noise not of their own making. Consequently, even in the quietest environment, some complaints will occur. Another 25 percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected.

# 6.4.4. Planning and Design Considerations

There are many mechanisms available to control noise in the community. A noise ordinance can be adopted to control noise sources, but the best way to minimize the adverse effects of noise is through planning and design.

Planning noise compatible land uses near existing or projected high noise levels is an effective technique. Certain land uses are more compatible with noise than others. Schools, hospitals, churches and single-family residences are relatively sensitive to noise. Multiple-family residential uses are less sensitive to noise than single-family residential uses. Commercial, office and industrial uses are relatively noise tolerant. Where possible, the land use plan places

noise tolerant uses within areas impacted by noise from State Route 60, arterial streets and aircraft over flights. The historical land use pattern and other community needs made it impractical to avoid all noise conflicts through land use planning.

Acoustic site planning, architectural design, acoustic construction techniques and noise barriers are effective methods for reducing noise impacts. Acoustic site planning involves the arrangement of lots, buildings, berms and walls to minimize noise conflicts and impacts. Sound walls and berming are often used as sound barriers between residential uses and nonresidential noise sources, such as commercial uses, industrial uses, freeways and other major roadways.

Acoustic architectural design involves the incorporation of noise attenuation strategies in the design of individual structures. Building heights, room arrangements, window size and placement, balcony and courtyard design can be adjusted to shield noise sensitive activities from intrusive sound levels.

Acoustic construction is the treatment of various parts of a building to reduce interior noise levels. Acoustic wall design, doors, ceilings and floors, as well as dense building materials and acoustic windows (double-paned, thick, non-openable, or small windows) are all available options.

## 6.5 GEOLOGIC HAZARDS

#### 6.5.1 Background

Most of the Moreno Valley study area lies at the eastern margin of a block of the earth's crust known as the "Perris Block." The Perris Block is a mass of granitic rock, generally bounded by the San Jacinto fault, the Elsinore fault, and the Santa Ana River. The Perris Block has had an apparent history of vertical land movements of several thousand feet.

Page 6-16

### APPENDIX 3.2:

**GENERAL PLAN GUIDELINES** 

# APPENDIX C

# Guidelines for the Preparation and Content of the Noise Element of the General Plan

The noise element of the general plan provides a basis for comprehensive local programs to control and abate environmental noise and to protect citizens from excessive exposure. The fundamental goals of the noise element are:

- To provide sufficient information concerning the community noise environment so that noise may be effectively considered in the land use planning process. In so doing, the necessary groundwork will have been developed so that a community noise ordinance may be utilized to resolve noise complaints.
- To develop strategies for abating excessive noise exposure through cost-effective mitigating measures in combination with zoning, as appropriate, to avoid incompatible land uses.
- To protect those existing regions of the planning area whose noise environments are deemed acceptable and also those locations throughout the community deemed "noise sensitive."
- To utilize the definition of the community noise environment in the form of CNEL or Ldn noise contours as provided in the noise element for local compliance with the State Noise Insulation Standards. These standards require specified levels of outdoor to indoor noise reduction for new multifamily residential constructions in areas where the outdoor noise exposure exceeds CNEL (or Ldn) 60 dB.

The 1976 edition of the *Noise Element Guidelines*, prepared by the California Department of Health Services (DHS), was a result of SB 860 (Beilenson, 1975), which became effective January 1, 1976. SB 860, among other things, revised and clarified the requirements for the noise element of each city and county general plan and gave DHS the authority to issue guidelines for compliance thereto. Compliance with the 1976 version of these guidelines was mandated only for those noise elements that were not submitted to the Office of Planning and Research by the effective date of SB 860 and to subsequent revisions of previously submitted noise elements.

A comparison between the 1976 *Noise Element Guidelines* and this revised edition will not reveal substantial changes. The basic methodology advanced by that previous edition remains topical. Where necessary, code references have been updated and the text revised to reflect statutory changes.

#### **DEFINITIONS**

- **Decibel, dB**: A unit of measurement describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
- A-Weighted Level: The sound level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the response of the human ear and gives good correlation with subjective reactions to noise.
- **L10**: The A-weighted sound level that is exceeded ten percent of the sample time. Similarly, L50, L90, etc.
- Leq: Equivalent energy level. The sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. Leq is typically computed over 1-, 8-, and 24-hour sample periods.
- CNEL: Community Noise Equivalent Level. The average equivalent A-weighted sound level during a 24-hour day, obtained after addition of five decibels to sound levels in the evening from 7 p.m. to 10 p.m. and after addition of 10 decibels to sound levels in the night from 10 p.m. to 7 a.m.
- Ldn: Day-Night Average Level. The average equivalent A-weighted sound level during a 24-hour day, obtained after the addition of 10 decibels to sound levels in the night after 10 p.m. and before 7 a.m. (Note: CNEL and Ldn represent daily levels of noise exposure averaged on an annual or daily basis, while Leq represents the equivalent energy noise exposure for a shorter time period, typically one hour.)

Noise Contours: Lines drawn about a noise source indicating equal levels of noise exposure. CNEL and Ldn are the metrics utilized herein to describe annoyance due to noise and to establish land use planning criteria for noise.

Ambient Noise: The composite of noise from all sources near and far. In this context, the ambient noise level constitutes the normal or existing level of environmental noise at a given location.

Intrusive Noise: That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence, and tonal or informational content as well as the prevailing noise level.

Noisiness Zones: Defined areas within a community wherein the ambient noise levels are generally similar (within a range of 5 dB, for example). Typically, all other things being equal, sites within any given noise zone will be of comparable proximity to major noise sources. Noise contours define different noisiness zones.

#### NOISE ELEMENT REQUIREMENTS

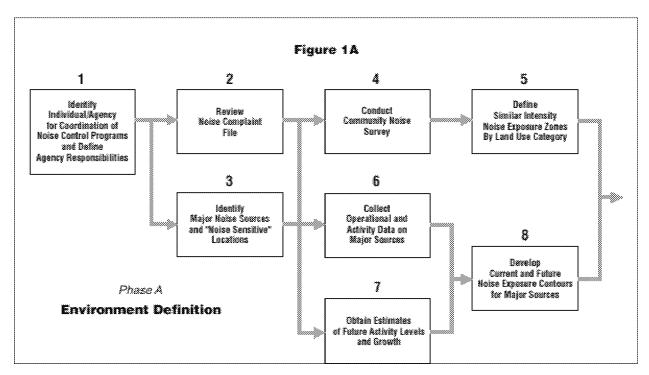

Government Code Section 65302(f): A noise element shall identify and appraise noise problems in the community. The noise element shall recognize the guidelines established by the Office of Noise Control in the State Department of Health Services and shall

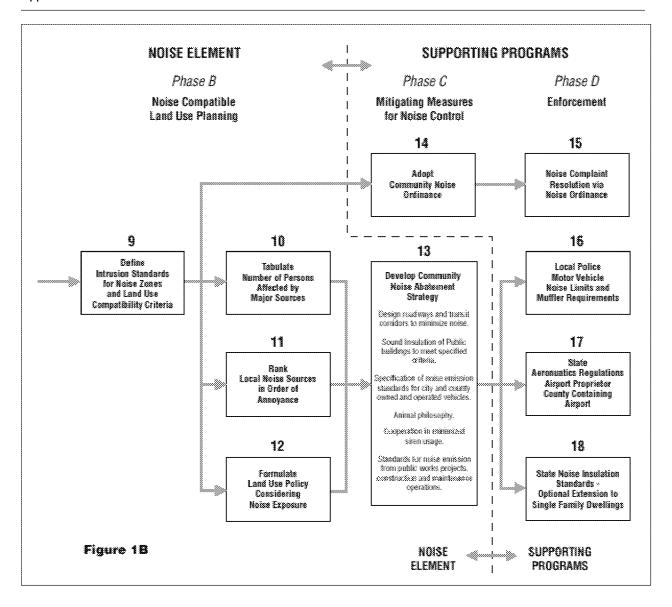

analyze and quantify, to the extent practicable, as determined by the legislative body, current and projected noise levels for all of the following sources:

- 1. Highways and freeways.
- 2. Primary arterials and major local streets.
- 3. Passenger and freight on-line railroad operations and ground rapid transit systems.
- Commercial, general aviation, heliport, helistop, and military airport operations, aircraft overflights, jet engine test stands, and all other ground facilities and maintenance functions related to airport operation.
- 5. Local industrial plants, including, but not limited to, railroad classification yards.
- Other ground stationary sources identified by local agencies as contributing to the community noise environment.

Noise contours shall be shown for all of these sources and stated in terms of community noise equivalent level (CNEL) or day-night average level (Ldn). The noise contours shall be prepared on the basis of noise monitoring or following generally accepted noise modeling techniques for the various sources identified in paragraphs (1) to (6), inclusive.

The noise contours shall be used as a guide for establishing a pattern of land uses in the land use element that minimizes the exposure of community residents to excessive noise.

The noise element shall include implementation measures and possible solutions that address existing and foreseeable noise problems, if any. The adopted noise element shall serve as a guideline for compliance with the state's noise insulation standards.

#### NOISE ELEMENT DEVELOPMENT PROCESS

The sequential steps for development of a noise element as an integral part of a community's total noise control program are illustrated in the flow diagrams of figures 1A and 1B. The concept presented herein utilizes the noise element as the central focus of the community's program and provides the groundwork for all subsequent enforcement efforts. The process may be described in terms of four phases:

Phase A: Noise Environment Definition

Phase B: Noise-Compatible Land Use Planning

Phase C: Noise Mitigation Measures

Phase D: Enforcement

These phases encompass a total of eighteen defined tasks, the first thirteen of which relate directly to the statutory requirements contained in Government Code §65302(f). The remainder relate to critical supportive programs (noise ordinances, etc.). Citations from §65302(f) are contained within quotation marks.

#### Phase A: Noise Environment Definition

The purpose of this phase is to adequately identify and appraise the existing and future noise environment of the community in terms of Community Noise Equivalent Level (CNEL) or Day-Night Average Level (Ldn) noise contours for each major noise source and to divide the city or county into noise zones for subsequent noise ordinance application.

#### Step 1:

Identify a specific individual or lead agency within the local government to be responsible for coordination of local noise control activities. This individual or agency should be responsible for coordinating all intergovernmental activities and subsequent enforcement efforts.

#### Step 2:

Review noise complaint files as compiled by all local agencies (police, animal control, health, airport, traffic department, etc.) in order to assess the following:

- 1. Location and types of major offending noise sources.
- 2. Noise-sensitive areas and land uses.
- Community attitudes towards specific sources of noise pollution.
- 4. Degree of severity of noise problems in the community.
- 5. Relative significance of noise as a pollutant.

#### Step 3:

Specifically identify major sources of community noise based upon the review of complaint files and interagency discussion and the following statutory subjects:

- 1. Highways and freeways.
- 2. Primary arterials and major local streets.
- Passenger and freight on-line railroad operations and ground rapid transit systems.
- 4. Commercial, general aviation, heliport, helistop, and military airport operations, aircraft overflights, jet engine test stands, and all other ground facilities and maintenance functions related to airport operation.
- 5. Local industrial plants, including, but not limited to, railroad classification yards.
- 6. Other ground stationary noise sources identified by local agencies as contributing to the community noise environment. (§65302(f))

In addition, the land uses and areas within the community that are noise sensitive should be identified at the same time.

#### Step 4:

Given the identification of major noise sources and an indication of the community's attitude toward noise pollution (when available), it is advisable to conduct a community noise survey. The purposes of the survey are threefold:

First and foremost, to define by measurement the current noise levels at those sites deemed noise sources and to establish noise level contours around them. The noise contours must be expressed in terms of CNEL or Ldn.

Second, the collected data will form the basis for an analysis of noise exposure from major sources.

Finally, the survey should define the existing ambient noise level throughout the community. Intrusive noises over and above this general predetermined ambient level may then be controlled through implementation of a noise ordinance.

#### Step 5:

Given the definition of existing ambient noise levels throughout the community, one may proceed with a classification of the community into broad regions of generally consistent land uses and similar noise environments. Because these regions will be varying distances from identified major noise sources, the relative levels of environmental noise will be different from one another. Therefore, subsequent enforcement efforts and mitigating measures may be oriented towards maintaining quiet areas and improving noisy ones.

#### Step 6:

Directing attention once again to the major noise sources previously identified, it is essential to gather operations and activity data in order to proceed with the analytical noise exposure prediction. This data is somewhat source-specific but generally should consist of the following information and be supplied by the owner/operator of the source:

- 1. Average daily level of activity (traffic volume, flights per day, hours of operation, etc.).
- 2. Distribution of activity over day and night time periods, days of the week, and seasonal variations.
- Average noise level emitted by the source at various levels of activity.
- Precise source location and proximity to noise-impacted land uses.
- 5. Composition of noise sources (percentage of trucks on highway, aircraft fleet mix, industrial machinery type, etc.).

Step 7:

In addition to collecting data on the variables affecting noise-source emission for the existing case, future values for these parameters need to be assessed. This is best accomplished by correlating the noise element with other general plan elements (i.e. land use, circulation, housing, etc.) and regional transportation plans and by coordination with other responsible agencies (Airport Land Use Commission, Caltrans, etc.).

Step 8:

Analytical noise exposure modeling techniques may be utilized to develop source-specific noise contours around major noise sources in the community.

"The noise contours shall be prepared on the basis of noise monitoring or following generally accepted noise modeling techniques..." (§65302(f))

Simplified noise prediction methodologies are available through the Department of Health Services for highway and freeway noise, railroad noise, simple fixed stationary and industrial sites, and general aviation aircraft (with less than twenty percent commercial jet aircraft activity—two engine jet only). Noise contours for larger airport facilities and major industrial sites are sufficiently complex that they must be developed via sophisticated computer techniques available through recognized acoustical consulting firms. (Airport contours generally have already been developed in accordance with requirements promulgated by Caltrans' Division of Aeronautics: Noise Standards, Title 21, Section 5000, et seq., California Code of Regulations.)

Although considerable effort may go into developing noise contours that, in some instances, utilize rather sophisticated digital programming techniques, the present state of the art is such that their accuracy is usually no better than +/- 3 dB. In fact, the accuracy of the noise exposure prediction decreases with increasing distance from the noise source. In the near vicinity of the source, prediction accuracy may be within the range of +/- 1 dB, while at greater distances this may deteriorate to +/- 5 dB or more. At greater distances, meteorological and topographic effects, typically not totally accounted for in most models, may have significant influence. Thus, while dealing with the concept of noise contours, it is best not to think of them as absolute lines of demarcation on a map (such as topographical contours), but rather as bands of similar noise exposure.

In addition to assessment of the present-day noise environment, it is recommended that the noise exposure data be projected through the time horizon of the general plan. The noise element should be updated and corrected every five years, or sooner as is necessary, and, at that time, the forecasted noise exposure should be projected an additional five years.

#### Phase B: Noise-Compatible Land Use Planning

A noise planning policy needs to be rather flexible and dynamic to reflect not only technological advances in noise control, but also economic constraints governing application of noise-control technology and anticipated regional growth and demands of the community. In the final analysis, each community must decide the level of noise exposure its residents are willing to tolerate within a limited range of values below the known levels of health impairment.

Step 9:

Given the definition of the existing and forecasted noise environment provided by the Phase A efforts, the locality preparing the noise element must now approach the problem of defining how much noise is too much. Guidelines for noise-compatible land use are presented in Figure 2. The adjustment factors given in Table 1 may be used in order to arrive at noise-acceptability standards that reflect the noise-control goals of the community, the particular community's sensitivity to noise (as determined in Step 2), and the community's assessment of the relative importance of noise pollution.

Step 10:

As a prerequisite to establishing an effective noise-control program, it is essential to know, in quantitative terms, the extent of noise problems in the community. This is best accomplished by determining, for each major noise source around which noise contours have been developed, the number of community residents exposed and to what extent. It is also useful to identify those noise-sensitive land uses whose noise exposure exceeds the recommended standards given in Figure 2. The exposure inventory can be accomplished by using recent census data, adjusted for regional growth, and tabulating the population census blocks within given noise contours.

*Step 11:* 

Once the noise exposure inventory is completed, the relative significance of specific noise sources in the community (in terms of population affected) will become apparent. The local agencies involved may wish to use this information to orient their noise-control and abatement efforts to achieve the most good. Clearly, control of certain major offending sources will be be-

yond the jurisdiction of local agencies; however, recognition of these limitations should prompt more effective land use planning strategies.

#### Step 12:

A major objective of the noise element is to utilize this information to ensure noise-compatible land use planning:

"The noise contours shall be used as a guide for establishing a pattern of land uses in the land use element that minimizes the exposure of community residents to excessive noise." (§65302(f))

The intent of such planning is to:

- (1) Maintain those areas deemed acceptable in terms of noise exposure.
- (2) Use zoning or other land use controls in areas with excessive noise exposure to limit uses to those which are noise compatible and to restrict other, less compatible uses.

# Phase C: Noise Mitigation Measures

Step 13:

Based upon the relative importance of noise sources in order of community impact and local attitudes towards these sources, "[t]he noise element shall include implementation measures and possible solutions that address existing and foreseeable noise problems, if any" (§65302(f)).

Selection of these noise-mitigating measures should be coordinated through all local agencies in order to be most effective. Minimization of noise emissions from all local government-controlled or sanctioned activities should be a priority item. This includes low noise specifications for new city or county owned and operated vehicles (and noise reduction retrofitting where economically possible) and noise emission limits on public works projects. Local governments should insure that public buildings (especially schools) are sufficiently insulated to allow their intended function to be uninterrupted by exterior noise. Local agencies can work with state and federal bodies to minimize transportation noise, primarily through transitway design, location, or configuration modifications.

Additional measures might include such policies as limitation of siren usage by police, fire, and ambulance units within populated areas. Animal control units may be encouraged to minimize barking dog complaints through use of an improved public relations campaign termed "Animal Philosophy." This involves working with pet owners to determine why the dog barks and

attempting solutions rather than just issuing citations. Local zoning and subdivision ordinances may require the use of noise-reducing building materials or the installation of sound-insulating walls along major roads in new construction and subdivisions.

In general, local noise reduction programs need to address the problems specific to each community, with the ultimate goals being the reduction of complaint frequency and the provision of a healthful noise environment for all residents of the community.

The remaining steps are beyond the scope of the noise element requirements, but pertain to coordination with other state noise-control programs and achievement of the goals set forth in the noise element through development of an active local noise-control effort.

#### Step 14:

While the noise element identifies problem areas and seeks to develop medium- and long-range solutions to them, a community noise ordinance is the only viable instrument for short-term or immediate solutions to intrusive noise. A model noise ordinance that can be tailored to the specific needs of a given community by simply incorporating those sections deemed most applicable has been developed by the Department of Health Services. The model ordinance also suggests a cure for non-stationary or transient types of noise events, for which noise contours are generally meaningless.

#### Phase D: Enforcement

To adequately carry out the programs identified in the noise element and to comply with state requirements for certain other noise-control programs, specific enforcement programs are recommended at the local level.

#### Step 15:

Adopt and apply a community noise ordinance for resolution of noise complaints.

#### Step 16:

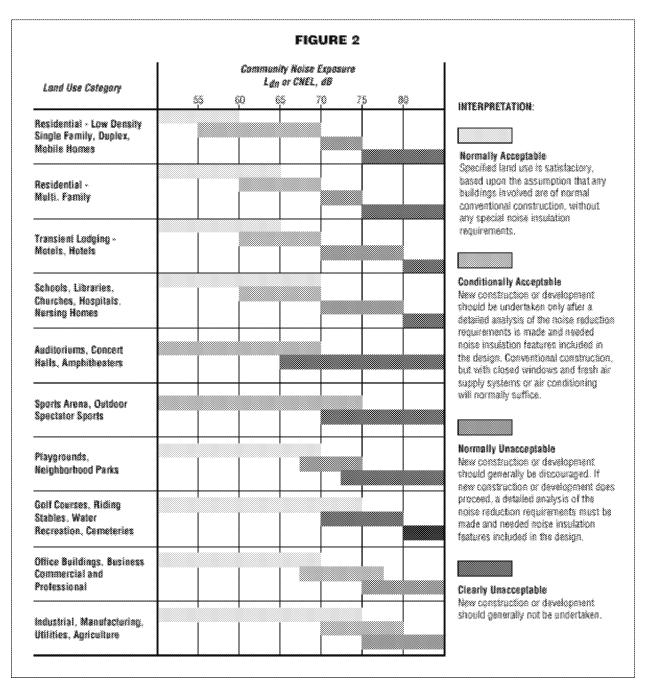

Recent studies have shown that the most objectionable feature of traffic noise is the sound produced by vehicles equipped with illegal or faulty exhaust systems. In addition, such hot rod vehicles are often operated in a manner that causes tire squeal and excessively loud exhaust noise. There are a number of statewide vehicle noise regulations that can be enforced by local authorities as well as the California Highway Patrol. Specifically, Sections 23130, 23130.5, 27150, 27151,

and 38275 of the California Vehicle Code, as well as excessive speed laws, may be applied to curtail this problem. Both the Highway Patrol and the Department of Health Services (through local health departments) are available to aid local authorities in code enforcement and training pursuant to proper vehicle sound-level measurements.

#### Step 17:

Commercial and public airports operating under a permit from Caltrans' Aeronautics Program are required

to comply with both state aeronautics standards governing aircraft noise and all applicable legislation governing the formation and activities of a local Airport Land Use Commission (ALUC). The function of the ALUC is, among other things, to develop a plan for noise-compatible land use in the immediate proximity of the airport. The local general plan must be reviewed for compatibility with this Airport Land Use Plan and amended if necessary (Public Utilities Code §21676). Therefore, the developers of the noise element will need to coordinate their activities with the local ALUC to

| Type of Correction   | Table 1  Description  | Amount of<br>Correction to be<br>Added to<br>Measured CNEL in<br>dB |  |

|  | Pure Tone or impulsive character present.   | + !   |  |

ensure that compatible standards are utilized throughout the community and that the noise element develops as part of a coherent master plan, of which the ALUP forms an integral component.

#### Step 18:

"The adopted noise element shall serve as a guideline for compliance with the State's noise insulation standards." (§65302(f)) Recognizing the need to provide acceptable habitation environments, state law requires noise insulation of new multifamily dwellings constructed within the 60 dB (CNEL or Ldn) noise exposure contours. It is a function of the noise element to provide noise contour information around all major sources in support of the sound transmission control standards (Appendix, Chapter 2-35, Part 2, Title 24, California Code of Regulations).

# RELATIONSHIP OF THE NOISE ELEMENT TO OTHER GENERAL PLAN ELEMENTS

The noise element is related to the land use, housing, circulation, and open-space elements. Recognition of the interrelationship of noise and these four other mandated elements is necessary in order to prepare an integrated general plan. The relationship between noise and these four elements is briefly discussed below.

- ♦ Land Use—A key objective of the noise element is to provide noise exposure information for use in the land use element. When integrated with the noise element, the land use element will show acceptable land uses in relation to existing and projected noise contours. Section 65302(f) states that: "The noise contours shall be used as a guide for establishing a pattern of land uses in the land use element that minimizes the exposure of community residents to excessive noise."
- ♦ Housing—The housing element considers the provision of adequate sites for new housing and standards for housing stock. Since residential land use is among the most noise sensitive, the noise exposure information provided in the noise element must be considered when planning the location of new housing. Also, state law requires special noise insulation of new multifamily dwellings constructed within the 60 dB (CNEL or Ldn) noise exposure contour. This requirement may influence the location and cost of this housing type. In some cases, the noise environment may be a constraint on housing opportunities.
- ♦ Circulation—The circulation system must be correlated with the land use element and is one of the major sources of noise. Noise exposure will thus be a decisive factor in the location and design of new transportation facilities and the possible mitigation of noise from existing facilities in relation to existing and planned land uses. The local planning agency may wish to review the circulation and land use elements simultaneously to assess their compatibility with the noise element.
- ♦ Open Space—Excessive noise can adversely affect the enjoyment of recreational pursuits in designated open space. Thus, noise exposure levels should be considered when planning for this kind of open-space use. Conversely, open space can be used to buffer sensitive land uses from noise sources through the use of setbacks and landscaping. Open-space designation can also effectively exclude other land uses from excessively noisy areas.

#### SELECTION OF THE NOISE METRIC

The community noise metrics to be used in noise elements are either CNEL or Ldn (as specified in §65302(f)). A significant factor in the selection of these scales was compatibility with existing quantifications of noise exposure currently in use in California. CNEL is the noise metric currently specified in the State Aeronautics Code for evaluation of noise impacts at specific airports that have been declared to have a noise problem. Local compliance with state airport noise standards necessitates that community noise be specified in CNEL. The Ldn represents a logical simplification of CNEL. It divides the day into two weighted time periods (Day—7 a.m. to 10 p.m. and Night—10 p.m. to 7 a.m.) rather than the three used in the CNEL measure (Day—7 a.m. to 7 p.m., Evening—7 p.m. to 10 p.m., and Night—10 p.m. to 7 a.m.) with no significant loss in accuracy.

# CRITERIA FOR NOISE-COMPATIBLE LAND USE

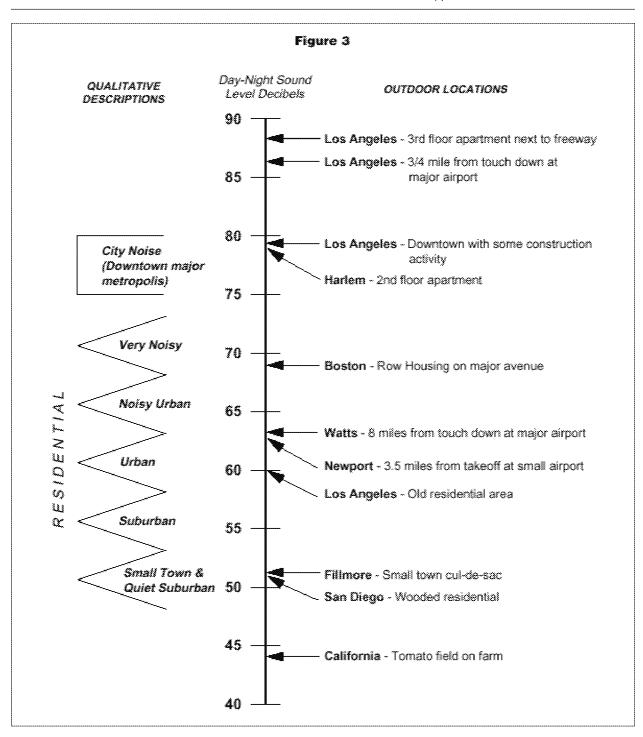

Figure 2 summarizes the suggested use of the CNEL/Ldn metrics for evaluating land use noise compatibility. Such criteria require a rather broad interpretation, as illustrated by the ranges of acceptability for a given land use within a defined range of noise exposures.

Denotation of a land use as "normally acceptable" on Figure 2 implies that the highest noise level in that band is the maximum desirable for existing or conventional construction that does not incorporate any special acoustic treatment. In general, evaluation of land use that falls into the "normally acceptable" or "normally unacceptable" noise environments should include consideration of the type of noise source, the sensitivity of the noise receptor, the noise reduction likely to be provided by structures, and the degree to which the noise source may interfere with speech, sleep, or other activities characteristic of the land use.

Figure 2 also provides an interpretation as to the suitability of various types of construction with respect to the range of outdoor noise exposure.

The objective of the noise compatibility guidelines in Figure 2 is to provide the community with a means of judging the noise environment it deems to be generally acceptable. Many efforts have been made to account for the variability in perceptions of environmental noise that exist between communities and within a given community.

Beyond the basic CNEL or Ldn quantification of noise exposure, one can apply correction factors to the measured or calculated values of these metrics in order to account for some of the factors that may cause

the noise to be more or less acceptable than the mean response. Significant among these factors are seasonal variations in noise source levels, existing outdoor ambient levels (i.e., relative intrusiveness of the source), general societal attitudes towards the noise source, prior history of the source, and tonal characteristics of the source. When it is possible to evaluate some or all of these factors, the measured or computed noise expo-

sure values may be adjusted by means of the correction factors listed in Table 1 in order to more accurately assess local sentiments towards acceptable noise exposure.

In developing these acceptability recommendations, efforts were made to maintain consistency with the goals defined in the federal EPA's "Levels Document" and the State Sound Transmission Control Standards

for multifamily housing. In both of these documents, an interior noise exposure of 45 dB CNEL (or Ldn) is recommended to permit normal residential activity. If one considers the typical range of noise reduction provided by residential dwellings (12 to 18 dB with windows partially open), the 60 dB outdoor value identified as "clearly acceptable" for residential land use would provide the recommended interior environment.

Figure 3 has been included in order to better explain the qualitative nature of community noise environments expressed in terms of Ldn. It is apparent that noise environments cover a broad range and that, in general, it may be observed that the quality of the environment improves as one moves further away from major transportation noise sources.

Title 11 PEACE, MORALS AND SAFETY

#### Chapter 11.80 NOISE REGULATION

#### 11.80.010 Legislative findings.

It is found and declared that:

- A. Excessive sound within the limits of the city is a condition which has existed for some time, and the amount and intensity of such sound is increasing.
- B. Such excessive sound is a detriment to the public health, safety, and welfare and quality of life of the residents of the city.
- C. The necessity in the public interest for the provisions and prohibitions hereinafter contained and enacted is declared as a matter of legislative determination and public policy, and it is further declared that the provisions and prohibitions hereinafter contained and enacted are in pursuance of and for the purpose of securing and promoting the public health, safety, welfare and quality of life of the city and its inhabitants. (Ord. 740 § 1.2, 2007)

#### 11.80.020 Definitions.

For purposes of this chapter, certain words and phrases used herein are defined as follows:

"A-weighted sound level" means the sound pressure level in decibels as measured with a sound level meter using the A-weighting network. The unit of measurement is the dB(A).

"Commercial" means all uses of land not otherwise classified as residential, as defined in this section.

"Construction" means any site preparation, and/or any assembly, erection, repair, or alteration, excluding demolition, of any structure, or improvements to real property.

"Continuous airborne sound" means sound that is measured by the slow-response setting of a meter manufactured to the specifications of ANSI Section 1.4-1983 (R2006) "Specification for Sound Level Meters," or its successor.

"Daytime" means eight a.m. to ten p.m. the same day.

"Decibel" (dB) means a unit for measuring the amplitude of sound, equal to twenty (20) times the logarithm to the base ten (10) of the ratio of the pressure of the sound measured to the reference pressure, which is twenty (20) micropascals (twenty (20)

"Demolition" means any dismantling, intentional destruction or removal of structures or other improvements to real property.

"Disturb" means to interrupt, interfere with, or hinder the enjoyment of peace or quiet or the normal listening activities or the sleep, rest or mental concentration of the hearer.

"Emergency" means any occurrence or set of circumstances involving actual or imminent physical trauma or significant property damage which necessitates immediate action. Economic loss alone shall not constitute an emergency. It shall be the burden of an alleged violator to prove an "emergency."

"Emergency work" means any work made necessary to restore property to a safe condition following an emergency, or to protect persons or property threatened by an imminent emergency, to the extent such work is, in fact, necessary to protect persons or property from exposure to imminent danger or damage.

"Frequency" means the number of complete oscillation cycles per unit of time.

"Impulsive sound" means sound of short duration, usually less than one second, with an abrupt onset and rapid decay. Examples of sources of impulsive sound include explosions, drop forge impacts, and discharge of firearms.

"Nighttime" means 10:01 p.m. to 7:59 a.m. the following day.

"Noise disturbance" means any sound which:

- 1. Disturbs a reasonable person of normal sensitivities;
- 2. Exceeds the sound level limits set forth in this chapter; or
- 3. Is plainly audible as defined in this section. Where no specific distance is set forth for the determination of audibility, references to noise disturbance shall be deemed to mean plainly audible at a distance of two hundred (200) feet from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right of way, public space or other publicly owned property.

"Person" means any person, person's firm, association, copartnership, joint venture, corporation, or any entity public or private in nature.

"Plainly audible" means that the sound or noise produced or reproduced by any particular source, can be clearly distinguished from ambient noise by a person using his/her normal hearing faculties.

"Public right-of-way" means any street, avenue, boulevard, sidewalk, bike path or alley, or similar place normally accessible to the public which is owned or controlled by a governmental entity.

"Public space" means any park, recreational or community facility, or lot which contains at least one building that is open to the general public during its hours of operation.

"Residential" means all uses of land primarily for dwelling units, as well as hospitals, schools, colleges and universities, and places of religious assembly.

"Sound" means an oscillation in pressure, particle displacement, particle velocity or other physical parameter, in a medium with internal forces that causes compression and rarefaction of that medium capable of producing an auditory impression. The description of sound may include any characteristic of such sound, including duration, intensity and frequency.

"Sound level" means the weighted sound pressure level as measured in dB(A) by a sound level meter and as specified in American National Standards Institute (ANSI) specifications for sound-level meters (ANSI Section 1.4-1971 (R1976)). If the frequency weighting employed is not indicated, the A-weighting shall apply.

"Sound level meter" means an instrument, demonstrably capable of accurately measuring sound levels as defined above.

All technical definitions not defined above shall be in accordance with applicable publications and standards of the American National Standards Institute (ANSI). (Ord. 740 § 1.2, 2007)

#### 11.80.030 Prohibited acts.

- A. General Prohibition. It is unlawful and a violation of this chapter to maintain, make, cause, or allow the making of any sound that causes a noise disturbance, as defined in Section 11.80.020.
  - B. Sound causing permanent hearing loss.
- 1. Sound level limits. Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 and Table 1-A specify sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the

sound levels are being exceeded. No sound shall be permitted within the city which exceeds the parameters set forth in Tables 11.80.030-1 and 11.80.030-1-A of this chapter:

# Table 11.80.030-1 MAXIMUM CONTINUOUS SOUND LEVELS\*

| Duration per Day |                     |
|------------------|---------------------|
| Continuous Hours | Sound level [db(A)] |
| 8                | 90                  |
| 6                | 92                  |
| 4                | 95                  |
| 3                | 97                  |
| 2                | 100                 |
| 1.5              | 102                 |
| 1                | 105                 |
| 0.5              | 110                 |
| 0.25             | 115                 |
|                  |                     |

\* When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percent of allowed period of sound exposure at each level exceeds 100 percent

## Table 11.80.030-1A MAXIMUM IMPULSIVE SOUND LEVELS

| Number of Repetitions | Sound level [dB |  |
|-----------------------|-----------------|--|
| per 24-Hour Period    | (A)]            |  |
| 1                     | 145             |  |
| 10                    | 135             |  |
| 100                   | 125             |  |

- 2. Exemptions. No violation shall exist if the only persons exposed to sound levels in excess of those listed in Tables 11.80.030-1 and 11.80.030-1A are exposed as a result of:
  - a. Trespass;
  - b. Invitation upon private property by the person causing or permitting the sound; or
  - c. Employment by the person or a contractor of the person causing or permitting the sound.
- C. Nonimpulsive Sound Decibel Limits. No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimplusive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.

# Table 11.80.030-2 MAXIMUM SOUND LEVELS (IN dB(A)) FOR SOURCE LAND USES

| Residential |           | Commercial |           |
|-------------|-----------|------------|-----------|
| Daytime     | Nighttime | Daytime    | Nighttime |
| 60          | 55        | 65         | 60        |

- D. Specific Prohibitions. In addition to the general prohibitions set out in subsection A of this section, and unless otherwise exempted by this chapter, the following specific acts, or the causing or permitting thereof, are regulated as follows:
- 1. Motor Vehicles. No person shall operate or cause to be operated a public or private motor vehicle, or combination of vehicles towed by a motor vehicle, that creates a sound exceeding the sound level limits in Table 11.80.030-2 when the vehicle(s) are not otherwise subject to noise regulations provided for by the California Vehicle Code.
- 2. Radios, Televisions, Electronic Audio Equipment, Musical Instruments or Similar Devices from a Stationary Source. No person shall operate, play or permit the operation or playing of any radio, tape player, television, electronic audio equipment, musical instrument, sound amplifier or other mechanical or electronic sound making device that produces, reproduces or amplifies sound in such a manner as to create a noise disturbance. However, this subsection shall not apply to any use or activity exempted in subsection E of this section and any use or activity for which a special permit has been issued pursuant to Section 11.80.040.
- 3. Radios, Electronic Audio Equipment, or Similar Devices from a Mobile Source Such as a Motor Vehicle. Sound amplification or reproduction equipment on or in a motor vehicle is subject to regulation in accordance with the California Vehicle Code when upon the public right-of-way. When upon public space or publicly owned property other than the public right-of-way or upon private property open to the public, sound amplification or reproduction equipment shall not be operated in such a manner that it is plainly audible at a distance of fifty (50) feet in any direction from the vehicle.
- 4. Portable, Hand-Held Music or Sound Amplification or Reproduction Equipment. Such equipment shall not be operated on a public right-of-way, public space or other publicly owned property in such a manner as to be plainly audible at a distance of fifty (50) feet in any direction from the operator.
  - 5. Loudspeakers and Public Address Systems.
- a. Except as permitted by Section 11.80.040, no person shall operate, or permit the operation of, any loudspeaker, public address system or similar device, for any commercial purpose:
  - 1. Which produces, reproduces or amplifies sound in such a manner as to create a noise disturbance; or
  - 2. During nighttime hours on a public right-of-way, public space or other publicly owned property.
- b. No person shall operate, or permit the operation of, any loudspeaker, public address system or similar device, for any noncommercial purpose, during nighttime hours in such a manner as to create a noise disturbance.
- 6. Animals. No person shall own, possess or harbor an animal or bird that howls, barks, meows, squawks, or makes other sounds that:
  - a. Create a noise disturbance;
- b. Are of frequent or continued duration for ten (10) or more consecutive minutes and are plainly audible at a distance of fifty (50) feet from the real property line of the source of the sound; or

- c. Are intermittent for a period of thirty (30) or more minutes and are plainly audible at a distance of fifty (50) feet from the real property line of the source of the sound.
- 7. Construction and Demolition. No person shall operate or cause the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of eight p.m. and seven a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee. This section shall not apply to the use of power tools as provided in subsection (D)(9) of this section.
- 8. Emergency Signaling Devices. No person shall intentionally sound or permit the sounding outdoors of any fire, burglar or civil defense alarm, siren or whistle, or similar stationary emergency signaling device, except for emergency purposes or for testing as follows:
- a. Testing of a stationary emergency signaling device shall not occur between seven p.m. and seven a.m. the following day;
- b. Testing of a stationary emergency signaling device shall use only the minimum cycle test time, in no case to exceed sixty (60) seconds;
- c. Testing of a complete emergency signaling system, including the functioning of the signaling device and the personnel response to the signaling device, shall not occur more than once in each calendar month. Such testing shall only occur only on weekdays between seven a.m. and seven p.m. and shall be exempt from the time limit specified in subsection (D)(8)(2) of this section.
- 9. Power Tools. No person shall operate or permit the operation of any mechanically, electrically or gasoline motor-driven tool during nighttime hours so as to cause a noise disturbance across a residential real property boundary.
- 10. Pumps, Air Conditioners, Air-Handling Equipment and Other Continuously Operating Equipment. Notwithstanding the general prohibitions of subsection a of this section, no person shall operate or permit the operation of any pump, air conditioning, air-handling or other continuously operating motorized equipment in a state of disrepair or in a manner which otherwise creates a noise disturbance distinguishable from normal operating sounds.
- E. Exemptions. The following uses and activities shall be exempt from the sound level regulations except the maximum sound levels provided in Tables 11.80.030-1 and 11.80.030-1A:
- 1. Sounds resulting from any authorized emergency vehicle when responding to an emergency call or acting in time of an emergency.
  - 2. Sounds resulting from emergency work as defined in Section 11.80.020
- 3. Any aircraft operated in conformity with, or pursuant to, federal law, federal air regulations and air traffic control instruction used pursuant to and within the duly adopted federal air regulations; and any aircraft operating under technical difficulties in any kind of distress, under emergency orders of air traffic control, or being operated pursuant to and subsequent to the declaration of an emergency under federal air regulations.
- 4. All sounds coming from the normal operations of interstate motor and rail carriers, to the extent that local regulation of sound levels of such vehicles has been preempted by the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.) or other applicable federal laws or regulations
- 5. Sounds from the operation of motor vehicles, to the extent they are regulated by the California Vehicle Code.
- 6. Any constitutionally protected noncommercial speech or expression conducted within or upon a any public right-of-way, public space or other publicly owned property constituting an open or a designated public forum in compliance with any applicable reasonable time, place and manner restrictions on such speech or expression or otherwise pursuant to legal authority.

- 7. Sounds produced at otherwise lawful and permitted city-sponsored events, organized sporting events, school assemblies, school playground activities, by permitted fireworks, and by permitted parades on public right-of-way, public space or other publicly owned property.
- 8. An event for which a temporary use permit or special event permit has been issued under other provisions of this code, where the provisions of Section 11.80.040 are met, the permit granted expressly grants an exemption from specific standards contained in this chapter, and the permittee and all persons under the permittee's reasonable control actually comply with all conditions of such permit. Violation of any condition of such a permit related to sound or sound equipment shall be a violation of this chapter and punishable as such.
- F. Nothing in this chapter shall be construed to limit, modify or repeal any other regulation elsewhere in this code relating to the regulation of noise sources, nor shall any such other regulation be read to permit the emission of noise in violation of any provision of this chapter. (Ord. 740 § 1.2, 2007)

#### 11.80.040 Special provisions for temporary use and special event permits.

The exemption by permit set forth in Section 11.80.030(E)(8) shall be subject to the following requirements and conditions:

- A. The permit application shall include the name, address and telephone number of the permit applicant; the date, hours and location for which the permit is requested; and the nature of the event or activity. It shall also specify the types of sounds and/or sound equipment to be permitted, the proposed duration of such sound, the specific standards from which the sound is to be exempted, and the reasons for each requested exemption.
- B. The permit shall be issued provided the proposed activity meets the requirements of this section and the issuing official determines that the sound to be emitted at the event as proposed would not be detrimental to the public health, safety or welfare, that the event cannot reasonably achieve its legitimate aims and purposes without the exemption and that the sound levels proposed will not unreasonably damage the peace and quiet enjoyment of the lawful users of surrounding properties, nor constitute a public nuisance.
- C. The official issuing the permit may prescribe any reasonable conditions or requirements he/she deems necessary to minimize noise disturbances upon the community or the surrounding neighborhood, and/or to protect the health, safety or welfare of the public, including participants in the permitted event, including use of mufflers, screens or other sound-attenuating devices.
- D. Any permit granted must be in writing and shall contain all conditions upon which the permit shall be effective.
- E. No more than six events requiring a sound limit exemption may be held at any particular location upon privately owned or controlled property per calendar year, provided further that the number of events shall not exceed the number permitted under the regulations for the type of permit issued. For purposes of this subsection, "location" means a legal parcel of real property or a complete shopping or commercial center or mall sharing common parking and access even if comprised of multiple legal parcels.
- F. The exemption from sound limits under such permit shall not exceed maximum period of four hours in one twenty-four (24) hour day.
- G. The permit will only be granted for hours between nine a.m. and ten p.m. on all days other than Friday and Saturday; and, on Friday and Saturday, between the hours of nine a.m. and one a.m. of the following day, except in the following circumstances:
- 1. A permit may be granted for hours between nine a.m. on New Year's Eve and one a.m. the following day (New Year's Day).
- 2. A permit may be granted for hours between nine a.m. and two a.m. the following day if there are no residences, hospitals, or nursing homes within a 0.5 mile radius of the property where the function is taking

place.

H. Functions for which the permits are issued shall be limited to a continuous airborne sound level not to exceed seventy (70) dB(A), as measured two hundred (200) feet from the real property boundary of the source property if on private property, or from the source if on public right of way, public space or other publicly owned property. (Ord. 740 § 1.2, 2007)

#### 11.80.050 Measurement or assessment of sound.

- A. Measurement With Sound Meter.
- 1. The measurement of sound shall be made with a sound level meter meeting the standards prescribed by ANSI Section 1.4-1983 (R2006). The instruments shall be maintained in calibration and good working order. A calibration check shall be made of the system at the time of any sound level measurement. Measurements recorded shall be taken so as to provide a proper representation of the source of the sound. The microphone during measurement shall be positioned so as not to create any unnatural enhancement or diminution of the measured sound. A windscreen for the microphone shall be used at all times. However, a violation of this chapter may occur without the occasion of the measurements being made as otherwise provided.
- 2. The slow meter response of the sound level meter shall be used in order to best determine the average amplitude.
- 3. The measurement shall be made at any point on the property into which the sound is being transmitted and shall be made at least three feet away from any ground, wall, floor, ceiling, roof and other plane surface.
- 4. In case of multiple occupancy of a property, the measurement may be made at any point inside the premises to which any complainant has right of legal private occupancy; provided that the measurement shall not be made within three feet of any ground, wall, floor, ceiling, roof or other plane surface.
- 5. All measurements of sound provided for in this chapter will be made by qualified officials of the city who are designated by the city manger or designee to operate the apparatus used to make the measurements.
- B. Assessment Without Sound Level Meter. Any police officer, code enforcement officer, or other official designated by the city manager or designee who hears a noise or sound that is plainly audible, as defined in Section 11.80.020, in violation of this chapter, may enforce this chapter and shall assess the noise or sound according to the following standards:
- 1. The primary means of detection shall be by means of the official's normal hearing faculties, not artificially enhanced.
- 2. The official shall first attempt to have a direct line of sight and hearing to the vehicle or real property from which the sound or noise emanates so that the official can readily identify the offending source of the sound or noise and the distance involved. If the official is unable to have a direct line of sight and hearing to the vehicle or real property from which the sound or noise emanates, then the official shall confirm the source of the sound or noise by approaching the suspected vehicle or real property until the official is able to obtain a direct line of sight and hearing, and confirm the source of the sound or noise that was heard at the place of the original assessment of the sound or noise.
- 3. The official need not be required to identify song titles, artists, or lyrics in order to establish a violation. (Ord. 740 § 1.2, 2007)

#### 11.80.060 Violation.

A. Violation of Sound Level Limits. Any person violating any of the provisions of this chapter shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punishable by a fine not to exceed one

thousand dollars (\$1,000.00) and/or six months in the county jail, or both. Notwithstanding the forgoing, any violation of the provisions of this chapter may, in the discretion of the citing officer or the city attorney, be cited and/or prosecuted as an infraction. Any person found guilty of an infraction hereunder shall be punished by a fine of not less than fifty dollars (\$50.00) nor more than one hundred dollars (\$100.00) for the first offense; a fine of not less than one hundred dollars (\$100.00), nor more than two hundred dollars (\$200.00) for the second offense. Any third or subsequent offense shall constitute a misdemeanor. Violations of this chapter may also be subject to civil citation pursuant to Chapter 1.10.

- B. Joint and Several Responsibility. In addition to the person causing the offending sound, the owner, tenant or lessee of property, or a manager, overseer or agent, or any other person lawfully entitled to possess the property from which the offending sound is emitted at the time the offending sound is emitted, shall be responsible for compliance with this chapter if the additionally responsible party knows or should have known of the offending noise disturbance. It shall not be a lawful defense to assert that some other person caused the sound. The lawful possessor or operator of the premises shall be responsible for operating or maintaining the premises in compliance with this chapter and may be cited regardless of whether or not the person actually causing the sound is also cited.
- C. Violation May Be Declared a Public Nuisance. The operation or maintenance of any device, equipment, instrument, vehicle or machinery in violation of any provisions of this chapter which endangers the public health, safety and quality of life of residents in the area is declared to be a public nuisance, and may be subject to abatement summarily or by a restraining order or injunction issued by a court of competent jurisdiction. (Ord. 740 § 1.2, 2007)
